The rapid increase in the manufacture of Portland cement and reduction in cost, has made the use of concrete available for a multitude of purposes, and to no use is it more applicable than in building such structures as bridges, abutments, culverts, retaining walls, etc. Taken in combination with steel—the steel being properly imbedded in the concrete—the two materials combine and assist each other in resisting the stresses brought upon them, each material serving the purpose for which it is best adapted.

Brick and stone were formerly used for building abutments, and in some cases, arch bridges and culverts, but only to a limited extent, on account of the difficulty of procuring the material and the cost of placing it at the site of the proposed work. On the other hand, most of the ingredients entering into the composition of reinforced concrete are to be found in every township, and in many districts, in every concession. The cement and steel have only to be hauled from the nearest railway station; and as these ingredients in the mixture are by far the least portion, it is not expensive to haul them comparatively long distances.

Plain Concrete: Plain concrete is admirably adapted to the construction of works where it is only used in compression, such as abutments for bridges. Even for that purpose the use of a comparatively small amount of steel properly imbedded in the concrete will permit of a considerable reduction in the quantity of material used, and in most cases will also show a saving in cost. At the same time it will add materially to the strength and stability of the abutment, by uniting it more firmly together and making it less susceptible to cracks from expansion and contraction.

Concrete Pipe Culverts: Small culverts up to three or four feet in diameter can economically be built with concrete pipe—preferably reinforced—but these should always be protected at the ends with concrete abutments and wing walls, to prevent the water washing out the earth under them, and permit the free entrance and exit of the water.

The pipe should be made with hub and spigot ends, and be placed close together and cemented, so that there will be no chance of water leaking through the joints and making its way under the pipe. Should this occur, there is danger of the earth being washed out below and thus cause a failure of the culvert.

Short Spans: Culverts from four feet to eighteen feet can be more economically built with flat tops, when properly reinforced, than by arch construction. The side walls should be made about one foot in thickness up to sixteen feet in height, and the footings wide enough to suit the density of the ground on which they stand.

The wing walls should have a base of at least one-third the height and be supported by either counterforts or buttresses.

Beam Bridges: For spans over eighteen feet and up to forty feet beam bridges are the cheapest and give greater water-way than arch construction.

The side walls should be made heavier than for flat top culverts in order to safely carry the increased load and beams. Wing walls should be built the same as for flat top structures.

There are cases where beam construction has been used up to seventy-five feet, but generally they are not economical for a span over forty feet.

Arch Bridges: Concrete arch bridges will compare favorably in cost with steel construction in spans of forty feet to one hundred feet, and in cases where the material for concrete is easily obtainable, this length may be considerably increased. In the construction of arch bridges a perfect foundation is absolutely essential.

In flat top and beam bridges there is no longitudinal thrust. The whole weight of the structure and load is a downward pressure. But in arch construction there is an outward thrust pressure that has to be met with an increased weight of concrete supported by a perfect foundation. Should the foundations of an arch bridge give way, the result would likely be the destruction of the bridge. In the case of a flat top or beam bridge, the settlement of a foundation might not seriously affect the structure; although in every case it is advisable to secure a perfect foundation for any kind of a structure.

Steel Superstructures: For bridges over one hundred feet span it is generally considered more economical to build them of steel on concrete foundations, and in every case they should be made strong enough to support a solid floor. It is quite true that the life time of a steel bridge is not as great as that of concrete, but with proper care and attention, keeping the steel well painted, a bridge of this type should be safe for at least fifty years.

It is said that there is a cast iron bridge in France on the Seine River that was built in 1801 and is still in use.

Kind of Bridges to Build: The question of determining the kind of structure best suited to any particular crossing of a stream, can only be made after a careful examination of the site and its surroundings. No two sites are alike, and therefore a study of local conditions and requirements is necessary in every case before a recommendation can be made as to the best and most economical structure to build.

Great care should be taken to have the foundation built so that in future years there will be no danger of undermining by the scouring action of the water.

Size of Openings: Determining the length and height of openings is also an important matter. Freshets will undoubtedly be greater in future as the country becomes better drained. Ample room should, therefore, be provided for the water, for if confined in too narrow a space, scouring of the bed of the stream is sure to occur and consequently injury to the structure.

Design of Structure: In designing a structure, the first consideration should be the public safety. It is far better to provide in excess of the requirements than to have the structure too weak. Then loss of life would probably be the result Cheapness in construction should never be considered as against the security of the traveling public.

It is an undoubted fact that a large number of the steel and iron bridges that have been erected throughout the province are now inadequate for present traffic conditions. This is not all due to imperfect design or construction. Traffic conditions twenty years ago were quite different to what they are to-day. At that time the heaviest load to provide for would probably be a threshing engine or a drove of cattle. Now the law provides that bridges shall be safe for the

* Paper read at Ontario Good Roads Association meeting, Toronto, Tuesday, February 27th, 1912.

passage of a traction engine not exceeding in weight eight tons, and where roads are now being systematically improved, it is necessary that they be sufficiently strong to carry a fifteen ton steam roller in addition to the live load provided.

Bridge Floors: Very few of the bridges that have been erected with wooden floors are strong enough to carry a floor of concrete. In some pin connected bridges where the top chord and batter posts are strong enough, the other members can be strengthened sufficiently for this purpose, but in most cases it means the rebuilding of the superstructure.

All bridges where possible should be constructed with solid floors. Vehicular traffic on wooden floors causes a greater strain and vibration to the bridge than the same loads on a solid floor. This is caused by the irregularities of the plank when worn, and projecting knots. On a solid floor the surface is much smoother, and in consequence of it being a large slab, the stresses are distributed over a larger area.

Traction Engines: The cutting action of the lugs of traction engines is very destructive to wooden floors, particularly when they are soaked with water; and although the "Act" provides for planking to be laid under the drive wheels of the engine, this is rarely complied with.

Plans and Specifications: All plans and specifications of steel bridges should be submitted to and approved by a competent tribunal before erection. This is more necessary in the case of steel bridges than of concrete. If a reinforced concrete bridge, after the forms are removed, shows no defects, then after thirty days it is reasonable to suppose that it will stand the ordinary travel, and as its strength increases rapidly, there is little to fear for its safety. But in a steel bridge the reverse is the case. It is strongest the day it is completed, and from that day it decreases in strength.

The Legislature last session passed an Act providing that the specifications of all County Bridges should be submitted to the Provincial Engineer of Highways for approval before being built. As the majority of the bridges in the province—and in many cases those most traveled upon—are under control of the minor municipalities, this Act should apply to all bridges.

Inspection of Steel Bridges: Rigid inspection of steel bridges after erection, by a competent person, should be compulsory. The design and specifications of a bridge may be all that is desired, but if the erection is defectve, then the whole intention of the design is a failure. This inspection should be made immediately after erection and before any painting is done. All rivets, particularly those in tension members, should be carefully examined and each one tested with a light hammer to see if they are loose or do not fill the holes properly. All loose or imperfect rivets should be cut out and properly replaced.

The Provincial Engineer of Highways in his last report, has an amended specification for steel highway bridges, which if lived up to, will ensure the completion of better bridges in future. Proper inspection after erection is the only way to guarantee that those specifications are effective.

Inspection of Concrete: For concrete structures it is very important and necessary that a competent inspector should have charge of the work. He should be able to thoroughly understand the plans and specifications prepared for the work, and also have a knowledge of the different ingredients that make up the concrete, how to mix and place them in position. He should also know how the forms for holding the concrete should be made and placed, and see that they are strong enough to resist the pressure of the wet concrete. Good results can only be obtained by a thorough knowledge of materials and how to prepare and place them in position.

Painting: Keeping steel bridges well painted is a matter that should not be forgotten. Unpainted or imperfectly painted bridges deteriorate very rapidly in strength, and although a fair margin of safety is provided in the design, a failure to properly protect the steel will soon reduce the strength of the bridge to a point where it will be unsafe.

UTILIZATION OF WASTE STEAM AT THE MILWAUKEE REFUSE INCINERATOR.

At the November meeting of the Milwaukee Section of the American nstitute of Electrical Engineers, held in cooperation with the Engineers Society of Milwaukee, Mr. J. A. Neseroff, city engineer of Milwaukee, presented a paper on "The Utilization of Waste Steam at the Refuse Incinerator and the Electrification of Two River Flushing Stations."

The City of Milwaukee now operates a refuse incinerator in which all classes of refuse are burned in special furnaces under special boilers. At the present time the steam is blown off except a very small portion used to run the plant. Tests made showed that the steam available varied widely, depending on the grades of refuse, being lowest when green garbage was fed to the furnaces. Further tests showed that by adding a very small amount of coke dust to the charges of green garbage, enough steam could be raised to produce 600 kw. at all times, although at some times nearly three times this amount would be available.

Since it is undesirable to make a large investment in machinery at this time, it has been decided to install one 600 kw. steam turbine and proper auxiliary apparatus in a new engine house adjoining the incinerator. The nature of the steam supply and the absence of spare units made it inadvisable to utilize this power supply for service requiring great reliability, and street lighting would not be economical by reason of the absence of any day load. The city, however, now operates by steam two pumping plants taking water from the lake and forcing it through tunnels into the rivers running through the city, for the purpose of flushing them to carry off sewage. One plant is only two years old, with a capacity of about 200 horse-power, while the other is 24 years old, with a capacity of about 250 horse-power. Both run practically continuously, but a few hours shut-down would not be disasatrous. This load therefore seems ideal as an outlet for the power available at the refuse incinerator.

The plans contemplate 6,600-volt three-phase underground transmission to induction motors in the two pumping stations, about two miles in each case, and the removal of the present steam engines. The motors will be geared to the present shafts.

Figures were given of the cost of operation of the present steam pumping stations and it was shown that by an investment estimated at $80,000, a saving of approximately $28,000 a year could be made. This did not make any allowance for interest or depreciation on the new investment, nor did it include any value for the steam that will be used. As the steam is now a waste property of the city it is merely a matter of bookkeeping whether the economy is shown in the pumping plant by using waste steam, or whether the steam is charged against the pumping stations, and the economy shown in the operation of the incinerator.

The discussion which followed the reading of the paper was general, and involved criticisms of the present operation of the steam plants and suggestions that other more profitable markets be selected for the use of waste steam, but no practical suggestions were made that appeared better than the plan already adopted.

ENGINEERS' LIBRARY

Any book reviewed in these columns may be obtained through the Book Department of The Canadian Engineer.

BOOK REVIEWS.

Geodetic Surveying. By Edward L. Ingram. Published by The McGraw Hill Book Co., New York. Cloth; 289 pages, including index; size 6½ x 9¼ inches; 92 figures; 10 tables; price $3.00.

The author of this treatise is Professor of Railroad Engineering and Geodesy at the University of Pennsylvaia, and the full title of the volume is Geodetic Surveying and the adjustment of Observations (Method of Lease Squares). Up to the appearance of this treatise there has been a lack of a satisfactory text from which to teach civil engineering students the fundamental principles of geodetic surveying and the adjustment of observation. It was with the intention of filling this need that the volume was compiled. In order to make the book complete for the practising civil engineer a large amount of other matter has been included. A large number of illustrative examples are given and are worked out in detail, so that every process may be fully understood.

Strength of Materials. By James E. Boyd, M.S. Published by The McGraw Hill Book Co., New York. Cloth; size 6½ x 9¼ inches; 295 pages, including index; 200 figures and 15 tables; price $2.50.

Many treatises have been published recently on the subject of "Strength of Materials," and some of these have been very good. This new volume is a valuable addition to the subject and is intended to give the student a grasp of the physical and mathematical ideas underlying the mechanics of materials, together with enough of experimental facts and simple applications to sustain his interest, fix his theory, and prepare him for the technical subjects as given in works on machine design, reinforced concrete, or stresses in structures. It is assumed that the reader has completed the integral calculus, and has taken a course in the theoretical mechanics, which includes statics and the moment of inertia of plain areas. The book is a well-balanced, logical exposition of the subject, and will be found a valuable text for the student of the strength of materials.

The Law Relating to Engineering. By L. W. J. Costello. Published by the Society of Engineers and the Junior Institution of Engineers, London. Cloth; size 6 x 8¾ inches; 170 pages; including index; price $1.60.

This book is a course of six lectures delivered at Caxton Hall, Westminster, in 1910 and 1911, before the Society of Engineers and the Junior Institution of Engineers, by the author. There is also an introduction by Lord Justice Fletcher Moulton, past president of the Junior Institution of Engineers. The lectures comprise a judicious selection of the decided cases in law bearing on the matters with which the engineering profession have to deal, the cases being arranged in such manner that those that relate to each point come together. The perusal of them will benefit the most experienced, and will give invaluable training to the beginner. While the cases all came up in the English courts, still they are of great interest to the Canadian engineering profession.

Efficiency. By Harrington Emerson. Third edition, revised and enlarged. Published by The Engineering Magazine, New York. Cloth; size 5¼ x 7½ inches; 254 pages; price $2.00.

This volume forms one of the Works Management Library published by this company, and the full title is "Efficiency as a Basis for Operation and Wages." The rapid expansion of interest not only in the pursuit of efficiency, but in Mr. Emerson's interpretation of it as applied to industrial affairs, exhausted the first two editions in a very short time. In this third edition the author has made a thorough revision of his text, elucidating points upon which experience has shown added emphasis must be laid, adding sections to cover the development of thought and practice since the first draft was written and establishing points of connection between this volume and the following one on the twelve principles of Efficiency. The principal changes will be found in chapters 4, 5, 6 and 7.

The Twelve Principles of Efficiency. By Harrington Emerson. Published by The Engineering Magazine, New York. Size 5¼ x 7½ inches; 423 pages; price $2.00.

This is the latest work by Mr. Emerson and follows the volume entitled "Efficiency as a Basis for Operation and Wages," a review of the revised edition of which will be found in this issue of The Canadian Engineer. In this latest volume Mr. Emerson reduces the elements of efficiency to definite and clearly defined principles. These principles are so universal that they may be used to test the efficiency of an existing organization, or they may be made to serve as guides in directing the conduct of further enterprises. The method of treatment is simple and logical. An introductory chapter lays down the premise that the prime institutions for the attainment of efficiency are not men, materials, money, machines, methods, but theories of organization and principles, and that inefficiency prevails because the type of organization in general use does not lend itself to the application of efficiency principles. The second chapter discusses the type of organization under which efficiency principles can be successfully applied. The twelve following chapters take up each one a single principle: 1, Ideals; 2, Common-Sense and Judgment; 3, Competent Counsel; 4, Discipline; 5, The Fair Deal; 6, Reliable, Immediate and Accurate Records. 7, Planning and Despatching; 8, Standards and Schedules; 9, Standardized Conditions; 10, Standardized Operations; 11, Written Standard-Practice Instructions; 12, Efficiency Reward. The two concluding chapters show how the principles are applied as a means of diagnosis of industrial conditions and correction of existing inefficiencies.

Engineering as a Vocation. By Ernest McCullough, C.E., M. Am. Soc., C.E., etc. Published by David Williams Company, New York, N.Y. Cloth; 5¾ x 8 inches; 201 pages; 4 illustrations; 6 tables; price $1.00.

The book takes up first the definition of the word engineer and what is meant by engineering. Then is discussed the work and the education of the engineer, one chapter containing a full list of studies pursued at schools of civil, mechanical, electrical and mining engineering. The statement is made that the modern engineer should have a college education or its equivalent, the author mentioning that the

equivalent is very hard to obtain. To show what the self-tutored man is apt to encounter and to help him accomplish his purpose he gives a list of books to study, with the price of each book. Directions for home study are also given, the author being a man who is ready to admit that many first-class engineers never saw the inside of a technical School. There is a long chapter entitled "Does it Pay to Study Engineering?" which the reader cannot help but feel is largely autobiographical. An appendix containing reprints of editorials from prominent engineering papers is somewhat pessimistic in tone; more so than anything the author seemed to dare write. Contractors should be interested in this book, the author believing an engineering education the best, if contractors care for a college training. He refers to contracting as "migratory manufacturing" and calls attention to the great changes in methods since engineers entered the field. The author has a pleasing style, the pages being enlivened occasionally by quiet humor. The book will be useful to young engineers in setting before them the reasons for non-success and showing them how to advance. It will be interesting, because reminiscent, to older engineers, and if required to be read by every high school student and freshman in college will undoubtedly prevent many fine young fellows from making a mistake in selecting a vocation for which they may be totally unfit.

Tests on Reinforced Concrete Columns. By Morten Owen Withey. Has just been issued as Bulletin No. 466 of the University of Wisconsin. This bulletin is 116 pages in length; size 6 x 9; and records the tests on columns of the series of 1910. These tests were made in the laboratory for testing materials of the University of Wisconsin, and are a continuation of a branch of the work reported in Bulletin No. 300. The purpose of these experiments was to make a further study of the strength and elastic properties of columns reinforced with spirals and longitudinal rods. Copies of Bulletin No. 466 may be obtained by addressing the librarian of the University of Wisconsin.

Pipes and Tubes. By P. R. Björling. Published by Whittaker & Company, London. Size 5¼ x 7 inches; 244 pages, including index; price $1.00.

This little volume which forms one of the series of Whittaker's library of Arts, Sciences and Industries, deals with the construction and joining of pipes and tubes, together with many rules, formulae and tables. The chapters on Construction and Laying of Pipes are exceedingly good, and while they represent English practice, will be very useful to any engineer interested in this subject.

Mining Without Timber. By Robt. Bruce Brinsmade, B.S.E.M. Published by McGraw Hill Book Co., New York., 239 West 39th Street, New York, 1911. Size 6½ x 9½ inches; 309 pages, including index; 146 figures; price $3.00 net.

This book has been written to supplement many other valuable treatises on such work, such as Mayer's Mining Methods in Europe, Storm's Timbering in Mining, and those books also dealing with the financial side of mining, which include Ingall's Economics of Mining, Hoover's Principles of Mining, and Finlay's Cost of Mining. The mining industry is becoming alarmed as to its future supply of the big timber of which it has hitherto been such a prodigal consumer on account of the rapid depletion of the forests of America by fires and the axe in recent years.

The use of steel and masonry for the support of mine shafts and tunnels, the author states, has long been practised in Europe because most mines there are considered to be investments rather than temporary speculations; this system has been thoroughly covered by other writers, and has not been touched on in this treatise. The book deals with the various systems of excavation with such additional matter regarding exploring, blasting, explosives and the control of ground as is necessary for the elucidation of the main theme.

This book should be well received by both coal miner and metal miner, for they will find a great deal of interest in it.

Street Lighting. By J. M. Bryant and H. G. Hake, has just been issued as Bulletin No. 51 of the Engineering Experiment Station of the University of Illinois.

Efficient and economical street lighting is a subject on which little information of a definite and tangible character has been published. Bulletin No. 51 is designed to supply such information concerning electric street lighting. The subject has been treated in a simple, direct manner, and while of especial interest and value to the technically trained illuminating engineer, will appeal particularly to city councils and central station managers.

The general theory and construction of electric lamps, both incandescent and arc, are discussed, together with the standard systems of electric distribution for lighting, and accepted methods for the measurement and study of illumination, with and without shades and reflectors.

These principles are then applied to the study of street illumination, curves and calculations being given to show the candle-power distribution for the various lamps used, equipped with their proper glassware and reflectors, and others to show the illumination along the street for representative installations and conditions. Based upon these results, a discussion is given of the proper lighting of business streets, cross streets, boulevards, residence streets and outlying districts. The subject of economy for the several systems and lamps is thoroughly discussed—the initial cost, upkeep, interest and depreciation of various lamps and equipment are considered in tables and curves showing their relative economy at standard costs of power. Attention is given also to the economical selection of different lamps for certain classes of illumination.

Copies of Bulletin No. 51 may be obtained gratis upon application to W. F. M. Goss, Director of the Engineering Experiment Station, University of Illinois, Urbana, Illinois.

An Investigation of the Strength of Rolled Zinc. By Herbert F. Moore, has just been issued as Bulletin No. 52 of the Engineering Experiment Station of the University of Illinois.

For many years engineers have been studying the strength of iron and steel, and though much remains to be learned about these, the commonest of metals, yet we have sufficient knowledge of their strength and stiffness to enable them to be used safely and economically. Very little attention has been given to the study of the strength of zinc, though that metal has had a wide use on account of its rust-resisting and electric properties. Zinc has, in fact, rarely been used in places where heavy loads were liable to be imposed. Recently, it was proposed to use loops of sheet zinc to suspend electric cables, and it became important to determine the strength of zinc so that such hangers could be designed to carry heavy cables with safety. The Engineering Experiment Station of the University of Illinois, at the suggestion of an Illinois zinc works, undertook the investigation of the strength of zinc, and the results of the investigation have just been published in this bulletin. The tests performed showed that thin sheet zinc is about one-third as strong as soft steel plate of the same thickness, and that a punch or shear which would punch or shear steel plate one-tenth of an inch thick would punch or shear zinc plate about one-quarter of an inch thick. Zinc plate was found to break under pull with much less stretching than steel, but a cylinder of zinc could be flattened out without cracking.

Copies of Bulletin No. 52 may be obtained gratis upon application to W. F. M. Goss, Director of the Engineering Experiment Station, University of Illinois, Urbana, Illinois.

Retaining Walls for Earth. By Malverd A. Howe, C.E., Professor of Civil Engineering, Rose Polytechnic Institute. Published by John Wiley & Sons, New York. Canadian agents, Renouf & Co., Montreal. Fifth edition, revised and enlarged; size 5x7½ inches; 181 pages; price $1.25.

This little volume, now in its fifth edition, treats of the design of retaining walls for earth, including the theory of earth-pressure as developed from the ellipse of stress. It contains also a short treatise on foundations, illustrated with many examples from practice. The captions for the different parts of the book are: Theory of Earth Pressure; Formulas for Earth Pressure; Stability of Trapezoidal Walls; Formulas for Trapezoidal and Triangular Walls; Foundations for Walls Retaining Earth; Examples; Foundations; Foundations Under Water and Deep Foundations; Tables; Appendices. Not the least valuable part of the volume are the appendices, which are devoted to the analysis and design of reinforced concrete retaining walls, and the profiles of gravity walls retaining earth. This little volume should be in the library of every engineer engaged in the design of walls or foundations, for the theory and practice is closely and concisely presented.

Concrete in Cold Weather is the title of a new booklet published by the Universal Portland Cement Co., of Chicago and Pittsburg. The subject matter of this very seasonable book is the mixing, handling and depositing of concrete in freezing weather. The booklet is particularly valuable at this time by reason of the increased use of cement during the winter months and on account of the demand for rapid building construction.

The necessity of a work of this character has long been felt by architects and cement users generally. This is perhaps the first time that any thorough study of the subject has been published in pamphlet form. The booklet contains much matter of great practical value to persons interested in doing concrete work properly in the winter months. The booklet may be had, free of charge, upon request to either the Chicago, Pittsburg or Minneapolis office of the Universal Portland Cement Co.

Economies of Contracting. By Daniel J. Hauer. Published by E. H. Baumgartner, Chicago. Cloth; 269 pages; size 5½ x 8½ inches; illustrated; price $2.50.

The author of this book is the eastern editor of The Contractor. Mr. Hauer has had an engineering training as well as practical experience as a contractor. Therefore his ideas will be calculated to command respect. He holds that contracting is a profession, and as such, may be studied as any of the other professions are. The volume is addressed to students of the subject as well as to the older men, who may feel that some advance in efficiency may be made in this work. The book contains ten chapters. The first deals with contracting as a profession, stating the way in which one may go into the business: first preliminary study, then by joining a partnership or corporation or acting as a subcontractor. General legal considerations regarding contracts are stated, such as matters of payment, breach of contract and ownership of materials of construction. The second chapter states the various forms of contracts, unit price, lump sum, percentage, cost plus a fixed sum, etc. Considerations regarding proposals, bonds, arbitration and other features, are discussed in the third chapter. The formal proceedings which a contractor must go through from the making out of his bid to the receipt of his final payment make up the subject matter. The chapter on the business end of contracting endeavors to outline in a general way the methods by which contracts may be obtained. The reputation of the contractor, his financial standing, as prerequisites to the obtaining of work, are emphasized. The relations of the engineer and contractor are also discussed. The fifth chapter deals with the clerical end of contracting. Herein are matters that should interest the older contractor. The office work, organization, execution and financial department are discussed. The subject of daily and other reports of progress and cost keeping and cost data are gone into. Chapter six deals with the labor question, obtaining workmen, transporting men, the welfare of laborers, wages and efficiency. The seventh is an interesting chapter on construction camps, covering the subject from the selection of a site to the supply of drinking water and lights. Under the caption "Management of Men" are laid down certain rules of management, which, however, will still require the intangible elements of leadership. The ninth chapter, on contractors' outfit and plant, is a long one, and outlines the chief classes of items in a contractor's equipment. The tenth chapter is entitled a personal chapter for the contractor dealing with the prevention of accidents, etc. An addenda gives a talk on specifications, and useful books for the contractor. Altogether this is a most valuable book for the contractor and engineer.

Highway Engineering. By Arthur H. Blanchard, C.E., and Henry B. Drowne, C.E. Published by J. Wiley & Sons. Renouf & Company, Montreal, Canadian Agents. Pages 299; price $2.

The object of the authors in writing this book appears to be to render available to those interested in the progress of highway engineering the large mass of information relative to the construction and maintenance of roads and pavements which was presented by the various reporters and contributors at Brussels in 1910.

The authors, appreciating the valuable knowledge which may be acquired by a close observance of the practice of highway engineering in the various countries of the world and believing that it is possible in many cases to profit by the successes and failures of others who have worked in similar fields and thus avoid costly duplication of experimental work and the waste of public and private funds through the adoption of methods which have resulted in unsaisfactory roads and pavements, wish to emphasize the fact that the subject of foreign practice has not received the attention it deserves by American engineers.

The main part of the book is devoted to the presentation of the fundamental facts and salient opinions submitted to the Congress and the discussions at many sessions of the Congress which occupied over two hundred pages of the "Report of the Proceedings of the Congress," recently published by the Association. It should be borne in mind that the reporters selected by the Executive Committee were instructed to cover in their reports the progress in the particular field assigned relative to the practice of the countries which they represented. The conclusions which were finally adopted by the Congress were the outcome of thorough consideration and ofttimes strenuous debates by highway engineering experts from all parts of the world. It is self-evident that through the medium of an International Road Congress a very comprehensive review of foreign practice is presented.

The plan adopted in the compilation of the book has been to collate the material under headings familiar to American engineers. Discussions in every case follow the reporter's name, hence quotation marks were not used although in some cases the words of the reporters were employed, but generally the object of the authors was attained by presenting the important ideas of the reporters in

abstract. The discussions on a given topic relative to the practice in a given country have been congregated while the groups thus formed have been arranged in alphabetical order in each chapter.

Modern methods of road building are improving so quickly that a discussion such as took place at this congress must be of exceptional value to road builders and this volume is an added advantage, in that the material has been selected and arranged by a prominent highway engineer, a man who has a clear appreciation of all that is required.

Steam Power Plants. By Henry C. Meyer, jr., M.E.; third edition, revised and enlarged. Published by McGraw-Hill Book Company, New York; 6 x 9¼ in.; 219 pages, including index; 67 illustrations. Cloth; price $2.

The first edition of the book appeared in 1902, and shortly after the author began to practise as a consulting engineer for power-plant design. This revision therefore entails many changes and additions, including the experience gained in actual work. The chapter on turbines is new, and a great deal of new matter is added on the subject of steam piping, condensers and chimneys. A good deal of space is devoted to the structural parts of installations, such as foundation design of chimneys, design of boilers, etc.; and here it is noticed that the author quotes empirical rules and formulae without going into the mathematical derivations. When an engineer uses a formula he desires to know on what basis it is founded. However, by doing this the author has brought the book to a reasonable size, while at the same time covering the subject well. The book is closely written and will be found very valuable to the mechanical engineer interested in the design of steam power plants.

Roofs and Bridges, Part III, Bridge Design. Fifth edition. By Mansfield Merriman and Henry S. Jacoby. Published by John Wiley & Sons, New York. Renouf & Co., Montreal, Canadian Agents. 6 in. x 9 in.; 414 pages; 185 illustrations; cloth. Price $2.50.

The first edition of Merriman and Jacoby's text book on Roofs and Bridges was published in 1894, and the fact that it has been standard in many institutions during the intervening years is evidence of its value. It has been revised four times—in 1896, in 1898, in 1902, and in 1912. The changes in bridge design and construction during the past ten years have been very important and the present revision was made necessary in order to include practices which have become standard. The principal change in the new edition is the complete rewriting of the chapters on Fabrication and Erection, Highway Bridges, Railroad Riveted Bridges, and several other articles. The subject of erection is added in the first chapter mentioned, the matter being well covered by Warren B. Keim, assistant engineer of the Pennsylvania Steel Company. The chapter on highway bridges is entirely new, being written by F. O. Dufour, assistant professor of structural engineering, University of Illinois. While the new volume gives latest details of bridge practice, the matter is presented especially for students and young engineers, the experience of the authors qualifying them well for presenting the subject to this class of readers.

PUBLICATIONS RECEIVED.

Annual Report of the Smithsonian Institution, 1910. Showing the operations, expenditures and conditions of the Institution for the year ending June 30th, 1910.

Report on the Geology and Mineral Resources of the Chibougamau Region, Quebec. A report by the Chibougamau Mining Commission, composed of Mr. E. R. Faribault, Mr. J. C. Gwillim, Mr. Alfred E. Barlow, for the Department of Colonization, Mines and Fisheries, Mines Branch, of the Province of Quebec.

Annual Report of the Department of Railways and Canals of the Dominion of Canada, for the year ending March 31st, 1911.

Steamboat Inspection Report. Supplement to the 44th annual report of the Department of Marine and Fisheries for the year 1911.

The Road Material Resources of Minnesota. By George W. Cooley, Bulletin No. 40, of the Office of Public Roads, United States Department of Agriculture.

Report of the Director of the Office of Public Roads for 1911. By Logan Waller Page, Director, United States Department of Agriculture.

Wood Distillation, 1910. Bulletin No. 7, Forest Products, Department of Commerce and Labor, Bureau of the Census, United States.

The Annual Report of Water and Lighting Department, City of Harrisburg, Pa., for the year 1911, being the 24th annual report of the Board of Commissions.

Reports of the Harbor Commissioners for Montreal, Quebec, etc. Supplement to the 44th Annual Report of the Department of Marine and Fisheries for the calendar year ending 31st of December, 1910.

Report of the Board of Governors of the University of Toronto, for the year ending 30th of June, 1911.

Railway Statistics of the Dominion of Canada for the year ending June 30th, 1911, compiled by A. W. Campbell, Deputy Minister of the Department of Railways and Canals.

New Hampshire Highways. Bulletin No. 42, Office of Public Roads, United States Department of Agriculture. A report of an inspection of Highways in the State of New Hampshire, August, 1911, by Charles H. Holt, superintendent of construction.

Technological Papers of the Bureau of Standards, United States. No. 5, the effect of high pressure of steam on the pressing strength of Portland cement mortar and concrete, issued by the Department of Commerce and Labor, United States.

Proceedings of the Fourth Annual Convention of the Indiana Sanitary and Water Supply Association, held at Indianapolis, February 9-10, 1911.

Directory of Portland Cement Manufacturers, 1912. Compiled and published by The Cement Era, 1207 Morton Building, Chicago. Price $1.

CATALOGUES RECEIVED.

Excavators. The F. C. Austin Drainage Excavating Company, Railway Exchange Building, Chicago, Ill., manufacturers of irrigation and drainage excavating machinery, forward catalogue showing different machines in operation.

The Tromanhauser System of Sub-Aqueuous Concrete Construction. By J. H. Tromanhauser, engineer and contractor, Temple Building, Toronto, describes his patented method of floating pontoon system of concrete construction in a pamphlet printed by the Canadian Engineer Press.

Compressors, Air and Gas. Catalogue issued by the Canadian Rand Company, Ltd., Montreal, Canada, describing their different types of compressors.

Ignition Appliances and Auto Accessories. Supply catalogue issued by the Canadian General Electric Company, Ltd., Toronto, Canada.

Steam Tables for Condenser Work. Issued by The Wheeler Condenser and Engineering Company, of Carteret, N.J.

Pneumatic Tools. A series of pamphlets issued by the Chicago Pneumatic Tool Company, of Chicago, describing their different types of pneumatic tools, air compressors, hoists, electrical drills, etc.

The Best Manufacturing Company, Pittsburg, Pa., forward catalogue and hand-book of piping materials for steam, air, hydraulic, high-pressure piping systems.

Expanded Metal Constructiotn. Pamphlet No. 1, issued by the Northwestern Expanded Metal Company, Chicago, Ill.

Intermittent Flush Tanks. Pamphlet issued by the Pacific Flush Tank Company, Chicago and New York, describing their automotic, intermittent flush tank syphons.

Corrugated Bar Company, Buffalo, forward pamphlets describing the different materials fabricated by them and giving data useful in design.

Ferro Engines. Published by the Ferro Machine and Foundry Company, Cleveland, O.

Engineers' and Surveyors' Instruments. Catalogue L 112, of E. R. Watts & Sons, Ottawa and Winnipeg. Catalogue of engineers, surveyors, architects and draughtsmen's instruments and supplies.

Catalogue No. 50, The H. Shannon Company, Chicago, machinery and general supplies.

Description Leaflet No. 2298 of The Westinghouse Electric and Manufacturing Company, describing its well-known type CCL Inductor Motor.

Leaflet No. 2330 of the Westinghouse Electric and Manufacturing Company, covering a direct-current (type JL) vertical edgewise switchboard ammeter operating on the D'Arsonval principle with a single air-gap.

NATIONAL ASSOCIATION OF CEMENT USERS.

Eighth Annual Convention.

On March 11-16, 1912, the association will meet in its eighth annual convention, at Kansas City, Mo. The first Kansas City Cement Show will be held March 14-21, under the auspices of the Cement Products Exhibition Company.

The headquarters and convention will be at the Hotel Baltimore, where each member must go to register and secure information on all matters pertaining to the convention and Cement Show.

Tentative Program.—Monday, March 11.

10.30 a.m.—Meeting of the Executive Board, Hotel Baltimore.

2.00 p.m.—Meeting of Sectional Committees on: Building Blocks and Cement Products; Exhibition; Fireproofing; Insurance; Measuring Concrete; Nomenclature; Reinforced Concrete and Building Laws; Roadways, Sidewalks, and Floors; Specifications and Methods of Tests for Concrete Materials; Treatment of Concrete Surfaces; Education.

8.00 p.m.—Formal opening of the convention, Hotel Baltimore. Address of welcome to Kansas City. Response by the president, Richard L. Humphrey, consulting engineer, Philadelphia, Pa. Address. Address. Business session. Reinforced Concrete Water Purification Works, Dr. Walter M. Cross, city chemist, Kansas City, Mo.

Tuesday, March 12.

9.00 a.m.—Meeting of the Sections on Measuring Concrete, Nomenclature, and Specifications and Methods of Tests for Concrete Materials. Topical discussion on Methods of Measuring Concrete Construction, and on Materials Used for Concrete.

10.30 a.m.—Report of the Committee on Measuring Concrete, Robert A. Cummings, chairman. Report of the Committee on Nomenclature, Peter Gillespie, chairman. Report of Committee on Specifications and Methods of Tests for Concrete Materials, Sanford E. Thompson, chairman. Discussion on Aggregates for Concrete, Wm. M. Kinney, assistant inspecting engineer, Universal Portland Cement Co., Pittsburg, Pa. Discussion on the Use of Calcium Chloride as a Preventive of the Freezing of Concrete, Richard K. Meade, chief engineer, Tidewater Portland Cement Company, Baltimore, Md. Report of the Committee on Fireproofing, Rudolph P. Miller, chairman.

8.00 p.m.—Annual address by the president, Richard L. Humphrey, consulting engineer, Philadelphia, Pa., Construction of the Hollow Reinforced Concrete Dam of the Portland Railway Light and Power Company, Robert S. Edwards, consulting engineer, Portland, Oregon. Discussion of the Advantages and Comparative Cost of the Hollow Concrete Dam, W. L. Church, president, Ambursen Hydraulic Construction Company, Boston, Mass. The Design and Construction of the Keokuk Dam, Hugh L. Cooper, chief engineer, Mississippi River Power Company, Keokuk, Iowa. Report of the Committee on Insurance, W. H. Ham, chairman. Report of the Committee on Treatment of Concrete Surfaces, L. C. Wason, chairman.

Wednesday, March 13.

9.00 a.m.—Meeting of the Section on Reinforced Concrete and Building Laws. General discussion on Design, Methods of Construction, etc.

10.30 a.m.—Report of the Committee on Reinforced Concrete and Building Laws, A. E. Lindau, chairman. The Design of Concrete Flat Slabs, F. J. Trelease, Engineer, Corrugated Bar Company, Buffalo, N.Y. Business session: Report of the Executive Board; election of officers; place of next convention.

3.00 p.m.—The Control Beam as a Field Test for Concrete, Fritz E. von Emperger, consulting engineer, Vienna, Austria. Notes on the Deformation in the Webs of Rectangular Concrete Beams, H. C. Berry, assistant professor of materials of construction, University of Pennsylvania, Philadelphia, Pa. Continuous Concrete Beams, Dr. E. Probst, consulting engineer, professor, Royal Technical High School, Berlin. The Construction of the Fireproof Type of School House with Separately Molded Members, Theodore H. Skinner, architect, Oneida Community, Ltd., Oneida, N.Y. Unit Cost of Reinforced Concrete for Industrial Buildings, F. W. Reynolds, Lockwood, Greene and Company, Boston, Mass.

8.00 p.m.—Methods of Construction Used in the Arbuckle Building, Brooklyn, R. C. Wilson, assistant engineer, Turner Construction Company, New York, N.Y. The Design and Construction of a Reinforced Concrete Dome, 220-foot span, Dr. S. J. Trauer, chief engineer, Breslau, Germany. The Design of Reinforced Concrete Domes, H. Brussel, president, Reinforced Concrete Company, St. Louis, Mo. The Design of Concrete Grain Elevators, E. Lee Heidenreich, consulting engineer, Kansas City, Mo. The Construction of Concrete Grain Elevators, John S. Metcalf, consulting engineer, Chicago, Ill. Reinforced Concrete Grain Elevators and Silos, M. S. Ketchum, consulting engineer, Boulder, Col. The Use of Concrete in the Fourth Avenue Subway, Brooklyn, Frederick C. Noble, division engineer, Public Service Commission, Brooklyn, N.Y.

Thursday, March 14.

9.00 a.m.—Meeting of Section on Treatment of Concrete Surfaces. Topical discussion on the Artistic Treatment of Concrete Surfaces.

10.30 a.m.—Concrete Highway Bridges, Walter Scott Gearhart, State Highway Engineer, Extension Department, Agricultural College, Manhattan, Kansas. The Dallas Oak Cliffe Viaduct, Ira G. Hedrick, consulting engineer, Kansas City, Mo. Flat Slab Bridges, W. H. Finley, assistant chief engineer, Chicago and Northwestern Railroad, Chicago, Ill. The Use of Cement for Protecting the Steel Pipes Along the New York Aqueduct, Alfred D. Flinn, department engineer, Board of Water Supply, New York, N.Y.

8.00 p.m.—The Necessity for Good Roads, Logan Waller Page, director, Office of Public Roads, president, American Good Roads Association, Washington, D.C. Cement Paving as Constructed at Mason City, Iowa, F. P. Wilson, city engineer, Mason City, Iowa. An Improved Concrete Pavement, E. W. Groves, city engineer, Ann Arbor, Mich. Concrete and Highway Construction. Report of Committee on Roadways, Sidewalks and Floors, C. W. Boynton, chairman. Report of Committee on Education, Logan Waller Page, chairman.

Friday, March 15.

9.00 a.m.—Meeting of the Section on Roadways, Sidewalks and Floors. Topical discussion covering the Preparation of Materials, Laying, Finishing, Costs.

10.30 a.m.—Report of Committee on Building Blocks and Cement Products, P. S. Hudson, chairman. Advantages and Durability of Cement Sewer Pipe, Gustave Kaufman, engineer, The Wilson and Baillie Manufacturing Company, Brooklyn, N.Y. Cement Drain Tile, A. Marsten, Dean School of Engineering, Iowa State College, Ames, Iowa. The Manufacture and Use of Cement Drain Tile, Charles T. Sims, Worthington, Minn. Methods of Testing Cement Pipe, Duff A. Abrams, assistant professor, University of Illinois, Urbana, Ill.

8.00 p.m.—Reception and banquet, Hotel Baltimore.

Saturday, March 16.

9.00 a.m.—Meeting of the Section on Building Blocks and Cement Products. Topical discussion on the Manufacture, Curing, Cost, etc., of Cement Products.

10.30 a.m.—Concrete Fence Posts, W. J. Towne, engineer of maintenance, Chicago and Northwestern Railroad, Chicago, Ill. Some Notes on the Value and Comparative Cost of Reinforced Concrete Telegraph Poles, George Gibbs, chief engineer of construction, Pennsylvania Railroad, New York, N.Y. Concrete Piles and Harbor Work, Dmitri Alexeev, engineer, Russian Northern Railway, Moscow, Russia. Reinforced Concrete Piles, Robert A. Cummings, consulting engineer, Pittsburg, Pa. The Concrete Block Industry in Russia, Alexander Zuberbuhler, engineer, Moscow, Russia. Modern Methods of Manufacturing Concrete Products, Robert F. Havlik, engineer, Ideal Concrete Machinery Company, South Bend, Ind.

8.00 p.m.—The Use of Concrete in Irrigation Work, F. H. Newell, chief director, U.S. Reclamation Service, Washington, D.C. Reinforced Concrete in Agriculture, W. A. Collings, engineer, Builders' Material Supply Company, Kansas City, Mo. The Handling of Concrete in the Construction of the Panama Canal, S. B. Williamson, engineer, Pacific Division, Panama. Iron Portland Cement.

ENGINEERING NOTES.

Guelph, Ont.—Messrs. McArthur Bros., of New York, U.S.A., are contemplating the building of the Hamilton, Waterloo and Guelph Railway. They are waiting on certain engineering reports now being prepared.

Lethbridge, Alta.—The M. Rumley Co., of La Porte, Ind., will donate a 30 horse-power oil traction engine to the farmer exhibiting the best bushel of hard wheat at the Dry-Farmed Exhibition to be held at this point on October 21-26 next. The contest is open to farmers of every land.

Halifax, N.S.—Negotiations now in progress between the government and certain Canadian and English transportation companies operating trans-Atlantic steamship lines will result, if successful, in the establishment of a new fast service between Canada and England The proposal will make Halifax the Canadian terminal.

Glasgow, Scotland.—The street railway systems of the cities of Glasgow and Leeds are the two most successful municipally owned street railways in the old country, if not in the world. In each case the railway is the owner of its own power stations, distinct from whatever other electrical plants the city may own, and they manufacture only their own energy, no power being taken from them for any other purpose.

Vancouver, B.C.—In order to stimulate interest in good roads throughout Canada, W. J. Kerr, president of the Canadian Highway Association, is offering three medals for the best essay on "What Good Roads Mean to Canada." The competition for these medals is to be confined to boys and girls under 18 years of age, and no distinction is to be made between the sexes. Women have long since taken a place in literature equal to that occupied by men, Mr. Kerr believes, and a contest in which girls will compete against boys will be more interesting to all concerned than one in which separate prizes are given. The competition will be open to students in all parts of Canada, and there will be no hard and fast rules as to the length of the essay submitted, although articles of 800 to 1,000 words will be preferred. All essays must be in the hands of the secretary, P. W. Luce, 614 Columbia Street, New Westminster, B.C., on or before May 1st, 1912.

Magdalene Islands, Eastern Canada.—These islands, which lie directly south-east of the Gaspe peninsula, in the Gulf of St. Lawrence, and which in the past have been cut off from communication with the outside world during the winter months by the ice fields which bridge them from the main land, for a distance of more than 100 miles, will in the future be provided with a weekly news letter by wireless. For the sum of $450 the government has arranged with the Marconi Wireless Company whereby a wireless message of 1,000 words will be sent to the islands every Saturday evening, containing in brief the most important happenings of the world. Upon reaching the islands this news will be sent to the various clergymen, and will be read from the pulpits of the churches on Sunday.

PERSONAL.

Mr. Thomas H. Mawson has been appointed by the city of Vancouver to lay out Stanley Park, 900 acres in extent. Mr. Mawson is an English landscape artist.

Mr. Clifford Richardson, M.Am.Soc.C.E., Consulting Engineer, New York City, on February 16th, delivered a lecture on "Trinidad and Bermudez Asphalts and Their Use in Highway Construction," before the Graduate Students in Highway Engineering at Columbia University.

Mr. E. C. Hewson has been appointed to the position of resident engineer for the Grand Trunk Railway at Toronto. Mr. Hewson has been Mr. Power's assistant for nearly three years, and, before entering the service of the G.T.R. was engaged on various engineering works for the Dominion Government.

OBITUARY.

Francis H. Stillman, president of the Watson-Stillman Company, and a prominent figure in machine tool and engineering industries, died at his residence, 105 Rodney Street, Brooklyn, N.Y., in his sixty-second year.

MEETINGS.

Mr. H. H. Hagerman addressed the Engineering Society of the University of New Brunswick, on the "Bacteria and Their Relation to Water."

ONTARIO LAND SURVEYORS' RESULTS.

The following have been granted certificates as Ontario land surveyors by the Board of Examiners: Messrs. W. L. Malcolm, W. A. Sibbett, F. V. Siebert, W. C. Webster, W. J. Baird, G. Hogarth, J. M. McGregor, O. R. Blandy, F. C. Lane, R. M. Gourlay, M. C. Lloyd, W. S. Earle, M. M. Gibson, J. C. Street.

The following passed the preliminary examination: Messrs. V. H. Ramsden, A. L. Stanley Nash, C. J. Manser, N. J. Goebel, R. O. Sturdy.

COMING MEETINGS.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS — Toronto Section. Regular Meeting will be held at Engineers' Club, 96 King Street West, on Friday evening, March 1st, 1912, at 8 p.m. Illustrated paper on "The Shawinigan Water and Power Co.'s New Power House and 110,000 Volt Transmission to Montreal," by Mr. Julian C. Smith, Chief Engineer of the Shawinigan Water and Power Co. Secretary, Valentine Boyd.

THE CANADIAN MINING INSTITUTE.—Annual Meeting held in Toronto, March 6th, 7th, and 8th, 1912, the American Institute of Mining Engineers co-operating; also important delegates of the Institute of Mining and Metallurgy of Great Britain will be present. Secretary, H. Mortimer-Lamb.

ONTARIO GOOD ROADS ASSOCIATION.—Annual Convention to be held at Toronto, February 26, 27, 28. Secretary, J. E. Farewell, Whitby.

ASSOCIATION OF ONTARIO LAND SURVEYORS.—Annual Meeting to be held in Lecture Room, Engineers' Club, 96 King Street West, Toronto, on Feb. 27, 28 and 29. Secretary, Killaly Gamble, 703 Temple Bldg., Toronto

THE ENGINEERS' CLUB OF TORONTO, 90-96 King St. West.—Thursday, Feb. 29th, 8 p.m. Meeting of Toronto Branch of Canadian Society of Civil Engineers. R. B. Wolsey, Secretary.

ENGINEERING SOCIETIES.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—413 Dorchester Street West, Montreal. President, W. F. TYE; Secretary, Professor C. H. McLeod.

QUEBEC BRANCH—
Chairman, P. E. Parent; Secretary, S. S. Oliver. Meetings held twice a month at Room 40, City Hall.

TORONTO BRANCH—
96 King Street West, Toronto. Chairman, T. C. Irving; Acting Secretary, T. R. Loudon, University of Toronto. Meets last Thursday of the month at Engineers' Club.

MANITOBA BRANCH—
Secretary E. Brydone Jack. Meets every first and third Fridays of each month, October to April, in University of Manitoba, Winnipeg.

VANCOUVER BRANCH—
Chairman, Geo. H. Webster; Secretary, H. K. Dutcher, 319 Pender Street West, Vancouver. Meets in Engineering Department, University.

OTTAWA BRANCH—
177 Sparks St. Ottawa. Chairman, S. J. Chapleau, Ottawa; Secretary, H. Victor Brayley, N.T. Ry., Cory Bldg. Meetings at which papers are read, 1st and 3rd Wednesdays of fall and winter months; on other Wednesday nights in month there are informal or business meetings,

MUNICIPAL ASSOCIATIONS.

ONTARIO MUNICIPAL ASSOCIATION.—**President, Chas. Hopewell, Mayor, Ottawa; Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ontario.**

UNION OF ALBERTA MUNICIPALITIES.—President, H. H. Gaetz, Red Deer, Alta.; Secretary-Treasurer, John T. Hall, Medicine Hat, Alta.

THE UNION OF CANADIAN MUNICIPALITIES.—President, W. Sanford Evans, Mayor of Winnipeg; Hon. Secretary-Treasurer, W. D. Lighthall, K.C., Ex-Mayor of Westmount.

THE UNION OF NEW BRUNSWICK MUNICIPALITIES.—President, Councillor Siddall, Port Elgin; Hon. Secretary-Treasurer, J. W. McCready City Clerk, Fredericton.

UNION OF NOVA SCOTIA MUNICIPALITIES.—President, Mr. A. S. MacMillan, Warden, Antigonish, N.S.; Secretary, A. Roberts, Bridgewater, N.S.

UNION OF SASKATCHEWAN MUNICIPALITIES.—President, Mayor Bec, Lemberg; Secretary, Mr. Heal, Moose Jaw.

UNION OF BRITISH COLUMBIA MUNICIPALITIES.—President, Mayor Planta, Nanaimo, B.C.; Hon. Secretary-Treasurer, Mr. H. Bose, Surrey Centre, B.C.

CANADIAN TECHNICAL SOCIETIES.

ALBERTA ASSOCIATION OF ARCHITECTS.—**President, G. M. Lang;** Secretary, L. M. Gotch, Calgary, Alta.

ASSOCIATION OF SASKATCHEWAN LAND SURVEYORS.—**President, J. L. R. Parsons, Regina;** Secretary-Treasurer, M. B. Weeks, Regina.

ASTRONOMICAL SOCIETY OF SASKATCHEWAN.—**President, N. McMurchy;** Secretary, Mr. McClung, Regina.

BRITISH COLUMBIA LAND SURVEYORS' ASSOCIATION.—**President, W. S. Drewry, Nelson, B.C.; Secretary-Treasurer, S. A. Roberts, Victoria, B.C.**

BUILDERS, CANADIAN NATIONAL ASSOCIATION.—President, E. T. Nesbitt; Secretary Treasurer, J. H. Lauer, Montreal, Que.

CANADIAN ASSOCIATION OF STATIONARY ENGINEERS.—President, Wm. Norris, Chatham, Ont.; Secretary, W. A. Crockett, Mount Hamilton, Ont.

CANADIAN CEMENT AND CONCRETE ASSOCIATION.—President, Peter Gillespie, Toronto, Ont.; Secretary-Treasurer, Wm. Snaith, 57 Adelaide Street, Toronto, Ont.

CANADIAN CLAY PRODUCTS' MANUFACTURERS' ASSOCIATION.—President, W. McCredie; Secretary-Treasurer, D. O. McKinnon, Toronto.

CANADIAN ELECTRICAL ASSOCIATION.—President, N. W. Ryerson, Niagara Falls; Secretary, T. S. Young, **Canadian Electrical News, Toronto.**

CANADIAN FORESTRY ASSOCIATION—President, John Hendry, Vancouver. Secretary, James Lawler, Canadian Building, Ottawa.

CANADIAN GAS ASSOCIATION.—President. Arthur Hewitt, General Manager Consumers' Gas Company, Toronto; J. Keillor, Secretary-Treasurer, Hamilton, Ont.

CANADIAN INDEPENDENT TELEPHONE ASSOCIATION.—President, W. Doan, M.D., Harrietsville, Ont.; Secretary-Treasurer, Francis Dagger, 21 Richmond Street West, Toronto.

CANADIAN MINING INSTITUTE.—Windsor Hotel, Montreal. President, Dr. Frank D. Adams, McGill University, Montreal; Secretary, H **Mortimer-Lamb, Windsor Hotel, Montreal.**

CANADIAN PEAT SOCIETY.—President, J. McWilliam, M.D., London, Ont.; Secretary-Treasurer, Arthur J. Forward, B.A., 22 Castle Building Ottawa, Ont.

THE CANADIAN PUBLIC HEALTH ASSOCIATION.—President, Dr. Charles A. Hodgetts, Ottawa; General Secretary, Major Lorne Drum, Ottawa.

CANADIAN RAILWAY CLUB.—President, A. A. Goodchild; Secretary James Powell, P.O. Box 7, St. Lambert, near Montreal, P.Q.

CANADIAN STREET RAILWAY ASSOCIATION.—President, D. McDonald, Manager, Montreal Street Railway; Secretary, Acton Burrows, 70 Bond Street, Toronto.

CANADIAN SOCIETY OF FOREST ENGINEERS.—President, Dr. Fernow, Toronto; Secretary, F. W. H. Jacombe, Department of the Interior, Ottawa.

CENTRAL RAILWAY AND ENGINEERING CLUB.—Toronto, President, G. Baldwin; Secretary, C. L. Worth, **409 Union Station. Meets third Tuesday each month except June, July, August.**

DOMINION LAND SURVEYORS.—President, Thos. Fawcett, Niagara Falls; Secretary-Treasurer, A. W. Ashton, Ottawa.

EDMONTON ENGINEERING SOCIETY.—President, J. Chalmers; Secretary, B. F. Mitchell, City Engineer's Office, Edmonton, Alberta.

ENGINEERING SOCIETY, TORONTO UNIVERSITY.—President, W. B. McPherson; Corresponding Secretary, **A. McQueen.**

ENGINEERS' CLUB OF MONTREAL.—Secretary, C. M. Strange, 9 Beaver Hall Square, Montreal.

ENGINEERS' CLUB OF TORONTO.—96 King Street West. President, Killaly Gamble; Secretary, **R. B. Wolsey. Meeting every Thursday evening during the fall and winter months.**

INSTITUTION OF ELECTRICAL ENGINEERS.—President, Dr. G. Kapp; Secretary, P. F. Rowell, Victoria Embankment, London, W.C.; **Hon. Secretary-Treasurer for Canada, Lawford Grant, Power Building, Montreal, Que.**

INSTITUTION OF MINING AND METALLURGY.—President, Edgar Taylor; Secretary, C. McDermid, London, England. **Canadian Members of Council:—Prof. F. D. Adams, J. B. Porter, H. E. T. Haultain, and W. H. Miller, and Messrs. W. H. Trewartha-James and J. B. Tyrrell.**

INTERNATIONAL ASSOCIATION FOR THE PREVENTION OF SMOKE.—Secretary, R. C. Harris, City Hall, Toronto.

MANITOBA LAND SURVEYORS.—President, George McPhillips; Secretary-Treasurer, **C. G. Chataway, Winnipeg, Man.**

NOVA SCOTIA MINING SOCIETY.—President, T. J. Brown, Sydney Mines, C.B.; Secretary, **A. A. Hayward.**

NOVA SCOTIA SOCIETY OF ENGINEERS, HALIFAX.—President, J. N. MacKenzie; Secretary, A. R. McCleave, Assistant Road Commissioner's Office, Halifax, N.S.

ONTARIO PROVINCIAL GOOD ROADS ASSOCIATION.—President, W. H. Pugsley, Richmond Hill, Ont.; Secretary, **J. E. Farewell, Whitby.**

ONTARIO LAND SURVEYORS' ASSOCIATION.—President, J. Whitson; Secretary, **Killaly Gamble, 703 Temple Building, Toronto.**

THE PEAT ASSOCIATION OF CANADA.—Secretary, Wm. J. W. Booth, New Drawer, 2263, Main P.O., Montreal.

PROVINCE OF QUEBEC ASSOCIATION OF ARCHITECTS.—Secretary J. E. Ganier, No. 5. Beaver Hall Square, Montreal.

ROYAL ARCHITECTURAL INSTITUTE OF CANADA.—President, F. S. Baker, F.R.I.B.A., Toronto, Ont.; Hon. Secretary, Alcide Chausse, No. 5 Beaver Hall Square, Montreal, Que.

ROYAL ASTRONOMICAL SOCIETY.—President, Prof. Louis B. Stewart, Toronto; Secretary, J. R. Collins, Toronto.

SOCIETY OF CHEMICAL INDUSTRY.—Dr. A. McGill, Ottawa, President; Alfred Burton, **Toronto, Secretary.**

UNDERGRADUATE SOCIETY OF APPLIED SCIENCE, McGILL UNIVERSITY.—President, J. P. McRae; Secretary, H. F. Cole.

WESTERN CANADA IRRIGATION ASSOCIATION.—President, Wm. Pierce, Calgary; Secretary-Treasurer, John T. Hall, Brandon, Man.

WESTERN CANADA RAILWAY CLUB.—President, R. R. Nield; Secretary, W. H. Rosevear, 115 Phœnix Block, Winnipeg, Man. Second Monday, except June, July and August, at Winnipeg.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand and projected, contracts awarded, changes in staffs, etc. Printed forms for the purpose will be furnished upon application.

PLANS AND SPECIFICATIONS ON FILE.

The following Plans (P.) and Specifications (S.) are on file for reference only unless otherwise noted at the office of The Canadian Engineer, 62 Church Street, Toronto:—

Bids close		Noted in issue of
2-26	75,000 gallon water tank, Moose Jaw, Sask. (S.)	2- 8
3- 8	Water Tube Boilers; Automatic Stokers; Turbines; Saskatoon, Sask. (S.)	2-15
3-18	Concrete reservoir (2,000,000 gallons' capacity), Moose Jaw, Sask. (P. & S.)	2-22
3-18	Centrifugal pumps, motors, etc., Moose Jaw, Sask. (P. & S.)	2-22
3-18	Valves and Fittings, Moose Jaw, Sask. (P. & S.)	2-22
3-18	96,000 ft. of 18-in. Steel Pipe, Moose Jaw, Sask. (S.)	2-22
3-15	Pavements, Welland, Ont. (P. & S.)	2-29

TENDERS PENDING.

In Addition to Those in this Issue.

Further information may be had from the issues of The Canadian Engineer referred to.

TENDERS.

Calgary, Alta.—The time for receiving tenders for electrical machinery has been extended to March 20th, 1912. J. M. Miller, City Clerk, Calgary. (See advertisement in Canadian Engineer).

Calgary, Alta.—Tenders will be received up to noon, March 6th, 1912, for the construction of various municipal works, such as concrete sidewalks, asphalt, bitulithics and block pavements, specifications of which may be obtained at the office of the City Commissioners or City Engineer, City Hall, Calgary. J. M. Miller, City Clerk.

Calgary, Alta.—The Calgary College will erect an Arts Building, costing about $500,000, and the Building Committee invites sketch plans. Full particulars, W. J. Tregillus, secretary, Calgary, Alta.

Calgary, Alta.—Tenders will be received by the Commissioners of the city of Calgary for one boiler feed pump and switchboards for the city of Calgary municipal electric light and power plant, until noon, March 15th, 1912. Specifications can be secured by application at the office of the city commissioners. J. M. Miller, City Clerk, Calgary.

Calgary, Alta.—Tenders will be received until March 14, 1912, for the supplying the city with sewer and conduit pipe, to be delivered at the city yards in carload lots as may be required. Specifications may be secured upon application at the office of the city engineer. J. M. Miller, City Clerk, Calgary.

Fort William, Ont.—Tenders will be received at the office of the City Clerk, until the 7th day of March, 1912, for the laying of an eighteen (18) cast iron main and the construction of a concrete culvert. Plans, etc., at the office of John Wilson, City Engineer.

Fredericton, N.B.—Tenders are being called for the construction of the concrete substructure and approaches of the Heine bridge, over Millstream, King's County; the Murchie bridge, over the Madawaska River, at Edmundston, and the Bocaguimac Mouth bridge, at Hartland. The plans and specifications can be seen at the office of Public Works Department, and tenders for the work will be received until April 1st.

High River, Alta.—Tenders will be received at the office of the Secretary of the High River school district No. 144, until March 15th, 1912, for the erection and completion of a four-roomed brick schoolhouse. Plans and specifications at office of Norman Young, Secretary, High River.

High River, Alta.—Tenders will be received until March 15th, 1912, for the heating, ventilating and plumbing of a four-roomed brick schoolhouse, as per plans and specifications on file at office of the Secretary, Norman Young, High River, Alta.

North Battleford, Sask.—Plans and specifications will be received for the erection of a Collegiate Institute in the town of North Battleford, Sask. The building to be erected is to cost from $50,000 to $80,000 complete, designs to be in the hands of the secretary by the 1st of March, 1912, or as soon after as possible. Hugh Moher, secretary-treasurer, North Battleford High School District, No. 12.

Oshawa, Ont.—Tenders will be received until March 11th, 1912, for the construction of a brick or asphalt block pavement, on a concrete base, together with a cement concrete curb and gutter, approximately 25,000 sq. yards. Plans and specifications obtained at the office of Frank Chappell, Town Engineer, Town Hall, Oshawa. (See advertisement in Canadian Engineer).

Ottawa, Ont.—Tenders will be received until the 15th of March, 1912, for the erection of a new brick veneer presbytery at South Gloucester. For plans and specifications apply to Rev. Geo. Prudhomme, South Gloucester, Ont.

Ottawa, Ont.—Tenders will be received until March 6th, 1912, for the supply of coal and fuel wood required to heat the Military Buildings at Halifax, Canning, N.S.; Fredericton, Woodstock, Sussex, Chatham, St. John, N.B.; Charlottetown, P.E.I.; for the year ending March 31st, 1913. Eugene Fiset, Col. Deputy-Minister of Militia and Defence, Ottawa.

Ottawa, Ont.—Tenders will be received until March 11, 1912, for the construction of two 150 cubic yards capacity steel hopper scows. R. C. Desrochers, Secretary, Dept. of Public Works, Ottawa. (See advt. in Can. Eng.)

Ottawa, Ont.—Tenders for the construction of a breakwater at Green Point, Gloucester County, N.B., will be received until March 18, 1912. Plans, etc., can be seen at the offices of Geoffrey Stead, Esq., Dist. Engineer, Chatham, N.B.; E. T. P. Shewen, Esq., Dist. Engineer, St. John, N.B.; on application to the Postmaster at Green Point, Gloucester County, N.B., and the office of R. C. Desrochers, Secretary Dept. of Public Works, Ottawa.

Prince Albert, Sask.—Tenders will be received until Friday, March 15th, 1912, for the supplying of sewer pipe required by the city during the year 1912. C. O. Davidson, Sec.-Treas., Prince Albert, Sask. (See advt. in Can. Eng.)

Prince Albert, Sask.—Tenders will be received by the City Commissioners, until March 8th, 1912, for the supplying of cast-iron water pipe required by the city during the year 1912. C. O. Davidson, secretary-treasurer, Prince Albert. (See advertisement in Canadian Engineer).

Regina, Sask.—Tenders will be received up to noon, March 4th, at the offices of F. Chapman Clemesha, architect, Regina, for the erection of a brick Presbyterian church at Swift Current, Sask.

Saskatoon, Sask.—Tenders for the supplying of approximately 5,000 barrels of Portland Cement will be received until Friday, March 15th, 1912. All information obtained on application to Geo. T. Clark, City Engineer, Saskatoon. (See advertisement in Canadian Engineer).

Saskatoon, Sask.—The time for receiving tenders for electrical machinery has been extended to March 22nd, 1912. City Commissioners, Saskatoon, Sask. (See advertisement in Canadian Engineer).

Saskatoon, Sask.—Tenders will be received until March 8th, 1912, for all trades required for the completion of the superstructure of the Y.M.C.A. Building, Saskatoon. Plumbing and heating to be separate, and will be received at the same time. Plans and specifications may be seen at the office of D. W. F. Nichols, Winnipeg, Thompson, Daniel & Colthurst, Associate Architects, Saskatoon.

Saskatoon, Sask.—Tenders will be received until March 29th, 1912, for the laying of approximately 8,990 lineal feet of storm sewers, and the construction of manholes, catch basins and appurtenances. All information may be obtained from Geo. T. Clark, City Engineer, Saskatoon. (See advt. in Canadian Engineer).

Saskatoon, Sask.—Tenders will be received by the City Commissioners until March 29th, 1912, for the laying of approximately 13 miles of sanitary sewer and water mains, and the construction of all necessary manholes and flush-tanks, setting of fire hydrants and gate valves, etc., as shown on plans and profiles, and according to specifications. Further information may be obtained at the office of Geo. T. Clark, City Engineer. (See advt. in Canadian Engineer).

Sydney Mines, C.B.—Tenders will be received until March 2nd, for the erection and completion of an annex to "Harbor View Hospital," Sydney Mines. Plans and specifications can be seen at the general office of the N.S.S. & C. Co., and at the Town Engineer's office, Sydney Mines. Edmund MacDonald, Secretary to Trustees, Harbor View Hospital, Sydney Mines, C.B.

Toronto, Ont.—Tenders will be received by the chairman of the Board of Control until March 19, 1912, for the supply of rails, ties and fastenings, specifications and forms of tender of which may be obtained on application to the Dept. of Railways and Bridges, City Engineer's Office, Toronto. (See advt. in Can. Eng.)

Toronto, Ont.—Tenders for the construction of the proposed branch of the Temiskaming Railway into the Elk Lake region, will be called for shortly.

Vancouver, B.C.—Tenders will be received for the supply of hydrants and water pipe, for the proposed extensions to the water works distribution system, during the current year. Tenders for hydrants will be received up to Wednesday, March 6th, 1912, and tenders for pipe will be received up to Wednesday, March 20th, 1912. Specifications may be seen at the City Engineer's Office, City Hall. Wm. McQueen, City Clerk, City Hall, Vancouver, B.C.

Welland, Ont.—Tenders are invited for the construction of approximately 37,000 square yards of pavement, in vitrified brick, bitulithic, asphalt block, or granitoid. Plans, etc., on file at the office of The Canadian Engineer, 62 Church Street, Toronto, or at the Town Engineer's office, Welland. (See advertisement in Canadian Engineer).

CONTRACTS AWARDED.

Calgary, Alta.—The contract for the building of the new Knox Presbyterian church is in the hands of Messrs. Fysche, Martin Co., Ltd. The contract, exclusive of value of lots, excavation, organ, pews or furnishings, will be $183,000.

Calgary, Alta.—Messrs. P. Lyall & Sons Construction Company, of Montreal, have secured the contract for the new big C.P.R. hotel here.

Calgary, Alta.—The Westinghouse Church, Keer & Company, of Pittsburg, Pa., will build for the Canadian Pacific Railway Company, additional railway shops at a cost of $2,750,000. Construction will start shortly. Contract includes the design and construction of locomotive, machine, boiler, blacksmith, pattern, coach and freight car repair and paint shops, foundry, planing mill, power house, dry kiln, scrap docks, material bins, store room and office buildings. In general the construction will be of concrete, steel, brick or hollow tile.

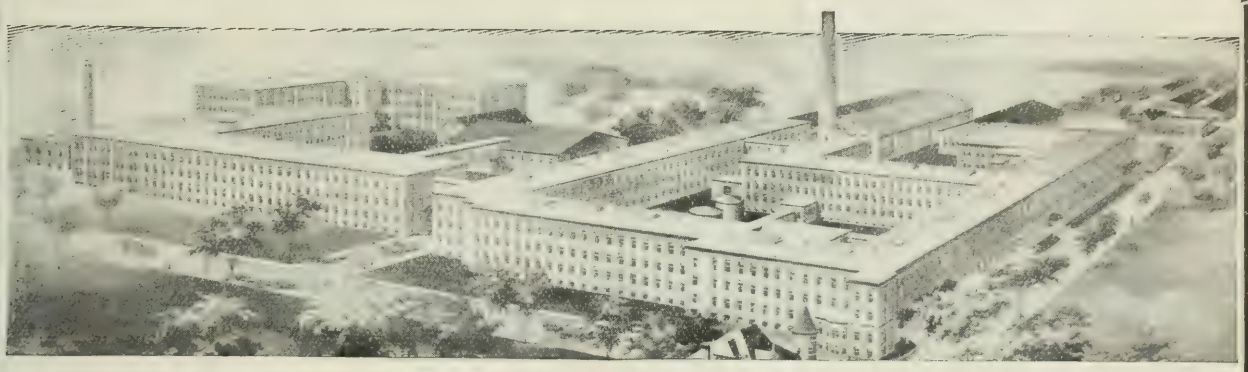
Hamilton, Ont.—The Hamilton Bridge Works, Hamilton, Ont., have awarded the contract for two overhead traveling cranes of 30 tons lifting capacity and approximately 60 ft. span, and for two overhead traveling cranes of 10 tons lifting capacity and approximately 90 ft. span, to Messrs. Royce, Limited, of Manchester, England. Mr. C. S. Mallett, of 207 Lumsden Building, Toronto, the Canadian manager for Messrs. Royce, Limited, also announces the award to his company of a contract for supplying the Jenckes Machine Company with an overhead traveling crane of 5 tons lifting capacity and 41 ft. span, for the Sherbrooke shops; and an overhead traveling crane of 10 tons lifting capacity and 48 ft. span, for the St. Catharines, Ont., shops.

Montreal.—The Foundation Company, Limited, of Montreal and Winnipeg, have been awarded the contract for the new substructure in connection with the double-tracking of the C.P.R. Red River bridge at Winnipeg. The work consists of five river piers and two abutments.

Moose Jaw, Sask.—The contract for the erection of the Boys' College building and the principal's residence in connection with Saskatchewan College, in this city, has been awarded to Claydon Bros., of Winnipeg, Man.

North Burnaby, B.C.—Messrs. Mussens, Ltd., have received the contract to supply a rock crushing plant at a cost of $2,568.20. It is being ordered by the council of Edmonds, Burnaby.

Barrett Specification Roofs



Warner Bros. Co., Corset Manufacturers, Bridgeport, Conn. Day & Zimmerman, Engineers, Philadelphia, Pa.

The Most Economical Roof

FOR half a century architects have known that slag and gravel roofs would *often* show marvelous durability.

The Barrett Specification defines the method by which these roofs may be built so that they will *always* show such durability.

It provides for the best materials manufactured, and prescribes the most approved methods of application.

A Barrett Specification Roof will cost less than any other permanent roof, will last upwards of twenty years and will need no painting or coating or care. Such roofs are fire-retardant and take the base rate of insurance.

That is why they are invariably used on large manufacturing plants where the roof areas are great and where, therefore, the unit costs are carefully studied.

Booklet giving the Barrett Specification in full mailed free on request. Address nearest office.

Special Note

We advise incorporating in plans the full wording of The Barrett Specification, in order to avoid any misunderstanding.

If an abbreviated form is desired however the following is suggested:

ROOFING—Shall be a Barrett Specification Roof laid as directed in printed Specification, revised August 15th, 1911, using the materials specified, and subject to the inspection requirement.

The Paterson Manufacturing Co., Limited

Montreal Toronto Winnipeg Vancouver St. John, N.B. Halifax, N.S.

Saskatoon, Sask.—The Bithulithic Paving Company have been awarded the contract for 63,000 square yards of the 125,000 sq. yards of paving to be done this season. The tender of this company was for $2.95 per square yard.

Seven Falls, P.Q.—The Ambursen Hydraulic Company of Montreal, have been awarded the contract for the construction of a 10,000 horse-power development on the St. Anne River.

Suffield, Alta. — J. G. Hargrave & Company, Ltd., of Winnipeg, have received a contract from the C.P.R. for earthwork and embankments on the new branch from Suffield, Alta., from the main line in a south-westerly direction. The work will be started in April after the completion of similar work at Bassano.

Victoria, B.C.—Messrs. Moore & Whittington, builders and contractors, are building a three-story, brick apartment house at the junction of Fort and Pandora Streets. The expenditure contemplated is $25,000.

Vancouver, B.C.—A contract to the value of about $200,000 was awarded to the B.C. Equipment Company, of Vancouver, for combined gravel washing and rock crushing plants at Cragilacchie, Trail Creek and Old Man Creek. Each of these plants are capable of washing out a thousand yards daily. The gravel will be used for concrete culverts and the rock for ballast.

RAILWAYS—STEAM AND ELECTRIC.

British Columbia.—The promoters of the British Columbia and Alaska Railway announce their intention of renewing work in the spring of 1912. Mr. E. C. Harris, of New York, the new president of the company, was for some time assistant engineer of the Chicago, Milwaukee and St. Paul, and later having served as general manager of the Santa Fe road.

Fredericton, N.B.—Mr. Frank de L. Clements is interested in a proposed electric line from this point to Springhill, a distance of five miles. The proposition is to purchase a storage battery car and secure running rights over the St. John Valley Railway rails, giving a service at regular intervals throughout the day. A car such as proposed would cost about $12,000, and it is expected to have the service in operation by some time next summer.

Halifax, N.S.—Mr. C. C. Longard has prepared a sketch showing proposed improvements to the railway station in this city.

North Toronto, Ont.—A proposed electric line, known as the Forest Hill Electric Railway Company, contemplate building a line in these parts.

Ottawa, Ont.—City Engineer, Mr. N. J. Ker, has prepared plans for an extension of the street railway lines. The extension will total six and a half miles.

Prince Edward Island.—The Federal Government contemplate spending $450,000 on a car ferry, $400,000 on increasing the gauge of the P.E.I. Railway, and $490,000 on the construction of a third rail. This work is all for the benefit of the P.E.I. Railway.

Province of Saskatchewan.—The Grand Trunk Pacific Railway contemplate opening forty-seven new towns. A contract has been awarded to a Minnesota firm to construct twenty-five general stores throughout these towns.

Vancouver, B.C.—The work of filling in the Great Northern Railways right-of-way on False Creek is to be started in the course of the next few weeks. Three or four million yards of earth will be required.

Vernon, B.C. — A Canadian Northern Railway survey party of 12 men in charge of A. E. Ashcroft, C.E., will begin work on the location of the proposed branch line from Vernon to Kamloops. At the latter point connection will be made with the company's main line. The distance between Vernon and Kamloops is about eighty miles, and it is expected that an easy grade will be secured although there will be a short stretch of heavy work at the summit.

COPY OF ENGINEER WANTED.

A copy of our issue of August 10, 1911, is required. Parties sending in the same will have the expiration date of their subscription advanced one month.

LIGHT, HEAT AND POWER.

Acton, Ont.—The ratepayers voted in favor of adopting the hydro-electric policy and to issue debentures for $8,500 to equip the municipal line for hydro-power. A. J. Mackinnon, Town Clerk.

Brantford, Ont.—Certain improvements being made to the plant of the Waterous Engine Works will necessitate a new power plant installation.

Fredericton, N.B.—A survey of the Boccaguimaca stream has been made for power purposes.

Niagara Falls, Ont.—A report indicates that extensive additions to the plant of the Electrical Development Company will be made. The powerhouse is to be extended to the south, the addition to be erected costing over $200,000. Four more power units are to be installed, increasing the power development from 80,000 to 120,000 horsepower, and the transmission line to Toronto will likely be duplicated. Altogether a sum of about $1,000,000 will be spent by the company on the contemplated improvements.

Porcupine, Ont. — The management of the McIntyre, Hollinger and Dome mines are preparing to install electric motors in their mills.

Smith's Falls, Ont.—Mr. Acres and Mr. Gates have been in Smith's Falls in connection with the Hydro-Electric Commission, to make a thorough inspection of the water powers, the electric light and power plants, the pumping station, and the topography of the town and will make a report to the commission on their findings. The probable source of supply is Chats Falls.

GARBAGE, SEWAGE AND WATER.

Halifax, N.S.—Mr. F. W. W. Doane, municipal engineer of this city, has prepared a report covering proposed changes in the waterworks system. In this he recommends the construction of two reservoirs and other works costing $100,000.

Ottawa, Ont.—The municipal council have been asked to construct a septic tank for the treatment of sewage to cost $6,000. N. J. Ker, City Engineer.

Province of Ontario.—The Provincial Board of Health will shortly serve notice on municipalities to cease contaminating the navigable streams of the province by pouring sewage into them. At present, no municipality in Ontario is allowed to extend its sewage system without special permission from the provincial board.

Regina, Sask.—An extension programme of sewer extensions will be carried through to completion during the present year, if at all possible. To expedite the completion of the work it is proposed to divide the various undertakings into separate contracts.

Toronto, Ont.—The municipal council voted in favor of spending $100,000 on water meters.

Westmount, Montreal, P.Q.—The assessment of the city of Westmount is being sued before the courts, by the Montreal Water and Power Company. The allegation is that the assessors do not give to real estate its real value, being as a rule, about ten per cent. below the level. The contention is denied by the officials of the city, and the facts are being argued upon in the Circuit Court, before Mr. Justice Dorion. The argument of the Montreal Water and Power Company is that payment of the water rates in Westmount is based on the valuation of property and that by undervaluing real estate in their assessment, the assessors affect the income of the company.

Winnipeg, Man.—Acting City Engineer Wilson will prepare plans for a water supply to be obtained from Poplar Springs.

BUILDINGS AND INDUSTRIAL WORKS.

Berlin, Ont.—The municipal authorities are taking steps toward the erection of a tubercular sanitarium to cost $1,500. A. H. Miller, Town Clerk.

Brampton, Ont.—A report states that the Pease Foundry Company, now located at Toronto, will remove to this point. They intend erecting a large plant to employ 100 men.

Kerr Turbo-Generators

FOR SMALL LIGHTING PLANTS

The Kerr Turbine is peculiarly suited to generator driving and our sets are made in suitable sizes to fill all requirements up to 500 kw. alternating and 350 kw. direct current. The operation is economical throughout a wide range of initial steam pressures, the steam economy is improved by superheat, and any exhaust conditions are permissible. When operating non-condensing, the steam consumption compares favorably with that of a high speed engine of the same capacity, while in condensing plants the economy at full loads equals that of the best compound engine and at fractional loads is much better.

A Kerr Turbo-Generator for lighting or small power or both is extremely profitable in any plant having power boilers, since the freedom of the turbine exhaust from oil makes reuse of the exhaust inexpensive and safe for boiler feeding or any other purpose where clean low pressure steam is desirable. See Bulletin No. 22.

P.O. Box 563. Full Particulars and Estimates Furnished.

Edson, Alta.—The Portland Cement Company have prepared plans for an industrial plant at Marlboro, 17 miles west of Edson, on the Grand Trunk Pacific, which will cover nine acres of ground.

Hull, Que.—The Hull Electric Railway Company are building new car shops. They will cost about $25,000.

Fort William, Ont.—Messrs. Park Blackwell, The Matthews Packing Company and the Laing Company will erect an $80,000 cold storage plant at this point.

Fredericton, N.B.—M. M. Haines of Cardigan, N.B. contemplates the erection of a sawmill at the mouth of the Nashwaaksis stream.

Fredericton, N.B.—The management of the John Palmer Company intend to erect a new factory. Chas. R. Palmer, president and general manager.

Lethbridge, Alta.—Among several building contracts recently let are a $40,000 structure known as the Hick-Sehl Block; Geo. Beaton, builder. The Sherlock building, cost $45,000; Smith Bros., contractors. Rukham Block, cost $40,000. Power plant extension, $33,500.

Moose Jaw Sask.—The Western Maufacturing Company intend to erect a modern wood working factory. Mr. T. H. Wilson is general manager of this company.

Naden Harbor, B.C.—Messrs. Wallace Bros., fisheries, are erecting a cannery at this point. J. E. Gilmore, of Prince Rupert, B.C., is contractor.

Ottawa, Ont.—It is reported that Messrs. W. W. & J. Wylie are interested in a $75,000 garage, to be of concrete consruction. It will be of three storeys, and so built that more storeys can be added at will. On the ground floor there will be accommodation for about 100 machines, and the two upper floors will be given up to repair shops and show rooms.

Pincher Creek, Alta.—The municipal council will erect a $15,000.00 town hall. Mr. McDonald architect, of Calagry has prepared the plans.

Port Arthur, Ont.—The Fitzimmons Fruit Co., will erect a new office and warehouse 50 feet by 80 feet, brick and mill construction at a cost of about $25,000.

Stratford, Ont.—The Traders Bank intend to remodel the Scott block for banking purposes. Mr. R. H. Smart is the local manager.

St. John, N.B.—Messrs. N. C. Scott and H. W. Johnston have decided to erect a piano factory near this city.

Toronto, Ont.—C. E. Proctor has obtained a permit for a $40,000 two-storey, brick apartment house at 31-33 Melbourne Avenue. Messrs. Weismuller and MacKenzie Bros. have been granted a permit for a three-storey apartment house on West Queen Street, to cost $75,000. W. R. Phillips & Co. have been granted a permit for a $20,000 warehouse, three-storeys and basement, at the north-west corner of Richmond and Duncan Streets.

Vancouver, B. C.—Work will shortly be started on the erection of a two-storey building which has been designed as an arcade. It will cost approximately $60,000.00. Mr. M. P. Thompson is interested.

Vancouver, B.C.—The North West Canadian Trust Company will proceed with the erection of an eight storey block at 507 Richard Street. The building will be of reinforced concrete construction and will cost $120,000. A six storey reinforced concrete building will be erected for Mr. F. W. Padmore, at 610 Cordova Street, at a cost of $50,000.

BRIDGES, ROADS AND PAVEMENTS.

Welland, Ont.—Tenders will soon be called for new pavement here. Plans and specifications will be on file at the office of The Canadian Engineer, 62 Church Street, Toronto, about March 3rd. D. T. Black, town engineer.

CURRENT NEWS.

Province of Alberta.—Two million dollars will be spent this year by the provincial government on telephone construction in Alberta. The programme includes the construction of over 3,000 miles of rural lines, 500 miles of long-distance lines over new routes, connecting towns along recently-constructed railways, and about 700 miles additional circuits on existing long-distance routes, also a number of new town exchanges as well as extensive additions to existing exchanges. Hon. A. L. Sifton, Provincial Minister of Railways and Telephones.

Calgary, Alta. — The convention of the Builders Exchange will meet in this city in 1913. Ald. Brockelbank has made the arrangements.

Montreal, P.Q.—Messrs. Lyall & Sons have reorganized their company, taking the name of P. Lyall Construction Company, Ltd., with a capital of $4,300,000.

Regina, Sask.—The Educational Committee will recommend to the council that an architect be retained for one year at a fixed salary. This committee contemplate erecting two or more new school buildings.

Saskatoon, Sask.—Twenty firms have tendered to supply the various electrical equipment required by the municipality. The cost of these will be $50,000.

St. Catharines, Ont.—The municipal educational committee intend to spend $400 on the equipment of a physical laboratory for the Collegiate Institute.

Sydney, C.B., N.S.—The new nail mill under construction at the steel plant was somewhat damaged, as the result of a collapse of a portion of it, from a heavy weight of snow on the roof.

Toronto, Ont.—The municipal board of works have made application for the sum of $2,721,000, to carry out their proposed programme of 1912.

Winnipeg, Man.—The Manitoba Government Telephone Commission have purchased a motor truck with a loading capacity of four tons. It is fitted with a special winch, at the rear end of the platform, by means of which a load can be hoisted either to or from the truck, or the winch can be utilized for pulling cable through mains, or in jobs that necessitate power.

TRADE ENQUIRIES.

The following were among the inquiries relating to Canadian trade received at the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W., during the week ended February 12th, 1912. Fuller information may be obtained by communicating with the Department of Trade and Commerce, Ottawa.

A Birmingham firm of general silversmiths and manufacturers of electro plate wish to appoint agents in every province of Canada.

A London firm of filter manufacturers desire to appoint an agent in every province of Canada. Enquiry is made for the names of Canadian manufacturers of leather cloth.

A Glasgow firm of consulting, inspecting and contracting engineers desire to get into touch with Canadian importers of machinery requiring such services as they can render.

A London firm for filter manufacturers desire to appoint supplies of all kinds desire to do business in Canada.

A West of England firm make enquiry for the names of Canadian manufacturers of wood turnings, such as dowels, spindles, legs for chair work and wooden wheels for toys.

A Birmingham firm of mechanical and electrical engineers manufacturing steam, air, and electrically-driven hauling and winding gears and three throw pumps, electric capstans, etc., wish to be placed in communication with Canadian importers.

A London firm of manufacturing electrical engineers desire to appoint an agent at Vancouver.,

A London firm of mechanical engineers manufacturing air compressors, vacuum pumps, lifting tackle, runways, power transmission, etc., desire to arrange for the sale of their machinery in Canada.

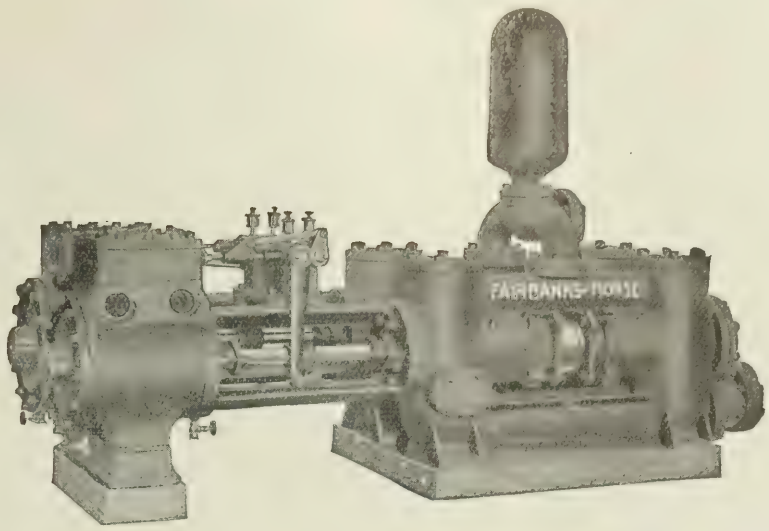
Enquiry is made on behalf of a number of important newspaper publishers in Italy for the names of Canadian manufacturers of news paper.

A London engineer who is proceeding to Canada in April next wishes to obtain agencies for electrical apparatus of every description, electric cranes and other heavy engineering specialties, also hardware lines.

From the branch for City Trade Enquiries, 73 Basinghall Street, E.C.:—

A firm in Southern India wish to get into touch with Canadian importers of tanned sheep and goat skins, and also of tanned cow, calf and buffalo hides.

A London company manufacturing a lamp for exterior and interior lighting, burning methylated spirit, wish to arrange for its sale in Canada.



PUMPS

The superior excellence and splendid results shown by

"FAIRBANKS-MORSE"

pumping machinery are largely due to the fact that for many years we have manufactured Hydraulic Machinery of all descriptions. We are therefore able to build pumps which are properly designed and adapted to every-day use. This is of the greatest importance in a first-class pump, for the usefulness of an engine may be lost if the pumping machine is badly designed.

You will get all these important features when you purchase a "FAIRBANKS-MORSE" pump.

Let us solve your pump problems.

PATENTS.

Below will be found a list of patents recently granted to inventors in Canada. This list is furnished by Messrs. Fetherstonhaugh & Company, Royal Bank Building, Toronto: C. A. R. Roy, file protectors; J. W. Mowbray, hydrocarbon vaporizers for internal combustion engines; S. Aikins, door knobs; J. Andron and G. F. Hickmott, ash sifters; R. L. Gardner and S. S. Holden, portable stable tents; S. Ashdown, hooks; W. P. Cahoe, methods of producing a glucose like product from cellulose and ligneous materials; A. G. Hunter, Churns; J. W. Lucas, lantern handles; A. J. McDonald, barrels; T. A. Murray, sewage sedimentation tanks; J. A. Ray, stove lids; J. Samuels, cinder sifters; F. G. Hunt, disc harrows.

The following is a list of Canadian patents recently issued through the agency of Messrs. Ridout & Maybee, Manning Chambers, Toronto: I. S., I. & S. McDougall, insectides and the like; E. D. Gouk, veneer box; C. B. Redrup, Fluid pressure engines or pumps; J. B.Beadman and H. J. Macklin, axle boxes and other bearings; I. H. Storey, flying machine; F. M. Field and D. A. Skene, railway control system; F. Orbell, elevating mechanism; A. H. Reid, concrete; A. W. Cooper and S. H. Watts, cultivator shares; A. C. Thompson, filling spring for mattresses.

H. J. Daniels, potato harvester; Weedon Grossmith, collar for personal wear; Kilgour Bros., paper drinking cup; R. W. Bateman and L. H. Bateman, driving and reversing gear; Bain Wagon Company, Limited, wagon.

The following list of Canadian patents is supplied by Messrs. Fethersonhaugh & Co., 10 King St. E., Toronto:—

C. E. O. Langlois, self couplers for fluid train lines; W. P. Stephenson, display boxes; A. E. McKenzie, seed show cases; M. Filion and H. L. Dumouchel, automatic cattle guards for railroads; W. Topp and F. Topp, automatic fire alarms; L. E. Beaulieu, fish plate bolts; T. H. Elliott, fire escapes; A. Hackett, combined throttle and reversing valves for motors; A. Horwitz, gas water heaters; J. J. Noon, pipe couplers.

MACHINERY FOR RUSSIA.

Mr. A. L. G. Taylor, 629 Corydon Ave., Winnipeg, Man., has asked us to put him in touch with firms in Canada who are prepared to tender for the supplying of the following equipment for works in Russia:—

(a) Electric furnace for scrap iron, 16-25 tons per diem.

(b) A rolling mill of smallest possible size (round) up to 3-inch diameter. (b) Rectangular 1⅞-inch by 1¼-inch and 1½-inch by 1⅝-inch.

(c) Bending and electric welding machines for chains from ⅛-inch to ½-inch.

(d) Stamp and forging machines for scythes, sickles and horse shoes.

(e) Lamps for giving about 200 candle-power from crude naphtha.

(f) Machine lathes for turning pick and axe handles (taper).

(g) Machines for making long boots of thick felt and similar materials.

ORDERS OF THE RAILWAY COMMISSIONERS OF CANADA.

Each week on this page may be found summaries of orders passed by the Board of Railway Commissioners, to date. This will facilitate ready reference and easy filing. Copies of these orders may be secured from The Canadian Engineer for small fee.

15947—February 12—General Order re Rules and Regulations for Inspection of Locomotive Boilers, etc.

15948—February 5—Approving location of G.T.P. Ry. station site at Stony Plains, Alta.

15949—February 12—Authorizing Geo. H. Shaw, G.T.M., N.St. C. & T. Ry. to prepare and issue tariffs of tolls.

15950—February 8—Directing C.P.R. to, before July 1, 1912, install electric bells at crossing in village of Coldwater, Ont., 20 per cent. from Railway Grade Crossing Fund.

15951—February 12—Authorizing C.N.O. Ry. to cross Ford St., Toronto, by overhead structure over highway and across tracks of Toronto Suburban Ry. Co.

15952—February 12—Authorizing C.N.O. Ry. to cross seven highways in Twp. of Etobicoke.

15953—February 12—Directing Bell Tel. Co. to amend Supp. No. 42, C.R.C. No. 1708 and providing for certain changes in rates to telephone subscribers between Island and city of Toronto. (See Order 12625, December 14, 1910.)

15954—February 9—Authorizing C.P.R. (G.B. & S. Ry.) to cross St. Patrick and Dermot Sts. at mileage 72.21 and to take certain lands for road diversion belonging to W. B. Fee, Twp. of Ops, County of Victoria, Ont.

15955—February 6—Approving location of C.N.O. Ry. station at Brockville Junction.

15956—February 12—Directing Grand Valley Ry. Co. to pay to T.H. & B. Ry. $200 for old diamond at crossing on South Market St., Brantford, Ont.

15957—February 9—Authorizing C.P.R. to cross with second main line track (double track) McTavish St., Fort William, Ont.

15958—February 9—Authorizing C.N.O. Ry. to connect with G.T.R. at Cobourg, Ont.

15959—February 9—Authorizing C.N.O. Ry. to cross Russell Road, at Junction Gore, County of Carleton, Ont.

15960—February 14—Directing that crossing of G.T.R. near Kettle Creek Bridge, St. Thomas, Ont., be protected by day and night watchmen, 15 per cent. to be paid by Twp. of Yarmouth, 15 per cent. by city of St. Thomas.

15961—February 15—General Order re freight rates in Canada, west of Port Arthur, adding Province of British Columbia to enquiry.

15962—February 15—Directing G.T.R. to install within ninety days electric bell at crossing of Grand Ile Ave., Valleyfiield, Que.

15963-64—February 14—Issuing certificate of correction to G.T.P.B.L. Co. correcting errors in plan of location Biggar-Calgary Branch and Biggar-Calgary Branch.

15965—February 12—Relieving C.P.R. from erecting and maintaining fences, gates and cattle guards on portions of Atlantic, Eastern, Ontario and Lake Superior Divisions.

15966—February 15—Authorizing C.P.R. (G.B. & S. Ry.) to use and operate bridges at mileages 20.64, 23.4 and 24.3 at Couchiching Narrows.

15967—February 3—Authorizing C.P.R. to construct spur for A. Bowerman in city of Saskatoon, Sask.

15968—January 31—Authorizing C.N.R. to cross with its Grosse Isle Branch twelve highways in municipality of Woodlands, Man.

15969—February 13—Amending Order No. 15667, December 15, 1911, by substituting plan "B" for plan "A" filed.

15970—February 15—Extending until July 1, 1912, time for construction of spur by C.N.R. in city of Edmonton, in H. B. Reserve.

15971—February 15—Approving coal chute clearances of G.T.P. Ry.

15972—February 14—Authorizing Edmonton, Dunvegan & B.C. Ry. Co. to cross highways from mileage 0 to 30, Alberta.

15973—February 15—Adding Twp. of Bentinch to application re protection of crossing by Walkerton & Lucknow Ry. (C.P.R.), County Grey, Ont.

15974—February 14—Approving plan "A" and rescinding Order 14066 of June 24, 1911, in so far as it approves the plans of said automatic signal on T.H. & B. Ry. between Hamilton and Vinemount.

15975—February 15—Certificate of correction to G.T.P.B.L. Co. re errors in plan of location of Biggar-Calgary Branch.

15976—February 16—Re Brockville train connection between G.T.R. and C.P.R. when passengers for Ottawa on G.T.R. train.

15977—February 15—Approving location of C.N.O. Ry. station grounds at St. Joseph, Parish of St. Eustache, County Two Mountains, Que.

15978—February 14—Authorizing C.N.O. Ry. to cross C.P.R. by overhead structure on Lot 11, Con. 2, Twp. of Nepean, County of Carleton, Ont.

15979—February 16—Certificate of correction to G.T.P.B.L. Co. correcting errors in location Biggar-Calgary Branch.

15980—February 15—Authorizing C.N.R. to construct spur to Round Hill Collieries, Ltd., Province of Alberta.

15981—February 16—Approving by-law of T.H. & B. Ry. authorizing F. D. Backus, G.F.A. and P.A., and Geo. C. Martin, A.G.F. and P.A., to prepare and issue tariffs of tolls.

15982—February 14—Authorizing Twp. of York to construct bridge over old belt line, so-called, of G.T.R. east of Yonge St., and to open up a new highway.

15983—February 15—Authorizing G.T.P. Ry. Co. to operate industrial spur to serve P. Burns & Co., Ltd., Edmonton, Alta.

15984-85—February 16—Approving revised location of C.P.R. Virden to McAuley Branch from mileage 14 to mileage 36.27, Manitoba and Saskatchewan, and revised location of Kerrobert Northeasterly Branch from mileage 0 to mileage 20.2, Saskatchewan.

15986—February 16—Authorizing C.N.O. Ry. to cross three highways in Twp. of Nepean, County of Carleton, Ont.

15987—February 16—Rescinding Order No. 14379, July 22, 1911, and authorizing C.P.R. to divert public road between Cons. 7 and 8, Twp. of Eldon, County of Victoria, and to cross diversion at mileage 56.4 by overhead bridge, company to also compensate John McArthur by reason of any damages sustained by closing highway.

15988—February 17—General Order re Ash Pans on Locomotives.

15989—February 16—Authorizing G.T.P. Ry. to cross with its second track of C.N.R. on Empire Ave., Fort William, Ont.

15990—February 15—Authorizing C.P.R. to construct spur for Manitoba Bridge & Iron Works, Ltd., on Higgins Ave., Winnipeg, Man.

15991—February 16—Approving revised location of James Bay & Eastern (C.N.R.) through Twp. of Demeules, County of Lake St. John, Que.

15992—February 16—Directing C.N.R. under penalty of $10 per day to, before May 15, 1912, provide suitable farm crossing for E. K. Glidden, of Vermilion, Alta.

15993—February 15—Dismissing application of Dominion Sugar Co., Ltd., Wallaceburg, Ont., re re-adjustment of rates on sugar in carloads from Wallaceburg to Winnipeg and western points.

(Continued on Page 74.)

The Canadian Engineer

An Engineering Weekly

RAILLESS TROLLEY CARS.

The railless trolley system which of late has undergone severe development, forms a link in modes of transportation between the automobile and the familiar central power driven street car, in use throughout many cities and districts on the North American continent.

The railless system of street transportation has many advantages over the pre-existing type, among which might be mentioned the disposal of track expenses and the diminished possibility of a block on the right of way.

The many municipalities throughout Great Britain have probably done more to encourage the development of this system of transportation than any foreign communities. In fact, the municipalities of Leeds and Bradford lay claim to being the possessors of the first commercial railless lines in the United Kingdom. A description of these lines has been given by the "Tramway and Railway World," and with their permission we publish the photographs accompanying this article.

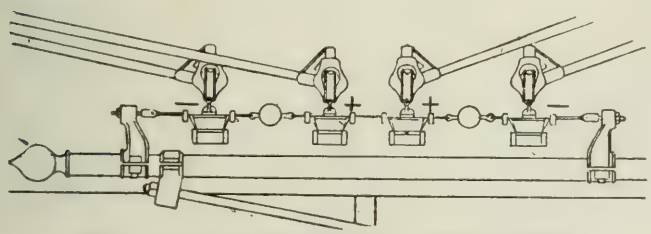

Fig. 1.—Bracket Supports for Overhead Wires.

The corporation of Leeds a few years ago gave serious attention to this system of transportation, owing to a district situate to the southwest of the municipality which was in need of transportation facilities, but too sparsely populated to make a regular tramway system remunerative. A thorough investigation of railless trolleys was made by the Tramways Committee and a report was made. The investigation included a visit to Austria, Northern Italy and Germany.

Shortly after the issuing of the report the corporation applied for powers in the session of 1909-10 to equip the route for railless traction.

A consideration of this system will show that the main points of departure from the ordinary tramway system are the tires, the methods of trolley contact, and the method of trolley wire support.

The poles of the Leeds Tramways are 8 in. diameter at the base, with a top diameter of 6 inches, and 7 inches at base, with a top diameter of 5 inches; the weight of these are 1,213 pounds and 890 pounds each.

The overhead wires (+ and —) are of 0000 S.W.G. grooved, hard drawn, copper. Fig. 1 shows the method of wire support from the bracket; the two outer ones being negative and the central ones positive.

The bracket arm supporting these extends 18 feet from the pole. This method of construction gives double insulation between the two positives and treble insulation between the bracket arm and the negative.

This system is arranged in such a manner as will allow the extension of the existing track tramway system, should pecuniary circumstances call for such; the current is supplied to the feeders from the pre-existing power station, the pressure being 525 volts, direct current.

Section boxes and section insulators divide the positive wires into half-mile sections as in standard tramway practice, but the negative wires are continuous from end to end of

Fig. 2.—Railless Trolley.

the route, and cross connected at intervals of half a mile to minimize losses, and for the same reason the negative wires are bonded to the existing tramway rails near the terminus.

The method of completing the circuit between the trolley and motors is illustrated in Fig. 2. This, of course, is the critical feature of the system.

The trolley is of the under-running type, capable of allowing the vehicle to run at a distance of 15 ft. from the centre of the wires, measuring from the centre of the vehicle. It is so arranged that the negative trolley may be put out of action, and thus allow the vehicle to run with the positive trolley only on the line.

A rail collector has been included in the fittings of the car. This is used when the vehicle is taken in or out of the central depot and where no overhead negative wires are provided. It consists of a skate hinged at the rear end of the vehicle, and is provided with means for raising and lowering, so that when the negative trolley is out of action the electrical circuit may be completed through the ordinary tramway rails, and thus allow the car to proceed along any existing tramway route. The arrangement allows a maximum deviation of five feet.

The cars are of similar construction to the ordinary tramway type in many particulars, as may be gathered from an examination of Fig. 3. The general mechanical make-up is clearly shown in Fig. 4 and Fig. 5. It will be seen that two motors supply motivity to the rear wheels. The motion is transported by means of double reduction worm-wheel and chain gearing, the former working in an oil bath. Each chain is of the roller type, protected by a case giving easy access to chain and wheel, and the latter is case hardened. The power cables are run in screwed conduit tubing filled in with bitumen.

The wheels are fitted with solid rubber tires, the rear wheels supporting two each.

Two mechanical brakes are provided, one being connected to the counter shaft and operated by a foot pedal, and the other consisting of drum brakes on the rear wheels, operated by either foot pedal or hand lever, with ratchet device for retaining the brake in the one position.

The motors have a capacity of 20 b.h.p. at 525 volts, and a speed of 1,050 revolutions per minute, equivalent to a speed of 10 miles per hour. They are of the Siemens type, series wound with shunted fields, provided with commutating poles, and having wool waste oil lubrication. The controller is of the Siemens series-parallel magnetic blow-out type, provided with special arrangements for cutting out either motor as desired, but having no provision for rheostatic braking. The main barrel has nine positions in addition to the off position, and the reversing barrel six.

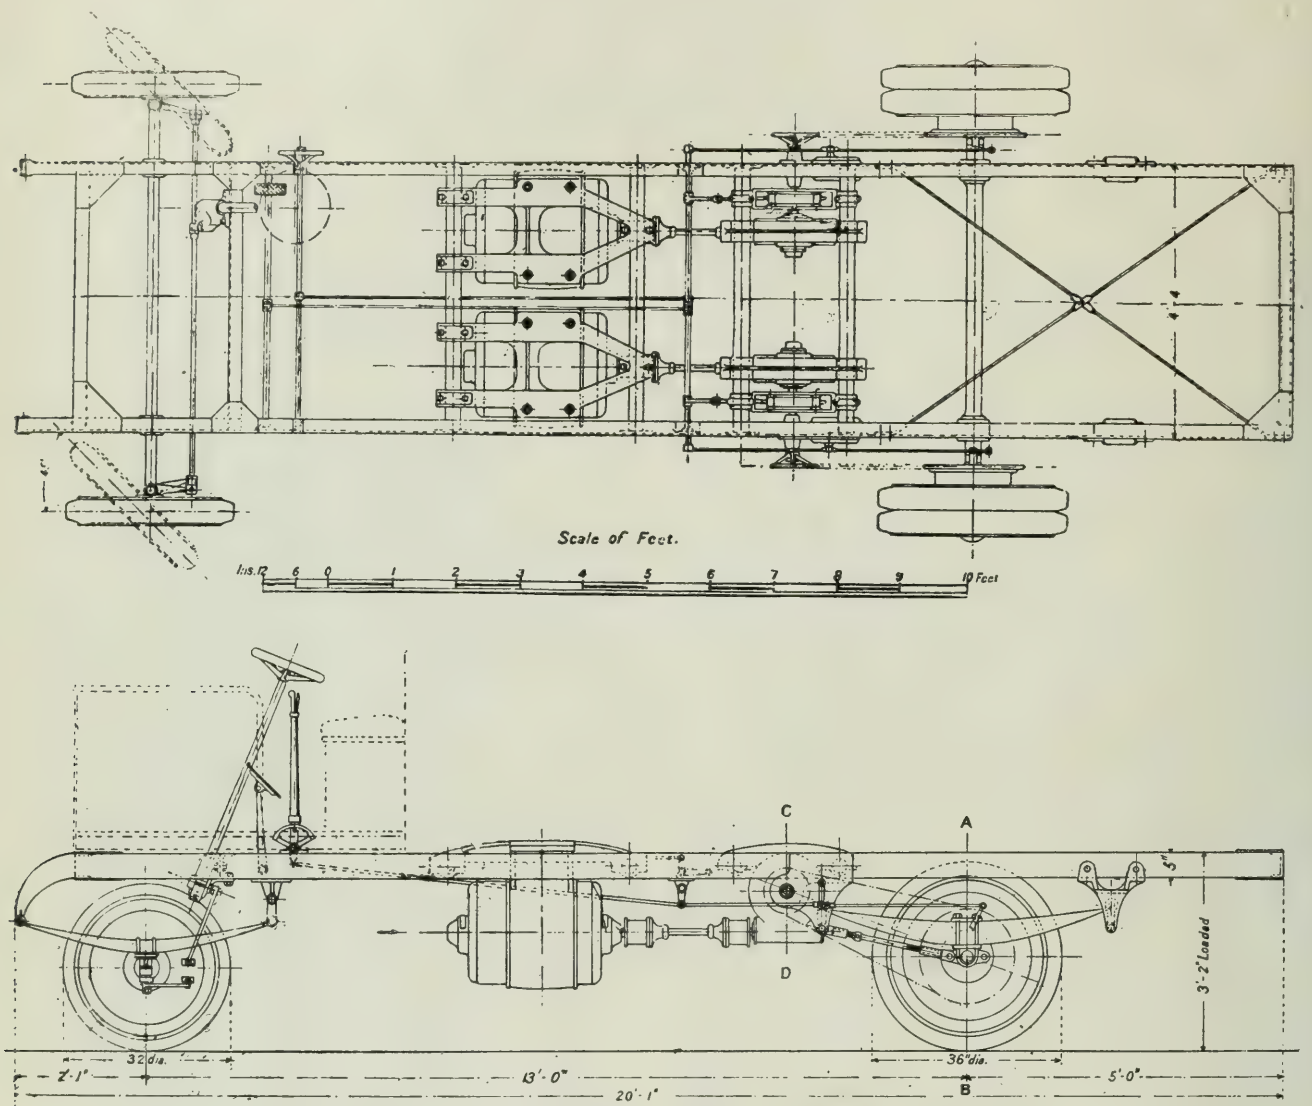

Fig. 4.—Plan and Side Elevation of Chassis of Railless Trolley Car.

GRAND TRUNK IN THE UNITED STATES.

Tenders have been requested by the Grand Trunk Railway Company for the construction of roadbed and buildings of the Southern New England railway, which will bring the Grand Trunk Company from Palmore, Mass., to Tidewater in the city of Halifax, N.S. The contracts call for completion of everything in connection with extension of the road on or before December 31st, 1913. The company officials expect to have trains running over the new road before the end of this year.

SPECIFICATIONS FOR THE ERECTION OF RAILROAD BRIDGES.

The following specifications for bridge erection were submitted by the Committee on Iron and Steel Structures to the American Railway Engineering Association, and will be considered at the annual meeting of the association. The committee recommend that they be adopted and printed in the manual.

1. Work to Be Done.—The contractor shall erect, rivet and adjust all metal work in place complete, and perform all other work hereinafter specified.

2. Plant.—The contractor shall provide all tools, machinery and appliances necessary for the expeditious handling of the work, including drift pins and fitting up bolts.

3. Falsework.—The method of erection and plans for falsework and erection equipment shall be subject to approval by the engineer, but such approval shall not relieve the contractor from any responsibility. Falsework will be built by *..... Falsework material of every character will be provided by the *.....

The temporary structure for use during erection and for maintaining the traffic shall be properly designed and substantially constructed for the loads which will come upon it. All bents shall be thoroughly secured against movement, both transversely and longitudinally. The bents shall be well secured against settling, and piles used wherever firm bottom cannot be obtained. Upon completion of the erection, the temporary structure, if the property of the railway company, shall be removed without unnecessary damage, and neatly piled near the site or loaded on cars, as may be directed. If the property of the contractor, it shall be removed in a manner subject to the approval of the engineer.

Falsework placed by the railway company under an old structure or for carrying traffic, may be used as far as practicable by the contractor during erection, but it shall not be unnecessarily cut or wasted.

4. Conduct of Work.—The work shall be prosecuted with sufficient force, plant and equipment to expedite its completion to the utmost extent and in such a manner as to be at all times subordinate to the use of the tracks by the railway company, and so as not to interfere with the work of other contractors or to close or obstruct any thoroughfare by land or water, except under proper authority.

Reasonable reduction of speed will be allowed upon request of the contractor.

Tracks shall not be cut nor shall trains be subjected to any stoppage except when specifically authorized by the engineer.

The contractor shall protect traffic and his work by flagman furnished by and at the expense of the railway company.

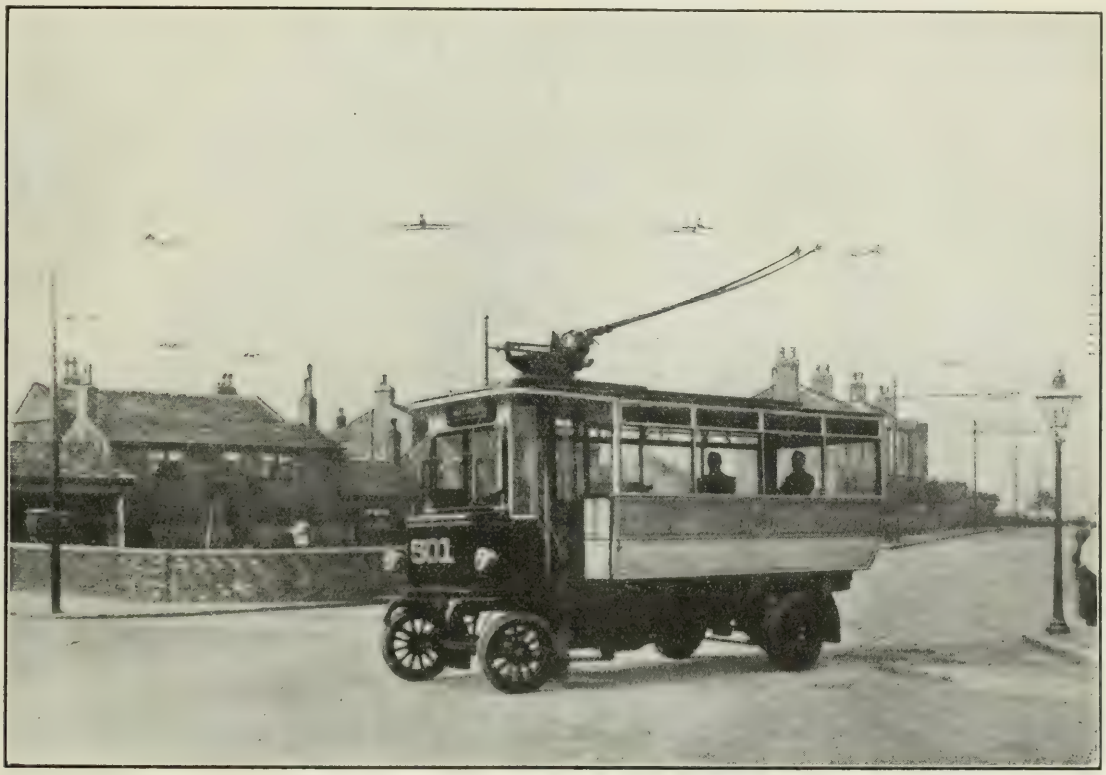

Fig. 3.—Railless Car Rounding Loop.

The contractor shall provide competent watchmen to guard the work and material against injury.

5. Engine Service.—If under the contract, work train or engine service is furnished the contractor free of charge, such service shall consist only in unloading materials and in transferring the same from a convenient siding to the bridge site. Other engine service shall be paid for by the contractor at the rate of $..... per day per engine, the time to include the time necessary for the engine to come from and return to its terminal. When engine service is desired the contractor shall give the proper railway officials at least 24 hours' advance notice and the railway company will furnish the service as prompty as possible, consistent with railroad operations.

When derrick cars are used on main tracks, their movements shall be in charge of a train crew, and the expense of the crew and any engine service other than as noted above shall be charged to the contractor.

* Insert "railway company" or "contractor," as the case may be.

6. Transportation.—When transportation of equipment, materials and men is furnished free over the railway company's line, it shall be subject to such conditions as may be stated in the contract.

7. Masonry.—The railway company will furnish all masonry to correct lines and elevations, and unless otherwise stated in the contract, will make all changes in old masonry without unnecessarily impeding the operations of the contractor. The railway company-s engineers will establish lines and elevations and assume responsibility therefor, but the contractor shall compare the elevations, distances, etc., shown on plans, with the masonry as actually constructed as far as practicable, before he assembles the steel. In case of discrepancy, he shall immediately notify the engineer.

8. Handling and Storing Materials.—Cars containing materials or plant shall be promptly unloaded upon delivery therefor, and in case of failure to do so the contractor shall be liable for demurrage charges. Material shall be placed on skids above the ground, laid so as not to hold water, and stored and handled in such a manner as not to be injured or to interfere with railroad operations. The expense of repairing or replacing material damaged by rough handling shall be charged to the contractor. The contractor, while unloading and storing material, shall compare each piece with the shipping list and promptly report any shortage or injury discovered.

9. Maintenance of Traffic.—When traffic is to be maintained it will be carried on in such a manner as to interfere as little as practicable with the work of the contractor.

Changes in the supporting structure or tracks required during erection shall be at all times under the direct control and supervision of the railway company.

10. Removal of Old Structure.—Unless otherwise specified, metal work in the old structure shall be dismantled without unnecessary damage and loaded on cars or neatly piled at a site immediately adjacent to the tracks, and at a convenient grade for future handling, as may be directed. When the structure is to be used elsewhere all parts will be matchmarked by the railway company; when the old bridge is composed of several spans the parts of each shall be kept separate.

11. Metal Work.—Material shall be handled without damage. Threads of all pins shall be protected by pilot and driving nuts while being driven in place.

Light drifting will be permitted in order to draw the parts together, but drifting for the purpose of matching unfair holes will not be permitted. Unfair holes shall be reamed or drilled.

Nuts on pins and on bolts remaining in the structure shall be effectively locked by checking the threads.

All splices and field connections shall be securely bolted prior to riveting. When the parts are required to carry traffic, important connections, such as attachments of stringers and floor beams, shall have at least fifty (50) per cent. of the holes filled with bolts and twenty-five (25) per cent. with drift pins. All tension splices shall be riveted up complete before blocking is removed. When not carrying traffic, at least thirty-three and one-third (33⅓) per cent. of the holes shall have bolts.

Rivets in splices of compression members shall not be driven until the members shall have been subjected to full dead load stresses. Rivets shall be driven tight. No recupping or calking will be permitted. The heads shall be full and uniform in size and free from fins, concentric and in full contact with the metal. Heads shall be painted immediately after acceptance.

Rivets shall be uniformly and thoroughly heated and no burnt rivets shall be driven. All defective rivets shall be promptly cut out and redriven. In removing rivets the surrounding metal shall not be injured; if necessary, the rivets shall be drilled out.

12. Misfits.—Correction of minor misfits and a reasonable amount of reaming shall be considered as a legitimate part of the erection.

Any error in shop work which prevents the proper assembling and fitting up of parts by the moderate use of drift pins, and a moderate amount of reaming and slight chipping or cutting, shall be immediately reported to the engineer and the work of correction done in the presence of the engineer, who shall check the time expended.

The contractor shall render an itemized bill for such work of correction for the approval of the engineer.

13. Anchor Bolts.—Holes for all anchor bolts, except where bolts are built up with the masonry, shall be drilled by the contractor after the metal is in place and the bolts shall be set in Portland cement grout.

14. Bed Plates.—Bed plates resting on masonry shall be set level and have a full even bearing over their entire surface; this shall be attained by either the use of Portland cement grout or mortar, or by tightly ramming in rust cement under the bed plates after blocking them accurately in position.

15. Decks.—The *..... will frame and place the permanent timber deck.

16. Painting.—The waint will be furnished by *..... ..... and shall be of such color, quality and manufacture as may be specified.

Surfaces inaccessible after erection, such as bottoms of base plates, tops of stringers, etc., shall receive two coats of paint before assembling in place. After erection, the entire structure shall receive two coats of paint, allowing enough time between coats for the first coat to dry before applying the second. No paint shall be applied in wet or freezing weather, nor when the surface of the metal is damp. Painting shall be done in good and workmanlike manner, subject to strict inspection during progress and after completion, and in accordance with special instructions which shall be given by the engineer. All metal shall be thoroughly cleaned of dirt, rust, loose scale, etc., before the the paint is applied.

17. Clearing the Site.—The contractor, after completion of the work of erection, shall remove all old material and debris resulting from his operations and place the premises in a neat condition.

18. Superintendence and Workmen.—During the entire progress of the work the contractor shall have a competent superintendent in personal charge and shall employ only skilled and competent workmen. Instructions given by the engineer to the superintendent shall be carried out the same as if give to the contractor. If any of the contractor's employees by unseemingly or boisterous conduct, or by incompetency or dishonesty, show unfitness for employment on the shall, upon instructions from the engineer, be discharged from the work, nor thereafter be employed upon it without the Engineer's consent.

19. Inspection.—The work of erection shall at all times be subject to the inspection and acceptance of the engineer.

20. Responsibility.—The contractor shall assume all responsibility for less or damage to his own work, materials or plant, due to any cause; also, for all loss or damage to the railway company's materials or property, and to other property adjacent to the railroad, due to causes within his reasonable control.

---

* Insert "railway company" or "contractor," as the case may be.

The contractor shall assume all responsibility for injury to the workmen and the public, or to any individual; and in case of accident or suit he shall defend the suit in person and relieve the railway company from all costs and expenses, and pay any judgments that may be recovered thereon.

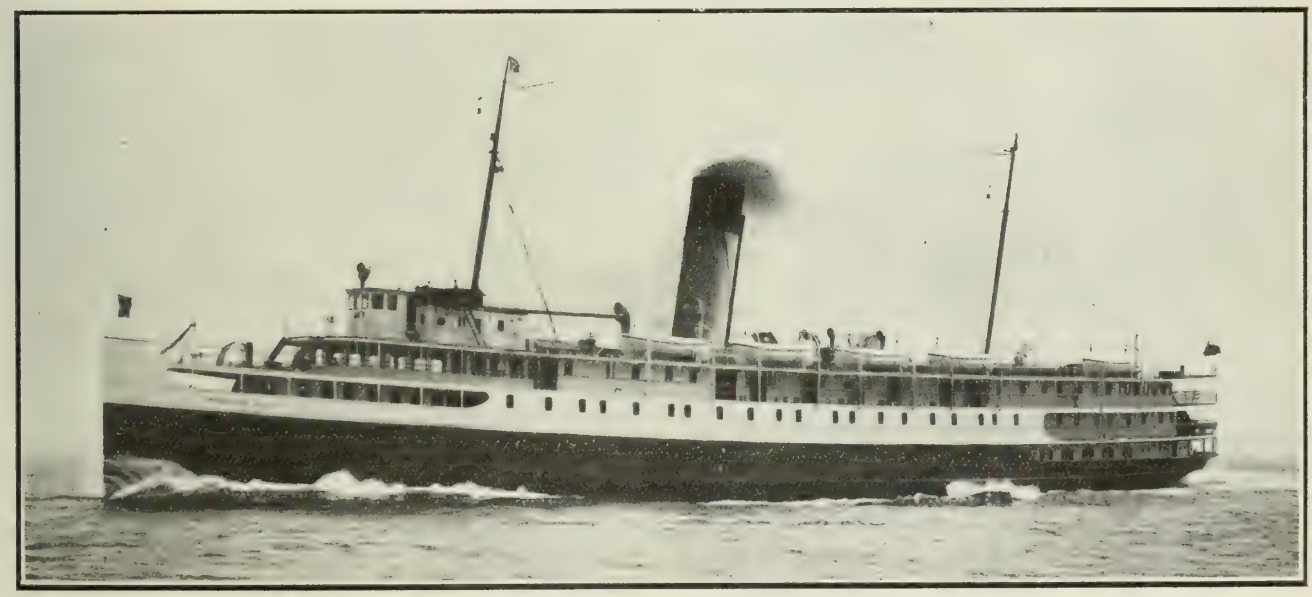
The contractor shall comply lith the laws and ordinances affecting the manner of doing work; shall take out all necessary permits and comply with their requirements, and shall take such precaution as may be necessary to protect life and property.

21. Insurance and Bond.—The contractor shall carry such liability insurance as is necessary to protect himself and the railway company against loss or damage caused by injuries to his men, and shall furnish the railway company a bond in form and of a surety acceptable to the railway company, providing for the faithful performance of the work and all matters pertaining thereto, in such sum as shall be specified in the contract.

22. Engineer.—The term "engineer," as used herein, shall be understood to mean the chief engineer of the railway company, or his accredited representative.

THE TWIN SCREW STEAMSHIP, "PRINCESS ALICE," FOR THE BRITISH COLUMBIA COASTAL SERVICE OF THE CANADIAN PACIFIC RAILWAY CO.

The twin screw steamship, "Princess Alice," illustrated in the photograph, has just recently been introduced into the British Columbia service of the Canadian Pacific Railway Co., and is now in regular operation between Vancouver, Victoria and Seattle. This vessel, which was constructed by Swan, Hunter and Wigham Richardson, Ltd., of Wallsend-on-Tyne, has a length between perpendiculars of 290 ft., a moulded depth from the keel to the main deck at the side of 17 ft., and a beam of 46 ft. 2 in. She was built to the requirements of the Canadian Government for the Pacific Coast and channel service, and carries the highest class of Lloyd's Registry, and takes her passengers and cargo on a draught of 12 ft. 6 in. She is fitted with one set of four-cylinder triple-expansion engines, having one h.p. cylinder 27 in. in diameter, one i.p. cylinder 42 in. in diameter, and two l.p. cylinders, each 48½ in. in diameter, with a common stroke of 39 in. The first h.p. and i.p. cylinders are fitted with piston valves, and the l.p. cylinders are fitted with flat-slide valves having relief valves at the back. The engines are balanced on the Yarrow, Schlic and Tweedy system, and they are fitted with all the latest improvements, which include Brown's reversing engine and special lubricating arrangements suitable for the high speed at which they run. The condenser is of Weir's "Uniflux" type and Weir's "Dual" air pump is fitted, the circulating water being supplied by a centrifugal pump driven by an entirely enclosed engine. There are no pumps of any description worked from the main engines. The main feed pump consists of a pair of Weir's vertical pumps with float control. Duplicate pumps are provided for dealing with the various services of the ship—two for bilge purposes, a vertical ballast pump for fresh water, and a general service pump. An ash ejector is fitted in each stokehold, worked by a special duplex donkey. A Sentinel steam ash hoist is provided for port use. The evaporator and feed heater are of Weir's manufacture, and a feed water filter is also fitted. There are four boilers, 15 ft. 7 in. in diameter, by 12 ft. in length, each fitted with three furnaces and worked under forced draught on the enclosed stokehold system. An interesting feature of this ship is that she is the first of the Canadian Pacific Railway Company's fleet that has been specially built to carry oil fuel for raising steam in the boilers, although, of course, oil-burning apparatus has previously been installed into several of the older steamers of this company. The patented system of the Wallsend Slipway and Engineering Co., Ltd., was adopted and the installation is a very simple one. The oil is pumped from the liquid fuel bunkers through a heater and filter to the burners and is simply sprayed into the furnaces under pressure. The salient feature of this system is the method in which the air is brought into contact with the spray of liquid fuel, this being effected in such a manner as to secure perfect combustion within a very short distance from the mouth of the furnace. The method is so simple that it can be easily worked by an unskilled laborer after half an hour's instruction, as all that is necessary is to merely adjust the temperature and pressure to suit the quantity of oil which is required to be burned to obtain the requisite power. Another feature is the oil-spraying nozzle, which is so arranged that by simply changing the nozzle of



New Liner for Canadian Pacific Railway Co., S.S. "Princess Alice."

the burner and a small disc in the inside of it, the quantity of oil may be varied from a maximum to a minimum. When burning liquid fuel on this system, all brickwork is entirely removed from the furnaces and from the moment of lighting there is no smoke to be seen from the ship's funnel. The Passenger accommodation of the "Princess Alice" embodies all that the experience of the owners and the skill of the builders could devise, and the ship is, therefore, one of the most handsome on the Pacific Coast. As will be gathered from the elevation drawing and the photographs, the "Princess Alice" has a large range of superstructure and is a typical example of the most recent practice in Canadian river and coastal steamers. On the promenade deck the observation room is placed forward and the smokeroom aft, both of these rooms having large plate glass windows, which afford an uninterrupted view of the splendid scenery of the coast along which the ship passes. The observation room is handsomely panelled in mahogany, and the smokeroom in fumed oak, relieved by hammered copper panels, depicting ancient "totem" poles of the North American Indians, and also specimens of the trees, fruits and grain of Canada. The corridors between the observation and smoke rooms are of polished mahogany with inlaid panels, and they lead to a succession of comfortable deckhouse staterooms. A feature of the corridors is that they are all surmounted by a cambered roof with a clerestory, giving a feeling of height and spaciousness and ample light and ventilation. From the promenade deck, companion-ways lead down to the upper deck, which is largely occupied by a series of first-class staterooms, including several suites of bridal chambers. On this deck there are also two social halls, or music-rooms. The dining saloon, a handsome apartment panelled in beautiful Italian walnut, is on the main deck aft, and a noticeable feature of this room is the provision of specially large plate glass windows. The saloon is arranged with small tables, those at the sides being ensconced in bays. At the after end of the dining room is the pantry and behind that a galley. Under the dining-room deck is the first-class restaurant, where a la carte meals are served. The photograph showing the vessel was taken whilst she was undergoing official trials off the Tyne and burning liquid fuel, when a speed of 18 knots was easily attained, and during this time, and whilst the vessel was on her way to Victoria, British Columbia, and also for the short time she has been in commercial service, we understand, the machinery and boilers have worked to the complete satisfaction of all concerned, the owners being represented by Captain H. Mowatt, their marine superintendent. It is of interest to note that the Canadian Pacific Railway Co. has at present 15 vessels engaged in the Atlantic trade with a total gross tonnage of 125,666 tons. The largest of these steamers are the sister ships, "Empress of Britain and "Empress of Ireland," the gross tonnage of each of which being approximately 14,500 tons. The Pacific service is maintained by four steamers, the total gross tonnage of which is 23,984 tons, three of which are the well-known vessels "Empress of China," "Empress of Japan," and "Empress of India." The British Columbia service is now being carried on by nine vessels, the total gross tonnage of which amounts to 19,977 tons. The Canadian Pacific Railway Co., has at present three steamers on the stocks in this country, two large and fast vessels for trans-Pacific service, the gross tonnage of which will be approximately 15,000 tons. The other vessel is intended for the Pacific Coast service, and will have a tonnage of about 2,000 tons for the coast service and the Canadian Pacific Railway has also acquired the 1,000-ton steamer "Queen Alexandra," which is now refitting on the Clyde and will, in due course, take her place in the coast service under the new name "Princess Patricia."

ENGINEERING PHOTOGRAPHY.

By Lyman B. Jackes.

It is seldom nowadays that any structure is completed without the securing of a number of photographs. Many instances may be cited where this faithful servant has placed on record the various epochs and points of interest which are hidden when the problem or structure assumes a finished condition.

In the construction of many large buildings in United States cities, photographs are secured of all surrounding conditions to serve as infallible witnesses, should a process of law be resorted to when building operations have commenced. The writer recently saw a photograph of several persons gazing into the windows of a jewel merchant's shop on Broadway, New York; the scene also depicted one or more persons in the act of leaving and entering the premises. This photograph was secured to assist in defending the contractors engaged in erecting one of the world's largest office buildings against a damage suit entered by the above mentioned merchant, who alleged that the litter, noise and dirt, etc., of the construction work drew custom from his store.

Stripped of all technical terms and accessories, the photographic principle depends on the fact that certain salts of silver are capable of changing properties due to the action of light and that these changes may be developed from the latent condition to one of perceptability. The silver salts are generally supported by means of gelatine on glass, celluloid or paper, the former condition being known as a "plate" and the second a "film."

Photographers are divided largely on the question of which form presents the more points of excellence, but both possess equal latent powers for negative making when properly handled. The prominent advantage claimed for films over plates is that of weight and ease in manipulation; that of plates being cheapness, (usually 50% lower than films) variety, both in make and properties, and stillness; while the disadvantages claimed for films are inflammability and lack of variety. By lack of variety is meant the selection of a certain plate, be it landscape, process, non-filter or ordinary, for a special piece of work.

In making pleasing and presentable pictures the great factor is the lens; in fact without a lens of some sort photography would be greatly handicapped, although it is possible under extreme conditions to secure passing negatives without a lens.

Lenses are divided into two great classes, single and double, these two classes branching off into many subdivisions. The photographic lens, like many other articles, is the result of many men's brains; the chief improvements, however, might include the compounding of two lenses into a "single" one, known as an achromatic; the compounding of two single lenses to correct linear distortion, known as rectilinear; and the compounding of the two former in various ways to correct stigmatism, and known as anastigmatic.

The single lens finds its chief employment in the lower priced cameras, but, unfortunately, has not the power to produce a straight line upon the plate or film. Owing to this defect, it does not commend itself for engineering photography; the rectilinear lens corrects this fault, and has the advantage of passing much more light in a given time. The anastigmatic lens may be regarded as the highest development (for general all round work) of the lens making art. This type lens is much more expensive to purchase than the former mentioned types, but a fair anastigmatic lens of British manufacture may be obtained in this country for

from twelve to fifteen dollars and upwards. Lenses of this character purchased from the United States are, as a rule, much higher priced. A good single lens may be had from one dollar upwards, while the rectilinear variety may be obtained from three dollars upwards.

When a mechanical device or engineering construction has reached the stage where photography is called upon to enter the general scheme it is usual to exclude all idea of the artistic and brush all other features aside in the idea of securing the picture containing the most descriptive material.

Next to the lens and plate, the important item in picture making and taking is the diaphragm or "stop." This is a contrivance which admits of regulating the amount of light passing through the lens and, what is still more important, how much of the lens will be used. In most lenses of to-day the diaphragm is built into the lens cell (called an iris diaphragm) and regulated by a ring or lever which plays across a scale to show the relative size of one opening to another. Each number is placed in such a position as to indicate a reduction of 50% in area over the preceding number when the ring or lever is arranged over it.

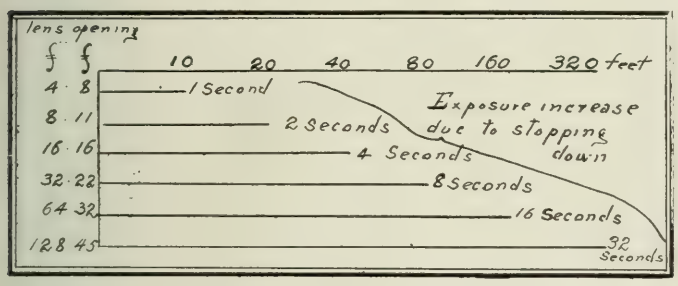


Fig. 1.

In explaining the use of these diaphragms it will be necessary to consult Figure 2. The figures on the top represent the distance in feet from the lens to the first principal object in the foreground. When the lens is open to its greatest photographic ability (represented by the upper left-hand set of figures) it will sharply focus any object at the distance indicated on the scale, but beyond this principal object the definition will become indistinct or "fuzzy." Assuming the operator desires the detail to extend farther into the picture than where the first principal object only appears sharp, this accomplished by stopping down the lens, and not by altering the focus. This might be put as a rule and read: "In focusing always regard the first principal object as the starting point, then consider what depth is required, and arrange this by the stops or diaphragm."

An examination of Figure 2 will disclose the fact that the smaller the opening used the more detail is secured. Allowance, however, must be made for the reduction in the light to secure equal contrast. An example will render this clear.

In Figure 3 assume the camera operator to be considering the taking of two views—one a group of workmen (a) and the other the interior of a power house (b). The group of workmen are drawn up in single line and twenty feet in the rear is a generator that they have been erecting. The purpose of securing this photograph is to photograph the workmen and not the generator, which is to be used as a background. An examination disclosed the fact that the men are fifteen feet from the lens and the generator thirty-five feet distance. If the lens is placed in such a position that the indicator points to fifteen feet, and the lens opened to its greatest capacity, the group will appear sharp and distinct, but beyond the group the detail will be very poor and the generator acting in this instance as a background, will perform its duties by keeping in the background and centering all interest on the group.

In the case of (b) the circumstances differ greatly inasmuch as detail is required. The operator would set his indicator at 25 feet and then arrange his lens opening so that stop f 32 was in the lens; this would evenly distribute the detail; allowance, of course, would be made for the reduction in light passing abilities as illustrated in Fig. 2. The distance from the lens to generator No. 1 is twenty-five feet, and, assuming the total length occupied by machinery to exceed this by one hundred feet, then stop No. 1 (f 8 or f 4) would render generator No. 1 sharp, the next stop would cut fifty feet, the next one hundred and the next two hundred; this includes the hundred and twenty-five feet and should be adapted (4–8–16–32) or the fourth stop. Once the relation between the focusing scale on a hand camera and the stops controlling the opening through the lenses is mastered, the operator has travelled a long portion of the road to successful picture making.

Of great importance is the light available when an exposure is about to be made, as, of course, the length of time in which the shutter remains open is governed entirely by this factor. The brightest portion of the year is obviously during the hours of 10 a.m. and 2 p.m. in the months of June and July; the darkest period is six months later. However, the important factor in estimating available light is not so much in the season's change, but in the hourly change. Under ordinary circumstances 7 a.m. may be regarded as the earliest average time in which successful negatives may be produced; and 4 p.m. may be regarded as the latest average time.

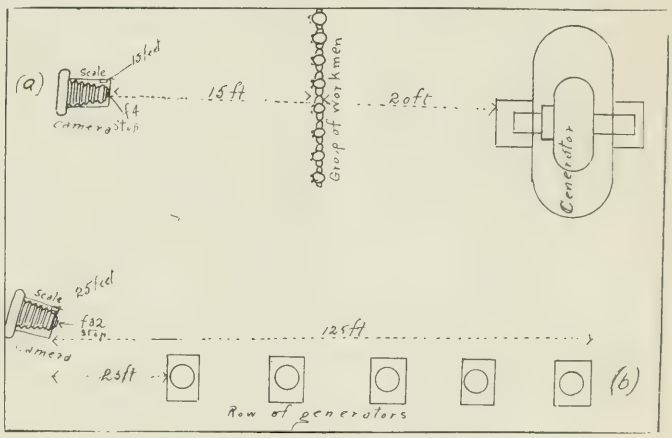

Fig. 2.

Exposure.—Fig. 4 is a curve showing the light value for a year for the district comprising the southern parts of Canada made on a noon comparison. Of course available active light in June will be of greater duration than in December, so that in making an exposure in the afternoon this must be accounted for.

An old photographic maxim is "Expose for the shadows and the high lights will take care of themselves." This is true to a certain extent in general photography, but would not yield results in certain specific cases.

There is generally found on a box of plates a "speed number" which is very useful in making an exposure. This figure is generally given in the H. & D. or Hurter and Driffield system.

The Eastman and Ensign film may be rated on the above system at 275 H.D. This figure represents that the plate or film quoted thus is practically twice as sensitive to light as one rated or quoted at 150, and consequently if the exposure of any specific plate for a given subject is known it becomes

merely a matter of division or multiplication to calculate the exposure for any given subject.

It is a very difficult matter to lay down any hard and fast table for exposures, but the following is from the writer's experience, based on a plate of a speed varying from 200–300 H.D. (average of 250) in a good light:

Subject.	Stop.	Time.
Distant landscape	8–11	1/100 second.
Rivers, snow scenes	8–11	1/100 second.
Light foreground	8–11	1/25 second.
Heavy foreground	8–11	1/5 second.
Portraits near windows	8–11	4 seconds.
Shady banks, brooks	8–11	1/5–1/2 second.
Ravines and under trees	8–11	1/4–1 second.
Interiors, light	8–11	5 seconds.
Interiors, medium	8–11	60 seconds.
Interiors, dark	8–11	30 minutes.
Interiors, very dark	8–11	60/100 minutes.

In photographing interiors with plates a decided improvement will be found by using "backed" plates, which may be purchased from most dealers at a slight advance in price over the unbacked. Failing to procure the article in this form, the dealer will generally suggest to apply the application of a backing preparation contained in a small jar or pot. The glass side of the plate may be coated with:

Strong gum solution	1 oz.
Caromel	1 oz.
Burnt sienna (powder)	1 oz.

This is applied in the dark room and the plates dried in a dark box. It is a good plan to use the plate box by securing small blocks of wood to the side; or they may be stood on a drying rack and then enclosed and protected from the light during the drying period.

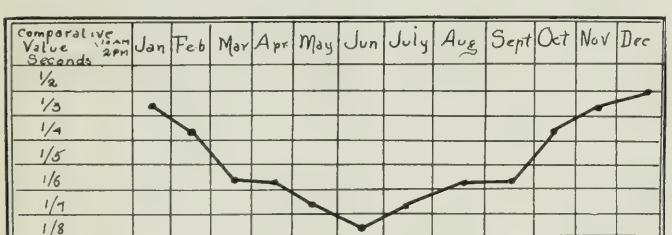

Fig. 3.

Orthochromatic Photography.—The average photographer is usually not long in discovering that his pictures do do not reproduce in the corresponding shades of brilliancy as compared with the colors of the object. This is due to the varying actinic powers of the various light rays, which is more prominent in the blue and violet light than in the yellow and reds. If an exposure is made of any brilliant colored object the resulting negative will be denser in the blue portions and thinner in the red portions than the actual color comparison appeared in nature. To remedy this an orthochromatic plate was introduced, which consisted of an ordinary plate immersed in a solution of certain analine dyes which left a slight yellowish stain on the film, and to a certain extent held back the blue and violet rays while the red, yellow and brown rays were affecting the silver solution. The color correcting properties of an orthochromatic plate are a distinct advance over an "ordinary" plate, but the full correcting properties are only brought out when a yellow screen is placed over the lens either on the front or rear combinations. These yellow screens are usually sold with a factor generally expressed as 2x, 4x, 6x or 8x, and often higher. This factor represents the length of time in which to increase the normal exposure to secure normal results. As an example, let us suppose a subject is arranged and the normal exposure is found to be 1/50 second; then, if the first screen were used 2x it would be necessary to double the exposure, which would be 2/50 or 1/25 second. Similarly the others would be used 4/50, 4x; 6/50, 6x; 8/50, 8x. Many camera shutters do not allow of such a fine range of adjustment as above; however, the average shutters purchased on cameras of today are automatic. As a rule, the speed possibilities are limited to 1/100, 1/50, 1/25, 1/5, ½, 1 seconds, and should the operator require an exposure of 1/12 second he may secure this speed or length of opening by quickly releasing his shutter twice when set at 1/25. Of course this does not give satisfactory results when the subject is in motion, but will illustrate the method of using the shutter to the greatest advantage.

Orthochromatic plates are, of course, much more sensitive to red light than "ordinary" ones, consequently must be handled during loading, unloading, and development with much more care than that bestowed on ordinary plates. They should be developed with pyro soda or pyro metal developers, as it is extremely difficult to secure satisfactory results with metal quinol (M.Q.) on orthochromatic plates. A good formulae for pyro soda and pyro metal is compounded thus:

Pyro Soda—		Metric.
Pyro	2 grains	4 grams
Sodium sulphite	12 grains	24 grams
Sodium carbonate (cryst.)*	22 grains	44 grams
Potassium bromide	½ grain	1 gram
Water	1 ounce	1 litre
Factor	6	

Pyro Metal—		Metric.
Pyro	1½ grains	3 grams
Metal	1 grain	2 grams
Pot Metabisulphide	3 grains	6 grains
Pot bromide	½ grain	1 gram
Sodium carbonate	48 grains	96 grams
Water	1 ounce	1 litre
Factor	9	

These formulae are given in ounce proportions and, if made to the above strength, will answer to the factor quoted below each one, provided that the water is not too cold. This factor is a most useful feature of development, doing away with all guess work. It is used by noting the time in seconds between the flowing of the developer on the plate and the **first** appearance of the image; this time is then multiplied by the factor, the plate and the tray covered for the number of seconds resulting from the multiplication, and at the end of the time specified the development will be at its best for that particular plate or film. Example: Pyro soda developer, factor 6; time from first appearance of highlights to flowing developer 50 seconds. Then 50 seconds × factor 6 = 300; 300 seconds = 5 minutes = time to leave plate in dish covered.

*When sodium carbonate (washing soda) is purchased in crystals it contains considerable water of crystalization which reduced the available Na_2CO_3 considerably. If the dry powder is purchased divide the figure in the formulae by 2.5, which gives 9 grams to the ounce. The pyro is the pyrogallic acid of commerce, usually sold at 25.30 cents per ounce. It is, however, very bulky—an ounce of the loose acid occupying as much space as 15 or 20 ounces of water.

The light used in the dark room should be as low as possible, and the plate or film should not be exposed to a prolonged examination; in this manner there are produced negatives of absolute clearness in the shadows, and in those portions which have been protected during the exposure in the camera by the various appliances needed to hold the plate or film in place. The developed image should be placed under water and rinsed before being transferred to the fixing bath (hypo.).

If a negative is valued it should be protected by a coating of varnish prepared as follows:

Shellac	3¼ ounces
Sandarac	¾ ounce
Mastic	40 grains
Castor oil	1 dram
Rectified spirit	30 oz. (fl.) (.920 to .950)

This is applied when the glass or film is warm (be cautious in warming films; do not let them get any warmer than can be comfortably endured when held against the cheek) and is flowed in a pool on the centre and allowed to flow over the edges and corners. It dries very quickly.

Lantern Slides.—This branch of photography is being used to a greater extent every year by engineers and teachers as it affords a means of presenting illustrations of a subject under discussion to a number of persons at once. There are three methods of making lantern slides which we will discuss in this article; two are direct applications of photography and the other is an indirect application of that science.

The first essential in the making of a slide is a good negative, one that possesses a good range of gradations and is not too thick; the second is an assortment of lantern plates. These plates may be purchased from dealers in great variety, both as regards make and qualities. The British manufacturers are producing the bulk of lantern plates used in Canada. Lantern plates may be purchased in Great Britain from 9d per dozen upwards. The usual retail price in Canada is 25 cents and 35 cents per dozen. Lantern plates are very slow, the average H. & D. speed being about 15. The standard size for lantern slides in the British Empire is 3¼ x 3¼ inches, while in the United States and France they are 3¼ x 4 inches. The method to be employed in slide construction is determined by the size of the negative and the desired opening of the lantern picture.

Supposing the reader to be in possession of a negative, say 3¼ x 4¼ or 4 x 5 inches; as the lantern plate is but 3¼ inches square, it is at once apparent that some process must be resorted to in order that the 4 x 5 negative may be reduced to a proportionate degree, wherein it may be reproduced on the lantern plate. To accomplish this satisfactorily is known as the process of reduction.

An examination of Figure 5 will serve best to illustrate the principle of this operation. The negatve is placed in the centre of a wood or cardboard frame and all light other than that entering through the negative is excluded from the room. If a clear view of sky cannot be procured, one or two thicknesses of white tissue paper should be secured a few inches from the negative. A lantern plate is secured in the ordinary plate holder and the negative photographed. The lantern plate is then developed when it is found that a small positive is formed which has the same proportions as the negative.

If a portion of a negative less than 3 x 3 inches only is required the slide is made by contact, which is accomplished by placing the negative in a punting frame, face up, and then laying a lantern plate face down over the desired portion and exposing to light for a few seconds.

In the matter of lantern slide exposures it will be best found by actual trial; however, as a guide the experimentee may use the following:

For Reduction—

Window in shady position, ordinary negative, average lantern plate F22 ..... 7 seconds.

For Contact—

Candle light, ordinary negative, distance from light to plate 12 inches .....25 seconds.

A lantern plate may be best judged in the developer. A plate which begins to appear in 30 to 40 seconds and is quite dense in 2 to 3 minutes, providing all the high lights remain clear, will, as a rule, give a satisfactory picture on the screen.

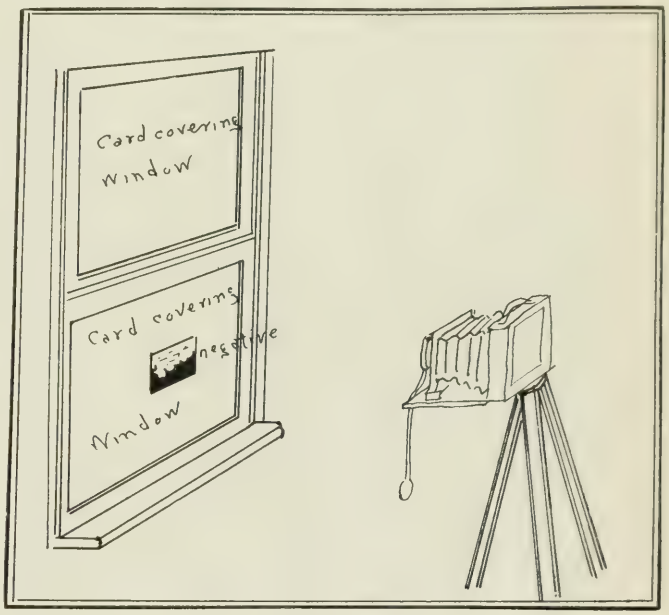

Fig. 4.

The mounting of a slide is a comparatively simple matter; however, it is imperative to have both slide and cover glass thoroughly dry before binding. The mat should be made of paper entirely opaque when held between the eye and a strong light. In placing the thumb spots on a slide it is the usual British method to arrange the slide in such a way that the mat is uppermost, then turn the plate so as to bring the lower portion of the picture farthest from the person, then the two white discs are secured at the two corners nearest to the person. An old lantern maxim is "Face in and sky down, and a mistake will never be made." It will be seen that the foregoing is summed up in the maxim.

It often happens that when a slide is required at short notice a half tone block may be secured from some technical publication or advertiser. The usual size for a cut is 3½ inches on its longest side. If a piece of celluloid is prepared by flowing over it a solution of gasoline and rosin, the resulting surface will have many of the properties of paper and will receive a very presentable impression of the halt tone when inked and placed in a small press such as a copying press or other variety. A pad of newspaper should be placed on top, and if the celluloid is inclined to lay flat the inked cut should be placed face up, then the celluloid face down, and on top of all the pad of newspaper about ¼ inch thick. The celluloid is then masked and bound between two pieces of glass.

Printing.—The majority of negatives are made with the intention of preparing paper prints, and although there is

scope for considerable display of ability in preparing prints, the essential is a good negative. For detail work and a finished appearance the glossy gaslight papers are generally used. The extreme glaze is an after operation. Here again the subject of exposure is all important, and the little table given below is an average:

Source of light.	Distance of printing frame.	Time.
16 c.p. electric	12 inches	40 seconds
Open gas flame (17 c.p.).....	12 inches	40 seconds
Incandescent gas (bright)....	12 inches	20 seconds

This, of course, is for an average negative, that is, one showing clean and clear through the frame and not unduly stained. In development of a print, the image should begin to appear in 15–25 seconds, and be fully developed in one to two minutes. Place the print as taken from the frame face up in the developing tray and flood with cool, clean water, then pour off and quickly flow the developer over the softened print; keep the direct light from reaching the paper by introducing the body in the direct path of the rays. Always rinse the print well before fixing, and when in the fixing bath (hypo) the print should be kept below the surface, thus avoiding brown stains.

The glaze is imparted by placing the well washed print face down on a clean piece of glass and allowing to dry in that position. The print should be well rolled when first placed on the glass.

THE VERTICAL POSTS OF BRIDGES.*

By Prof. Albert Smith.

There is no point in the design of steel structures more loosely defined in specifications and in the standard practice of the profession than the design of compression members for bridges.

Very many careful tests have been made as to the testing machine strength of the common combinations of structural shapes, and lately a great deal of money and labor has been spent to widen the range of these tests to include very large compression members.

This work is very valuable and very necessary. When it it completed, however, there will still be a lack of accuracy in our design of these members. The following questions will still be unanswered:

(a) What is the amount of the secondary stresses?

(b) What is the proper free length to be used in correlating a given design to test formulae?

Practice in regard to the second point varies widely. In the case shown in Fig. 1 most designers prefer to use L_1 for truss plane free length, and L_4 for cross plane free length. These assumptions are very reasonable if one works under the specification of unsupported length, instead of buckling length. It might, however, be urged that this post is supported in the cross plane at the foot of the knee brace and at the top of the floor beam.

For L_2 equal to 16 ft. 0 ins., L_3 might well be 13 ft. 0 ins. and L_4 be 17 ft. 6 ins. The assumed free length might then vary from 156 ins. to 210 ins. For a radius of gyration of as much as 4 ins. the permissible fibre stresses would be, by the common straight line formula:

$$16000 - 70 \times 210/3 = 11{,}100 \text{ lbs.}$$

$$16000 - 70 \times 156/3 = 12{,}360 \text{ lbs.}$$

This difference of 10 per cent. between the permissible fibre stresses calculated on the basis of two different interpretations of the specification would seem to be rather important. If the short length is correct the smaller permissible fibre stress is wasteful.

A much more serious ambiguity exists in the term "free length." In Schneider's Specifications, where "effective length" is used instead of free length, the author specifies that it shall be taken as one-half the distance between connections if the ends are fixed, two-thirds if one end is hinged, and the whole distance if both ends are hinged.

A theoretical definition of fixity might be stated as follows: A condition in which the neutral axis is prevented at the given point from changing direction on account of the tendency to buckle under a compressive load.

But who has determined when this condition shall have been fulfilled? Does a floor beam firmly riveted to the post

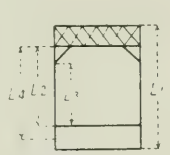

Fig. 1.

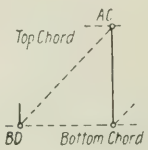

Fig. 2.

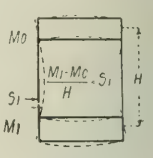

Fig. 3.

fix the direction of its neutral axis, and, if so, at what point of its attachment? Does a latticed strut with a knee-brace fix the neutral axis of the post, and, if so, where—at the bottom of the strut, at the bottom of the knee-brace, or at some point between?

If in the post of Fig 1, dimensioned as above, complete fixity were assumed at top of floor beam and at feet of knee-brace, we should have a free length, by Schneider's Specifications, of $L_3/2 = 78$ ins., and the permissible fibre stress would then be:

$$16000 - 70 \times 78/3 = 14{,}180 \text{ lbs.}$$

This is an increase of 30 per cent. over the most unfavorable assumption.

Mr. C. T. Morris, in the Engineering News of November 2, 1911, calls attention very forcibly to the uncertainty in regard to the assumption of fixity. He appears to assume, however, that the presence of secondary stress and the accompanying point of contra-flexure requires the free length to be measured from the point of contra-flexure to the point of fixity. To this the present writer can not agree. It appears to him that while the position of the free buckling length would be changed on the post, that its amount would be unchanged. The presence of secondary stress in a member is to be considered, not because it lowers the permissible fibre stress, but because it increases the actual existing fibre stress.

Still more serious than the uncertainty as to the point at which fixity may be assumed to exist, is the uncertainty as to whether the empirical formulas into which we substitute are derived from tests on free or hinged end columns. If they are so derived, there would be little question as to the propriety of compensating in the length for fixed end conditions. Obviously we may not substitute half length in fixed end conditions (if we have them, and know it), in a formula arrived at from tests upon flat end columns. Even tests upon hinged end columns can not be considered to show the strength of columns absolutely free to turn at the ends, and should, therefore, not be adopted to fixed end conditions by reducing the length with the factors one-half and two-thirds.

Without excessive difficulty, tests upon members braced in manner as the vertical posts of bridges could be so contrived as to throw enough light upon the subject to enable a committee of one of the national professional societies to draw up a defining specification.

* Paper before Indiana Engineering Society.

The secondary stress in the cross plane is very easy to determine theoretically. The engineer should not think, however, that these theoretical results are exactly true. The Engineering News, in a very able review of the practical aspects of secondary stresses, notes that truss plane secondary stresses are self relieving. It is also to be noted, in regard to cross plane secondaries, that the warping of the truss as a whole, which must take place when a series of posts is bent from the floor beam action, causes the inside half of the diagonals to take a disproportionate stress, which tends to develop an outward bending in the post. The eyebar, or diagonal angle CD, in Fig. 2, will have a stress appreciably greater than that in AB. This excess, multiplied by the arm CD/2, produces a bending moment opposite to that produced by the bending of the floor beam.

It is certainly not possible in contracts with small allowance for engineering, to compute the relief of the secondary stress from this cause. The secondary itself is not expensive to compute. The amount of this relief can never exceed one-half the secondary stress, since it is the imposition of a uniform moment upon a moment varying from zero to a maximum.

There is, however, one thing that the secondary stress calculations for vertical posts can teach us, which is worth while bearing in mind when designing these members. In two examples in Hirei, "Statically Indeterminate Stresses," pages 167-8, the moments M_1 and M_0 are computed for a railway and a highway bridge bent. The change of moment between top and bottom of the post is found to be 52,000 lbs. and 36 lbs. respectively. For heights of 20 ft. and 16 ft., the value of S_1 in these bents is 2,600 lbs. for the railway bridge and 2,250 lbs. for the highway bridge. Remembering that a certain amount of the wind load on the top chord is certain to be carried down the posts, it seems quite possible that there may be a shear of about 4,000 lbs. in the post.

If, then, this post is latticed in the cross plane with single-rivet lattice bars, each rivet of the latticing throughout the whole length of the post must endure a considerable stress. For a shear of 4,000 lbs., and with two systems of 60° lattices, this stress would be 2,000 lbs. × 1.15 = 2,300 lbs. This is not a very large stress for a single rivet, if only it were the average stress in a joint of several rivets. Here, however, the safety of the whole structure depends upon the ability of each of a great number of rivets to bear alone a load of over one ton. Such a reliance upon single units of construction is contrary to the principles of good design.

The conclusion which I wish to draw from these considerations is that the latticing of vertical posts of bridges should all be in the truss plane, in spite of the loss in pin plate metal. Where channels are turned with their webs in the truss plane a web plate should be used to connect them.

LARGE STEEL INGOTS.

Messrs. Cammell, Laird and Co., Limited, of England, have just turned out two very large steel ingots at their Grimesthorpe works, Sheffield. One of them weighs nearly 140 tons, and will form the base of an armor-bending or straightening press for a neighboring firm. It was cast from three furnaces, then reheated and placed under the 4,000-ton hydraulic press, in which its thickness was reduced from 4 ft. 6 in. to 3 ft. 6 in., and the top end, weighing about 40 tons, was cut off. After being again re-heated, it was rolled down in the armor-plate mill to a thickness of 2 ft. 7 in. The second large ingot is an octagon of 1 ft. 7 in., for a gun jacket.

Messrs. Cammell, Laird are at present very busy with naval construction work, including castings for the two battleships now being built at Devonport and Portsmouth, and for the Audacious and other vessels which are in hand at Birkenhead and Fairfield.

A NEW PETROL CAR.

The Leyland Motor Company, of Leyland, England, have recently constructed a new petrol car, which is now in operation at Hepsham. The car is driven by petrol engines and runs on the tramway lines, an adaptation, in fact, of the motor driven 'bus to tramways.

The Leyland Motor Company, of Leyland, near Preston, have constructed the car, in so far as the driving machinery is concerned. It is a single-decked petrol driven tram car, of 55 horse power, and has seating capacity for 37 passengers. The general particulars are as follows:—The transmission is from the four-speed gear box through universal joints to a gear case on one of the axles. The two axles are connected together by a roller chain, and the axle gear case contains heavy spur and bevel gears and reverse gear, the whole running in oil on ball bearings. The ordinary pattern tramway hand brake is fitted, and a large diameter external band pattern foot brake is fitted immediately behind the gear box. The car, which is completely controlled by the driver from either end at will, is built up of angle irons and timber on the usual tramway practice. The body is well finished, all the side windows being made to raise and lower by screw operating gear. Plain varnished seats are placed crossways with a central gangway. The car is lit by elecric light by means of a number of metallic filament 10-candle power 6-volt lamps, supplied by current from a dynamo driven from the engine on the Trier and Martin systems. The length of the car over collision fenders is 31 ft., width over all 7 ft. 7 in., length over corner pillars 21 ft. 6 in., total height 10 ft. 1½ in., gauge 4 ft. 8½ in., wheel base 8 ft., weight of car complete 7 tons 5 cwts. The sub-contractors were as follows:—For car body, the United Electric Car Co., Ltd., Preston; electric light, Messrs. Trier and Martin, London. The approximate cost is $5,250.

At the first trial of the car, Mr. C. B. Nixon, the representative of the Leyland Motor Company, gave some figures on cost of operation, etc., as follows. It was, he said, an ordinary tram car body built by the United Electric Car Company. It was fitted with a 55-horse power four-cylinder petrol motor, capable of developing 60-horse power. As the car was intended to run on a road that had steep gradients, and was somewhat greasy, it was thought better to couple the two axles together with a large driving chain, to get the adhesion of both axles. As to the cost of the running of the car, that remained to be tested, but he thought it might safely be assumed that it would travel eight miles with a gallon of petrol, or at the rate of a penny a mile for fuel. It generally took two units of electricity per car mile, and if the cost was 4 cents per unit the saving in current would be considerable. The cost of maintenance and general running would be about the same as a motor 'bus, 2 cents to 3 cents per mile. The cost of the track must be put against the cost of the rubber tires of a motor 'bus, which would be about 3½ cents per mile. A motor 'bus would do 45,000 miles a year for $1,800 in the cost of rubber tires, but it could be seen that the track could be maintained at less than that amount.

ELECTRIC RAILWAYS OF CANADA.

The electric railway systems throughout the Dominion, in common with other industrial enterprises, have received a large share of the general prosperity of the past year. To state the total of the net profits would be impossible at this early date; the net profits of seven of the more prominent railways, however, amount to $10,500,000.

Several of the western cities have placed electric lines in operation during the year 1911, and these, though giving in nearly every instance satisfactory returns, are not as yet on a profit-making basis. Electric railway construction has not been entirely confined to the west, however, as the central and eastern municipalities have constructed considerable extension work. Among this construction work will be found the extension of the Halifax Tramway Lines into Point Pleasant Park; during this present year it is proposed to increase the efficiency of the service by double tracking the belt line, which will necessitate the laying of about three and one-quarter miles of track, additional cars, increased car housing facilities and the installation of an additional unit in the power plant; the whole involving an expenditure of approximately $200,000.00.

The Montreal Street Railway Company do not report any line extension of magnitude; on the question of expansion along other lines, however, this company has been exceedingly active. During the past year this company secured an amendment of its charter, authorizing the sale, lease or transfer to any person or company of all its undertakings. Following this a meeting of the shareholders was held for the purpose of considering the sale of the belongings of the company to the Montreal Tramways Company; the majority of the stockholders being in favor, the sale was concluded. By thus disposing of the property of the Montreal Street Railway to the Montreal Tramways Company, all the subsidiary companies previously partially controlled by the Montreal Street Railway, together with the latter mentioned company, are all under one control. It is thus hoped that this amalgamation will materially assist to speedily complete negotiations, now under way, for a new franchise.

In Toronto there has been considerable activity with rail laying, but most of this has been confined to the civic car lines. The Toronto Railway Company completed improved car housing facilities and increased the rolling stock by the addition of one hundred double truck cars. Track and overhead construction on various streets, which was completed last year, has given improved traffic handling facilities by allowing the company to change the route of several lines.

As a result of the Dominion census of 1911 the municipality of London, Ont., is entitled to 1.73 miles of additional track. Various routes and localities have been considered for this but no definite agreement has been concluded with the city as yet.

Among the seven companies mentioned above probably none have been so active as the Winnipeg Street Railway Company. 10.84 miles of track with concrete foundation have been laid, thirty large double truck cars have been purchased, 1,134 new poles were erected, and 216,424 pounds of wire with 189 transformers were put up. A new auxiliary steam plant of 12,000 horse-power was constructed during the past year. The company now has auxiliary power to the extent of 20,000 horse-power available in event of a serious break-down at the hydraulic plant.

ELECTRIC RAILWAYS OF CANADA.

Table Showing Comparison Between Different Companies for Year 1911.

City.	Total earnings.	Operating expenses.	Percentage of operating expense to income.	Population of city.	Passengers carried.	Car mileage.	Gross earnings per car mile.	Operating expense per car mile.	Number of miles of track.
Halifax	$ 502,399	$ 256,874	51.97 %	40,081	5,212,257	918,121	54.6¢	28.08¢	14.62

CRITICISM OF MUNICIPAL ENGINEERS.

The criticism of municipal engineers and other officials appears to be as prevalent in England as it is in Canada. Mr. J. A. H. Green, the retiring town clerk of Nottingham, in a recent address condemned the abuse of city officials. Among other things he said: "Those whom we come into contact with in our daily work, and who know what we do for the most part, treat us generously and well. They appreciate the services that are rendered by officials, and they know that officials as a body do their utmost to serve the city to the best of their ability. But it is an intolerable thing that officials as a class should be liable to be branded by those who know nothing, and care nothing, simply for the sake of creating confusion and unrest. I want to protest here as strongly as I possible can against the reckless and indiscriminate abuse of officials as officials."

The above words apply with equal force to the criticisms, which are now so general, of town and city engineers. Municipal councils seem to have no regard for their faithful employees other than to stir up trouble for them. The life of the municipal engineer at best is a hard one. Their work is seldom appreciated, yet the management and construction and design of all the city's affairs are in their hands. An engineer who is employed by a private corporation has a comparatively easy task, for the people he must satisfy are few in number and quite amenable to reason. On the other hand, it seems to be a universal practice for certain members of town and city councils by their constant nagging and lack of fairness to make the life of their engineers a hard thing. We agree with Mr. Green when he says that no word can be said too strong in condemnation of these attacks.

WATER POWER.

Too little attention is paid by the Provincial and Dominion Governments to the conserving of our water power resources. It is true that the Dominion Conservation Commission have made an initial move towards a consideration of the problem, and the recent report compiled by Messrs. A. V. White and L. G. Dennis, and issued by the Commission, on the water powers of Canada, is a very valuable collection of data. This feature of the problem is very necessary, for it is impossible to do much on the conservation question until the requisite data and information are to hand. There is one feature of the conservation question, however, which is lost sight of, and that is the absolute necessity of securing the highest possible economy of water in all water power developments. Our water powers in the future will be too valuable to allow of their waste at the present time. To illustrate a little more clearly what we mean, the total head at Niagara Falls is 212 feet. One of the companies operating there uses of this available head only 136 feet. The turbines in operation have an efficiency of less than 75 per cent., or a combined efficiency of generator and turbine of about 70 per cent. Add to this the fact that very high velocities in the tail-race tunnel are used, or will be used, when the plant is under full development, with an additional preventable loss, and it can be easily seen that a very considerable percentage of the total available power is thrown away. From the standpoint of the company, this is perfectly legitimate and proper, for the whole expenditure on the plant is designed to secure the highest possible rate of interest on the investment. From the standpoint of the

Government or the public, this power is lost in that it cannot be used in any way, and later on this will work serious harm to the consumer.

This same condition is occurring on many, if not nearly all, the hydraulic developments being installed at the present time, and for the reason outlined above. The engineers and the men who are financing these developments are looking to receive the maximum of return from the minimum of expenditure, and for that reason they simply skim off the cream of the development. For instance, let us take a typical example: there may be a fall of fifty feet occurring at a certain spot in a river with an additional ten feet of fall in the 4,000 foot stretch below the main fall. The company takes the fifty foot fall and throws away the other ten feet.

In our opinion the plans of all hydraulic power companies should undergo strict examination by a competent commission of engineers and the company should be forced to use the total available head on the initial development or provide means for afterwards securing the total head. The most efficient forms of hydraulic turbines and generators should be used, and every means taken to secure the maximum possible power from each development. The above extreme measures may not be necessary in the early development of the individual company, but the government should satisfy itself that when the time comes for more efficient development it can be secured without trouble and with no radical change in the original plans.

EDITORIAL COMMENT.

It is evidently time for a revision of the Mining Act of Ontario. At the annual meeting of the Ontario Land Surveyors, held in Toronto February 27th to 29th, the members expressed great dissatisfaction with the way the Act works out with regard to land surveyors, and passed a resolution asking for a clearer interpretation.

* * * *

One of the best services the branches of the Canadian Society of Civil Engineers can do for their respective members is to extend and develop their libraries. The work of the executive committees will be well repaid by attention to this matter in the increased interest of the local members and the increased capacity for service.

* * * *

The growth and perfection of the gas engine is exemplified in its application to the road roller. The gasoline road roller should certainly fill a place in road building throughout Canada. They are economical, easy to operate, require very little water, and the fuel is easy to handle. In the Western provinces, particularly where coal is high, there will undoubtedly be a demand for them. The steam road roller is the product of many years of use and experiment, and as a piece of well-balanced, thoroughly compacted and designed machinery, little improvement can be made on it; necessity and invention have brought it to the highest stage of economy. The gas engine roller is comparatively new, and until it has been subject to some years of use troubles and weaknesses may develop. The field for both steam and gasoline rollers is great, and there is room for both. The local conditions will decide which is the more economical for the individual case.

* * * *

At the recent Ontario Good Roads Convention in Toronto, the Hon. Dr. Reaume, Ontario Minister of Public Works, stated that the Provincial Government had in mind a course of instruction for road supervisors to be given at the Ontario Agricultural College; also that the Provincial Engineer of Highways might deliver a course of lectures at the same place. A short time ago we suggested in the columns of *The Canadian Engineer* the advisability and necessity of immediate instruction for highway engineers, and that this instruction should be given in the engineering faculties of the universities throughout the country. We do not believe that instruction in the making of good roads comes properly in the sphere of the agricultural department. The whole question of road materials and road-making is an engineering question, and we sincerely hope that the Provincial Government will realize this fact and place this work in the Engineering Department of the University.

* * * *

The tie question is becoming a very important one on the railroads throughout the country. With the decrease in available timber ties comes the demand for a substitute for wood. In a recent report the Committee on Ties for the American Railway Engineering Association submitted the following conclusions, which show that, as yet, a perfect substitute for the wood tie has not appeared. The committee states that the concrete tie, a combination of concrete and metal tie, or a combination of asphalt and metal tie, has not yet proved a success because of fracture caused by vibration, excessive weight, and consequent difficulty in handling, and the deterioration of the asphalt filling. A combination tie of steel and wood gives promise of developing an economic substitute. They add that the all-steel tie has proved a satisfactory substitute for the wood ties under heavy medium street traffic. It is durable, line and surface can be maintained, has sufficient resiliency, and can be insulated. The fastening so far in use can, and no doubt will, be improved.

THE PRINCIPLES OF SPECIFICATION AND AGREEMENT WRITING.

By C. R. Young, A.M. Can. Soc. C.E.

(Registered in accordance with the Copyright Act.)

Fourth Article.

SPECIFIC CLAUSES—Continued.

(6) **Classification and Estimating Rules.**—The establishment of definite rules of classification is one of the most difficult tasks of the specification writer. Such rules have their most frequent application to excavation, and when one considers that the materials to be moved may consist of highly variable proportions of everything from quicksand to solid rock, the difficulty of fixing a small number of classes which will secure, at prices named in the tender, fair and just compensation to the Contractor is readily apparent. The usual practice in grading specifications is to divide the excavation into four classes: (a) Solid Rock, (b) Loose Rock, (c) Hard Pan, and (d) Common Excavation. The tests for these classes are based upon the size of the pieces, and the economically-practicable methods of removal, such as blasting, plowing, picking, etc. Because of the indefiniteness of these latter rules and the consequent necessity of relying largely on judgment to determine the class of material, disputes over matters of classification are of the greatest frequency. So common are they that some railways purposely divide all excavation into three, or even two classes, eliminating partly or entirely the necessity of

resorting to the indefinite plowing test for loose rock and hard pan. But this introduces another difficulty. If no recognition is made of hard pan and the relative quantities of common excavation and hard pan are unknown to the Contractor, his bid is likely to be high in order to cover the possibility of having to remove a large amount of hard material at the price for ordinary earth. The remedy would seem, therefore, not in reducing the number of classes, but in making the tests for these classes much more definite than they now are. For example, it has been suggested that the plowing test be modified by requiring a continuous furrow of a certain specified depth to be cut with the four or six horses, whichever it may be, moving at a specified speed and with a certain maximum weight on the plow.

In addition to the variables of hardness and formation, it is necessary to distinguish carefully between dry and wet excavation. It is customary to class all material below the ground water level as wet, but if instead of this level, the level of the water in an adjacent stream or lake is to be followed, it should be stated in the specifications.

The rules of measurement to be followed in making up final estimates should be carefully indicated in the specification. If this were done there need be no disputes between the Contractor and the engineer concerning the method of computing quantities. Whether the length of piles as delivered, or from point to one foot above water level, or the length as left in the work is to be paid for, should be established in the specification. The payment for sections of sewers constructed at so much per foot will depend upon whether the length considered is from centre to centre of manholes or face to face of manhole walls. If the concrete floor on a bridge is to be paid for at so much per square foot or yard, the inclusion or exclusion of the wheel-guard is of importance. Volumes of excavation, concrete or masonry do not total up the same by using the prismoidal formula and by averaging end areas. The manner of computing overhaul, whether it be by diagram or by the centre of gravity method, should be plainly stated. Indefinite units, like the miners' inch, should be avoided, and the cord is not 128 cubic feet in all parts of the continent. Where the work is likely to affect parties in both Canada and the United States, units of measurement applying to the contract in question and which differ in the two countries—the gallon, for example—should be carefully defined. If the weight of cement is to be determined from its volume, the fact whether it is to be loose or packed should be indicated, since in its loose state a given volume of cement weighs only about two-thirds as much as when thoroughly packed.

(7) **Quality of Materials.**—In specifying the particular kinds of materials to be employed, the class names, designations or terms should convey exactly the same meanings to all bidders, or, failing that, they should be carefully defined in the specification. The various masonry classifications, as first class, second class and third class, are variable with the locality and the persons having to do with them. Even such terms as quarry-faced, random rubble or bush-hammered, range ashlar are elastic in their significance, and a fuller specification than a mere name is necessary.

One of the most common faults in specification writing is indefiniteness in describing the grade of materials required. Lacking a knowledge of the particular properties of the materials to be used, many engineers attempt to dispose of the matter by the broad provision that the materials shall be "the best." So long as the engineer and his inspectors are reasonable in their interpretation of what constitutes "the best," there is no objection to the requirement, but when inexperienced inspectors attempt to put a rigidly literal construction on the term "best," it may mean disaster to the Contractor. If one were to require engineering works to contain only timber abolutely free from knots or checks, or steel entirely free from rust, or sewer pipe perfectly circular and free from cracks, blisters and lumps, the cost would be altogether beyond the pockets of the people and wholly out of proportion to the service required. Such a practice is impracticable, because only a small percentage of the output of our mills and factories would come up to this standard, and perhaps in the case of certain mills such material could not be produced at all. If the engineer or his inspector insists upon absolute perfection in the materials enmployed, he either forces a tremendous hardship on the Contractor (or the supply-man who is under agreement with the Contractor to furnish the materials to the satisfaction of the engineer), or he sustains a loss of personal prestige through having to abandon his ruling and accept what can reasonably be supplied. The word "best" should be replaced by a definite description of the properties of the materials required, and if it is retained at all it should be modified by requiring, as expressed by Mr. Wm. B. Bamford, "the usual best to be had in the market supplying the vicinity."

The rules by which the quality of a given material is to be judged should be both positive and negative; that is, they should set forth, on one hand, the minimum desirable quantities, and, on the other, those defects which would be sufficient cause for rejection. Among the former would be the strength, as of cement and steel; resistance to abrasion, as in paving brick; the chemical composition, as of steels; the physical composition, as of cement or asphalt; the weight, as of cement; the size of particles or constituent parts, as of sand, gravel, stones in a masonry wall, or pieces of leather in belts. The latter, or negative characteristics, concern chiefly the imperfections of manufacture, or those natural to the commodity. An excellent example of definite fixing of the maximum defects permissible in material is furnished in the following extracts from a specification for sewer pipe prepared by Mr. Emil Kuichling, and quoted by Professor Johnson in his Engineering Contracts and Specifications:—

> "A single fire-crack which extends through the **entire thickness** of a pipe or special, must not be over two inches long at the spigot end, nor more than one inch long at the hub or socket end, measured in the latter case from the bottom, or shoulder, of said hub or socket. Two or more of such fire-cracks, however, at either end of said pipe or special will cause the same to be rejected.
>
> . . . . . .
>
> "A transverse fire-crack in a pipe or special must not be longer than one-sixth of the circumference of such pipe, nor shall its its depth be greater than one-third of the thickness thereof. Two or more such fire-cracks will be cause for rejection.
>
> . . . . . .
>
> "Irregular lumps or unbroken blisters on the interior surface of a pipe or special of sufficient size and number to form an appreciable obstruction to the free flow of sewage will be cause for rejection. A few small, unbroken blisters, not exceeding one-fouth of an inch in

height and one or two inches in diameter, upon the inner surface, need not reject a pipe or special."

(8) **Quality of Workmanship.**—What has already been said respecting the necessity for definite standards for the judgment of the quality of materials will apply quite as well to the quality of workmanship. It is not possible to wholly avoid the stipulation that workmanship shall be "to the satisfaction of the engineer," but much might be done to render the acceptability of the work and its conformity with the spirit of the specifications more readily apparent to an outside engineer than is now the case. There must, of course, be reason in whatever rules are adopted, and, above all, reason in their interpretation.

Definiteness of requirements might be introduced with respect to workmanship by specifying under the head of straightness, for example, the maximum deviation of a nominally straight member from the truly straight, and under other headings might be set forth the maximum permissible deviation of a sheared, sawn or faced surface from the theoretically correct one, the permissible eccentricity of rivet heads, and the like. For such matters as uniformity of covering or color, as in painting or surface finish of concrete, it would be difficult to make a rule, unless, perhaps, photographs of the finish required were attached to the specification.

As in specifying materials, it is unwise to be unusually exacting in the matter of workmanship. Such requirements, for example, as that the edges of shoe or bed plates shall be planed are absurd, and high bids and discredit for the engineer are the outcome. It is practically impossible to get workmen to greatly change their methods, and, unless the work is unusual and calls for special attention and care, it is advisable to specify the **"customary best"** class of workmanship attainable in that particular kind of construction. If anything better than this is sought, the engineer will probably find that any specification is unworkable, and that he will have to give it his own personal attention throughout.

(9) **Methods of Construction.**—In general, the less said about the methods of construction, the better. The engineer should concern himself about the result rather than the means. Of course, if the work is special and there is only one way known to be practicable, the methods to be followed may be described, but usually it is best to leave the Contractor free to devise ways and means of his own. If he is experienced in the class of work in question, he may be able to suggest methods superior to those of the engineer, from the point of view of both cost and time of execution. It is also inadvisable for the engineer to fix the methods of construction, since if they prove unworkable or result in failure, the Contractor will generally be able to place the responsibility on the engineer, and finally on the Owner.

(10) **Inspection.**—Apart from the general provisions concerning inspection in the general part of specifications, references to this feature are properly made at various places in the specific clauses. In the description of each particular class of work, it is frequently necessary to provide that the continuance of the work beyond a certain stage shall be contingent upon the approval of the work up to that point. Thus, before any concrete or masonry is placed on foundation beds, they must be approved by the inspector, or preferably by the engineer himself; forms should be to the satisfaction of the inspector before any concrete is placed in them, and they should not be removed till he is convinced that such a step is perfectly safe; piles should be driven only in the presence of the inspector, who can then satisfy himself concerning length and penetration. Sometimes, also, it is specified that before any particular material is shipped to the work or to the Contractor's shops it shall be approved by the engineer's inspector. Steel is always inspected (if at all) in this way, and sometimes cement, sand and gravel are examined in the same way. Whatever provisions of this sort are thought advisable should be set forth in describing the particular material or class of work affected.

(11) **Condition of Finished Work.**—As a sort of blanket clause, it is desirable to specify that the finished work shall be, as a condition to final acceptance, in entire accordance with the plans and specifications. This accord should be made to cover not only correctness of detail, but the character of the completed work from the point of view of workmanship and finish,

(12) **Acceptance Tests.**—As a further condition of acceptance, the finished structure, machine or plant should be able to show a certain capacity, performance or endurance, bearing some important relation to the service for which it was designed. Bridges and buildings are frequently required to be tested by the application of loads equal to, or often considerably in excess of, the loads for which they were designed. Pumping engines must show under test a certain specified duty, while engines, motors and dynamos must give a prescribed output of power. Another kind of acceptance test quite different from these is the maximum leakage test, often specified for concrete tanks or standpipes.

(13) **Cleaning Up.**—To ensure sightly surroundings and freedom of the adjacent spaces or thoroughfares from obstruction, it is customary to require that the site of the work shall be properly cleaned up before acceptance. Surplus material, débris, falsework, staging, tools, appliances, and all marks of the Contractor's operations should be removed, leaving the surroundings at least as neat and presentable as they were before construction began.

The series of articles by Mr. C. R. Young on **"Principles of Specification and Agreement Writing"** will soon be complete, and may then be obtained in pamphlet form from *The Canadian Engineer*. Orders will be received at any time.

NATIONAL TRANSCONTINENTAL RAILWAY.

When the National Transcontinental Railway is finally completed and handed over to the Grand Trunk Pacific for operation the total capital expenditure, according to the estimates of the chief engineer of the National Transcontinental Railway Commission, will be $187,781,128. This includes interest charges of nearly nineteen millions. The total interest charges, taking into consideration every phase of the agreement, or, in other words, the net cost to the country to secure the building of the line from Moncton to Winnipeg, Mr. Cochrane in the House at Ottawa, estimated at sixty-five millions. The total capital cost per mile he estimated at $143,015, which means at three per cent. interest an annual fixed charge of about $4,300 per mile. The gross expenditure to complete the road and to provide for all the country's liabilities in connection therewith until, under the terms of the contract with the Grand Trunk Pacific Company, the rental of three per cent. per annum on cost of construction will have to be paid, beginning nine years hence, is estimated at $258,050,000.

THE OCOEE RIVER POWER DEVELOPMENT.

By J. A. Switzer.

The year 1912 will be notable in the annals of Tennessee, because it marks the beginning of a new era—the era of water-power development. The month of January will witness the opening of the first two hydro-electric plants within the State—will see the first long-distance power transmission by means of high-potential electricity within our borders.

These two events, the inauguration of the Watauga Power Company's plant in Carter County, and of the Eastern Tennessee Power Company's in Polk are of greater significance than we are likely to realize. The production of power cheaply—what will it mean to Tennessee? The answer depends upon the distance we attempt to penetrate into the future. For the immediate future, it means the inevitable, and the prompt expansion of our manufacturing interests; since the certainty of obtaining power at a low cost will assuredly attract manufacturing enterprise.

The Watauga Power Company carries off the honor of being the first water-power company in the State to begin operation. But this is relatively a small development, while that of the Eastern Tennessee Power Company on the Ocoee River, but a few days later, in going into service, is entitled to take rank with the great water-power projects of the country.

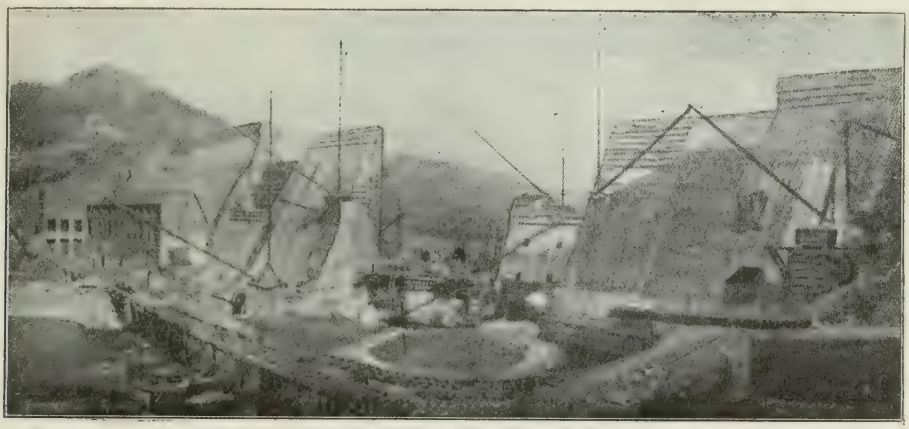

Fig. 1.—Dam at Parksville as it Appeared November 25, 1911.

In many respects the plant at Parksville is replete with engineering interest.

The first impression which the visitor receives is that of the dam as a monument to engineering skill and efficiency. It has been built in a remarkably short time, for the first yard of concrete was not laid until February, 1911. The dam is 110 feet high and approximately 800 feet long, and it required for its construction 155,000 cubic yards of concrete. The work of establishing the construction camp (a small town in itself) was begun in August, 1910, and the first cofferdam was built in October of that year.

By October, 1911, not only had the power house been completed, but all of the machinery had been installed.

The progress of the dam on November 25, 1911, is shown in Figure 1. In this photograph may be seen, near the middle of the dam, two temporary sluiceways. On about December 15 these sluiceways were permanently closed, by filling them with concrete; and the storage of water in the newly created lake began. From that date forward it was a race between the completion of the concrete work and the water. The heavy rains that occurred from December 20 to December 27 caused a great flood of water, and in spite of the relief afforded by the opening of the two permanent sluiceways, the depth of the pool rapidly increased. On December 23 the water stood 20 feet deep behind the dam, and it was gaining depth at the rate of 10 feet a day. However, so excellent was the management that the work proceeded far enough in advance of the water as not to jeopardize the strength of the dam. At the present writing it is expected that the water will reach the crest of the dam at some time between January 10 and 15; and at that time the headgates will be lifted, and the work of generating electrical power will begin.

The pool to be created will extend from the dam upstream a distance of eight miles, will cover an area of approximately 2,200 acres—nearly 3½ square miles—and will contain 100,000 acre-feet of stored water. Of this stored water, only the top layer, so to speak, can be drawn upon for the production of power during the seasons of minimum stream flow. This layer extends from elevation 805 feet (above sea level) to elevation 825 feet (the elevation of the crest of the dam), and is hence 20 feet thick. It will contain about 31,000 acre-feet. Since the low tail-water elevation is 713 feet, the mean head which this storage water will have is about 103 feet; and the amount of power it would generate, if spread over a period of one month, and allowed to discharge for 12 hours a day, would be 9,700 electrical h.p. But the minimum stream flow of the river is about 350 cubic feet per second, and this water, discharging through the turbines for 24 hours per day would generate about 3,500 electrical horse-power. Assuming, therefore, that extremely low water persists for one month of the twelve, the plant would generate 3,500 h.p. during the night and 13,200 h.p. during the day. However, the year will doubtless prove to be exceptional, during which the stream flow will sink to so low a value as 350 second-feet, or even if it did, to remain so low for a period of 30 days. In order, however, to meet such a contingency the company is provided with auxiliary steam power to the extent of 9,000 h.p. Thus the minimum available h.p. will be about 20,000, and ordinary there will be not less than 30,000 h.p. to be developed at the dam site.

Figure 2 exhibits the details of construction of the dam and power house. Above is shown the plan of the dam, and below are sections, one through the power house, the other through the spillway of the dam.

One is struck at once with the curious plan of the dam. Originally the plan was to build the dam straight across the river. But in preparing the foundation of the dam it was learned that a fault-plane existed in the bed rock close to the south shore line of the river. Unless provision were made to meet this condition, the fault would serve to weaken the dam. The original plan was, therefore, modified, and a horizontal arch constructed to carry the thrust of the water

against the dam away from the region of the fault to the rock farther to the south, where secure anchorage was to be had.

Returning to a consideration of figure 2 the section on the line A'A' shows the location of the penstocks, wholly within the dam itself, with the trash-rack guarding its entrance, and the headgate to be operated from the top of the dam, the twin horizontal turbines, each discharging inward through a quarter bend into the draft-tube by which the water reaches the tail-race—the direct-connected generator. Within the dam, behind the turbines, a gallery or passage way is provided. This gives access to the rear bearings of the turbines, and also leads to the valves controlling the two permanent sluiceways which penetrate the dam within the spillway area. The details of these sluiceways are shown in the section on line B'B'. The plan drawing shows the

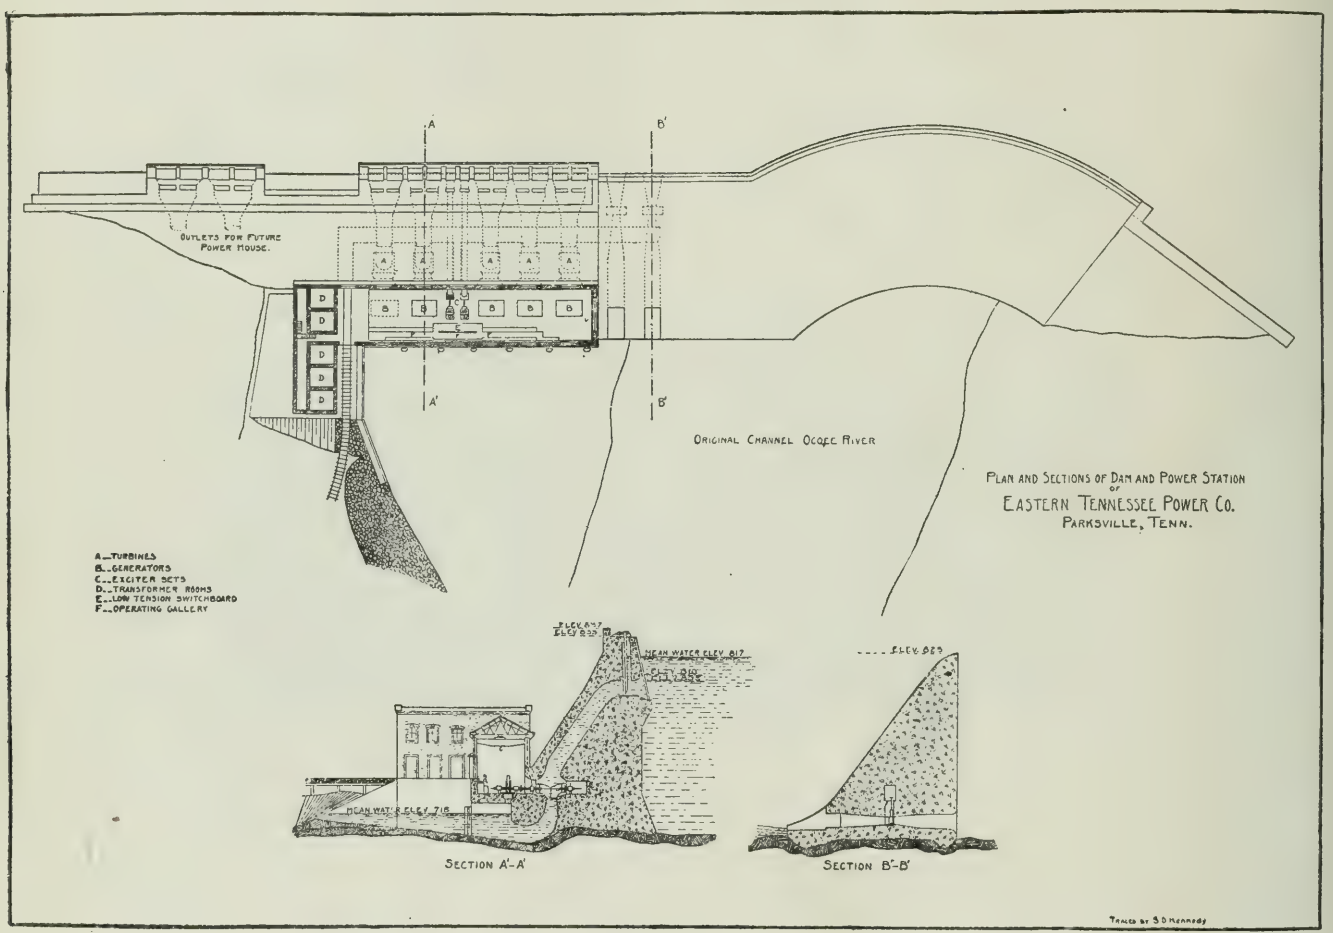

Fig. 2.

location of the four units now installed, and the place provided for a fifth unit for future extension. The turbines are 39 inches in diameter, of the "American" type (that is, inward- and downward-flow turbines). Each pair will discharge about 640 cubic feet per second under a head of 110 feet, and will be capable of developing, under these conditions, approximately 6,000 h.p. The turbines were made by the S. Morgan-Smith Co., of York, Pa.

The turbine governors made by the Lombard Governor Company, of Ashland, Mass., are of interest, because in common with modern turbines themselves, they are the outgrowth of a long process of experimentations and development. Hydro-electric development had for years to wait upon the perfecting of a turbine governor. For the successful utilization of electrical energy, perfect voltage control is essential; and for perfect voltage control, perfect speed control. It would scarcely be in place within the limits of this paper to enter into any lengthy discussion of this subject; but it is of interest to call attention to the office and the importance of the turbine governors.

The turbines at Parksville are known as wicket-gate turbines. This means that the guide vanes which properly direct the water as it enters the buckets of the turbines are a series of steel slats, as it were, arranged around the periphery of the turbine runner. The position of the wickets is controlled by the operating ring; and the operating ring is controlled by the governor. Motion of the operating ring is produced by a piston in a cylinder to which oil under heavy pressure may be admitted. Admission of oil to one end of the cylinder produces motion in one direction, and to the other end in the other direction. Oil is admitted to the cylinder through valves not unlike the valves of a steam engine; and the opening and closing of these valves is in turn controlled by the very slight motion of the stem of the fly-balls of the governor. The fly-balls are turned by a belt from the turbine shaft, and are held by centrifugal force at a predetermined distance from the stem. Any change in speed changes this distance, and in so doing sets in motion the train of operation necessary to open or to close the wicket gates as may be needed to admit more water or less water to the turbine to restore the speed to the normal.

But from this brief description it will be seen that some speed change of the turbine must occur before the governor can act to rectify the speed. This is equally true of steam engines; and it was onsidered a great triumph for water-power development when governors were perfected to the degree of giving as close speed regulation of water wheels as could be had of steam engines.

Even closer voltage regulation is needed, however, than can be attained by the most ideal speed regulation. And this is accomplished at the Parksville plant (as it now is at practically all power sations, whether steam,- water- or gas-driven) by the use of Tirill regulators.

The company can not anticipate who will be its customers, nor where the greatest manufacturing expansion will take place. They are prepared to sell power at Knoxville on the north, and Chattanooga and Rome on the south, and at the intervening cities as well. The power will run the street cars at Chattanooga, and light the city. Power is being contracted for at prices ranging from $20.00 to $30.00 per h.p. per year, depending upon the nature of the service expected. And manufacturers whose requirements would permit of their taking only "off-peak power" could probably buy the power for even less money. The superintendent of the company is Mr. J. A. Cunningham, to whom the writer is indebted for the accompanying photographs.

The plan and sections of the dam and power house are published by courtesy of J. G. White & Co., the well-known firm of engineering contractors. Both the engineering and the construction work have been done by this firm, the former under direction of Mr. R. H. Anderson, resident engineer; and the latter under the direction of Mr. J. G. Munson, construction superintendent.

ALBERTA'S RAILWAY POLICY.

CANADIAN NORTHERN.

(At $20,000 a Mile.)

Onoway Branch to Peace River, 250 Miles	$ 5,000,000

(At $15,000 a Mile.)

Athabaska Landing to Fort McMurray, 175 Miles	2,625,000
Athabaska Landing to Lesser Slave Lake, 100 Miles	1,500,000
Lac La Biche Branch, 40 Miles	600,000
St. Paul de Metis Branch, 100 Miles	1,500,000

(At $13,000 a Mile.)

Bruderheim to Eastern Boundary, 200 miles	$ 2,600,000
Extension Goose Lake Line, 130 Miles	1,690,000
Extension of Camrose Line, 80 Miles	1,040,000
Line West of C. & E., 100 Miles	1,300,000
Brazeau Line to Goose Lake Line, 130 Miles	1,690,000
Total to Canadian Northern Railway, 1,405 Miles	$19,545,000

Of this 150 miles at $15,000 is a revote.
The total new grant is for $1,255 with a guarantee of $17,595,000.

GRAND TRUNK.

(At $20,000 a Mile.)

Bickerdike to Pembina River, 58 Miles	$ 1,060,000
	$ 1,060,000

EDMONTON, DUNVEGAN & BRITISH COLUMBIA.

(At $20,000 a Mile.)

Edmonton to Dunvegan, 350 Miles	$ 7,000,000
	$ 7,000,000
Total, 1,813 Miles	$27,605,000
Less 150 Miles Revote at $15,000 a Mile	1,950,000
	$25,755,000

The above shows at a glance the bond guarantees which the Alberta Provincial Government will give to various railroads to build in that province.

Its railway policy is the most comprehensive that has yet been brought forward. Every part of the province will be given new railways, as a result of bond guarantees. Not alone is the undeveloped north provided for, but the more thickly settled sections of the south will soon secure transportation facilities, for which they have in some cases waited for many years.

The policy involves the guarantee of 1,813 miles of four railway lines involving total cash sum of $25,755,000, and the province holds ample securities in lines to be built as well as tolls, revenues, etc. Should the contingency ever occur that the province would be compelled to take over these lines, they are all through country that will be revenue producing for railways.

The railway lines to be covered by the guarantees of the Alberta Government are as follows:—

The Peace River line from Onoway towards the Peace River, 250 miles at $20,000 per mile.

The road from Athabaska Landing to Peace River, 100 miles of that road at $15,000 per mile.

The road from Athabaska Landing to Fort McMurray, 175 miles, and from that line to Lac La Biche, 40 miles, each at $15,000 per mile.

The road north of the Saskatchewan River running towards St. Paul de Metis, 100 miles, at $15,000 per mile.

The road running south of the Saskatchewan River through Bruderheim to the eastern boundary of the province, 200 miles, at $13,000 per mile.

The road running to the west of Calgary and Edmonton line to the west of Pigeon Lake, 100 miles, at $15,000 per mile.

The extension of the Brazeau line south-easterly to the extension of the Goose Lake line of the Canadian Northern, 130 miles, at $13,000.

The extension of the line from Camrose, 80 miles, at $13,000.

The line from Calgary east of Calgary and Edmonton line, 100 miles, at $13,000.

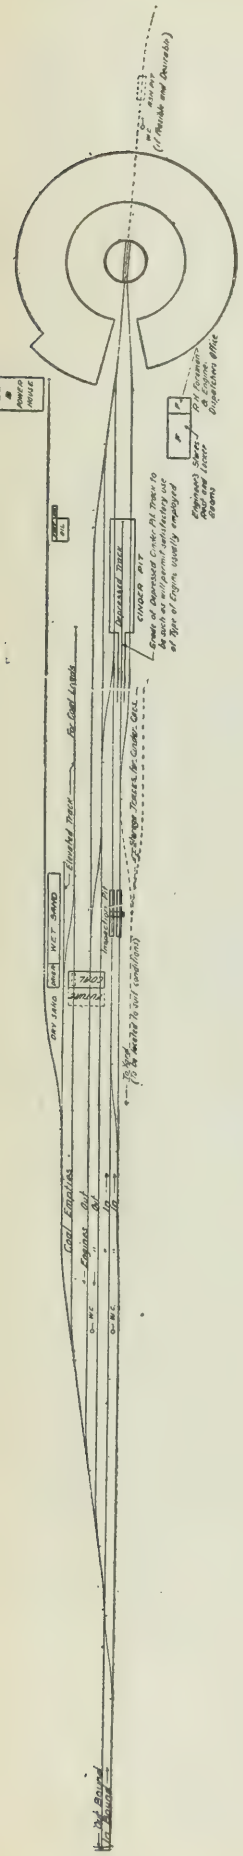
And under the Canadian Northern charter, the extension of the Goose Lake branch of that railway from the eastern boundary of the province to the junction of the Calgary-Vegreville line at the crossing of the Red Deer River, 130 miles, at $13,000.

The total mileage is 1,405 miles of which 150 are revotes covered by former guarantee under federal charters, so that the new lines amount to 1,225 miles.

THE TEMPERATURE OF THE SUN.

In a paper presented to the Berlin Academy of Sciences last year F. Kurlbaum describes a determination of the temperature of the sun, based on observations which he had made in Egypt, near Assuan, in February and March of that year. The brilliancy of the sun's light was compared with the brilliancy of a black body for the wave-lengths 0.651, 0.588, 0.521, and 0.486 μ with the aid of a spectropyrometer consisting of a Holborn-Kurlbaum pyrometer and a spectrum apparatus similar to that which Henning used in 1910. The rays were reflected into the photometer by a plate of magnesia which had a reflecting power of 0.870. The resulting sun temperature would be 5730 deg. Cent. absolute on the Holborn-Day scale, or 6390 deg. Cent. absolute on the Holborn-Valentiner scale.

TYPICAL SITUATION PLANS FOR DIVISION ENGINE TERMINAL.



In the last report of the Committee on Yards and Terminals, for the American Railway Engineering Association is a section on typical situation plans for division engine terminal. The following is abstracted from the report:

In treating this subject, the committee understands its work to be the making of recommendations as to the best arrangement of facilities for the handling of locomotives at terminals rather than as to specifications for exact designs of the various structures involved, excepting as in a general way the characteristics of such structures seem to be more or less suited to the arrangement recommended.

It is also understood that the scope of the committee's work does not include the consideration of shop or repair yard locations.

We submit herewith a typical plan or layout for an engine terminal whose characteristics permit of application equally well to larger or smaller demands practically without limit and without respect to whether the locomotives cared for are all freight or passenger, or in both kinds of service.

We have examined a number of plans of recently constructed engine terminals, and think we have adopted in our plan the best ideas of all, and that we have avoided the manifest errors of some at least of these plans. It must, of course, be recognized that in any case of actual construction, physical limitations as to space and shape of the ground site will impose more or less modification of the plan we recommend, but we think it will come more generally within the possibility of any given set of conditions than any other typical plan that could be suggested.

In locating an engine terminal, the facilities should be placed with reference to the yards and main line in the most advantageous position possible, that is, so that the distance between the engine terminal and the points where engines begin and end their service shall be a minimum, and so that reverse or conflicting movements shall be avoided as much as practicable.

The idea to be kept in mind is the most direct and most convenient, that is, rapid and economical performance of those things required for an engine in its terminal in that sequence which answers all requirements in the order of their accuracy. It appears to us that on the arrival of a locomotive at its terminal, the first imperative demand is likely to be for water, and that this demand is likely to be the last when leaving the terminal for service, and for this reason our typical plan provides for the location of watering facilities accordingly.

After an incoming engine has been protected by receiving water, the next step appears logically to clean its fires or remove it entirely, according to need, and place the engine as quickly as possible in the engine house where the repairs necessary to prepare it for new service may be made, engine cleaned, etc. The cinder pit should be located as close as practicable to the engine house and permit at the same time of engines moving off cinder pit in normal direction, being switched direct to an outbound track without using or fouling turntable, as may often be desired.

It appears logical that the process of coaling should be reserved, if practicable, until just before the engine re-enters service in order that it may do so with a maximum supply of fuel, and also because the cleaning or removal of fire on cinder pit, as well as repairs of engine tank or other repairs, can be accomplished without that interference that might result from having tender filled with coal, and this reasoning dictates that the location of the coaling station should be primarily to serve the outbound tracks. Inasmuch, however, as it may often occur that incoming engines will require coal, the coaling station should be located as indicated on our typical plan, so that coal may also be taken by an engine on an inbound track.

The trestle type of coal dock may be used if desired, if only two coaling tracks are required, and can be located between the inbound and outbound tracks in same relative position as shown in typical plan.

The most convenient and economical arrangement for storing and drying sand is at the coal station, where it may be handled by the same attendants. Sand should ordinarily be delivered to engines passing on the inbound tracks.

It will be observed that the arrangement of facilities permits of large increase in capacity of cinder pit, coaling station, etc., and in this connection the idea of having the coaling station at a busy terminal comprising two independent units making a strong appeal for approval in view of the possibility of one of the hoisting plants suffering temporary disability from breakdown, or other cause.

The location of storehouse, oil house, enginemen's tool and locker rooms need not be arbitrarily prescribed, but should be as close as practicable to the engine house and the cinder pit. However, where any of these buildings are served by their own tracks, those tracks should be so located and connected as not to interfere with the uninterrupted free use of the engine tracks.

A system of ample lighting facilities is important, with lights distributed so as to avoid, as far as practicable, darkness or shadow where men are engaged in work upon engines.

Conclusions.—(1) The engine terminal should be so located as to afford easy access to both main line and yards, with the fewest possible reverse or conflicting movements.

(2) The facilities provided should be arranged to permit of the most direct and rapid handling of an engine in its terminal in the order of its needs.

TREATING SEASONED vs. UNSEASONED TIES.*

By F. J. Angier.

Naturally, the first question which would arise in a subject of this kind is, What is a seasoned tie? When we speak of an unseasoned tie, we mean one freshly cut, or, at least, one that has been recently cut and has lost but a very small amount of the moisture which it originally contained; in other words, the sapwood is so completely filled with moisture that it would be impossible to thoroughly treat the tie until this moisture had been at least partially removed. A seasoned tie, therefore, is one that has been cut for some time and the moisture allowed to evaporate to a greater or less degree.

The time necessary to season a tie so that it can be properly treated varies in different localities, as well as in different seasons. The kind of wood also is of considerable importance. Oak ties, in Illinois, must be air-seasoned six months or more, according to the time of year, before they can be properly treated. Some kinds of ties may be seasoned in three or four months.

For the purpose of illustration, and as a basis for argument, we will assume that it requires six hours to treat a charge of thoroughly seasoned ties and nine hours to treat a charge of unseasoned ties. In other words, it requires one-half longer time to treat unseasoned ties. Of course, the time may vary one way or the other, but we found this to be a fair average. (It should be stated here that the treatment referred to is with a mixture of creosote and zinc-chloride.)

Assuming this to be correct, your attention is respectfully called to the two tables following, one showing the cost of treating in a plant having a maximum capacity of 1,800,000 seasoned ties a year, and the other the cost of treating in the same plant, where the maximum capacity is reduced to 1,200,000 unseasoned ties a year.

Seasoned Ties.

Capacity of Plant 1,800,000 Per Year.

Unloading from cars to ground to season at $0.0070 each	$ 12,600.00
Loading from ground to trams at $0.0055 each	9,900.00
Switching trams at $0.0020 per tie	3,600.00
Loading treated ties out at $0.0065 each	11,700.00
Fixed expenses	23,268.00
Preservatives at 15c. per tie	270,000.00
Fuel (assume ⅓ less for seasoned over unseasoned ties)	5,600.00
Insurance carried on 1,000,000 ties (estimated)	4,000.00
Interest on 1,000,000 ties for six months, or 5% on $250,000.00	12,500.00
	$353,168.00
600,000 more seasoned ties treated than unseasoned, worth $0.044 each (See statement)	26,400.00
	$326,768.00

$0.1815 per tie.

Unseasoned Ties.

Capacity of Plant 1,200,000 Per Year.

Unloading one-fourth from cars to ground to enable prompt releasing of cars, at $0.0070	$ 2,100.00
Loading 900,000 ties from cars to trams at platform and 300,000 ties from ground to trams at $0.0055	6,600.00
Switching 300,000 ties from yard to retorts at $0.0020	6,000.00
Loading treated ties out at $0.0065 each	7,800.00
Fixed expenses	23,268.00
Preservatives at 15c. per tie	180,000.00
Fuel	3,400.00
Insurance carried on 300,000 ties (estimated)	1,200.00
Interest on 300,000 ties, or 5% on $75,000.00	3,750.00
	$233,718.00

$0.1948 per tie.

In each case the total cost of handling is shown from the moment the ties are received at the plant until they are loaded into cars for shipment.

In the case of fixed expenses there are included the salaries of the superintendent, general foreman, office force, engineers, firemen, etc., that is, all labor which would not change one way or the other, whether treating seasoned or unseasoned ties. This amounts to $0.0129 per tie when treating 1,800,000 ties per year, and $0.0194 when treating 1,200,000 ties per year.

In the case of seasoned ties, where no steaming is done, it is assumed that insurance is carried on 1,000,000 ties for six months and that $250,000 will be continually invested at 5 per cent.

In the case of unseasoned ties, we must assume that at least 300,000 will always be in the yard. This stock is necessary to provide against delay to plant at certain times of the year, when traffic is so great that company material cannot be moved with regularity. Also, at certain times of the year, ties will be received faster than they can be treated, necessitating the storing of a portion of them.

It is shown in the table that a treated tie is worth $0.044 to the company. This is obtained as follows:

Untreated Ties.

First cost	$0.50	
Cost of putting in track	.15	
Cost of tie in track		$0.65
5 per cent. interest on investment for six years		.195
Second renewal, end of six years		.65
5 per cent. interest on first investment for six years, and on second investment for six years		.39
Total cost of tie for 12 years		$1.36
Average cost per tie per year		$0.157

Treated Ties.

First cost	$0.70	
Cost of putting in track	.15	
Cost of tie in track		$0.85
5 per cent. on investment for 12 years		.51
Total cost of tie for 12 years		$1.36
Average cost per tie per year		$0.113

Saving per tie per year $0.44.

Untreated ties are assumed to last six years, and treated ties twelve years.

Assuming this to be reasonable, and that 600,000 more ties per year can be treated when thoroughly seasoned, deduct from the cost of seasoned ties the difference between 1,800,000 ties and 1,200,000 ties, or 600,000 ties, at $0.044 each. We have a difference of $0.0133 per tie in favor of treating seasoned ties. This multiplied by 1,800,000, the number of seasoned ties treated per year, represents a saving of $23,940 in favor of seasoned ties.

*Paper presented at the recent convention of the Wood Preservers' Association in Chicago.

In addition there would be a better penetration of the preservatives; therefore a longer life obtained for the ties and the lessened possibility of injury to the wood by steaming. When steaming there is always a large amount of sewage to dispose of, while in non-steaming there is practically none. The disposition of sewage is a difficult problem at most plants, because no matter how it is handled some of it will get into the rivers or creeks and pollute the water to such an extent that damage suits may result. This is entirely avoided when using seasoned ties.

THE CHEMICAL PRINCIPLES INVOLVED IN SEWAGE DISPOSAL.*

By George C. Nasmith, Ph.D.†

It may now be accepted as a fact that chemical action is the basis of every method of sewage disposal. That this is true, the sanitary engineer has been slow to recognize, and he has struggled along for years, endeavoring by empirical experiment to improve existing methods of sewage disposal without having any sound basis for his experiment.

The chemist has come along subsequently, and very frequently has demonstrated the fallacy of his experiments, until it gradually came to be recognized that there were certain principles that must be adhered to in order to obtain fixed results. It was recognized that bacteria, and other forms of life were invariably necessary; that these worked under more or less definite, fixed conditions, and demanded certain treatment; that they could be harnessed to more efficiently perform their functions, and that finally they depended on a free supply of oxygen with which to carry on their work, to completely oxidize the organic matter and create a non-putrescible effluent.

It came to be recognized that one could obtain all sorts of hydrolytic decomposition in septic tanks, or under anærobic conditions, with productions of proteoses, peptones, amino acids, nitrites, hydrogen sulphide, methane and hydrogen; that these decomposition products were still for the most part putrescible, and sometimes more difficult to handle than the raw material from which they were derived, and that after all the complete end products of any method of decomposition depended on the fact that oxidization of carbon gave carbonic acid; of nitrogen gave nitric acid; of sulphur gave sulphuric acid, and of hydrogen, gave water. These are the final products obtained in any completely oxidized sewage. In other words, sewage disposal in the chemical sense might be stated: Organic matter+Oxygen=Inorganic matter+Humus.

The object of all methods of sewage disposal has been to knowingly or unknowingly take advantage of this oxidation process, through the intermediary of living organisms. The methods which have failed are those which have not supplied these micro-organisms with a sufficient supply of oxygen to carry out their functions. Those that have been successful have proved so because they have to a greater or less degree supplied this oxygen in an appropriate manner.

As the object of every method of sewage disposal is to create a non-putrescible effluent, and more recently a non-pathogenic effluent, the anærobic methods, such as that of the septic tank, have failed because of this one fact, that the end products of anærobic action are still putrescible, and must be further treated.

The real biological oxidation methods may be grouped together, since the action taking place in them all is practically the same. These are (1) Intermittent sand filtration, which really is an improvement on the older method of land filtration; (2) Contact beds—single, double, or triple, and (3) Trickling filters.

In all methods of sewage disposal it is deemed advisable as a preliminary to remove as much of the suspended material as possible, by means of the various forms of sedimentation tanks.

In the intermittent sand filtration method, a quantity of raw, screened, or sedimented sewage is distributed over the surface of the bed at regular intervals. This sinks in more or less rapidly, and in a matured bed a similar quantity of liquid, minus the organic constituents, flows off into the collecting tiles below.

In the contact method the sewage flows into beds made up of slag or other material, stands in contact with the filling material for a certain length of time, and is then allowed to flow away.

In the trickling filter the sewage is sprinkled evenly by some form of mechanical device, over the surface of the beds, which are also made up of some coarse material like slag, ling material for a certain length of time, and is then allowed posing the filter.

Now, if the material is sterilized in any of these methods, no action, or only a very slight one, takes place. If the sewage is treated with disinfectants, the same thing occurs; but if these various types of beds are given repeated doses of sewage, the organic matter is gradually converted into inorganic salts, and the filter becomes matured. At the same time it is found that the sand granules, or stone, slag, or other material, becomes coated with a gelatinous layer containing bacteria, organic material and iron. As the gelatinous film becomes thicker, the purifying action is improved.,

In such a matured, intermittent sand filter, Dunbar found that if a gallon of a solution of albumen was poured on to the top of the filter, a gallon of water, less the albumen flowed out at the bottom. That this was the same water he proved by adding readily detected chemicals, such as potassium, iodide or fluorescein to the original solution. When repeated at intervals he found that the sulphuric acid in the effluent corresponded almost exactly to the sulphur in the albumin, while only part of the nitrogen appeared as nitrate, the rest of the nitrogen disappearing as free nitrogen or remaining locked up in the humus, which was formed in small quantities. A considerable portion of the carbon also disappeared as carbonic acid, while the balance was retained in the humus.

The remarkable fact, therefore, became apparent, that a solution of albumen or sewage may leave an intermittent sand filter thoroughly purified in ten minutes. In other words, the organic material in the sewage became absorbed by the gelatinous material covering the granules in the filter. But we know from experience that micro-organisms cannot decompose such material in a few minutes.

By excluding air from the filter, it was found that such purification ceased to take place. By sterilization of the bed, or when disinfectants were added to the sewage, purification also ceased. The principle became fixed that bacteria in presence of air were essential for purification

It was then demonstrated that in a matured contact bed, if quantities of distilled water were added at intervals there would be considerable quantities of nitrates found in the effluent, and carbonic acid would continue to be given off and found in the air of the filter. The conclusion was therefore very obvious. The organic matter was first absorbed by the gelatinous film, and during the periods of rest while in contact with the air, this was decomposed with the

---

* Paper read before The Canadian Public Health Association, at Montreal, December, 1911.

† Director of Laboratories of the Health Department, Toronto.

aid of organisms, during which process oxygen was used up, and fresh oxygen drawn into the filter. This latter fact has been proved with the aid of capillary tubes inserted into the beds and connected with monometers. If a contact bed is filled with sewage, and air is blown in at the bottom, the free, unabsorbed oxygen is unable to carry out the necessary oxidizing action, and the sewage is not rendered non-putrescible. The oxygen thus absorbed during intervals of rest seems to be condensed on the surface of the gelatinous film, into some more active form, possibly as ozone, by the high pressure which we know to exist in such gelatinous films.

In the contact method, it was thought formerly that during the time of contact the bacteria were eating up the sewage.

In 1897, Dunbar, in Hamburg, demonstrated in a most convincing manner the fact that the process did not occur gradually during the contact period. He prepared several mature contact beds, and allowed sewage to remain in the first for five minutes; in the second for thirty minutes, and so on. In five minutes the oxygen consumed in the first bed was reduced by 83 per cent., showing, as in the sand filter, that the action took place quite suddenly, and that the time in which the sewage remained in the contact bed was practically wasted. The work, in fact, was done when the bed was exposed to the action of the air, which was exactly the reverse of the conception formerly entertained.

In the trickling filter, the principle of oxidation has been carried to its logical conclusion. In such beds, the sewage is continuously sprayed over the surface by one of the innumerable devices for the purpose. The bed itself is composed of some hard material, preferably of slag, which does not readily weather, and is so arranged that the filling material becomes smaller towards the top and larger towards the bottom, so that humus-like substances formed may be readily washed away.

A sand layer on the surface is advised, since it retains a considerable quantity of organic matter, which is gradually loosened and broken up by the organisms present. The drops of the sewage flow over the surface of the lumps of material, drop on to others, and so on until they reach the bottom. The organic matter as before is absorbed and decomposed by the combined action of micro-organisms, of which the gelatinous films are largely composed, and the oxygen which can penetrate to the interior of the bed at all times.

The effluent contains particles of humus-like material, which is non-putrescible, and being comparatively heavy, is readily sedimented out. The clear effluent is non-putrescible and contains much nitrates. Such beds are able to handle from 150 to 250 gallons of sewage per cubic yard of filling material per day.

Sewages which could not be treated satisfactorily in contact beds were handled satisfactorily by simply trenching the surface of the bed, placing a layer of sand along the bottom of the trench, and allowing the sewage to flow along these trenches, the raised parts allowing free access of oxygen. The contact beds were thus converted into trickling filters, and the results were eminently satisfactory.

The septic tank, which is wrong in principle, except in so far as it may prove useful as a liquefying agent, is already doomed as an integral essential to any method of sewage disposal.

The contact bed, which is on a right principle, wrongly carried out, will also probably soon disappear. The intermittent sand filtration method, which is satisfactory in principle, is very expensive to construct and maintain for a given unit of sewage treated.

Based on purely theoretical principles, and with the experience already gained, in point of economy and efficiency, there is no doubt but that the trickling filter is [illegible] and is bound to displace all present forms.

The sedimentation of the humus-like material from a trickling filter is readily accomplished, and should constitute part of the system in order to obtain a clear effluent suitable for disinfection with chlorine, as well as to remove an obvious physical objection.

The disinfection of raw sewage by chlorine may prove a valuable compromise in some rare instances when other methods of treatment are not possible, but is said to be not working out as well as was expected. It should prove of great value in rendering a clear effluent from biological sewage disposal systems absolutely safe.

In conclusion, I would like to give an almost perfect illustration of nature's method of disposing of sewage, in which the principles of the septic tank, the contact bed, the sedimentation tank, and the trickling filter were involved.

Berlin, Ontario, has a so-called sewage farm. After passing through a septic tank, the sewage passed on to ten acres of heavy clay soil. This became plugged, and the putrefying sewage, after standing for various lengths of time, was allowed to flow into a small creek by making convenient holes in the banks of the sewage basins. The volume of sewage flowing away was sometimes almost as large as the volume of the creek. Consequently, little oxidation took place, and the creek became a foul stream of black putrefying liquid, which flowed from pool to pool, and ultimately into a mill pond about a mile or so below the farm. The pond acted as a second septic tank and sedimentation basin, after the oxidation, which must have occurred to a certain extent during its flow to the pond. The decomposition in the pond was clearly shown by the bubbles rising to the surface and by the odors given off.

The water from the pond fell over a mill wheel, and was churned into foam. The gases present were dissipated by the process, and rising on the outside blackened the white lead paint owing to the hydrogen sulphide present, and causing a marked taint to the flour on the inside.

Below the mill the creek tumbled over a rocky bed for a hundred yards or so. These rocks were covered with a brownish black mat of vegetable matter, which on microscopical examination seemed to be chiefly composed of millions of protozoa, such as paramecium, vorticella, etc., and of bacteria. At the end of this rocky bed, the water was clear, and one mile below, where the road crossed it again the creek was perfectly clear, of a slight yellow color, and contained only traces of free and albuminoid ammonia. The natural action taking place in the creek during its extraordinary flow of one mile accomplished what the sewage works had failed to accomplish.

This process of Nature illustrates the typical methods which we have tried in one way and another to harness. There was the septic tank and sedimentation process going on in the pools and pond; the aeration process taking place in the mill wheel, and the adsorption and oxidation processes in the rocky river bed by the gelatinous growth, analagous to that of the trickling filter.

MEXICAN TRAMWAY COMPANY.

The Mexican Light and Power Company has not been disturbed by political unrest. It is the intention of the company to begin extensions on the tramway lines this year, which, when completed, will mean an expenditure of $5,000,000 gold, while $1,000,000 gold is being expended on extensions to the property of the Light & Power Company.

Dr. F. S. Pearson, New York, is interested in these works.

Correspondence and Discussion Invited

FOUNDRY TROLLEY SYSTEMS.*

D. Caehr.

Perhaps the earliest installations of the overhead trolley tems were made in provision houses and ice plants, where cking is impracticable and industrial railway systems out the question, and where traveling cranes covering more ce than necessary in one room or building without offer- practical means of connecting with another, are, there- e, out of place, besides being too expensive.

The advantage of having a track on which the load can easily propelled, without the need of attention to keep clean, and without monopolizing with floor space for a ck, commends the overhead trolley system especially to foundry where floor space is usually at a premium.

In fairness to the industrial railway system it must be ted, however, that unless trolleys used on the overhead tem are operated either automatically, i.e., the load started one place and automatically stopped at another, or unless operator travels along in an attached cage, an aisle of ne kind is necessary, because the operator cannot jump r flasks, molds, castings, in walking along under the lley, etc. Provision is often made, however, so that the lley can be operated from a disance and the aisle need be directly under it.

As regards the cost of installation between the two sys- ns the overhead system usually has a little advantage over industrial railway, if the latter is properly constructed, comparison including switches, turntables and similar cessories in both systems.

In some instances the industrial railway may be more eaply installed, especially where an overhead system would uire special bracing or trussing of the roof or other sur- es from which the track is to be suspended, and where avy loads are to be handled.

In a foundry desigend for and equipped with overhead lley systems a change in the arrangement of the floor ace, to accommodate different classes of work, can be ac- nplished with greater ease and at less expense than in one uipped with an industrial railway, and the flexibility of e former system is simply astonishing, especially when ed with electric power.

As a matter of economy the equipment of a foundry (or y other plant for that matter) should be used as nearly to full capacity as possible. The overhead trolley system bodies superb possibilities for increasing the output of a nt, by bridging over some of the gaps left by installation special cranes with limited spheres.

Take for instance a foundry for ordinary jobbing, cater- g to all classes of work: You will find a department, ere all the heavy work is done, containing either a travel- g crane of 15 to 50 tons capacity or several jib cranes, so ranged that two can be used together on the heaviest work ich is likely to come into the shop, at the same time serv- g the cupola. If this foundry department has a span of to 75 feet, the cost of a traveling crane is equal to the cost of several jib cranes of half its capacity and the service obtained is in favor of the latter, though for convenience, especially in transporting material, the former has no peer.

A monorail system here would be out of question, as it could not be made to cover enough space to handle all the molds, besides requiring an unusually massive roof construction or special structure for supporting the tramrail, which might be in the way, saying nothing of the impracticabliity of carrying heavy loads (over 10 tons) on the lower flange of a single beam.

However, in handling the iron from the cupola to the places where the light floor work and the bench work is done, the traveling crane can render service only to the end of its runway (taking for granted that it serves the cupola), from where the iron has to be handled by an overhead trolley system or an industrial railway, from which in turn it is either transferred to jib cranes, or light traveling cranes, which serve the light floor work department, or else the iron is poured from the large crane ladle into bull and hand ladles, an operation not practical with industrial railway systems unless special ladle cars are used, or special attachments (to support the ladle shank) are secured to the regular cars. With the overhead system such special features are not required.

The trolley system can go further, even in this matter of handling molten metal. By means of switches the trolley with its load (in this case the ladle of iron) can be run on to a jib crane or on to a traveling crane or on to a gantry crane and serve the entire floor space covered by these, automatic provisions being made to prevent it from running off the track, at transfer points. Such a trolley on any of the various jib or traveling cranes, after handling the molds on its floor all day can be made to go to the cupola to get iron and after being used for "pouring off" and "shaking out," can be made to handle the flasks, taking them to and from the proper storage place, and can handle the sand in the same manner, where systems have been designed with all these possibilities in view. Thus, castings can be taken from one floor to the cleaning-room and a load of sand brought back if the bins be near the cleaning department, as they usually are, before the molders report for work, and the number of trips thus reduced to a minimum.

Working very harmoniously with this overhead track system is a scheme in which one end of an I-beam is suspended by a pivotal support, the other end being carried on wheels running on a circular suspended track, on to which the trolley can be run, allowing a large area to be covered without the annoyance of masts or columns breaking up the space.

We have mentioned various types of cranes, but only their functions as a means of conveying have thus far been considered, although the name implies ability to lift (weights) as well.

We see from the foregoing facts that as to flexibility and co-operation with other systems, with the least amount of handling of loads in transferring, the overhead trolley system certainly holds a unique place, and has some decided advantages over the industrial railway to which may be added that loads can be picked up from points outside of the perpendicular and also so lowered, especially where track is high above the ground.

Both systems can be made to run up inclines by proper application of power, although this is seldom necessary in the overhead trolley system because the track can usually be supported so as to be level, regardless of variations in the ground level.

Special attention should be given to the track, which can be constructed in various ways, the simplest form being that of a rectangular bar which is supported from the wall

* Abstracted from Transactions of American Foundrymen's Association.

or ceiling by means of cast iron or malleable iron hangers, the tralleys used being of very simple construction, usually with one or two wheels running on the top surface of the rail, and capable of being readily taken off the track, which is of special advantage where meat hooks and similar attachments are a part of the trolley. This is the most primitive type of overhead tramway system, referred to previously.

Another, but rare type, employs two channel beams arranged either back to back or face to face, with an adequate space between them in which operates that part of the trolley to which the hoist or load is attached. The wheels of the trolley (usually four in number) run on the top flanges (beams back to back), or on the bottom flanges of the beams (face to face), respectively, due provision being made to have the hangers for this type of track also act as separators. It is probably the most expensive kind of tramrail, without having any particular meritorious qualities.

The plain I-beam track is used perhaps more than any other form, the trolley wheels running on the lower flange of the beams, while the supports are attached to the upper flanges. To obtain the most satisfactory results, the beams must be carefully straightened before being erected and the ends should be sawed rather than sheared. Special attention must be paid to splices and switches so as to have a minimum gap at the joints, and curves must be very smooth, particularly so where trolleys are operated at high speed (i.e., from 600 to 800 feet per minute). Any jar due to an uneven track is communicated to the entire trolley mechanism and load, and in motor driven outfits, parts of the machinery are thus often loosened or broken, merely because of a rough and poorly constructed track.

THE CORROSION OF CONDENSER TUBES BY CONTACT WITH ELECTRO-NEGATIVE SUBSTANCES.*

Arnold Philip, B.Sc., Assoc. R. S. M.

At the annual meeting of the Institute of Metals Mr. Philip (Admiralty Chemist) contributed a paper dealing with the corrosion of condenser tubes by contact with electro-negative substances, this constituting the first part of a series of contributions to the history of corrosion that he has promised to present to the Institute of Metals.

The paper is devoted to an examination of the relatively small number of cases experienced by the British Navy in which localized corrosion occurs in condenser tubes made of Admiralty composition, namely copper 70, tin 1, and zinc 29 parts per cent. The author makes the interesting statement —interesting because the causes of corrosion have generally been regarded as so mysterious—but the causes of fully 90 per cent. of the cases of corrosion observed in the establishments of the Royal Navy have long been known.

In the author's opinion the main problems which remain to be solved concerning localized corrosion are, firstly, the explanation of the causes of rather less than 10 per cent. of the cases, which are now observed; and, secondly, the devising of a general means of preventing these and all other cases of corrosion superior to the method of protector bars, etc., of zinc., aluminum, steel, or iron as at present employed.

Mr. Philip includes in his paper a schedule of queries as issued by the Admiralty to those of its officials who are likely to be able to throw any light on the subject of the corrosion of condenser tubes. This list of questions is very similar to the Corrosion Enquiry Form recently issued by the Institute of Metals, and if all who are experiencing trouble with their condenser tubes would fill up the latter Form (which is modeled to some extent on that of Mr. Philip's, and can be obtained from the Institute of Metals, Caxton House, Westminster S.W.) there is little doubt that Mr. Philip's "10 per cent." of mysterious cases of corrosion would be mysterious no longer.

The paper concludes with a consideration in detail of five very definite cases of corrosion of tubes used in the condensers of battleships, torpedo-boats and electric generating plants of the British Navy.

THE EFFECT OF TIN AND LEAD ON THE MICRO-STRUCTURES OF BRASS.*

F. Johnson, M.Sc.

In this paper the author records the results of experiments made with the object of ascertaining the structural relations which exist between lead and tin when present in brass where the ratio of copper to zinc is 2:1.

He found that by itself, tin was thrown out of the solution in the alpha phase (70 copper, 30 zinc) in the form of a hard pale-blue compound (probably $SnCu_4$) some time after solidification of a slowly cooled alloy. Annealing either preceded by rolling or not enabled this compound to again pass into solution in the alpha phase.

In a brass consisting of the alpha and beta phases, where the latter was present in sufficient amount (e.g., Naval Brass and Muntz Metal) the copper-tin compound was much more soluble, being apparently retained by the residual beta.

In an alloy where the beta phase exists in an unstable form (such as the alloy containing 2 parts copper to 1 part zinc) it is insufficient in amount to retain the tin compound which is deposited mainly as a thin envelope or film separating the beta from the alpha phase, thus giving a reticulated appearance to a polished and etched section.

With regard to lead, the author found that this acted independently of the tin, exhibiting behavior similar to that of lead in ordinary brass or in copper. That is to say it retained its individuality and existed in small particles unalloyed with more than mere traces of any other metal, these particles tending to segregate toward the areas last to solidify. In presence of the excess of the beta phase lead is probably held in solution therein.

As a result of the observation the author strongly advocates a thorough annealing of all cast material of the 70:29:1 and 62:37:1 compositions (admiralty and naval brass respectively) before subjecting it to rolling or drawing, in order that the brittle tin compound may be enabled to pass into solution.

FURTHER EXPERIMENTS ON THE CRITICAL POINT AT 470 DEGREES IN COPPER-ZINC ALLOYS.*

Prof. H. C. H. Carpenter, M.A., Ph.D.

In this paper it is shown that the so-called beta constituent in copper-zinc alloys is to be regarded below 470 degrees C. as an extremely minute and uniform complex of alpha and gamma particles. Its structural stability is so remarkable that even after six weeks' annealing at 445 degrees C. no appreciable coalescence of these particles has

* Papers read before the Institute of Metals at the annual meeting.

been observed in an alloy of exactly the eutectoid composition.

When, however, a few crystallites either of alpha or gamma are initially present in an otherwise pure eutectoid alloy, then, on annealing at 445 degrees C., this stability is comparatively easily destroyed. These crystallites constitute nuclei for the deposition of alpha and gamma, as the case may be, from the mixture, and eventually in both cases the final result is the same, viz.: coarse alpha, and coarse gamma, which can be seen with the naked eye, which have characteristic colors, viz.: alpha pale gold, and gamma pale bluish-gray, and which have the same etching properties.

The peculiarly persistent structural stability of the pure eutectoid alloy can be explained by supposing that at the inversion temperature on cooling, the resolution of beta into alpha plus gamma takes place throughout the entire alloy almost, if not quite, simultaneously. This constitutes a favorable condition for the production of the inversion products in an amorphous form, because the forces operative in crystal production do not have time to come into play. This view is in harmony with certain peculiarities which the freshly prepared alloy exhibits both in polishing and etching, which disappear when it has passed into a visibly crystalline condition.

Further, the structural stability of the eutectoid alloy has been so much diminished by the presence of 4 per cent. of aluminum that after two days' annealing at 445 degrees C. it was found to have undergone the typical lamella inversion such as is shown by the iron, iron carbide eutectoid-pearlite. These facts constitute overwhelming evidence that below 470 degrees C. the beta constituent in copper-zinc alloys consists of the two-phase system alpha plus gamma.

PRESERVATION OF TIMBER.

The deterioration of timber by preventable decay causes a heavy demand upon the timber resources of the country. In 1910 nearly 126,000,000 crossties were purchased to make renewals. By the adoption of devices to retard wear and methods to prevent decay, however, the present trackage could probably be maintained with approximately one-half the quantity of wood at present consumed annually for this purpose. To employ measures which increase the average length of time ties may remain in service without decay is equivalent to increasing the supply of timber.

The principal causes of the deterioration of crossties are decay, insect attack, breakage, splitting, mechanical wear, and respiking. By treatment of ties and the use of improver fastenings, S-irons, and similar devices, a mechanical life at least double the present average life of untreated ties may be secured. The treatment of ties to prevent decay, if the methods used are relatively inexpensive, results in a very great saving to the railroads. In the United States the preservatives used for the greater number of the crossties are creosote oil or a solution of zinc chloride, although large quantities of ties are treated with a mixture of the two preservatives mentioned or with crude petroleum. Other preservatives are also used.

COST OF A GRAVEL ROAD.

A convict-built gravel road two miles long graded to a width of 30 ft. and with a sub-grade 15 ft. wide, has been constructed near Kalamazoo, Mich., by the Office of Public Roads, and the following cost records of the work are from the last annual report of Director Logan Waller Page. The road runs through a level to rolling country over a soil of sand and worn gravel. Only a small amount of excavation was required, and this reduced the maximum grade from 3 to 1 per cent. Gravel of very good quality was obtained from a pit 2½ miles from the road and cost 10 cents per load at the pit. Various other items of cost were as follows: Stripping the pit, 0.1 cent per cubic yard; loading, 3.9 cents per cubic yard; hauling, 65.6 cents per cubic yard; spreading on the road, 0.9 cent per cubic yard, and harrowing, 0.2 cent. per square yard. The road was rolled with a horse roller at a total cost of $22, which is 0.13 cent per square yard. The gravel was deposited in two courses; the first course, 7½ in. deep at the centre and 4 in. deep at the edges, was compacted by rolling to 6 and 3 in. respectively, and the second course, 3 in. deep at the centre and 2 in. at the edges, compacted by rolling to 2 and 1½ in. respectively. The compacted surface was therefore 8 in. at the centre and 4½ in. at the edges. The total amount of gravel used was 3,959 cu. yd. The work on this road was done by county prisoners at a cost of 40 cents per 10-hour day. Double teams cost $4 per day, and the total cost of the road to the community was $3,945.15, which is at the rate of 22.4 cents per square yard, or $1,972 per mile. The work comprised 17,613 sq. yd.

ENGINEERING NOTES.

London, Ont.—Authority has been given from Ottawa to organize a field engineers' company and telegraph department. They will be about 200 strong.

Mr. F. W. Farncomb, C.E., of London, Ont., will organize and command the troop.

Montreal, P.Q.—During the past year the inspectors of the civic food inspection department confiscated an enormous quantity of food. Nearly 125 tons of meats were seized; 2,865 calves were taken away from the vendors; 400 gallons of milk and 6 tons of mixed groceries were confiscated. An effort will be made by the Board of Control to have the law amended so that heavier punishments may be provided for offences against the law in the way of offering impure foods to the consumers of the city.

PERSONAL.

Mr. J. J. Ward has ben re-elected chairman of the York County Good Roads Commission.

Mr. C. V. Mitchell has been appointed purchasing agent of the municipal engineering department, city of Toronto.

Mr. John M. Goodell, Assoc. Am. Soc. C.E., editor-in-chief, Engineering Record, on February 26th delivered a lecture on "Technical Literature" before the graduate students in highway engineering at Columbia University.

Dr. L. A. Herdt, of McGill College, Montreal, has been retained by the city of Winnipeg as consulting engineer in connection with the Point du Bois power plant. He is chairman of the Electric Service Commission of Montreal, having been appointed by the Public Utilities Commission of Quebec to represent them on that board.

OBITUARY.

Mr. Fred W. Doty, sen., President of the Doty Engine Works, Ltd., is dead. His death occurred at Goderich, Ont., on February 26th. He is survived by four sons and one daughter.

Mr. C. Nordmark, a Swedish engineer, met death in an accident at Welland, Ont. He was in charge of certain

waterworks being erected at this point by the Canadian Bovine Company, of Toronto. He was struck by a Michigan Central train.

The death of Mr. James Brownlee is reported. Mr. Brownlee was Canadian Pacific superintendent of the division at Kenora, Ont., where his death took place.

The death is reported of Mr. W. K. Watson, a member of the firm of Watson Bros., contracting firm, of Fairview, B.C. Mr. Watson was killed by the swinging arm of a crane striking his head during the construction of a building at the corner of Hemlock and Twelfth Streets, Vancouver.

MEETINGS.

The inaugural meeting of the Victoria, B.C., branch Canadian Society of Civil Engineers, was held on Monday evening, February 19th, and the following officers were elected for current years: F. C. Gamble (chief engineer of railways), chairman; R. W. Macintyre (Box 1290, city), secretary-treasurer. Amongst others present were Messrs. Bainbridge, Apenes, Rognass, Gray, O'Meara, Evans, Hoard, Hughes and Icke; also Mr. Foreman of the Vancouver branch.

The fifteenth annual meeting of the Canadian Mining Institute will be held at the King Edward Hotel, Toronto, on March 6th, 7th, and 8th.

Guests of the Institute from Great Britain and the United States will include Mr. T. A. Rickard, of London, England; Dr. James E. Kemp, of New York, president of the American Institute of Mining Engineers; Mr. J. Parke Channing, of New York, president of the Mining and Metallurgical Society of America; Dr. James Douglas, of New York; Dr. Joseph Struthers, of New York, secretary of the American Institute of Mining Engineers; Mr. W. R. Ingalls, of New York, editor of the Engineering and Mining Journal; Mr. H. B. Winchell; Prof. R. H. Richards, of Boston; E. W. Parker, of Washington.

THE ASSOCIATION OF THE ONTARIO LAND SURVEYORS.

The annual meeting of the above association was held in Toronto on February 27th, 28th and 29th last. The meeting was held in the rooms of the Engineers' Club, King Street West. Several matters of importance to the surveyor and engineer were discussed. Mr. J. P. Whitson and Mr. T. B. Speight presented some facts of interest regarding the Abitibi district and the timber conditions in that country. Mr. C. Dobie gave some information regarding the elementary conditions in that great clay belt. At the close of the session Mr. J. F. Whitson retired from the office of president and Mr. T. B. Speight was elected to that office by acclamation. Mr. James Dobie, of Thessalon, was elected vice-president. The complete list of officers will be published in a few weeks' time as the remaining officers will be elected by ballot.

THE MEETING OF THE GOOD ROADS ASSOCIATION OF ONTARIO.

The convention of the above association was held in Toronto on February 26th, 27th, 28th last, in the building of the York County Municipal Hall, Adelaide Street.

The convention was attended by representatives of every portion of the province. Mayor Geary, of Toronto, extended the civic welcome to the convention. The object of this convention was to frame a policy whereby the highways of the province should be improved and maintained in good order without further delay. Several practical schemes were brought forward and discussed; among these one proposed that all fines levied upon motorists for breaches of the speed laws should be put to road maintenance and kindred improvements. Another proposed that the Federal Government should contribute one-half the expense, one-quarter from the Provincial body, and the balance from the county benefited.

Major Kennedy opened the meeting, and during the course of his address pointed out that Ontario, during the past year, had exceeded all previous years in the matter of good road building. Major Kennedy further pointed out that the rural population were not, in many cases, in a position to afford road improvements and permanent roadways. In Ontario, he stated, one-half of the provincial assessment of $600,000,000 was upon the cities alone, while the remainder, or $500,000,000, was upon the towns, villages and townships of the province. In this connection he pointed out that whereas the cities had to maintain and build a few miles of highway only, the outlying districts were compelled to care for and construct long stretches of roadway. This gentleman did not speak approvingly of the proposed federal highway, stating that in his opinion it was a mistake and a boon to motorists from the United States.

At the concluding session Mr. A. M. Rankin, M.P.P., Colin's Bay, was elected honorary president; Major T. L. Kennedy, president; Mr. N. Vermilyea, Belleville, vice-president; Col. J. E. Farewell, K.C., Whitby, honorary secretary-treasurer; Mr. G. S. Henry, Oriole, secretary-treasurer. These officers, together with the following gentlemen, constitute the Executive Committee for the ensuing year: Messrs. J. A. Sanderson, Leeds and Grenville; C. R. Wheelock, Dufferin; S. L. Squires, Oxford; Dr. Fairbanks, Lambton, and K. W. McKay, Elgin.

Brief addresses were delivered on different phases of the good roads problem by Messrs. J. Armitage, J. P. Griffin and W. C. Bush.

THE CANADIAN NATIONAL ASSOCIATION OF BUILDERS' EXCHANGES.

The sixth annual meeting of the above association was held in Toronto on February 21st, 22nd and 23rd last. The National Association were the guests of the local exchange, the Provincial Builders' and Supply Association of Ontario. The object of this association is to forward and strengthen a feeling of union between contractors, architects and dealers in builders' materials; to provide a means of intelligent consideration in wage matters and to maintain a headquarters where information relative to the building trade may be obtained.

The entertainment of the Canadian society took the form of a smoker and banquet; the latter being held on the evening of February 22nd. In addition to the delegates and the local members, several prominent architects of the city of Toronto attended. Speeches on matters of interest to the builder were made by prominent members and others attending. The officers of the Ontario Association are: President, Mr. George S. Gould, London; 1st vice-president, Mr. George A. Crain, Ottawa; 2nd vice-president, Mr. George Gander; secretary-treasurer, Mr. P. L. Fraser, Builders' Ex-

change, Toronto. The Executive Committee was elected as follows: Messrs A. L. Jex, Cobourg; A. Bohoemer, Ottawa; Walter Davidson, Toronto; T. R. Wright, London; T. R. Somerville, Hamilton; W. A. Hadley, Chatham; R. Sanders, St. Thomas; John L. Youngs, Stratford; Jas. Bogue, Peterborough; T. D. Broom, Woodstock; P. H. Secord, Brantford; W. J. Detweiser, Sault Ste. Marie.

SCIENTIFIC MANAGEMENT.

Mr. Frank B. Gilbreth, whose eminence in the advocacy of scientific management has been universally recognized, is to speak on this subject at an open meeting of the University of Toronto Engineering Society in Convocation Hall on Friday afternoon, March 8th, at 4 o'clock. This address was to have been delivered on February 22nd, but an audience of over 1,000, consisting of members of the society and their friends interested in efficiency engineering, were doomed to disappointment because of Mr. Gilbreth's train meeting with an unfortunate blockade.

Mr. Gilbreth is one of the world's authorities on the scientific manipulation of labor. The problem is of such vital importance to all industrial organizations that the Engineering Society has extended an invitation to all interested, especially to foremen, superintendents and managers, to whom, in varied forms, the subject daily presents itself.

COMING MEETINGS.

THE CANADIAN MINING INSTITUTE.—Annual Meeting held in Toronto, March 6th, 7th, and 8th, 1912, the American Institute of Mining Engineers co-operating; also important delegates of the Institute of Mining and Metallurgy of Great Britain will be present. Secretary, H. Mortimer-Lamb.

NATIONAL ASSOCIATION OF CEMENT USERS.—March, 11th-16th. Annual Convention at Kansas City, Mo. Sec'y, Edward E. Krauss, Harrison Bldg., Philadelphia, Penn.

ENGINEERING SOCIETIES.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—413 Dorchester Street West, Montreal. President, W. F. TYE; Secretary. Professor C. H. McLeod.

VICTORIA BRANCH—Chairman, F. C. Gamble; Secretary-Treasurer, R. W. Macintyre

QUEBEC BRANCH—Chairman, P. E. Parent; Secretary, S. S. Oliver. Meetings held twice a month at room 40, City Hall.

TORONTO BRANCH—96 King Street West, Toronto. Chairman, T. C. Irving; Acting Secretary, T. R. Loudon, University of Toronto. Meets last Thursday of the month at Engineers' Club.

MANITOBA BRANCH—Secretary E. Brydone Jack. Meets every first and third Friday of each month, October to April, in University of Manitoba, Winnipeg.

VANCOUVER BRANCH—Chairman, Geo. H. Webster: Secretary, H. K. Dutcher, 319 Pender Street West, Vancouver. Meets in Engineering Department. University.

OTTAWA BRANCH—
177 Sparks St. Ottawa. Chairman, S. J. Chapleau, Ottawa; Secretary, H. Victor Brayley, N.T. Ry., Cory Bldg. Meetings at which papers are read, 1st and 3rd Wednesdays of fall and winter months; on other Wednesday nights in month there are informal or business meetings,

MUNICIPAL ASSOCIATIONS

ONTARIO MUNICIPAL ASSOCIATION.—President, Chas. Hopewell, Mayor, Ottawa; Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ontario.

UNION OF ALBERTA MUNICIPALITIES.—President, H. H. Gaetz, Red Deer, Alta.; Secretary-Treasurer, John T. Hall, Medicine Hat, Alta.

THE UNION OF CANADIAN MUNICIPALTIES.—President. W. Sanford Evans, Mayor of Winnipeg; Hon. Secretary-Treasurer, W. D. Lighthall, K.C., Ex-Mayor of Westmount.

THE UNION OF NEW BRUNSWICK MUNICIPALITIES.—President, Councillor Siddall, Port Elgin; Hon. Secretary-Treasurer, J. W. McCready, City Clerk, Fredericton.

UNION OF NOVA SCOTIA MUNICIPALITIES.—President, Mr. A. S. MacMillan, Warden, Antigonish, N.S.; Secretary, A. Roberts, Bridgewater, N.S.

UNION OF SASKATCHEWAN MUNICIPALITIES.—President, Mayor Bec, Lemberg; Secretary, Mr. Heal, Moose Jaw.

UNION OF BRITISH COLUMBIA MUNICIPALITIES.—President, Mayor Planta, Nanaimo, B.C.; Hon. Secretary-Treasurer, Mr. H. Bose, Surrey Centre, B.C.

CANADIAN TECHNICAL SOCIETIES

ALBERTA ASSOCIATION OF ARCHITECTS.—President, G. M. Lang Secretary, L. M. Gotch, Calgary, Alta.

ASSOCIATION OF SASKATCHEWAN LAND SURVEYORS.—President, J. L. R. Parsons, Regina; Secretary-Treasurer, M. B. Weeks, Regina.

ASTRONOMICAL SOCIETY OF SASKATCHEWAN.—President, N. McMurchy; Secretary, Mr. McClung, Regina.

BRITISH COLUMBIA LAND SURVEYORS' ASSOCIATION.—President, W. S. Drewry, Nelson, B.C.; Secretary-Treasurer, S. A. Roberts, Victoria, B.C.

BUILDERS' CANADIAN NATIONAL ASSOCIATION.—President, E. T. Nesbitt; Secretary-Treasurer, J. H. Lauer, Montreal, Que.

CANADIAN ASSOCIATION OF STATIONARY ENGINEERS.—President, Wm. Norris, Chatham, Ont.; Secretary, W. A. Crockett, Mount Hamilton, Ont.

CANADIAN CEMENT AND CONCRETE ASSOCIATION.—President, Peter Gillespie, Toronto, Ont.; Secretary-Treasurer, Wm. Snaith, 57 Adelaide Street, Toronto, Ont.

CANADIAN CLAY PRODUCTS' MANUFACTURERS' ASSOCIATION.—President, W. McCredie; Secretary-Treasurer, D. O. McKinnon, Toronto

CANADIAN ELECTRICAL ASSOCIATION.—President, N. W. Ryerson, Niagara Falls; Secretary, T. S. Young, Canadian Electrical News, Toronto.

CANADIAN FORESTRY ASSOCIATION—President, John Hendry, Vancouver. Secretary, James Lawler, Canadian Building, Ottawa.

CANADIAN GAS ASSOCIATION.—President, Arthur Hewit, General Manager Consumers' Gas Company, Toronto; J. Keillor, Secretary-Treasurer, Hamilton, Ont.

CANADIAN INDEPENDENT TELEPHONE ASSOCIATION.—President, W. Doan, M.D., Harrietsville, Ont.; Secretary-Treasurer, Francis Dagger, 21 Richmond Street West, Toronto.

CANADIAN MINING INSTITUTE.—Windsor Hotel, Montreal. President, Dr. Frank D. Adams, McGill University, Montreal; Secretary. H. Mortimer-Lamb, Windsor Hotel, Montreal.

CANADIAN PEAT SOCIETY.—President, J. McWilliam, M.D., London, Ont.; Secretary-Treasurer, Arthur J. Forward, B.A., 22 Castle Building, Ottawa, Ont.

THE CANADIAN PUBLIC HEALTH ASSOCIATION.—President, Dr. Charles A. Hodgetts, Ottawa; General Secretary, Major Lorne Drum, Ottawa.

CANADIAN RAILWAY CLUB.—President, A. A. Goodchild; Secretary, James Powell, P.O. Box 7, St. Lambert, near Montreal, P.Q.

CANADIAN STREET RAILWAY ASSOCIATION.—President, D. McDonald, Manager, Montreal Street Railway; Secretary, Acton Burrows, 70 Bond Street, Toronto.

CANADIAN SOCIETY OF FOREST ENGINEERS.—President, Dr. Fernow, Toronto.; Secretary, F. W. H. Jacombe, Department of the Interior, Ottawa.

CENTRAL RAILWAY AND ENGINEERING CLUB.—Toronto. President, G. Baldwin; Secretary, C. L. Worth, 409 Union Station. Meets third Tuesday each month except June, July and August.

DOMINION LAND SURVEYORS.—President, Thos. Fawcett, Niagara Falls; Secretary-Treasurer, A. W. Ashton, Ottawa.

EDMONTON ENGINEERING SOCIETY.—President, J. Chalmers; Secretary, B. F. Mitchell, City Engineer's Office, Edmonton, Alberta.

ENGINEERING SOCIETY, TORONTO UNIVERSITY.—President, W. B. McPherson; Corresponding Secretary, A. McQueen.

ENGINEERS' CLUB OF MONTREAL.—Secretary, C. M. Strange, 9 Beaver Hall Square, Montreal.

ENGINEERS' CLUB OF TORONTO.—96 King Street West. President, Killaly Gamble; Secretary, R. B. Wolsey. Meeting every Thursday evening during the fall and winter months.

INSTITUTION OF ELECTRICAL ENGINEERS.—President, Dr. G. Kapp; Secretary, P. F. Rowell, Victoria Embankment. London, W.C.; Hon. Secretary-Treasurer for Canada, Lawford Grant, Power Building, Montreal, Que.

INSTITUTION OF MINING AND METALLURGY.—President, Edgar Taylor; Secretary, C. McDermid, London, England. Canadian members of Council:—Prof. F. D. Adams, J. B. Porter, H. E. T. Haultain and W. H. Miller and Messrs W. H. Trewartha-James and J. B. Tyrrell.

INTERNATIONAL ASSOCIATION FOR THE PREVENTION OF SMOKE.—Secretary R. C. Harris, City Hall, Toronto.

MANITOBA LAND SURVEYORS.—President, George McPhillips; Secretary-Treasurer, C. G. Chataway, Winnipeg, Man.

NOVA SCOTIA MINING SOCIETY.—President, T. J. Brown, Sydney Mines, C. B.; Secretary, A. A. Hayward.

NOVA SCOTIA SOCIETY OF ENGINEERS, HALIFAX.—President, J. N. MacKenzie; Secretary, A. R. McCleave, Assistant Road Commissioner's Office, Halifax, N.S.

ONTARIO PROVINCIAL GOOD ROADS ASSOCIATION.—President, Major. T. L. Kennedy; Hon. Secretary-Treasurer, J. E. Farewell, Whitby; Secretary-Treasurer, G. S. Henry, Oriole.

ONTARIO LAND SURVEYORS' ASSOCIATION.—President, T. B. Speight, Toronto; Secretary, Killaly Gamble, 703 Temple Building, Toronto.

THE PEAT ASSOCIATION OF CANADA.—Secretary, Wm. J. W. Booth, New Drawer, 2263, Main P.O., Montreal.

PROVINCE OF QUEBEC ASSOCIATION OF ARCHITECTS.—Secretary, J. E. Ganier, No. 5. Beaver Hall Square, Montreal.

ROYAL ARCHITECTURAL INSTITUTE OF CANADA.—President, F. S. Baker, F.R.I.B.A., Toronto, Ont.; Hon. Secretary, Alcide Chausse, No. 5. Beaver Hall Square, Montreal, Que.

ROYAL ASTRONOMICAL SOCIETY.—President, Prof. Louis B. Stewart, Toronto; Secretary, J. R. Collins, Toronto.

SOCIETY OF CHEMICAL INDUSTRY.—Dr. A. McGill, Ottawa, President; Alfred Burton, Toronto, Secretary.

UNDERGRADUATE SOCIETY OF APPLIED SCIENCE, McGILL UNIVERSITY.—President, J. P. McRae; Secretary, H. F. Cole.

WESTERN CANADA IRRIGATION ASSOCIATION.—President, Wm. Pierce, Calgary; Secretary-Treasurer, John T. Hall, Brandon, Man.

WESTERN CANADA RAILWAY CLUB.—President, R. R. Nield; Secretary, W. H. Rosevear, 115 Phœnix Block, Winnipeg, Man. Second Monday, except June, July and August, at Winnipeg.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand and projected, contracts awarded, changes in staffs, etc.
Printed forms for the purpose will be furnished upon application.

PLANS AND SPECIFICATIONS ON FILE.

The following Plans (P.) and Specifications (S.) are on file for reference only unless otherwise noted at the office of The Canadian Engineer, 62 Church Street, Toronto:—

Bids close		Noted in issue of
3- 8	Water Tube Boilers; Automatic Stokers; Turbines; Saskatoon, Sask. .....(S.)	2-15
3-18	Concrete reservoir (2,000,000 gallons' capacity), Moose Jaw, Sask.....(P. & S.)	2-22
3-18	Centrifugal pumps, motors, etc., Moose Jaw, Sask. .....(P. & S.)	2-22
3-18	Valves and Fittings, Moose Jaw, Sask. .....(P. & S.)	2-22
3-18	96,000 ft. of 18-in. Steel Pipe, Moose Jaw, Sask. .....(S.)	2-22
·15	Pavements, Welland, Ont. .....(P. & S.)	2-29

TENDERS PENDING.

In Addition to Those in this Issue.

Further information may be had from the issues of The Canadian Engineer referred to.

TENDERS.

Belleville, Ont.—Tenders will be received by A. W. Chapman, Esq., County Clerk, Belleville, up to March 13, 1912, for furnishing one concrete mixer. Specifications and full particulars obtained at the office of the County Engineer, Belleville.

Calgary, Alta.—Tenders will be received until March 15th, 1912, for approximately 300 (three hundred) waterworks valves, ranging in sizes from 4 inches to 16 inches. Full particulars at City Engineer's office. J. M. Miller, City Clerk, Calgary.

Carp, Ont.—Tenders will be received until March 21st, 1912, for the erection of a new church in the village. Building to be of brick with concrete basement. Tenders will be received for the cement work and the remainder of the building separately. Plans and specifications can be seen at the Methodist Parsonage, Carp, or at office of Horwood, Taylor & Horwood, Architects, 130 Sparks St., Ottawa. T. E. Argue, Carp, Ont.

Columbus, Ont.—Tenders will be received by the town clerk, Columbus, until noon March 18, 1912, for the construction of twelve reinforced concrete bridges in the township of East Whitby. For plans, etc., apply to Reeve Gifford, Cedardale, Ont., or Messrs. Bowman & Connor, Engineers, 36 Toronto Street, Toronto.

Fredericton, N.B.—Tenders will be received until March 18th, 1912, for a bridge to be built at Stone Ridge, York County, with concrete abutments, and to consist of one covered Howe truss span 123 feet in length. A pipe culvert is to be constructed at the McKenzie Hollow Embankment, in the parish of St. Mary's, York county, tenders closing on April 3rd. Tenders are being asked for the construction of a pipe culvert at the Pokiok Embankment in the parish of Brighton, Carleton county, tenders closing on March 25th. A new bridge is also to be erected at Upham, King's county, bridge consisting of one span 86 feet long, covered Howe truss, and to have concrete abutments. Harry M. Blair, Secretary of the Provincial Board of Works.

Kamloops, B.C.—Tenders will be received until March 7, 1912, for the construction of a covered concrete reservoir, capacity 1,500,000 gallons. J. J. Carment, City Clerk, Kamloops. (See advt. in Can. Eng.)

Moose Jaw, Sask.—Tenders will be received by the City Commissioners up to 10 a.m., March 30, 1912, for the following:—Contract "A"—One 1,500 K.W. A.C. steam turbo-generating set; contract "B"—One 500 K.W. A.C. generator, direct connected to Diesel Oil Engine. Full particulars and specifications can be obtained on application to J. D. Peters, Electrical Superintendent, Moose Jaw.

Moose Jaw, Sask.—Tenders will be received until March 25, 1912, for supplying and erecting two prime mover equipments, an electric lighting equipment, a transmission equipment and accessories for headworks pumping station. E. B. Bonnell, City Clerk, Moose Jaw. (See advt. in Can. Eng.)

Moose Jaw, Sask.—Tenders will be received until March 18th, 1912, for the supply and delivery of certain valves, fittings, pipes and specials, to be used in connection with the laying of 18-in. water main from Sandy Creek to Moose Jaw. All information may be obtained on application to the city clerk, Moose Jaw, or at the office of Walter J. Francis & Co., Consulting Engineers, Montreal.

Merid, Sask.—Up to March 24th, 1912, tenders will be received for the following: 1 road grader, 6 wheel scrapers, 12 slush scrapers. L. W. Atkinson, Merid, Sask.

Niagara Falls, Ont.—Tenders will be received until April 1st, 1912, for the construction of a modern city service hook and ladder truck, horse-drawn, for the city of Niagara Falls, Canada. W. J. Seymour, City Clerk, Niagara Falls.

Ottawa, Ont.—Tenders will be received until March 12, 1912, for the supply and delivery of valves required by the corporation. Newton J. Ker, City Engineer, Ottawa. (See advt. in Canadian Engineer.)

Ottawa, Ont.—The Corporation of the city of Ottawa, municipal electrical department, invite tenders on meters, transformers, incandescent lamps, arc lamp globes, carbons, and sundry supplies, tenders to be received until March 11, 1912. Specifications may be seen at the office of J. E. Brown, Electrical Supt., City Hall, Ottawa.

Ottawa, Ont.—Tenders will be received until April 1st, 1912, for the construction of an extension to Breakwater at Reed's Point, Lorneville, St. John County, N.B. Plans, specifications, etc., can be obtained at the offices of E. T. P. Shewen, Esq., Dist. Engineer, St. John; Geoffrey Stead, Esq., Dist. Engineer, Chatham, N.B.; the Postmaster at Lorneville, N.B., and the office of R. C. Desrochers, Secretary Dept. of Public Works, Ottawa.

Ottawa, Ont.—The Dept. of Public Works invite tenders up to Wednesday, March 20th, 1911, for dredging required at Cheticamp, N.S. Combined specification and form of tender can be obtained at the office of Secretary Desrochers, Dept. of Public Works, Ottawa.

Sanford, Man.—Tenders will be received until March 23rd, 1912, for the removal of about 20,000 yards of earth from the bottom and sides of ditches on the road allowances in Tp. 8, R. 2, 3 E. Plans and specifications may be seen at the offices of C. A. Millican, 428 Main Street, Winnipeg, Man. H. Grills, Sec.-Treas., Municipality of Macdonald, Sanford.

Toronto, Ont.—Tenders will be received until March 9, 1912, for the various trades required in the erection of a building for the Union Bank of Canada at Sunnyside. Plans and specifications and all information may be obtained at the office of the architects, Darling & Pearson, 2 Leader Lane, Toronto.

Toronto, Ont.—Tenders for the works (other than steel bridges) necessary to the complete construction of the roadbed, ready for the ties and rails upon that section of the Temiskaming & Northern Ontario Railway Commission's Railway, extending from Earlton to Elk Lake, will be received until March 20th, 1912. All information may be obtained at the office of the chief engineer of the commission, North Bay, or at the office of A. J. McGee, Secretary T. & N.O. Railway Commission, 25 Toronto St.

Toronto, Ont.—Tenders will be received until noon, March 26th, 1912, for the supply of electrical equipment for pumping station, sewage disposal works. Plans, etc., at the office of the City Engineer, Toronto, G. R. Geary (Mayor), Chairman Board of Control, City Hall, Toront. (See advt. in Can. Eng.)

Victoria, B.C.—The Government of British Columbia is inviting competitive plans for the new provincial university to be situated at Point Grey. Only Canadian architects can compete. Specifications call for buildings aggregating in value $1,500,000. Particulars, etc., may be obtained from the Minister of Education, Parliament Bldgs., Victoria, B.C.

Victoria, B.C.—Tenders will be received until March 12th, 1912, for the erection and completion of a high school building on Fernwood Road and Grant Street. Drawings and specifications may be seen at the office of C. Elwood Watkins, Architect, Victoria.

Victoria, B.C.—Tenders will be received until March 12th, 1912, for the erection and completion of a High School building on grounds situated on Fernwood Road and Grant Street in City of Victoria. Separate tender will be required of the electrical equipment. Drawings and specifications at the office of C. Elwood Watkins, Architect, Victoria.

CONTRACTS AWARDED.

Brantford, Ont.—Messrs. Schults Bros. have received the contract for Brantford's new Y.M.C.A. Building will cost $95,000.

Calgary, Alta.—Messrs. McNeil & Farmer have the contract for the building of a warehouse to cost $60,000. Owners, Nicholson & Bain.

Cap St. Ignace, Que.—Wharf; Misael Bernatchez, of Montmagny, P.Q., at $11,440.

Devil's Island, N.S.—Extension to breakwater; Obed A. Ham, of Mahome, N.S., $26,984.

Goderich, Ont.—J. H. Tromanhauser, of Toronto, has been awarded the contract for the erection of the new marine tower for the concrete elevator of the Western Canada Flour Mills Company. The piles and other material will be supplied by the Goderich Lumber and Milling Company. The elevator has a capacity of 600,000 bushels.

Goderich, Ont.—Wharf; Mr. S. F. Whitman, 38 Victoria St., Toronto, $35,427.90.

Guelph, Ont.—The contract for the plumbing in the new Y.M.C.A. building has been awarded to Messrs. Stevenson and Malcolm. Mr. F. Smith will install the heating apparatus.

Hamilton, Ont.—The Asphalt and Supply Co., of Montreal, P.Q., have been awarded the contract to furnish this municipality with asphaltic road materials.

Lloydminster, Sask.—Public building; F. E. Healy, Picton, Ont., and Joseph M. Piggott, Hamilton, Ont., $27,500.

Meaford, Ont.—Construction of extension to East Breakwater, removal of Lon West Breakwater, and dredging at Meaford; Gideon Kastner, Wiarton, Ont., $36,700.

Montreal, Que.—The Foundation Company, Ltd., 76 Bank of Ottawa Building, have been awarded a contract to construct a dam and small bridge, about five miles from Bankhead, Alta., on the Cascades River. Operations to commence at once.

Moose Jaw, Sask.—The contract for the erection of the Boys' College building of the Saskatchewan College has been awarded to Messrs. Hazelton and Wain, of Winnipeg, Man., and not to Messrs. Clayden Bros., as announced last week. These latter gentlemen canceled their agreement owing to a mistake in their estimate.

Ottawa, Ont.—Successful tenderer for water intake to cost $32,000, A. J. Dupius Co., Detroit. 60-in steel pipe, 500 feet long, ½-in. plate and equipment.

Saskatoon, Sask.—Messrs. Robinson & Foster, Spokane, have received the contract for the construction of a substructure for a subway under the C.N.Rly. Company's tracks at 23rd Street. Contract price, $50,027.

Steveston, B.C.—Jetty at mouth of Fraser River, B.C.; the Sinclair Construction Co., 1016 Sixth Ave., New Westminster, B.C., $171,350.

Toronto, Ont.—The contract for the construction of a cold storage warehouse for the Swift Canadian Co. at West Toronto, has been awarded to Messrs. Wells & Gray, Ltd., 315 Confederation Life Bldg.; total cost about $200,000.

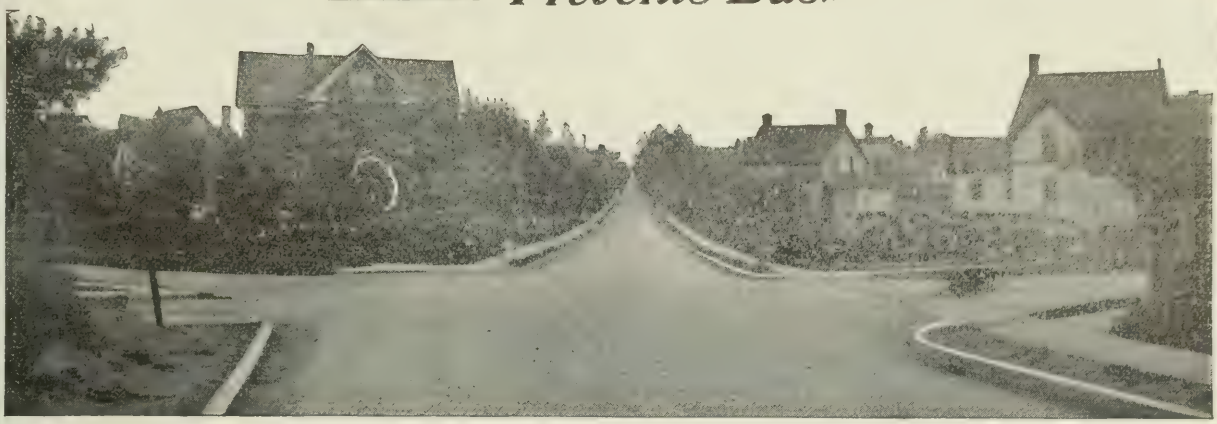
Henry Hope and Sons of Birmingham, England, for whom Mr. Alex. Young, of 45 King St. W., Toronto, is Canadian agent, have been awarded the contract for all the metal sash for the new Bank of Toronto building, Bay and King Streets, Toronto. The sash for the basement, main, mezzanine, and first floors will all be of solid bronze.

Toronto, Ont.—Toronto Junction main sewer, section No. 4, Bloor St. tunnel; Messrs. Orpen Co., Toronto, $28.33 per lineal foot. W. A. Littlejohn, City Clerk.

Victoria Harbor, Man.—Breakwater; the Fort Garry Lumber Co., Winnipeg, $14,500.

Tarvia

Preserves Roads
Prevents Dust



Lancaster St., Berlin, Ont. Constructed with Tarvia X Modern Pavement

Meets Modern Road Requirements

TARVIA is a powerful binder for the surfaces and foundations of macadam roads. fills the voids and locks the stone in a tough durable, plastic matrix.

A Tarviated surface is dustless and clean. It sheds water readily and is dry immediately after the rain, so that pedestrians are not inconvenienced. The surface never gets muddy or dusty.

On account of the Tarvia matrix, these roads will bear heavier automobile traffic than plain macadam because the surface yields instead pulverizing under the strains. The Tarvia matrix prevents internal movement and grinding.

The plasticity of the Tarvia also makes these roads very quiet. Horses' hoofs make almost no sound on a Tarviated road. Tarvia is waterproof, and Tarviated roads, therefore, are protected against damage from torrents on grades.

Tarvia has no odor except when being applied. After it hardens, it has no injurious effect on shoes, clothing or vehicles. The cost of using Tarvia is not a factor for consideration, because it has been repeatedly demonstrated that it is cheaper to maintain a dustless road with Tarvia than a dusty one without it. Maintenance economies more than balance the additional cost.

RAILWAYS—STEAM AND ELECTRIC.

Athabaska Landing, Northern Canada. — The Canadian Northern Railway have laid steel to within eight miles of this point. In the last eight miles there are eleven or twelve trestle bridges required. It is not likely that the laying of the steel will be completed before July, 1912.

Berlin, Ont.—The Lake Erie and Northern Railway has been sanctioned by the Railway Commission and the Minister of Railways. The route is from Port Dover to Berlin via Paris. It is to be a steam road.

Brandon, Man.—The Canadian Pacific Railway are preparing plans for considerable improvement to their property in this city. The improvements contemplated provide for two distinct yards, one for incoming trains and the other for outgoing trains. The improvements extend from the eastern limits of the yards to the western limits, a distance of two miles.

Montreal, P.Q.—The Grand Trunk Railway System have ordered 250 refrigerator cars from the Canadian Car & Foundry Company, and 250 from the American Car & Foundry Company. 250 automobile cars have been ordered from the last named firm an and equal number from the Western Steel Car & Foundry Company.

Province of Nova Scotia.—The Canadian Pacific Railway has commenced the work of replacing all the old bridges on the D.A.R. with modern structures. Mr. Ripley, one of the C.P.R. engineers, has a staff at work at Kentville, Nova Scotia, and already a number of smaller bridges have been replaced. The bridge over the Avon River at Windsor will be replaced by a larger one.

Niagara District.—The Canadian Northern Railway plans for this section of the country call for an extension of the Niagara, St. Catharines and Toronto Railway System in such a manner as to serve the fruit belt around Niagara-on-the-Lake.

Ottawa, Ont.—A group of English capitalists have held a conference with Mr. R. H. McElroy, of Carleton, Ont., with a view of taking over the stock of the proposed Kingston, Smith's Falls and Ottawa Electric Railway Company.

Province of Saskatchewan.—The Canadian Pacific Railway are about to install 3,200 miles of additional telegraph wire in this province. Three thousand miles will be of copper and the remainder of iron. The following gives in detail where the new wires are to be hung: (1) Copper wire from Winnipeg to Port Arthur. (2) Copper wire from Winnipeg to Moose Jaw via Arcola. (3) Two copper wires from Moose Jaw to North Portal, a distance of approximately 310 miles. (4) Copper wire from Bulyea to Neudorf. (5) Iron wire from Stoughton to Arcola, 80 miles. (6) Iron wire from Vale Port to Bulyea. (7) Heavy copper wire from Saskatoon to Calgary, via Wetaskiwin, about 425 miles.

St. Thomas, Ont.—City Engineer Baker has submitted an estimate of the cost of fixing up the local street railway system. His figures, which were as follows, will be considered at a special meeting to be held in the near future:

Repairing the Road Bed and Overhead Construction.

30 lightning arresters at $7	$ 210.00
Labor on same	20.00
6 miles wire, at 16c.	2,050.00
Labor putting up	200.00
15,500 feet strand wire	350.00
Labor on same	150.00
50 straight line hangers	50.00
350 ears at 35c. each	125.00
350 studs	15.00
150 poles, set and painted, at $7.00	1,050.00
1,200 ties at 60c. each	720.00
Labor putting in ties	300.00
1,500 pounds of spikes	36.75
Repairing bonds	100.00
	$5,376.75

Mr. Baker estimated the cost of repairing the present rolling stock at $2,000.

Western Canada.—A rumor is current in Eastern Canada to the effect that $5,000,000 of French capital will construct a line of railways from the Peace River to the Pacific. The company has taken the name of the Pacific and Peace Railway Department Syndicate. The distance is about 480 miles.

Winnipeg, Man.—The Canadian Pacific has purchased a site of 1,800 acres in East Kildon, a suburb of Winnipeg, the property to be used for the new yards of the company.

LIGHT, HEAT AND POWER.

Chats Falls, Ont.—The hydro-electric authorities are taking steps to expropriate these falls as a source of available power. These falls are owned by the Hon. William Harty, of Kingston, former Liberal member of Parliament, who is said to have secured them from the late Laurier Government for $60,000.

Kingston, Ont.—Mr. C. C. Folger has presented a report on the operation of the municipal power plant for the year 1911. In this report attention was drawn to the fact that the increase of gas at consumers' meters showed 5,015,500 cubic feet, while the electric output increased 74,114. The report showed that the amount received per 1,000 cubic feet, including rentals, was 1.09. The amount received per 1,000 cubic feet, rentals deducted, was 98. The cost at the consumers' meters, per 1,000 cubic feet, was 47, and at the station meter 43.2c. The total revenue from gas rentals was $5,025.01. The total amount of gas manufactured at the station meter was 50,156,000 cubic feet, and at the consumers' meters, 41,577,000 cubic feet. Plans are at present being prepared for a complete reorganization of the entire purifying plant, it being the intention to install the latest type of overhead dry lute purifiers, with modern connections. The electric distribution will need some overhauling on account of the increased output. The electric generating end will require some additions in the immediate future as the 300 K.W. alternating current machine is taking over 200 K.W. and the direct current machine is taking a full load.

Moose Jaw, Sask.—Among certain by-laws to be submitted to the ratepayers will be found one calling for the expenditure of $225,000 on improvements to the municipal electric lighting system.

Niagara Falls, Ont.—A movement is under way to have the falls illuminated by electricity during the evening hours. Senator Gittins, of Niagara Falls, N.Y., has presented a bill at Washington for $50,000 to pay the United States share of the expense. It is proposed to spend $100,000 on a permanent means of illumination and allow $5,000 per year for the upkeep of the same. It is to be an international affair.

Sherbrooke, Que.—The Light, Heat and Power committee are discussing the question of withdrawing the supply of power now being supplied to Lennoxville. The Sherbrooke Railway and Power Company have expressed their willingness to supply that municipality with light and power.

Toronto, Ont.—City Engineer Rust has requested the Board of Control to purchase two new 100 horse-power vertical motors for use at the filtration plant. These are to replace the 75 horse-power motors at present installed. The difference in the price is $1,900.

Verdun, Que.—The municipal ratepayers expressed themselves to be in accord with the proposed expenditure of $300,000 on works improvements, as specified in our issue of February 15th last.

GARBAGE, SEWAGE AND WATER.

Edmonds, B.C.—The municipal council have advised the controllers of South Vancouver that they will be in a position to supply 800,000 gallons of water to South Vancouver in event of a water famine in that centre.

Kingston, Ont.—The report of the yearly operation of the municipal water system has been prepared; the financial statement shows a surplus of $8,115.57. The revenue amounted to $43,377 and the expenditure $35,261.43. The expenditure on plant account included $3,376.61 for mains and services and $650.50 for water meters. The expenditure taken out of the rest fund included the sum of $3,747.48 for a suction pipe. The department had a surplus of $6,000 two years ago.

Montreal, Que.—One of the pumps in the Clark Street station of Montreal Water and Power Company broke down and caused the water supply to fail in the upper section of the city.

Regina, Sask.—Among the companies tendering on the construction of the large water tank for this municipality were John Inglis Co., Toronto; Chicago Bridge and Iron Works; Thos. Belair, Montreal; and the Des Moines Bridge and Iron Co., Des Moines, U.S.A. The tenders have been placed, by order of the council, in the hands of Walter J. Francis and Co., who will make a report.

Kerr Turbo-Generators

FOR SMALL LIGHTING PLANTS

The Kerr Turbine is peculiarly suited to generator driving and our sets are made in suitable sizes to fill all requirements up to 500 kw. alternating and 350 kw. direct current. The operation is economical throughout a wide range of initial steam pressures, the steam economy is improved by superheat, and any exhaust conditions are permissible. When operating non-condensing, the steam consumption compares favorably with that of a high speed engine of the same capacity, while in condensing plants the economy at full loads equals that of the best compound engine and at fractional loads is much better.

A Kerr Turbo-Generator for lighting or small power or both is extremely profitable in any plant having power boilers, since the freedom of the turbine exhaust from oil makes reuse of the exhaust inexpensive and safe for boiler feeding or any other purpose where clean low pressure steam is desirable. See Bulletin No. 22.

PACIFIC COAST PIPE COMPANY, LTD.

Factory: 1551 Granville Street, VANCOUVER, B.C. P.O. Box 563.

St. Vital, Man.—Plans have been prepared by the municipal engineer, Mr. D. R. Baribault, calling for the expenditure of $500,000 on sewer and water system improvements. The plans call for the erection of a water purification plant to cost $200,000.

Toronto, Ont.—The municipal council are considering the following works expenditure:

New meters	$100,000
Two 36-inch mains under tracks, Main Pumping Station to Front Street	44,450
42-inch main along Front Street to Bathurst Street	55,048
24-inch main along Niagara Street to Queen Street	33,535
36-inch main cross town line, Beverley Street to Sumach Street	148,477

North Vancouver, B.C.—The municipal council intend to spend $137,000 on sewers and roadways.

BUILDINGS AND INDUSTRIAL WORKS.

Calgary, Alta.—A report states that the Sunlight Soap interests are considering the matter of establishing a factory in this city. Mr. Knight is the manager of the Toronto branch.

Calgary, Alta.—The management of the Canada Life Assurance Company are planning to erect a business structure at this point. The building is to be 75 x 80 of Gothic design and entirely fireproof. It is to be six stories in height. The head office of this company is in Toronto; Mr. J. W. Flavelle is the president.

Calgary, Alta.—Mr. E. Demiele is interested in the construction of a garage to cost $30,000. A permit has been secured for this work. The location is Eleventh Avenue between First and Second Street.

Fort William, Ont.—R. Vigars is having plans prepared for a 3-story apartment house to be erected on corner of Court and Van Norman Streets. Estimated cost, $25,000.

Levis, Que.—Representatives of the shipping interests have interviewed the federal government on the question of increasing the drydock facilities at this point. There are now fifteen ships on the St. Lawrence River too large for the drydocks now in use. Mr. Allen was the principal speaker of the delegation.

Lethbridge, Alta—The Rice Malting Company, Winnipeg, Man., are contemplating the erection of a plant at this point. Mr. P. H. Rice is the manager at Winnipeg

Moose Jaw, Sask.—A by-law calling for the expenditure of $6,000 for exhibition improvements, will be placed before the municipal ratepayers.

Moose Jaw, Sask.—The municipal council will submit a by-law to the ratepayers seeking authority to erect a $70,000 public library.

Saskatoon, Sask.—The plans for the hospital have been approved by the municipal council. The first portion to be constructed will be 160 x 48 feet, but the completed structure calls for a building 960 feet long and two wings 240 feet long, also a nurses' home and accommodation for fifteen hundred patients.

Saskatoon, Sask.—Mr. Allen Bowerman will erect a six-story building in this city. The new building will be of fireproof structure throughout. It is to have a frontage of 140 feet on 21st street and will run 75 feet south.

St. John, N.B.—The Canada Brush Company, Ltd., are erecting a new plant in this city. Machinery and raw material were ordered some time ago, and have been shipped from Germany, London and New York. It is intended to employ about seventy hands at the start, and it is expected that the company will be in full working order by May 1. Mr. John O'Regan of this city is interested in the project.

Toronto, Ont.—The Harbor Commissioners have instructed their engineer, Mr. Cousins, to prepare plans for the completion of the sea wall. When these are completed the board will confer with the municipal council with a view to have this work completed at an early date.

Toronto, Ont.—The congregation of St. Andrew's Church, King Street West, are about to erect a new parish building, to cost about $50,000. Mr. S. G. Curry, architect, is at present preparing the plans. The structure is to be completed by December 1st next.

Toronto, Ont.—The municipal council are considering the erection of the following fire halls:—

Greenwood Avenue Fire Hall	$30,000
Purchase price of site	7,004
Wychwood Fire Hall	30,000
Purchase price of site	7,004
Roncesvalles Avenue Fire Hall	25,000
Purchase price of site	7,000
Spare stable and supply in rear of the Adelaide Street Fire Hall	0,000

Victoria, B.C.—The Barbor Mattress Company, of Vancouver, are planning to erect a three-story frame factory on Topaz Street. The fire chief will be consulted in the matter.

Winnipeg, Man.—The municipal council has authorized the expenditure of $1,405,070 to extend the water supply. It is the intention of that body to obtain an additional supply from Poplar Springs and thus increase the available daily supply by 20,000,000 gallons.

Winnipeg, Man.—Messrs. Finnie and Murray have received a permit to erect an $85,000 warehouse in this city. Plans for six tall buildings have been placed in the hands of the building inspector for approval.

BRIDGES, ROADS AND PAVEMENTS.

Calgary, Alta.—Plans for several new bridges have been prepared by the city engineer, Mr. J. F. Childs. If these plans are approved by the council the cost will be $829,200. Several aldermen and councillers are reported to be in favor of using concrete for the materials of the above. If this is carried the cost will be about 40 per cent. above the estimate as quoted for steel structures.

Province of Manitoba.—The provincial legislature has set aside $100,000 per year, to be used for permanent highway construction and maintenance throughout the province.

Moose Jaw, Sask.—A by-law is to be submitted to the ratepayers of this municipality calling for the expenditure of $160,000 for pavement improvements.

Nelson, B.C.—This municipality is to have a $75,000 bridge across the Kootenay River, if the engineer now preparing a report gives a favorable reply. Provincial Premier McBride stated that it is to be a government project.

Toronto, Ont.—The municipal council are considering the erection of the following bridges:—

Crawford Street, reinforced concrete arch with girder span approaches	$ 29,450
Strachan Avenue, two steel plate girder spans, concrete floor, Class A, exclusive of land damages	58,200
Cattle market, steel lattice girder bridge on steel bench and steel approach ramps	14,900
Riverdale Foot Bridges, raising over span and adding two new spans over railway tracks	12,000
Gerrard Street Bridge, new bridge and river span—	
If of steel	151,800
If of concrete	200,000

FIRES.

Aylmer, Ont.—The pump works of Mr. Jas. Gillett were destroyed by fire on February 29th.

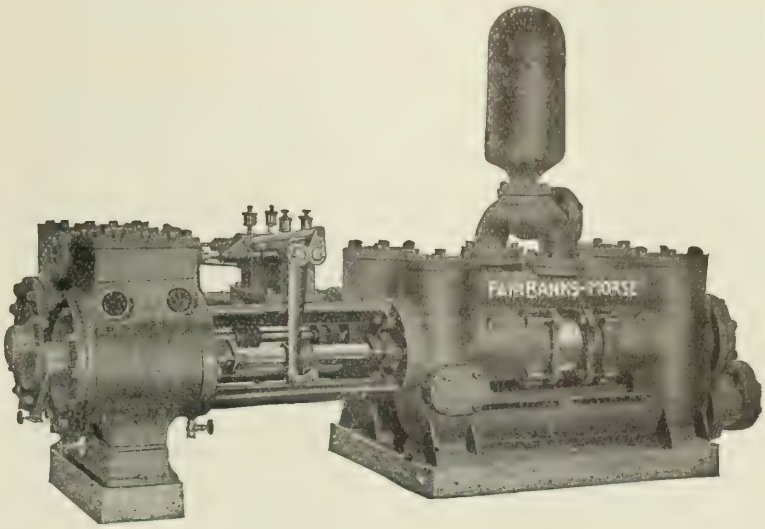
Chatham, Ont.—The elevator of the Canada Flour Mills Company was damaged by fire to the extent of $3,000.

Toronto, Ont.—The hide and fur establishment of Messrs. Hallam & Company was damaged by fire to the extent of $6,000.

CURRENT NEWS.

Province of British Columbia.—According to report the provincial government will spend $16,000,000 on improvements in that province during the next few months. The programme includes the construction of eight hundred and seventy miles of track.

Fort William, Ont.—The federal government are taking steps toward the leasing of two grain elevators at this point



PUMPS

The superior excellence and splendid results shown by

"FAIRBANKS-MORSE"

pumping machinery are largely due to the fact that for many years we have manufactured Hydraulic Machinery of all descriptions. We are therefore able to build pumps which are properly designed and adapted to every-day use. This is of the greatest importance in a first-class pump, for the usefulness of an engine may be lost if the pumping machine is badly designed.

You will get all these important features when you purchase a "FAIRBANKS-MORSE" pump.

Let us solve your pump problems.

THE CANADIAN FAIRBANKS-MORSE CO. Limited

Fairbanks Standard Scales — Fairbanks-Morse Gas Engines.
Safes and Vaults.

Montreal Toronto Winnipeg Vancouver Calgary St. John, N.B. Saskatoon Ottawa

They will be operated under the supervision of the grain board.

Montreal, P.Q.—The Richelieu and Ontario Navigation Company are about to try the experiment of burning oil on their steamers. The Rapids Prince and Rapids Queen on the Prescott-Montreal division will abandon the use of coal for the generation of steam. While the question of economy is largely problematical, it is expected by the Richelieu officials that the saving effected by a reduction of the crew necessary to look after the oil burning equipment will be considerable, while the absence of smoke and dirt should appeal to the passenger traveling on the line between here and Prescott.

Moose Jaw, Sask.—The City Commissioners are advertising for tenders for materials for extension of the electrical system. The tenders asked for include: Copper and iron wire, cedar poles, cross arms, pole line hardware and miscellaneous line supplies. J. J. Antonisen, city engineer.

Moose Jaw, Sask.—A committee has been formed to prepare a report on the question of erecting a new municipal hall. Ald. Caldwell has moved that competitive plans be called for the structure. The estimated cost is placed at $250,000.

New Westminster, B.C.—Ald. Dodd announced to the Trades and Labor Council that the municipal council have made $3 the daily wage for civic labor.

New Westminster, B.C.—A petition to submit a by-law to the ratepayers regarding the installation of a municipal gas plant has been presented to the civic council. A movement is being made to have a hospital by-law voted upon at the same time. Water and light extensions, fire and police apparatus, and the provision of storehouse and bunkers for the city, are some of the other requests to be made the subject of by-laws.

Ottawa, Ont.—The annual Dominion exhibition, to which the Federal government makes a grant of $50,000, will this year be held in Ottawa. The exhibition will probably last two weeks and will be the greatest ever held in Ottawa.

St. John, N.B.—Messrs. Norton-Griffiths, who have received the contract for the Grand Trunk Pacific terminal at this point, expect to have work under way by April 1st next. Mr. P. R. Warren will have charge of this work for the contractors.

Stettler, Alta.—The municipal Board of Trade have made a recommendation to the council that a large electric light be placed on the elevated water tower to serve as a landmark for travelers after dark. Mayor Bentley expressed himself to be in favor of the project.

Sydney, C.B., N.S.—The new sulphuric acid plant of the Dominion Iron and Steel Company is reported to be giving entire satisfaction. The erection of the new plant is under the personal supervision of F. J. Faulding, consulting engineer, of New York. This plant is a most important addition to the steel industry, and will employ a very large number of men.

Thorold, Ont.—This municipality voted in favor of granting certain privileges to the Thorold Township Paper Mill by a majority of 504.

Toronto, Ont.—The Harbor Board has issued instructions to tenants residing in certain houses along the water front of Ashbridge's Bay to the effect that they must vacate. The board consider the location unhealthy for human habitation.

Victoria, B.C.—Dr. Young, Provincial Minister of Education, Province of British Columbia, is now inviting plans for the first buildings to be erected on the Point Grey university site, at a cost of $1,500,000, and the competition is limited to Canadian architects. Ten thousand dollars will be given in awards.

Western Canada.—The railways report that there will be need of sixty thousand laboring men in this portion of Canada during the coming season.

State of Kansas, U.S.A.—A report states that the engineering department of the state university will in future investigate all companies attempting to sell stock for the development of any new invention. The banking department of the state will pass on the business end of the new companies and the merits of the mehcanical inventions will be tested by the engineering department of the university.

TRADE INQUIRIES.

The following were among the inquiries relating to Canadian trade received at the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W., during the week ended February 12th, 1912. Fuller information may be obtained by communicating with the Department of Trade and Commerce, Ottawa.

A London firm are anxious to get in touch with Canadian manufacturers of machinery for making wood pulp.

A South of England firm of paint, enamel and varnish manufacturers desire to introduce their goods into the Canadian market.

A firm in the English Midlands manufacturing ebonite sheets, rods and tubes, fibre sheets, rods and tubes, rubber washers, buffers, mats, sheeting, valves, bath plugs, caster bowls, and solid tyres for motor vehicles, are desirous of appointing Canadian agents.

A Welsh firm of slate manufacturers desire to get into touch with a Canadian firm in a position to store their slates and sell on commission.

A correspondent in Roumania stated to have good connections among agriculturists is open to take up the agency of Canadian manufacturers of ploughs and other agricultural machinery, electro-technical machinery, etc. Correspondence in French.

A London firm ask to be placed in touch with influential Canadian firms who are importers of Burmese buffalo hides, dry and wet salted.

A London company manufacturing electrical motor and generators, lamps, switch gear and appliances, and equipment generally, are looking for suitable Canadian resident agents.

A London firm ask for the addresses of Canadian manufacturers of beef powder.

A firm of brokers, import and export, in British Columbia, are desirous of securing a high-class agency. Canadian bankers' and London references.

ORDERS OF THE RAILWAY COMMISSIONERS OF CANADA.

Each week on this page may be found summaries of orders passed by the Board of Railway Commissioners, to date. This will facilitate ready reference and easy filing. Copies of these orders may be secured from The Canadian Engineer for small fee.

16009—February 20—Authorizing C.P.R. to take land for enlargement of Windsor Street Passenger Terminals at Montreal,, Que.

16010—February 22—Authorizing C.P.R. to open for carriage of traffic diversion of its railway in Dist. of Thunder Bay, from mileage 92.24 to 93.42, and 93.92 to 95.12, and rescinding Order No. 15932 of February 12, 1912, (old main line revision).

16011—February 23—16012—February 19—Authorizing C.P.R. to use and operate bridge No. 27.3 on MacLeod S.D. and No.'s 11.9 and 24.4 on Souris Subdivision.

16013—February 19—Authorizing C.P.R. to construct spur for Messrs. Britnell & Co., Ltd., at Cooksville, Ontario, mileage 14.75 on London S.D.

16014—February 20—Authorizing C.N.R. to construct across 5 highways on its Prince Albert-Battleford Line.

16015—January 23—Authorizing Nakusp and Slocan Ry. (C.P.R.) to construct branch line or spur into Truro Mineral Claim unsurveyed, for a distance of 6 miles.

16016—February 23—Extending for 60 days from date of this Order time for installation of interlocking plant by Essex Terminal Ry. in city of Windsor, Ont., crossing to be used for construction purposes during extended period.

16017—February 20—Approving Klondike Mines Rly. Co.'s Standard Freight Mileage Tariff for Carload Traffic, C.R.C., No. 5.

16018—February 20—Directing G.T.R. to file plans within two months from date of this Order for bridge where its railway crosses the Perche Drain, Twp. of Sarnia, Ontario.

16019—February 22—Directing that plan approved by Order 7,200 and filed with Board April 27th, 1909, be amended by showing York Street opened to Lake Street, and that subway full width of street be provided through elevated portion of railway lines and tracks. Question of Compensation for land damages, etc., to be reserved. Toronto Grade Separation, G.T.R. and C.P.R. Railways.

16020—February 24—Authorizing James Bay and Eastern (C.N.R.) to cross public road on Lot 19, between Rges 1 and 2, Twp. of Dufferin and County of Lake St. John, Quebec.

16021—January 30—Authorizing C.P.R. (G.B. & S. Ry.) to use and operate bridge across public road at mileage 56.4 Ct. Victoria, Ontario.

16022—February 23—Approving Standard Tariffs of Maximum Freight and Passenger Tolls C.R.C. no. 102 of Napierville Jct. Ry.

16023—February 17—Authorizing G.T.P.B.L. Co. to construct spur for Prince Albert Lumber Company's Mills, Prince Albert, Sask.

16024—February 22—Certificate of correction to G.T.B.B.L. Co. re error in location plan Yorkton-Canora Branch.

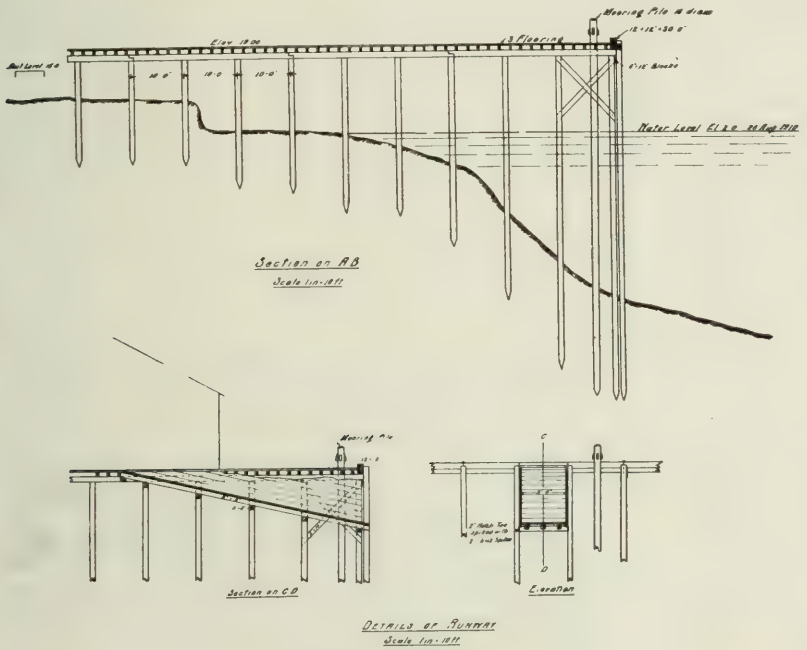
The Canadian Engineer

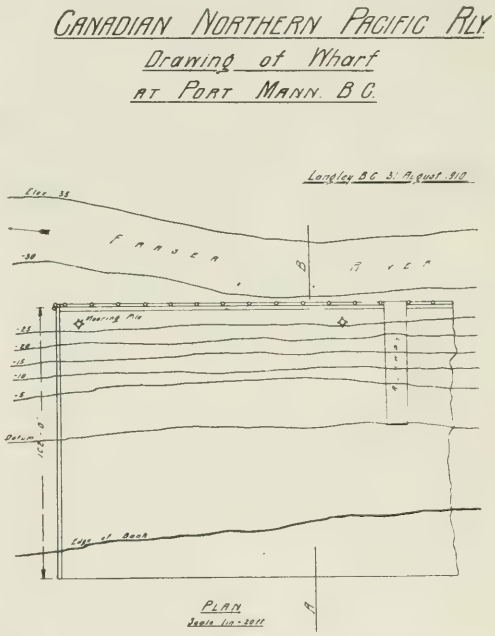
An Engineering Weekly

CANADIAN NORTHERN PACIFIC RAILWAY COMPANY'S WHARF AT PORT MANN, B.C.

BY W. C. SWAN, C.E.

The Fraser River is by far the greatest highway for fresh water shipping in British Columbia. It is navigable at low water for a distance of 60 miles from its mouth, while at high water it is navigable as far up as the town of Yale, more than 100 miles from the mouth. The river is tidal for 55 miles, at which point very slight rapids, known as the Sumas Riffle, overcome the effect of the tide. The current flows at the rate of seven miles per hour through the Riffle. The average rate of flow on the lower 50 miles of the river is about three miles per hour during the greater part of the year, and five miles per hour during the freshet time of June and July.





The finest agricultural land of British Columbia is, undoubtedly, to be found in the Lower Fraser Valley. The low lying portions, subject to flood at high water, are gradually being reclaimed by the construction of privately owned and government dykes. The corrosion of the bank is, however, the greatest difficulty to be overcome in preserving this splendid soil. Hundreds of acres are washed away annually, and the writer knows of one farm which has, during the past ten years, lost forty acres of first-class farm land. It would require, at the lowest estimate, $40,000,000 to adequately protect the banks of the Lower Fraser Valley, and to properly confine the river to its present channel.

Situated 20 miles from the mouth of the river is the townsite of Port Mann, the future industrial terminus of the Canadian Northern Railway on the Pacific Coast. Seven hundred and fifty acres, or about a third part of the townsite, have already been cleared. The accompanying photograph will give some idea of the natural features of the townsite. The location has been pronounced by prominent landscape artists and engineers to be an ideal one, as it undoubtedly is. Running back from the river, it is level for about half a mile, then there is a fairly abrupt rise of about seventy-five feet, beyond which a uniform slope of two or three feet per hundred is maintained clear to the boundary of the townsite. The area is broken only by three small streams.

Situated on the waterfront, slightly east of the central portion of the townsite, lie the Port Mann yards, where several miles of track have already been laid. Port Mann wharf stands on the Fraser River opposite the middle point of the yards. The object of this article is a description of Port Mann wharf.

The pardon of the reader is requested for so lengthy an introduction, but in view of the comparatively recent development of British Columbia, it has seemed to the writer that this geographical description might not be amiss.

Before locating Port Mann wharf, two and a half miles of water frontage were carefully sounded, lines of sounding being extended from the shore at short intervals, for 150 ft. into the river. The location selected gives the best water

available, for although a depth of 30 ft. of water was obtained 100 ft. from shore for practically the whole two and a half miles of water frontage, 45 ft. is found 100 ft. out from the shore for the entire length of the wharf, and for severol hundred feet farther west. The accompanying cross section of the wharf gives an accurate idea of the river bed at the point in question.

The sounding rods were then used to determine the nature of the foundation for piling. It was with great difficulty that the rods were put down, and with still greater difficulty that they were withdrawn. The soil is a river silt for a depth of at least thirty feet. This silt is a very

View of Port Mann Townsite, Looking South.—Taken from the Wharf.

fine sand, sticky like quicksand, when wet, but much firmer. Before making out a bill of piling, it was thought advisable to drive test piles. Two test piles were accordingly driven. The first was given a 25-ft. penetration, going at the last blow under a six-foot drop of a 4,300-lb. hammer, a distance of 15 inches. The second pile was given a penetration of 35 ft., going at the last blow 6 inches under a 10-ft. drop. Both piles were allowed to stand over night. Next morning the shorter pile penetrated only 3 inches under a 10-ft. drop of the hammer, while the longer pile resisted driving for seven blows under a 10-ft. drop of the hammer, and finally, being started, went 4 inches at a blow. It was accordingly decided that 30 to 35 feet of penetration was sufficient. It was found later that 35 ft. of penetration best suited the inner half of the wharf, while 20 to 25 feet was ample for the outer piles.

The distance between piles was, of course, governed by the loading of the wharf and the bearing power of the piles. When an impenetratable stratum of material is met with the pile probably derives its bearing power to the greater extent from this end bearing, but where penetrable soils are encountered throughout the driven length of the pile, the bearing is derived almost entirely from frictional resistance on the surface of the pile. The maximum bearing power of any pile is, of course, fixed by the strength of the projecting portion of the pile as a column.

To determine the bearing power of piles from calculation the Engineering News formula is the most simple and quite as reliable as any.

$$P = \frac{2\,w\,h}{d - 1}$$

where P is the safe bearing load in tons
W is the weight of the hammer in tons.
h is the fall of the hammer in feet, last blow.
and d is the penetration in inches, last blow.
Another simple formula is given by Saunders.

$$P = \frac{w\,h}{8\,d}$$

the notation being the same as above with the exception that "d" is the penetration in feet. Both are empirical formulae, and must, of course, be used with judgment. I consider that either of these formulae is very reliable and convenient. The following is a comparison of values given for "P" for the same pile.

W = 1.5 tons.
h = 10 ft.
d = 2½ inches = 0.21 ft.

Engineering News formula—

$$P = \frac{2 \times 1.5 \times 10}{2.5 - 1} = \frac{2 \times 1.5 \times 10}{3.5} = 8.6 \text{ tons.}$$

Saunders' formula—

$$P = \frac{1.5 \times 10}{8 \times .21} = \frac{1.5 \times 10}{1.68} = 8.9 \text{ tons.}$$

This is, indeed, a very good comparison, having less than 4 per cent. variation.

Before giving the details of construction of Port Mann wharf, it may be well to note the dimensions, which are as follows: Floor length, 1,000 ft.; floor width, 102 ft. The floor of the wharf is 16 ft. above mean water level of the Fraser River at this point. A bill of material covering all the materials of construction is given at the close of this article. The east 500-ft. section is known as the rail unloading wharf, and the west 500-ft. section as the freight wharf, over which it is proposed to construct freight sheds 76 ft. by 490 ft.

Let us now look at the details of construction of the wharf. First, to consider the foundations; cedar piles were used entirely for bearing. Under the rail unloading wharf the piles were spaced at 9 ft. centres, the bearing load per pile being 16 tons (of 2,000 lbs. each). This was equivalent to the dead load of 400 lbs. per sq. ft., corresponding to eight single tiers of 80 lb. steel rails piled as closely as possible. As a matter of fact, portions of the rail unloading wharf have had occasion to carry the weight of six double tiers of rails, or twelve single tiers, and not the slightest settlement was noted. The freight wharf piles were spaced at 10 ft. centres, the designed load being 300 lbs. per sq. ft.,

Rear View of Port Mann Wharf and Yards Under Construction.

which gave a total bearing of approximately 15 tons per pile. In every case where the driven piles were allowed to stand over night, and the hammer put on the next morning, they resisted driving entirely for several blows, so that a bearing load of 15 or 20 tons per pile gave an entirely ample factor of safety. The piles used were a splendid quality of cedar, such as are only to be found in British Columbia, being straight, sound and maintaining well their size. The longest of these was 90 feet. Springing piles at the face and end

of the wharf were of fir, as were also protection clusters driven at the wharf ends and the mooring piles, since, in a matter of cross bending fir has nearly three times the strength of cedar.

Next, let us consider the timber in the wharf. Douglas fir was used entirely, being the cheapest, and also the best, timber in British Columbia. This timber retails at from $13 to $15 per M., according to the sizes. It was supplied by the Canadian Western Lumber Co., whose immense mills on the north bank of the Fraser River, almost directly opposite Port Mann, are probably the largest in the world. The caps are 14-in. by 14-in. timber, a section of which, although not the most economical for the given loading, was considered best, as it gave added stiffness to the bents and provided a better joint. The caps were run at right angles to the face of the wharf. The splice indicated on the accompanying elevation was a 12-in. step joint, which, with the head of the pile having a minimum diameter of 18 in., provided for at least a 3-in. bearing of the cap outside the splice. To obtain this 3-in. bearing, however, occasioned some difficulty with the contractor, so that a butt joint was substituted, the ends of the caps being fastened down with a 24-in. drift bolt, driven 4½ inches from the end of the cap. The position of the shorter cap, as shown on the elevation, was varied, so that the break in the cap joints of alternate bents did not fall opposite to one another.

The joists were of dimensions 4 in. by 10 in., being staggered and overlapping one foot. They were toe-spiked to the cap with 6 in. wire spikes. The flooring was 3 in. in thickness. It should have been specified as dressed to 3 in. thickness, but this was not done, and in consequence the first portion of the floor laid was somewhat rough. The wharf floor was faced with two pieces of 12 in. by 12 in. waling drift bolted to one another, as shown in the elevation, and drifted in turn to the caps. This waling was perfectly lined, and has given the face of the wharf a very finished appearance, and has also done good service in operating the wharf to date.

Outside of each of the outer bearing piles were driven springing piles of fir. These springing piles were driven rather farther from the bearing piles than is shown on the plan, being distant 3 ft. centres at the river bed, and butted against the 14-in. by 14-in. cap with twelve inches clear be-

Fraser River, from C.N.P. Railway Track.

tween the piles at the top. Their object is, of course, to take the shock of a vessel coming to her mooring alongside the wharf. These springing piles were cut off on a bevel, being flush with the upper 12-in. by 12-in. wale on the inside, and sloping outward at an inclination of 30 to the horizontal. This uniformity of slope of these outer piles considerably enhances the appearance of the wharf. An 8-in. by 12-in. spacing wale was made fast along the entire face of the wharf, between these springing piles.

Mooring piles were driven as shown on the plan. They were braced to the four nearest bearing piles by means of 8-in. by 8-in. struts.

On the freight wharf two runways were constructed according to the details shown on the plan. Sliding stringers support the removal planks of the flooring over the runway, so that when not in use the runways may be covered in. These sliding stringers operate on rollers suspended from the joists of the adjoining portion of the wharf. They may be handled by one man quite readily.

Three four-pile clusters were driven at each end of the wharf, the first at the outside corners as a protection to that portion of the structure, and the two inner clusters in a line,

Port Mann Wharf, from the River.

making an angle of 45 with the face of the wharf. These clusters support glance booms, which were placed at the wharf ends to fend off ice in winter, and floating trees, &c., at freshet time. Owing to the tide causing a change in the direction of the current during the winter season, the placing of a glance boom at the west end of the wharf was also necessitated. The cluster piles were bound together near the top with ¾-inch steel cable.

Below is given the bill of material for the entire wharf.

In closing it will be of interest to note the cost of this work. The piling was paid for under two headings, "Piles driven in the finished work" and "Pile cut-offs," the price for the latter being the cost of the pile delivered on the work. Summing the daily records of time and material, the approximate cost of the various portions of the wharf was as follows:—

Piles driven in finished work ..... $ 0.18 per lin. ft.
Pile cut-off ..... 0.10 per lin. ft.
Timber ..... 17.50 per M.
Iron (wrought and cast) ..... 0.0475 per lb.

Considering the high price paid for labor covering this work, the cost is very reasonable indeed, as wages for labor generally in British Columbia are 40 per cent. higher than those paid in Ontario at the present time; and it might be well to add, so is the cost of living. Why? Because we have in this province, generally speaking, the laziest farmer in Canada, living on the unearned increment. But that is another story.

Some minor changes were necessitated from time to time in the bill of material, but as the final estimate varied less than 2 per cent from the foregoing bill of material, these changes are not worth recording.

PEEL COUNTY ROADS.*

C. R. Wheelock, County Engineer.

The system of roads assumed by the county of Peel, and approved by the Lieutenant Governor-in-Council, as provided by the Highway Improvement Act, is said to be one of the best laid out systems in the province. The county is an irregular shape, the townships adjoining the easterly and northerly boundaries being gores. It increases from a width of eight miles at the southerly boundary (the northerly shore of Lake Ontario) to a width of 19 miles at the north and the greatest length from south to north is 35 miles. The road system consists of one main north and south road, known as Hurontario Street, running through the county from Port Credit on the lake shore at the south to Orangeville at the extreme north, and the following main roads running east and west, all of which cross Hurontario Street; the Lake Shore Road, running along the lake shore through the county; Dundas Street from the Etobicoke River (the easterly boundary of the county) to Erindale; the Brampton Side Road, from the ninth line of Toronto Gore Township (near the easterly boundary of the county) to the westerly boundary of the county; the Bolton and Terra Cotta Road, from Bolton to the westerly boundary of the county. Besides the above main roads, there are a number of shorter pieces, all connected with the main roads except ten miles in the north part of the township of Albion, leading to the village of Palgrave. This makes a well connected system of roads leading to the markets of the county, and also forming connections with main roads in adjoining counties for through traffic.

The by-law designating a system of roads to be assumed by the county was passed by the council in 1906, and work was commenced on the roads in the following year. The principal work done the first year was the building of a number of bridges and culverts necessary to allow the heavy road-building machinery to pass over the roads, only one mile of road was completed. This piece of road was well constructed. In the first place, it was properly graded and drained and then metalled with crushed stone consolidated with a steam roller. Although there was considerable opposition from the people while the work was being done, after it was completed everyone seemed to be well satisfied, and the work on the county roads has gone on steadily since that time with very little opposition. At the end of last season 65 miles had been graded, metalled and completed, and besides about 10 miles were graded ready for metal. Permanent bridges and culverts, of cement concrete and steel, have been built where required on almost the whole system, leaving very few old ones to be replaced. We have built a total of 41 bridges of 10-feet span and over, and 58 reinforced concrete culverts up to 10-feet span, and besides have put in 357 concrete and steel pipe culverts. The total amount expended up to the 15th of November last and certified as coming under the provisions of the Highway Improvement Act is $240,618.77, and the total amount paid to the county by the government, as provided by the Act, is $81,995.94 (including the one-third due for last season's work).

* Paper read at Ontario Good Roads Association Convention, Feb. 27th, 1912.

The roads are graded from 22 ft. to 28 ft. wide and metalled from 8 feet to 15 feet wide. The depth of the metal consolidated is from 6 inches to 7 inches. The metal used was crushed stone, crushed and screened gravel and natural pit gravel. The most of the crushed stone used was brought in by rail, as local material was not available, and in such cases the freight rates increased the cost very materially. In some cases the freight on stone which cost 50 cents per ton f.o.b. at the quarries was $1.00 per ton. If this association would take this matter up and could succeed in having the freight rates on stone reduced, it would certainly help along the good work of road improvement in sections where local material cannot be procured.

The total cost per mile for the different classes of roads was as follows:—

Roads metalled with crushed stone, shipped in, from	$2,500 to	$4,000
Roads metalled with crushed stone, local, from	2,000 to	2,500
Roads metalled with gravel crushed and screened from	1,800 to	2,300
Roads metalled with screened gravel	1,500 to	1,700
Roads metalled with pit gravel, from	900 to	1,300

The road machinery owned by the county is as follows: 3 ten-ton steam rollers which cost $8,300; 3 road sprinklers, cost $734; 2 rock-crushing plants, consisting of a crusher, elevator, rotary screen and 20-ton mounted bins, cost $1,400 for each plant; 1 gravel-screening plant, consisting of a 4 horse-power gasoline engine, elevator, rotary screen and 12-ton mounted bins, cost $1,125; together with graders, wheel scrapers, drag scrapers, plows and tools; amounting in all for the entire plant to about $14,500.

The cost of operating a plant crushing stone amounted to $15 per day, including the amount paid per day for a 14 horse-power traction engine which supplied the power. The amount of stone crushed averaged about 40 cubic yards per day, making the cost of crushing about 37½ cents per cubic yard.

The crushing plants were also used in gravel pits where there was an excess of coarse gravel and stone. The material was run through the crusher, screened and separated in the bins. The cost of operating, including the cost of handling stone and gravel in the pit, was about $25 per day. An average of about 60 cubic yards of metal per day was turned out, making the cost about 42 cents per cubic yard.

The gravel-screening plant was used in a pit where there was an excessive amount of sand intermixed with the gravel. This was screened out and the fine and coarse gravel which was left was separated in the bins ready for the roads. The cost of operating was about $10 per day, and the amount of screened gravel obtained about 28 cubic yards per day, making the cost of screening about 36 cents per cubic yard.

The Highway Improvement Act has done much to demonstrate to the people of Ontario the advantage of good roads, and has given an impetus to road building on scientific principles in many parts of the province. It has, however, been generally admitted that for obvious reasons the aid given to counties under the Act is not sufficient for main roads which have to be kept up for through traffic. And it now seems that in the orderly course of progression the time is ripe for a further step in the shape of a provincial system of highways, to be built and maintained by the province, with the aid of the subsidy to be given by the Federal Government for the improvement of highways. These roads would be object lessons in the scientific construction and maintenace of highways, and would do much for the cause of good roads in an educational way. Besides, the best results should be achieved at a minimum cost, as the roads could be constructed and maintained on the most approved principles under experienced supervision.

In selecting the roads for a provincial system of highways the object in view should be the greatest benefit to the greatest number, and in carrying out this very wise maxim the farmers, who are the backbone of this agricultural province of ours, should get the first consideration. In fact, it seems to me that if we do what is in the best interests of the farmer in this matter, we will not require to go much further, as the interests of the farmer are so interwoven with the interests of the business man and the prosperity of the urban municipality depends so much on the prosperity of the rural municipality, that their interests cannot be separated.

Now, I do not think any general scheme can be laid down for this system of roads in old Ontario that is more practicable and will answer all purposes better than a connected interurban system having at least one main road through each county. This would provide a system of trunk roads for tourist traffic, as well as the roads for interurban traffic. This system of roads built and maintained by the province, with well constructed lateral roads or feeders built by the counties, would give us a system second to none on the continent. It would require, say 2,200 miles of road, to cover this system and would cost, say $15,000,000. This amount would necessarily be spread over a number of years, as it would be required only as the roads were built, and would be a small amount compared with the enormous sums expended on roads by other progressive counties.

BUILDING STONE FROM BLAST FURNACE SLAG.

The manufacture of building stone from smelter and blast furnace slag is an industry of considerable importance in Germany, and is carried on to a greater or lesser extent at nearly all these furnaces. The process is not patented and is very simple in details. Practically all blast-furnace and smelter slag is suitable for stone-making. Slag for this purpose must, however, be in a granulated state. After it has been allowed to harden it is unsuitable. All attempts to utilize slag that has been crushed or ground, after having once hardened, have failed to produce solid stone.

The slag is granulated by the addition of water as it flows hot from oven or furnace. The granulated slag after being thoroughly mixed with the required proportion of lime is allowed to stand one hour before being put through the press. After being pressed, the stones are stacked in the open air, where, after three or four weeks, according to the weather, they are ready for use. Under low temperature they harden slowly. If subjected to frost before thoroughly hardened, they are crumbled and destroyed. Operations may, however, be continued in the winter, the stones being hardened in steam-heated drying rooms. These stones grow constantly harder with time and after several years show a resistance of 100 kilos. per square centimetre.

THE BRITISH COLUMBIA ELECTRIC RAILWAY.

The report of this company up to the 30th of June, 1911, has been published in London, England. The net profits for the year are shown by this statement to be $1,363,461.00; this is an increase of 17% over the net earnings of the preceding year. The company now have 233.65 miles of track and 647 cars in operation. The number of passengers carried during the year was 46,541,448. The report shows that the company are planning for considerable development work in the near future.

TESTS ON THE STRENGTH OF NAILED JOINTS.*

J. H. Thornley, B.A.,Sc., '08.

In this day of steel and concrete, a discussion of anything pertaining to timber construction may seem somewhat out of place, but to the Canadian hydraulic engineer at least timber is still a building material of prime importance.

The brief nail test here reported was made in connection with the design of the Porcupine Power Company's Hydro-Electric plant at Sandy Falls on the Mettagami River, built by H. D. Symmes, of Niagara Falls, Ontario.

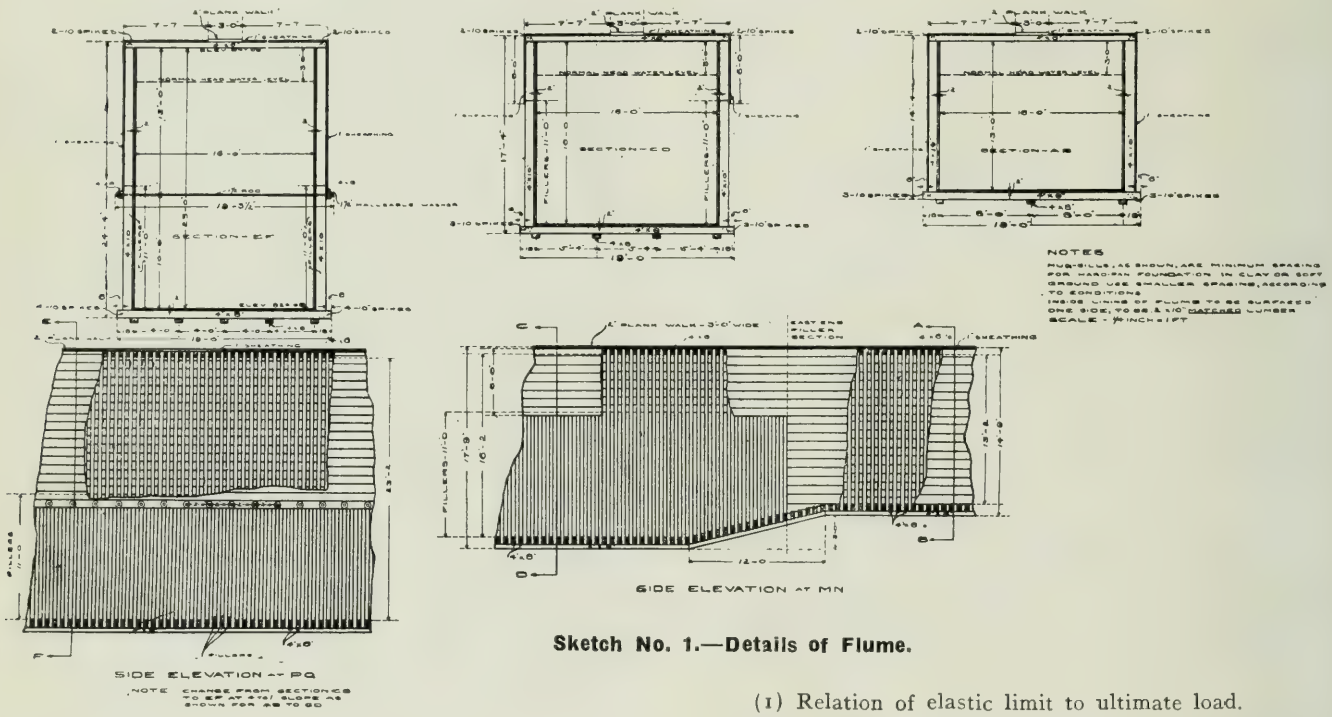
A word or two regarding this plant may be in place since the qualities sought in the joints tested can only be understood by a consideration of the special construction conditions.

Since the generating plant, a 4,500 h.p. hydro-electric station, was at the time of construction more than forty miles by bush road from the nearest station, and since it was essential that the plant should be constructed with the utmost speed, it was desired to cut to a minimum the use of steel, concrete or other bulky materials requiring to be brought in from the railroad. It was, moreover, desirable to use none but the simplest timber construction on account of the difficulty of turning out carefully sized lumber from a temporary sawmill, and also because it was the intention to avoid labor trouble by using lumberjacks rather than carpenters for the bulk of the work,—an obvious impossibility on work demanding car ful framing.

A rock filled corn crib and stop log dam and timber power house would satisfy conditions both in the matter of construction and material, but the flume offered difficulties. The standard types demanded a great deal of steel in the form of bolts and tie rods and the use of these bolts and rods demanded a fair average degree of skill, in the gangs erecting the work. Finally, after getting out several designs, that shown in Fig. No. 2 was suggested. As will be noted, the construction consists of a corn crib, such as is used in a crib and stop log dam, only that in the case of the flume the crib is turned on its side and sheeted on the inside instead of the outside. This construction called for the use of a minimum of steel, and since practically no skill was needed beyond the ability to drive nails, the flume could be built by lumberjacks quite as well as by carpenters. The one question in doubt was that of the possibility of constructing a nailed joint sufficiently strong to withstand the hydrostatic pressure. It was to determine this point that the tests, the results of which follow, were run.

Purpose of Test.—To ascertain the transverse holding power in pine lumber of nine-inch spikes (4½ to the pound), and in particular to find the permissible load on a nailed joint as used at lower corner of a corn crib flume of construction as shown in Sketch No. 1, and to find what nailing will give maximum strength for such a joint, that is, to find a nailing with which failure will be equally likely to occur by cracking of the timbers or by drawing of the nails.

Three characteristics of any timber joint of great importance are:



Sketch No. 1.—Details of Flume.

(1) Relation of elastic limit to ultimate load.

(2) Extreme permanent deflection possible without lessening of ultimate strength. This point is of prime importance since, owing to the inequalities in size of commercial lumber, more particularly in unplaned material and to unavoidable inaccuracies in work fabricated by carpenters, joints are often called upon to undergo very considerable deflections before the theoretical distribution of loads occurs.

(3) Effect of moisture and frost. The present test would have no bearing upon this point.

Method of Test.—The specimen was made by nailing together three pieces of 4 in. x 8 in., 4 in. x 10 in., 3½ in. x 8 in., or various combinations of these sizes, as shown in Sketch No. 3.

Sketch No. 2 shows the nailing used for the most of the tests.

Sketch No. 1 shows the nailed joint as used in the flume.

In Sketch No. 3—

"A" is a ½-in. steel plate used to distribute the load applied to the end of the 4 in. x 8 in. piece marked "F."

"B" is a universal head of the ball and socket type.

"G" and "H" are piles of blocking.

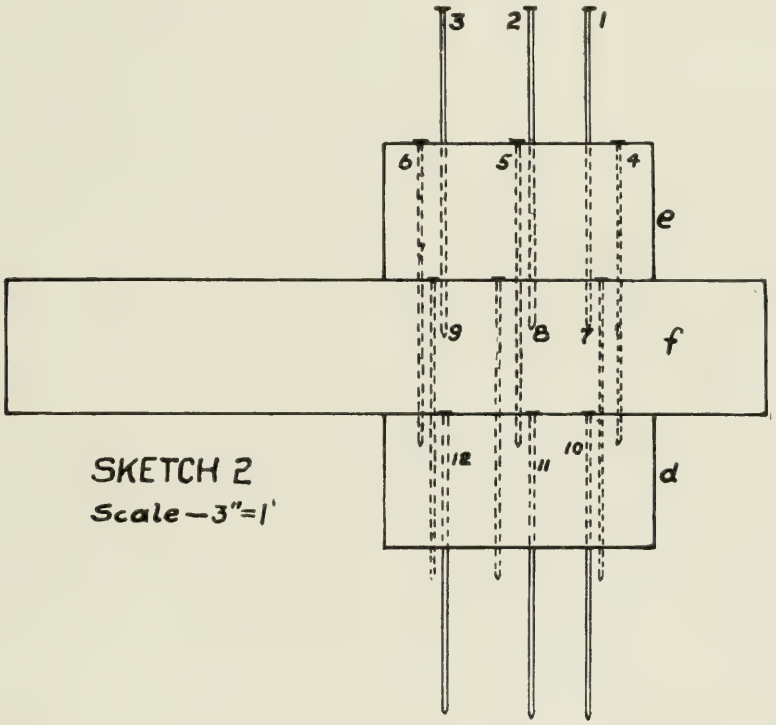
* From Applied Science, Feb., 1912.

"C" is a wedge-shaped piece of steel attached to the upper or movable head of a one hundred ton testing machine.

In several of the experiments the universal head "B" was dispensed with and the load applied directly to the steel plate "A." This had no apparent effect on the results.

Analysis of Nailing in Accordance with the General Laws, as Deduced from Previous Experiments.—Referring here to Sketch No. 2, which represents a joint at the lower corner of a 13 ft. x 16 ft. section of the flume, the effect of nails Nos. 1, 2, and 3 on the elastic limit load of the joint is obtained thus:

Since "grip" has no effect on elastic limit of joint, the elastic limit load of nail No. 1 should be $Cd^2 = 5500 \times (\frac{3}{8})^2 = 770$ pounds. The effect on the ultimate load of the joint



will be $2\,Cd^2 \times \frac{\text{grip}}{\frac{1}{3}\text{ length of nail}} = 2 \times 5{,}500 \times 9/64 \times \frac{1}{3}$

= 518 per nail if failure result from drawing of the nails.

The effect of nails Nos. 4, 5, and 6 on the elastic limit of joint must be considered for the points "A" and "B." Each nail will be effective at these points. Elastic limit load on No. 4 = $Cd^2 \times 2 = 5500 \times (\frac{3}{8})^2 \times 2 = 1540$ pounds. The ultimate load of No. 4 at "A" will be 1540 pounds and at "B" 513 pounds.

Each of Nos. 7, 8, and 9, will effect the elastic limit load to the extent of 770 pounds and the ultimate load to 1540 pounds.

Nails Nos. 10, 11 and 12 will have no effect on either the elastic limit or the ultimate load of the joint, except as they may effect a possible failure by cracking of the timbers.

Summary of Results of Previous Experiments Bearing on Strength of Nailed Joints.

In as far as could be ascertained, no experiments have been made on the transverse strength of the nailed joints made with nails larger than 60d. (6 in.), but from experiments with 60d. and smaller sizes of nails the following general laws have been deduced:—

1. Permissible deflection of a nailed joint 1/16 in. for 60d. nails.

2. Elastic limit of joint will be one-half ultimate strength.

3. Strength of joint is directly proportional to the number of nails used and is independent of relative position of nails when failure does not occur by cracks in timber.

4. The holding power of a nail at the elastic limit is expressed by the equation Cd^2 where C is a constant dependent on the material (5500 for pine, fairly dry) and d. is the diameter of the nail in inches (⅜ in. for 9 in. spikes 4½ to the pound). This holding power is independent of the length of the grip (that is, that part of the nail between the point of application of a shearing load and the point of the nail). It will be noted that according to this equation the elastic limit is entirely dependent upon the material, under a crushing load of the timber.

5. The holding power of a nail at ultimate load varies directly with the length of the grip up to a grip of one-third the length of the nail when it becomes practically constant and is expressed by the equation,

$$\text{Ultimate load} = \frac{2Cd^2 \times \text{grip}}{\frac{1}{3}\text{ length of nail}}$$

In consideration of the fact that wooden joints show a deflection of an inch or more before reaching ultimate load, a brief study of Sketch No. 2 would suggest that the ultimate load on the joint shown must be taken up by the nails in two ways.

(a) By a resistance to withdrawal from the wood.

(b) By a bending of the nail resulting from the shearing force and the resistance to crushing of the wood. Since nails with a grip of an inch or better are bent into very similar curves, this second element does not vary with the grip but is constant. A more reasonable equation for ultimate load for a nail as governed by grip would appear to be

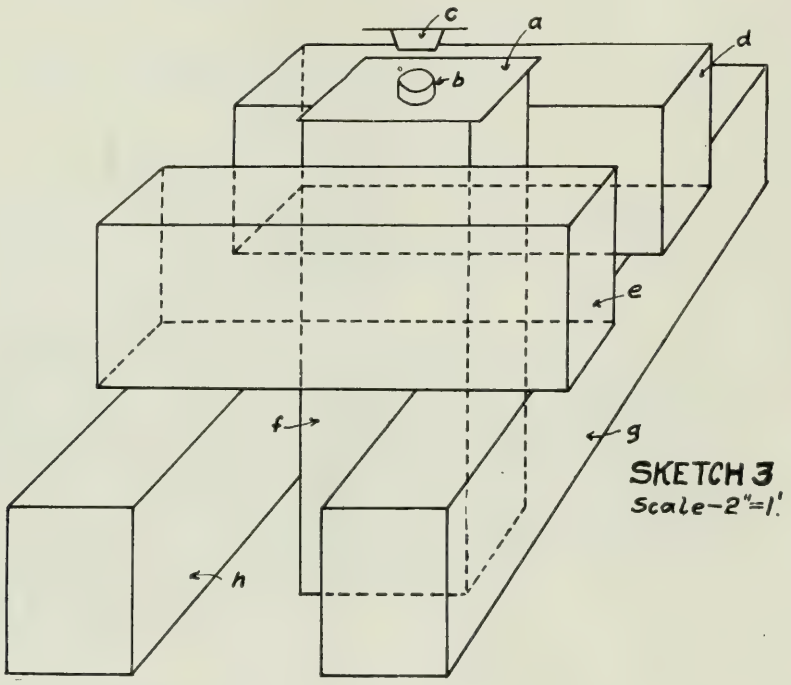
$$(2\ Cd^2 \times \frac{\text{length grip plus X times } Cd^2}{\frac{1}{3} \text{ length nail}}).$$

The value of X as assumed in these experiments was two-thirds. It will be noted that the value of this expression is dependent upon the modulus of elasticity of the timber and the steel in the nails.

failure of the timbers, this was in agreement with the observations.

In experiments Nos. 6 and 7 the nailing was as before, but the timbers were of an intermediate size 4 in. x 8 in. Failure occurred at about the same average load per nail as in experiments Nos. 1, 2 and 3, but while in No. 6 failure occurred by breaking of the timbers, in No. 7 the failure was due to bending and drawing of the nails. The proportioning of nails to timber was, therefore, about correct.

Omitting experiment No. 8 and averaging the values of a 9-in. spike as found in the remaining four experiments where failure took place by drawing of the spikes and using number of nails as found by equation, $\frac{\text{grip in inches}}{\frac{1}{3} \text{ total length}}$ —const., we get 1570 as ultimate load value in shear of 9 in. spike in pine, as against a theoretical value of 1540 pounds. The greatest divergence of a single experiment from the average was 60 pounds.



Notes on Results of Experiment.

To design a well proportioned joint it was necessary first to ascertain the laws governing the holding power of a 9-inch spike in cases where the failure took place by drawing of the spikes, that is, to find the value of one spike, and second to find the limiting number of spikes which would develop their full load (that is, would not cause failure by splitting) in a joint made up of 4 in. x 8 in. pieces. The 8 in. dimension was fixed by the load on the side of the flume under consideration.

Specimens Nos. 1, 2, and 3 were made with 4 in. x 10 in. used as cross pieces (failure by cracking would occur in the cross pieces if at all) and with two, three and four nails per piece respectively. In every case the failure of the joint took place in the nails, and since the results were quite uniform (1580, 1590, 1570 average per nail respectively) it may reasonably be concluded that these values would hold for 9-in. spikes in pine regardless of the dimensions of the timbers.

In experiments Nos. 4 and 5 the number of nails was as before, but the timbers were reduced from 4 in x 10 in. to 3½ in. x 8 in. Failure occurred at a much lower value per nail than with the 4 in. x 10 in., which would suggest a

Supposing the effect of the relation of grip to total length to be as suggested by Merriman, that is, the efficiency of the nail varies as $\frac{\text{grip in inches}}{\frac{1}{3} \text{ total length}}$ up to a grip equal to ⅓ of the length, the average value of a nail as found by the experiments would be 1920 pounds, and the greatest variation from this shown by any experiment would be one hundred and fifty pounds.

Therefore the equation introducing a constant for the effect of the bending of the nails seems, both from the standpoint of theory and observation, to be somewhat the nearer to the truth, though the experiments were far too few in number to in any sense settle this point. The constant assumed, ⅔ Cd^2 where C for the lumber used = 5500, and d = diameter of nail in inches, was in all probability somewhat excessive.

In the light of subsequent experience in actual field construction, the writer would judge that the value of C should be, for commercial grades of pine, somewhat higher than 5500, while the fraction two-thirds might with advantage be reduced to one-third or less.

Adverting to the summary of the results of previous experiments:

(1) The permissible deflection value of 1/16 inch, that is, deflection which can be caused without weakening the joint, is altogether too small. Joints tested to deflections of an inch and more seemed to be in no way weakened. This is a very strong point in favor of the nailed timber joint.

limit, but for practical purposes there can be no doubt that it is at least fifty per cent.

(3) The relation stated between the strength of a joint and the number of nails used, that is, that strength of joint is proportional to number of nails and entirely independent

8.—	D, E & F. 4 in. x 8 in.	9 NAILS 3 Nails with 1 in hold omitted	Pine rough Fairly dry Extra Good material	13000	16[illegible]0	7	8	2160	2[illegible]0	1540	6930	" "	The results from this specimen, as will be noted, show very poor agreement with the other theoretical values or with the observed values of the other seven specimens. This is probably, in part at least, a result of the extra good lumber used. It is included as showing a probable limiting maximum value for the nails.

NOTE:—Observations of Elastic Limit Load were entirely unsatisfactory since the specimens showed large permanent deflections under the first 25% or less of the load but even when the specimen had been stressed almost to the point of failure with corresponding deflections of an inch or more the load could be released and again brought about above the previous high point without causing any material increase in deflection beyond that which had resulted from the first loading

(2) As has been pointed out, no satisfactory results were obtained regarding the relation of elastic limit to ultimate load. The percentage relation of elastic limit to ultimate load would depend on the definition assumed of elastic

of arragemet of nails where failure does not occur by cracking of the timbers, was entirely borne out by the experimental results. Various arrangements of the nails were tried, the nails of almost every specimen being differently spaced, but as will be noted, no material difference in holding power resulted.

COST OF WATER PURIFICATION.

Filter operating costs at the water purification plant at Wilmington, Del., during 1911, averaged $1.08 per million gallons. Preliminary treatment of the water from the Brandywine River by rapid filtration through beds of sponge clippings cost 47.4 cents per million gallons, making a total cost of $1.554 per million. The slow sand plant comprises six units which are washed by a Blaisdell sand-washing machine. The distribution of cost for the slow sand filtration, according to figures given out by Mr. John A. Kienle, chief engineer of the water department, is as follows (in cents per million gallons of water filtered): Salaries, 53.6; additional labor, 10.3; supplies, 6.6; light and power, 16.6; repairs and renewals, 3.5; other operations, 5.0; recaulking groined arch seams, 12.3. During the year 3,680,000,000 gallons passed through the plant. The above charges do not include interest on first cost or laboratory charges. The purification process, on the same basis, cost 49.1 cents per million, distributed among the following items (cents per million): Salaries, 25.3; additional labor, 2.1; supplies, 2.1; light and power, 0.7; repairs, 10.0; other operations, 8.3. Samples of raw and treated water are analyzed daily, the laboratory charges amounting to 47.4 cents per million.

BOILER EXPLOSIONS.

Statistics of the Board of Trade Report of Great Britain for the year 1910 and up to the 22nd of June, 1911, show a total of one hundred and five explosions and sundry mishaps to boilers. A considerable percentage of these explosions occurred in marine boilers at docks or in British waters, the balance are distributed amongst chemical works, engineering works, iron works, copper works, collieries, electrical works and cold storage plants. The chart shown in Fig. 1 illustrates the variety of explosions since the year 1859, when statistics were first compiled. The chart shows the year 1910 to be among the heaviest seasons.

The following tables give the description of the boilers which have exploded or collapsed during the twenty-eight and a half years from June, 1882, when the first Boiler Explosion Act came into operation, to December, 1910, and the causes of these explosions and collapses; and the numbers of explosions, collapses, and mishaps reported on by the Board of Trade, and the total and average number of deaths resulting therefrom during the twenty-seven and a half years ending 31st December, 1909, with the corresponding figures for the year 1910:—

Type of Boiler.	Land Boilers		Boilers Afloat.	
	Number of Explosions.	Number of Collapses.	Number of Explosions.	Number of Collapses.
Plain cylindrical	68	0	0	0
Locomotive and portable.	43	37	0	2
Cornish	40	66	0	0
Vertical, with internal fire-box	25	154	8	35
Lancashire	20	32	0	0
Galloway	0	10	0	0
Chimney	1	6	0	0
Marine	1	0	5	77
Return flue	0	0	7	10
Water-tube	15	0	1	0
Multitubular, externally fired	1	0	0	0
Miscellaneous	25	4	0	3
Hot-water	89	4	0	0
	328	313	21	127

From this report we select a description of a boiler explosion and gas engine explosion rated by the report as a sundry mishap.

Explosions and mishaps to boilers used for heating buildings

Fig. 1.

On the 18th September, 1910, four Lancashire boilers exploded out of a group of eleven, and displaced the remaining seven from their seats.

The boilers were numbered 1 to 11. Nos. 1 to 7, made in 1880, were of iron, 30 ft. long by about 7 ft. 10 in. diameter. Nos. 8 and 9, made in 1882, were of the same dimensions, but of steel, and Nos. 10 and 11, made in 1894, were also of steel, 7 ft. 6 in. diameter and 32 ft. long.

No. 7 boiler exploded first. Its shell was made up of nine rings, each containing four plates, 7-16 in. thick, lap jointed, double riveted longitudinally, and single riveted circumferentially. The end plates were ½-inch thick, and were stayed by four gussets at each end above the flues, two at the front end and one at the back end below the flues. The internal tubes, 3 ft. diameter, were made up of one furnace ring, 8 ft. long, and six shorter rings, the second, third, fourth, and sixth being stiffened by cross tubes. The plates were 7-16 in. thick, lap jointed and single riveted longitudinally and circumferentially. The end plates were attached to the shell and flues by rings of angle iron, 3 in. by 3 in. by ½ in. There was a manhole, 20 in. by 16 in., with its major axis placed longitudinally on the top of th fifth ring of the shell, strengthened by a cast iron frame. Nos. 1 to 6 boilers were practically the same, also Nos. 8 and 9, except that their shells contained ten rings and their flues seven rings without cross tubes, but stiffened at the circular seams by bowling hoops. Also the manholes were circular instead of oval.

Cause of Explosion or Collapse.	Land Boilers		Boilers Afloat.

Seam rips	7	0	0	0
Deposit	13	12	0	35
Not ascertained	2	4	2	4
	328	313	21	127

Each of these boilers had one safety valve, 3½ in. diameter, fitted on a branch on the junction valve casing, loaded by a lever and weight to 45 lbs. per square inch. Nos. 10 and 11 were stronger boilers, and each had two independent safety valves fitted directly to the boiler shell.

The boilers were fed with good water and fired by waste gases from blast-furnaces. They were in good condition and well looked after.

No. 7 boiler was laid off for cleaning on the evening of the 16th September, and set to work again by turning on the gas at 1.45 p.m. on the 18th September. At 3.30 p.m. the pressure gauge indicated 45 lbs. per square inch, and the stop valve was opened to put the boiler in communication with the other boilers. At 5.15 p.m. the explosion occurred—fortunately, during the temporary absence of the attendant.

The boiler was torn into more than forty pieces, some of which were blown to a great height. Two of the pieces struck Nos. 6 and 8 boilers, and caused them to explode,

and in like manner the explosion of No. 6 caused the explosion of No. 5. The rest of the boilers, with the exception of No. 1. were crushed out of shape, and all were displaced from their seatings. The order of the proceedings is described with admirable lucidity in the report of the Board of Trade surveyors, who made the preliminary enquiry after the explosion, but the description is unfortunately too long to be inserted here.

It is shown that the cause was excessive pressure, probably about 150 lbs. per square inch, and that rupture commenced at the manhole and extended from it in three main lines, one longitudinally backward, the other two diagonally forwards, at about 30 deg. on each side of a line drawn along the top of the boiler, parallel to its longitudinal axis.

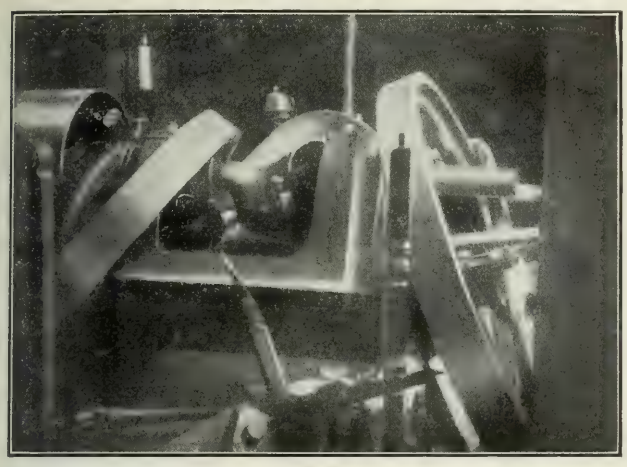

Fig. 2.

The cause of the excessive pressure was the insertion of a plug in the opening for the junction valve, which was leaking, to prevent the hot water dropping on to the men who were cleaning the boiler. By plugging the outlet for the steam the safety valve, which was attached to the side of the stop-valve casing, was cut off from the boiler and rendered inoperative.

The boiler was insured and inspected by the National Boiler and General Insurance Company, who had pointed out the dangerous position of the safety valve and the possible occurrence of what actually happened.

After the enquiry the No. 1 boiler, which, though displuaced from its seating, was uninjured, by the explosion, was tested to destruction to ascertain the pressure at which the manhole would give way. The pressure was found to be 145 lbs. per square inch.

The gas engine explosion occurred in a horizontal engine of unknown age, with cylinder 8½ in. diameter by 15 in. stroke, running at 160 revolutions per minute, with gas from a town main. The air for the cylinder charges was drawn from the interior of the bedplate, to which it was admitted through slots in one side. If by any means, such as leakage past a slightly open gas cock, gas should be forced into the cylinder during a stoppage of the engine, and if the engine should be stopped with the exhaust valve open, the space inside the bed would be filled with a combustible mixture of gas and air which might easily be fired when restarting. Something of the kind evidently occurred in the present instance. The engine had been stopped about an hour to repair the driving belt, and on restarting an explosion occurred inside the bedplate. The bedplate and a large casting on which it stood were shattered beyond repair, all the arms of both flywheels were broken, and the rims detached from them, besides minor damage. A photograph of the engine after breakdown is reproduced by Fig. 2.

A BEAM AND GIRDER SYSTEM vs. MUSHROOM.

Lockwood, Greene & Co., Boston and Chicago architects and engineers for industrial plants, recently had occasion to make comparative estimates on the cost of reinforced concrete for a 10-story warehouse 580 feet long by 109 feet wide, using beam and girder construction and a mushroom system. Unit prices were obtained from the records of work done in the vicinity in question and were as near correct as was possible to obtain for a preliminary estimate. It should be noted that the figures below do not include plant and tools or any items that would be common to both systems, and therefore should not be taken in any way as an estimate of the cost of the building. The quantities in the following table are based on one strip of floor 19 feet 3 inches wide and the height of the structure. It will be noted that the total cost per strip for the beam and girder system is $12,616, while for the mushroom design $12,432, leaving a net saving in favor of the mushroom system of $184 per strip, or $5,520 for the entire building.

The cubic yard price on 1:2:4 concrete is obtained as follows:—

Cement, 1⅔ at $1.10 net	$1.80
Sand, ½ yard	.40
Stone, 1 yard	1.00
Labor	1.00
Sundries	.10
Total	$4.30 yd.

Columns cost 70 cents per yard more for labor.

1½:3 concrete cost $1 more per yard for cement, making cost of $5 per yard for columns.

Mushroom Estimate.

Concrete 1:2:4 interior cols.=97 cu. yds., at $5.00..	$ 485
Concrete 1:1½:3 wall cols.=34 cu. yds., at $6.00..	204
Concrete in floors, including slab, capitals and wall beams=675 cu. yds. at 4.30	2,902
Forms for columns, 6,000 sq. ft. at 12c	720
Forms for column heads, 40 sq. ft. at $3.00	120
Forms for interior wall, 20 sq. ft. at $2.00	40
Forms for floor including slab and wall beams, 21,850 sq. ft. at 8c	1,748
Steel reinforcement (cost includes facing, 51 tons at 34c.)	1,734
Steel lattice columns, 58 tons at 52c	3,016
Erecting lattice columns, 32 tons at 5c	160
Brick work, 11 M at 18c	198
Windows, 2,690 sq. ft. at 30½c	807
Royalty	208
	$12,432

Beam and Girder Estimate.

Concrete 1:2:4 interior cols., 75 cu. yds. at $5.00...	$ 375
Concrete 1:1½:3 wall cols., 32.5 cu. yds. at $6.00..	195
Concrete in floor inc. beams, girders and slabs, 550 cu. yds. at $4.30	2,365
Forms for columns, 6,300 sq. ft. at 12c	756
Forms for floors, inc. beams, girders and slabs, 30,600 sq. ft., 9c.	2,754
Haunches, 80 sq. ft., $1.00	80
Steel reinforcing (cost inc. placing), 63 tons at $37	2,331
Bethlehem steel cols., 54 tons at $45.00	2,430
Erecting, 32 tons at $5.00	160
Brickwork, 20 M, at $18.00	360
Windows, 2,700 sq. ft. at 30c	810
	$12,616

A NEW HYDRAULIC VALVE.

A new type of hydraulic valve has recently been installed in the Ontario Power Company power house at Niagara Falls. The valve was designed and the principle patented by Mr. R. D. Johnson, the hydraulic engineer of the power company. Fig. 1 shows the section through the valve. The common type of sluice valve now in use works very well for low pressure and small dimensions. Such a valve is operated by hand wheel or spindle fitted with appropriate gearing. The larger types of gate valves under high pressures, are usually fitted with a by-pass and may be operated either hydraulically or by electric motors. The gate valve, however, for high pressure and large diameters is very difficult to operate.

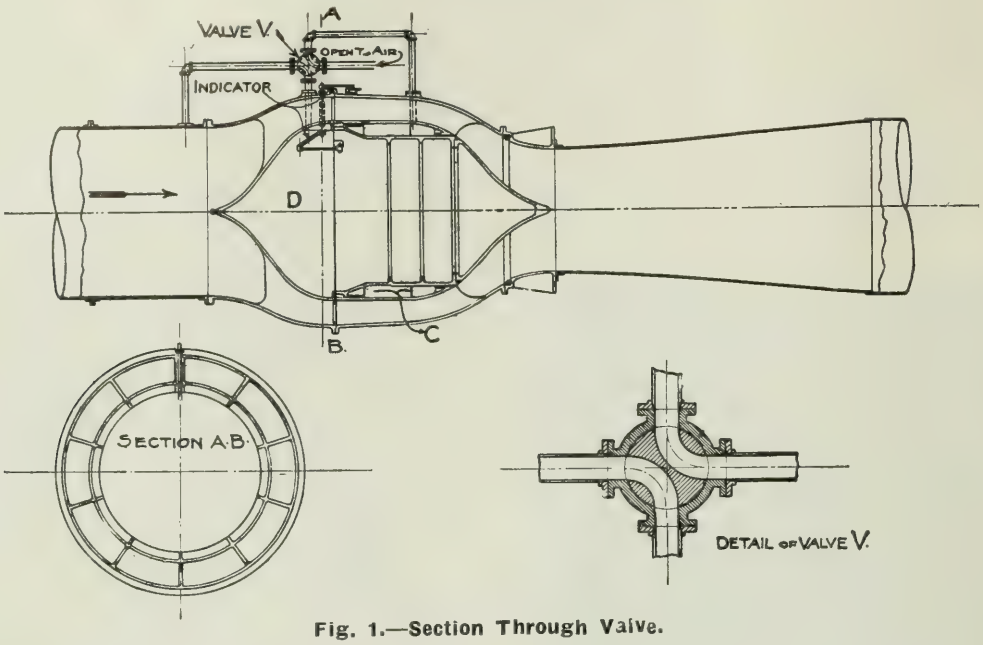

Fig. 1.—Section Through Valve.

Mr. Johnson designed this new type of piston valve to get over these difficulties. The operation of this valve is due to the difference of pressures causd by the changes in velocity of the water in the valve case. The valve, it will be noted, is composed of an enlarged and contracted section of pipe following each other closely. Inside the enlarged section is placed a stationary plunger, or bobbin, with the lower section moveable and telescoping into the upper section. When closed, the lower portion of the bobbin seats itself on a brass ring (shown in Fig 1) at the beginning of the restricted section of pipe. The opening of the valve is due to the static pressure on the submerged surface of the plunger above the valve seat. The closing work of the valve equals the static pressure inside the moveable plunger. As shown in Fig. 1, an indicator may be attached to control valve to exclude possibility of the main valve creeping from any desired opening. Valve V is a four-way valve by means of which different connections, as shown in Fig. 1, may be made. The annular chamber C is a leakage chamber. If the water is free to flow when the main valve is open, chamber C may be omitted by merging it into chamber D. Its presence is desirable as an efficient factor of safety. The valve V, in the position shown in Fig. 1, reduces the pressure in the annular chamber C to atmospheric, and the main valve closes due to full pressure transmitted into chamber D. Reversing the control valve reverses the pressure, and the main valve opens. This valve has many advantages over the ordinary gate valve, for it is simple in operation, possesses great strength, all of the parts being circular, and it is absolutely safe in operation. The valve can be designed for any dimension and any head.

Fig. 2 illustrates a 48-inch valve of this type installed at the Ontario Power Company, Niagara Falls. Two of these are placed on the exciter penstocks there. These valves are to be operated by electrical control from the power house. They have already been placed in operation and they work most satisfactorily. The two valves at the Ontario Power Company were manufactured by the Böving Company, of London, England, who hold the British patents and have offices in Toronto.

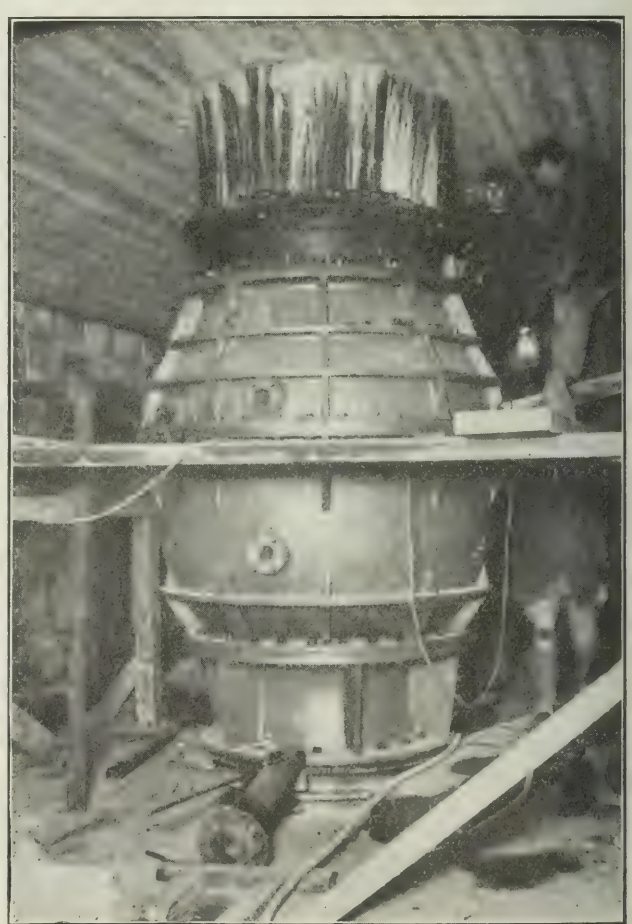

Fig. 2.—Erection of 48-inch Exciter Penstock Valve.

PREVENTION OF INDUSTRIAL ACCIDENTS.

At different times we have referred to the number of accidents occurring, and which appear to be on the increase. The majority of these accidents can be traced to carelessness, thoughtlessness, or selfishness on the part of some one, and it is, therefore, refreshing to hear that certain companies are taking measures to reduce the number of industrial accidents. Industrial accidents are those which result from the use of machinery. The Pennsylvania Railroad began a vigorous campaign of education among their employees a little over a year ago. In January, 1911, the percentage of serious injuries per month per thousand employees was 8.7. This has been reduced in less than a year to 3.5. In November, 1910, when this campaign of education was begun, experts were employed by the company to inspect the shops with a view to the installation of safety devices for the prevention of accidents. The results obtained from following the suggestions of the experts were so marked that the continuation of these inspections has become a fixed policy. The installation of the necessary protections for the machines was not very costly, in some cases the improvements being made with practically no expense to the company. Standing safety committees were formed from among the employees, for it was appreciated that the prevention of accidents depended largely on the care exercised by the individual workman. By this means many of the common and preventable accidents were avoided. The recommendations of these committees cover a wide variety of subjects, and have been the means of preventing many of the accidents so prevalent heretofore.

So successful has been the work during the past year that the Pennsylvania company are redoubling their efforts to reduce industrial accidents during the coming year. This same policy, if taken up by the small manufacturing companies and shops throughout the country, would do much towards wiping out this stain on our industrial life. In most cases there is little excuse for the numberless accidents, many of these occurring as a result of carelessness on the part of employer or employee. By the installation of safety devices and protection, the class of unavoidable accidents is reduced, and by the education of the employee the preventable accidents are avoided.

THE PUBLIC AND THE STREET RAILWAYS.

The hostility of the public towards public utility corporations has been on the increase during the past few years. In our larger cities a constant warfare is being waged between the companies operating under franchises voted by the citizens and the citizens themselves. It is hardly possible to pick up a daily newspaper without seeing column after column devoted to this conflict of corporation interests and public demands.

This is a good reason for much of the public objection to the carrying on of companies operating under municipal charters, for the companies have not as yet recognized the necessity of meeting the municipalities and co-operating for mutual benefit. Publicity of the methods of operation would no doubt do a great deal towards dissipating the constantly developing irritating points of contact. In one of the addresses at the convention of the American Electric Railway Association, held in New York during January last, the benefits of a consistent policy of publicity were outlined. Some of

the ideas expressed, if taken up and carried on vigorously by our Canadian street railway companies, would engender a different public sentiment. The ignorance of the public in the fundamental requirements necessary for successful electric railway operation is productive in many cases of unfavorable feeling on the part of the citizens. In regard to the actual details of service the people are in ignorance. Very few men know the cost of equipment, the cost of operation and the cost of maintenance, and as a result are unable to appreciate the reasonable limitations of service.

It must be appreciated that electric railway operation in the cities provides almost unlimited opportunity for disatisfaction, and this is all the more intensified by the lack of knowledge of conditions. To quote from the address referred to above, it is no longer a matter of opinion, but a demonstrated fact that it is quite possible so to educate the public that it will be almost reasonable; that it will not always expect the impossible, and will not, owing to ignorance, insist upon the enactment of punitive legislation, fares below cost of operation, overtaxation and onerous regulation.

The increase in the efficiency of equipment and operation of electric railways in our large cities has not been accompanied by a decrease in the volume of criticism, and for this condition the companies must blame themselves. The managers of these companies, instead of striving to promote a feeling of co-operation and friendship with the citizens, have taken the position of antagonism and demanded the full equivalent their franchises allowed them.

By consistently educating the public in the different elements necessary for the success of the system, both in returns to the company and in the maximum of efficient service to the people, this feeling of antagonism will be gradually dissipated and the companies will find that their position in the community has become one of benefit. The public will also appreciate the fact that the companies are entitled to their reasonable demands in order to provide efficient service and fair returns to the investors. This policy of education on the part of the companies must come, or their present attitude of antagonism will force the increase of public ownership of these utilities.

EDITORIAL COMMENT.

A notable increase in the production of stone, brick and other structural materials was recorded during 1911 in the Province of Quebec. This increase in a measure is due to a more thorough collection of data and returns, but nevertheless it is sufficient to consider the development, the increase and the progress of the industries in general in the Province of Quebec, to realize that the market for structural materials has increased tremendously in the last few years, and will continue to do so for many years to come.

* * * *

The Chicago Drainage Canal is again the subject of controversy. There is now a proposal before the United States Senate to increase the flow by 6,000 cubic feet per second over the amount now used. This is a most difficult question to decide, for many interests, both Canadian and American, will be affected if the request is granted. It is generally accepted that the increased diversion will mean a drop of some three or four inches in the lake levels, and will thus affect navigation, and by the decreased flow over the Niagara Falls will affect the power question there.

There is a movement under foot to secure funds for the illumination of Niagara Falls. A bill has been introduced in the New York Senate to provide an appropriation of $50,000 for construction and installation and $2,500 for one year's operation of an illuminating plant for this purpose. The Province of Ontario have also been asked to provide a like sum. This scheme has been advocated for some years back, and it looks as if it were at last to be realized.

* * * *

There is a bill now before the Ontario Legislature to regulate the width of tires on wagons and other vehicles. The bill provides that after the 1st of January, 1914, no vehicle shall be driven on a public highway in Ontario unless its tires are the width prescribed. We are glad to see that the provincial government have begun to appreciate the necessity of taking measures to prevent the destruction of the highways. There is little use in putting down good roads if no restriction is placed on the loading of vehicles and the width of tires used. It is to be hoped that the bill will be passed and become law.

GENERAL NOTES.

In Quebec, Prince Edward Island, and very locally in Northern New Brunswick and Ontario, the total precipitation was in excess of the average, while in other parts of Canada it was deficient, and in the Western Provinces only amounted to about one-third of the usual quantity. At the close of the month the ground was snow-covered throughout Canada, except on the Pacific Coast and the Lower Mainland of British Columbia, where the snow had disappeared. Considerable snow has been deposited on the mountains of British Columbia, but the depth is, in most places, less than last year. In the Western Provinces the depth is generally about five inches, but in Northeastern Saskatchewan and in Keewatin the snow on the ground is from fourteen to twenty-four inches deep. The snow covering in Ontario varies in depth with the district, the Highlands and eastern part of the upper country and the Ottawa Valley being covered by from twenty to thirty-six inches, while in other districts the depth is from six to ten inches. In Quebec, a depth of twenty-six inches at Montreal increased eastward to about sixty inches in the Gaspé Peninsula.

The table shows for fifteen stations, included in the report of the Meteorological Office, Toronto, the total precipitation of these stations for February, 1912:—

	Depth in inches	Departure from the average of twenty years
Calgary, Alta.	0.1	—0.45
Edmonton, Alta.	0.2	—0.54

THE RELATION OF THE PUTRESCIBILITY OF THE SETTLING AND NON-SETTLING SUSPENDED MATTER IN SEWAGE.*

By Dr. Arthur Lederer.

When we speak of a raw sewage being "strong" or "weak" we have, ordinarily, factors in mind which are furnished by the chemical determinations of total organic nitrogen, organic carbon, chlorine, and possibly fats. To one who is dealing continuously with one and the same sewage the suspended matter will give a fairly good idea of the strength of the sewage. It is likewise apparent that certain relations can be established between some of the chemical constituents from a long series of analyses. However, in different localities all these factors and relations will be subject to modifications, the chief cause for which lies in the varieties of trade wastes likely to be present in the majority of American sewages. In a general way a stronger domestic sewage will require more dilution in a water course than will a weaker, as expressed by any of these factors above.

Up to the time of the introduction of the methylene blue putrescibility test, we have lacked a definite expression for the strength of a sewage from the standpoint of a prospective nuisance. Since the vast majority of sewages reach the surface water in an unpurified or partially purified state, it is clear that any determination in which the natural agencies participate (as is the case in the putrescibility test of Spitta and Weldert) must of necessity come closer to the actual changes occurring in water courses than a purely chemical test, such as the determination or "oxygen consumed." This is the more apparent when we consider that the different methods in vogue of determining "oxygen consumed" give rise to very perceptible differences in the results. The methylene blue putrescibility test, as is well known, depends upon the formation of a colorless leucobase as the oxygen in the sample becomes exhausted. The test has been made more valuable by Phelps, who worked out relative stability figures which serve as a numerical measure of the relation between the available oxygen and the oxygen required for complete oxidization. Since the reaction is a biologic one, an incubation temperature of 20° C. will favor the development of bacteria likely to take part in the self-purification of rivers, while a temperature of 38° C. will favor the development of a bacterial flora not likely to take part in nature. The methylene blue test is at present almost universally used in sewage purification plants, and rightly so, for its purpose well. The main objection to the test, however, has been the time which is consumed to obtain results. This is the chief reason why sometimes an incubation temperature of 38° C. is preferred t othe more desirable temperature of 30° C.

Recently interest was awakened in the test for the loss of dissolved oxygen in a sewage mixture on incubation for a definite period of time under anaerobic conditions. The loss of oxygen, as determined quantitatively, serves as a measure of the stability of the sewage or the sewage mixture. This test is a more direct measure of the probable effect upon the stream than the methylene blue test. The test is not a new one. On looking over German literature repeated mention is found of "Sauerstoffzehrung" among the analytical data, the result of which is obtained by methods substantially the same as described above. Mention was first made of the results obtained with this method in this country in the report of the Lawrence Experiment Station for the year 1900 (Mass. State Board of Health). The test was also referred to recently as a good measure of stability by the writer, and by C. B. Hoover, of the Columbus Sewage Works. Hoover likewise recognized that the analytical results usually employed to show the degree of purification effected by sewage treatment do not reveal quantitatively the relative stability, and hence can not be looked upon as reliable indices of the deoxygenerating properties of sewages, sewage mixtures or effluents. As a result of a long series of tests he obtained certain definite relations for sewages, septic effluents and filter effluents as determined from a modified "oxygen consumed" test and the loss of dissolved oxygen on incubation, described previously. It may be possible to establish such a relation in dealing with one and the same sewage for a long time, but the relation is bound to differ in various places to a great extent. The method does not lend itself to a ready expression of the stability. Hoover measured his loss of dissolved oxygen by incubation at 37° C. for 24 hours. There is a possibility, as Phelps has pointed out, in certain effluents, particularly those from rapid filters, of oxygen becoming lost at this temperature without being consumed. The saturation point of oxygen at 37° C. is not over 7 p.p.m., and consequently there is a tendency for some of the dissolved oxygen to escape. Tight stoppers are not likely to prevent the escape of the released gas, nor are mercury seals adapted for routine work.

Recently Phelps introduced his method of calculating quantitatively the stability of a sewage mixture from determinations made by anaerobic incubation at 20° C. for a

*A paper read at the annual meeting of the American Public Health Association at Havana, Cuba, Dec. 4 to 9, 1911.

given period of time. The sewages are mixed with water saturated with oxygen, and the total amount of oxygen is determined directly. The sample is then stored in a tight bottle for a suitable period of time and the oxygen redetermined. The rate at which the oxygen disappears under these conditions is a direct measure of the probable occurrence upon a stream. Under given assumptions, other than those actually occurring in a specific test, the following formula derived by Phelps may be used:

$$C = \log (O^1/O) \div Kt$$

In this formula C represents the percentage of sewage permissible in the water used for dilution under the assumed conditions. O^1 is equivalent to the dissolved oxygen in the mixture before incubation expressed in parts per million, O the dissolved oxygen after incubation. K is a constant which defines mathematically the rapidity with which the oxygen is used up in a mixture of water and sewage. From a specific test K is determined. The formula can then be applied to other cases. According to Phelps K depends upon the character of the sewage matter and the concentration of that material in the sewage, and is independent of the extent of dilution or the character of the diluting water. Subsequent experiments made by the writer on crude sewages at the Sewage Testing Station of the Sanitary District of Chicago have proven, however, that the factor K is not independent of the amount of dilution. t represents in the formula the time which is allowed for the contact of water and sewage to produce the change in the oxygen of the mixture.

It occurred to the writer to utilize Phelps' quantitative expression of the stability of sewages to demonstrate the improvement of the liquid by the removal of the settling suspended matter and complete removal of all the suspended matter. The laboratory technique employed for these experiments was the same as employed by Phelps. Two dilutions were made as a rule on one and the same sewage. A dilution of 1 part of sewage to 8 and 10 parts of water from Lake Michigan has given satisfactory results. The time of incubation was 24 hours, and the temperature of incubation employed 20° C. The sewage was mixed with the lake water in a glass cylinder by a specially devised stirring apparatus to insure the least possible aeration. A portion of the same sewage was also filtered through a single layer of Swedish filter paper, which removed all suspended matter and pseudo colloids. The same dilutions were made as with crude sewage and the initial dissolved oxygen determined just as in the crude sewage mixtures. The same dilutions were also made on another portion of the sewage after the suspended matter had been allowed to settle for 4 hours. Citrate of magnesia bottles. with patent stoppers, obtainable at any drug store, have proven very efficient for these incubation experiments. They do not permit air to enter as do some of the bottles provided with ground stoppers.

All the results obtained were calculated on the basis of preserving 30 per cent. residual oxygen after a 24-hour period of contact or flow. Besides this test other tests were carried on, such as total solids, oxygen consumed, and organic nitrogen, in order to bring out the relation of the volatile organic carbonaceous and nitrogenous matter in solution and suspension to the calculated permissible dilution. As mentioned previously, the factor K in Phelps' formula has not been found to be independent of the dilution. Special experiments carried on with three different dilutions on the same sewage have clearly shown that K will decrease with a lower dilution, and the factor C of course will be found to be correspondingly higher. It was further found that the difference in K between the lower dilutions is greater than the difference between the two higher dilutions. As yet the results have not demonstrated a constant difference between C (the percentage of sewage) resulting from the various dilutions, consequently an exponent has not been introduced in the original formula. The highest C value has been used to compare results. Values of one and the same dilution only are given for a comparison of the permissible percentage of crude, settled and filtered sewages in Table 1. On the whole, the differences in the factor K in the different dilutions have not been materially different, and are hardly large enough to interfere with the intelligent interpretation of the results (Table 1.) The striking feature of this table is the last column, indicating the ratio of dilution or the "per cent. permissible sewage" (C) of the filtered sewage as compared to the raw and settled sewage. The remarkable result is still more apparent in Table 2, which indicates the improvement in percentages.

Avg.	63	54	37	46	82	68	30	46	31	143

Looking over the average of the nine experiments in Table 2 we note, for instance, that on removal of 63 per cent. of the total suspended matter, or 54 per cent. of the suspended volatile matter, the actual improvement in the sewage from the standpoint of a prospective nuisance is but 31 per cent. Results similar to this have been obtained by C. B. Hoover. The sewages with the low suspended matter (experiments 1 and 9) have the low percentage improvement. One exception is found in experiment 2 with a high suspended matter and a low improvement from a dilution standpoint. Now, when we turn to the results obtained by filtration we will note in Table 2 that the removal of only 37 per cent. of suspended matter, or 46 per cent. volatile suspended matter additional to sedimentation has shown an improvement of 143 per cent. for dilution purposes, or nearly five times the improvement gained by merely settling the sewage. Similar is the case with the carbonaceous matter as expressed in "oxygen consumed." A reduction of 30 per cent. of "oxygen consumed" is equivalent to an improvement of 31 per cent. in dilution, while an additional removal of 16 per cent. in "oxygen consumed" gives an actual additional improvement of 112 per cent.

A thorough study of these two tables will clearly bring out the fact that the removal of suspended matter capable of settling in settling tanks constitutes an improvement from the dilution standpoint much less than the percentage of suspended matter removed. Since we have to consider the improvement of any sewage or effluent from the standpoint of the degree of dilution required rather than from the standpoint of the reduction of any chemical constituents (as shown by analysis), the improvement made by settling con-

sists mainly in the improvement of the physical character of the liquid by the removal of material which may cause deposits, and incidentally some improvement in the stability. However, the removal of an additional small quantity of suspended matter not capable of settling, by simple filtration will improve the liquid far out of proportion to the percentage of volatile matter removed. This permits of only one conclusion, that is, on a domestic sewage from a large area the finely divided slowly settling suspended matter and pseudo colloidal matter not capable of settling make up the greater part of the putrescibility, due to the suspended and colloidal matter. This fact has been recognized before. Spillner states that the organic sulphur compounds in sewages which afford the material for the development of hydrogen sulphide are found in much smaller quantity in the suspended matter capable of settling than in the dissolved colloidal and finely suspended matter which has been removed by filtration in these experiments.

In the present state of the science of sewage disposal we aim to destroy the finely suspended matters by oxidization. However, most of the sewage is discharged to-day either in a raw or settled state. If a device can be worked out to take care of the finely divided non-settling suspended matters without resorting to biologic treatment, a degree of purification may possibly be attained intermediate between settling and biological treatment, which in many cases may be sufficient to avoid the expense of the more thorough biological treatment.

In conclusion the writer wishes to express his thanks to Prof. E. B. Phelps, of Boston, and to Mr. Langdon Pearse, engineer-in-charge of sewage disposal experiments in Chicago, for valuable suggestions, and further to Messrs. H. B. Hommon and F. Bachmann for their conscientious analytical work.

CANADA'S MINERAL PRODUCTION

The total value of the mineral production in Canada in 1910, according to revised statistics now complete, was $106,823,623. Compared with the previous year's production of $91,831,441, that of 1910 shows an increase of $14,992,182, or 16 per cent., and, says Mr. John McLeish, B.A., in his report to the Department of Mines, Ottawa, is the largest increase that has been recorded in Canada's mineral production in any one year. The production per capita has also increased from $12.82 in 1909, to $14.26 in 1910, an advance of 11.2 per cent. The largest production per capita previously recorded was $13.35 in 1907.

The year 1886 was the first year for which complete statistics of mineral production for the whole of Canada were collected, and the production that year was reported as $10,221,255, or about $2.23 per capita. In ten years the production had increased over 100 per cent., to $22,474,256, or $4.38 per capita, in 1896. At this time the Yukon began to contribute largely to the gold production, and, during the next five years, an increase of nearly 200 per cent. is shown, the total reaching a value of $65,797,911, or $12.25 per capita in 1901. The next three years witnessed a slight falling off, but from 1904 the production again rapidly increased to its present high record.

The production of metalliferous products in 1910 was valued at $49,438,873, being 46 per cent. of the total mineral output; and an increase in value over the previous year of $5,282,032, or nearly 12 per cent. The value of non-metalliferous products (excluding structural material and clays) in 1910 was $37,757,158, being 35 per cent. of the total mineral output; and an increase of $6,615,907, or 21 per cent. in value over 1909. The value of the production of clay, lime and stone, and other structural materials in 1910 was $19,627,592, or 18 per cent. of the total production; and an increase of $3,094,243 over the 1909 output.

Amongst the more important minerals mined, coal occupied first place, contributing about 29 per cent. of the total production; silver, next in importance, contributed over 16 per cent. of the total; nickel was next in order with over 10 per cent; while gold occupied fourth place with 9½ per cent. of the total; clay products contributed 7 per cent.; copper 6.6 per cent.; cement 6 per cent.

The increased production was not confined to a few products, but was, on the other hand, fairly well distributed throughout the list of ores and minerals mined in Canada. Amongst the metallic products the principal increases were in silver, nickel, gold and copper; there being a falling off in the production of lead and of zinc. There was an increased production of pig iron from blast furnaces, but a smaller amount credited to Canadian iron ore.

The prices of metals upon which the value of the production directly depends did not vary greatly during the year, nor did the averages differ much from those of the previous year. Lead, silver and zinc averaged higher in price in 1910, while copper was fractionally lower and nickel remained practically at the same price level.

The total value of the exports of products of the mine, including direct mine products and manufactures, in 1910 was $51,856,862, as compared with $47,442,001 in 1909. This value includes for 1910 mine products to the value of $42,236,270 and manufactures valued at $9,620,592. About 93 per cent. of the value of the mine products exported is made up by silver, nickel, copper, gold, coal and asbestos. Manufactured mine products consist chiefly of iron and steel goods, coke, and aluminum, made from imported ore.

The United States is the chief destination of Canada's mine exports, about 83 per cent. having been exported to that country during the fiscal year 1909-1910, and about 9 per cent. to Great Britain.

The following table shows the mineral production by provinces for the year 1899 to 1910, inclusive:—

	Nova Scotia.	New Brunswick.	Quebec.	Ontario.	Manitoba.
	$	$	$	$	$

TURBINE PUMPS.

A paper on "The Evolution and Present Development of the Turbine-Pump," by Dr. Edward Hopkinson and Mr. Alan E. L. Chorlton, was read before the Institution of Mechanical Engineers of Great Britain recently.

To-day, they said, the turbine principle seemed the accepted ideal for almost all primary machines, and it would appear that the age of the reciprocating engine for the various work of mechanical engineering, was passing and that the rotary engine of the turbine type was steadily taking its place. In that of steam prime-movers it had, perhaps, already taken the lead over the reciprocating type, and the engine of Watt must now be relegated to second place. In other fields and duties its progress to date was so great as to warrant the surmise that at no distant time a similar comparison of precedence would be made. Perhaps in no domain had the turbine rotary principle achieved greater success in the last few years than in high-lift pumping, though probably the realization of its possibilities for such duties was as old or older than the steam-turbine itself. Still, its general acceptance as correct engineering practice had occurred only within the last five years.

At the present time the use of the turbine-pump had become so extended that it was difficult to find work to which it could not be applied advantageously. It would no doubt be a matter of interest to trace the evolution and development of machines of this design, and the authors, therefore, gave the history of such apparatus from the beginning of the 18th century.

Modern Practice.—The mechanical construction of a standard Mather - Reynolds pump as built in 1895 consisted of four chambers working in series. At the one end these were secured by bolts against the circular flange of a frame carrying the driving pulley or shaft coupling, this having the suction branch and entrance to the first chamber cast with it. At the other end the delivery chamber formed the final cover, and had the delivery pipe cast on the upper part connecting to the annular space into which the last set of guide-passages delivered, and at this end a suitable stay was attached to support the pump from the floor. The chambers were secured to each other by bolts through external flanges, each chamber being recessed and spigoted so as to preserve correct alignment of the whole. This formed an inexpensive design and permitted accurate manufacture. In comparing such a pump with a modern one it would be found that it was in the form of its impeller and its delivery-casing that the original Mather-Reynolds pump differed most from the present design. The impeller was of the open type, with radial vanes, the roots of which were carried across the openings of the eye into the boss, necessitating the use of a modified form of Francis entrance. This form was probably adopted in order to secure sufficient strength to drive the vanes, necessitating them being carried through full width to the boss on the pump-shaft, and not starting level with the outer diameter of the eye as at present. The impeller was turned all over, and revolved a close fit in its casing, which was turned to a corresponding form. This prevented leakage and loss of efficiency by the return of the water from the tip to the suction along the impeller sides.

A considerable number of pumps of the 1895 form were constructed for installations in this country and abroad, and Messrs. Sulzer Brothers, of Winterthur, who began the manufacture of multiple turbine pumps about the year 1896, evolved various modifications in the Osborne Reynolds design, whereby both the efficiency and the lifting capacity were considerably improved. They established in 1898 an interesting and novel installation of these improved pumps at the Spanish mines of Horcajo, which attracted considerable attention. Two years later an agreement was concluded between Messrs. Sulzer Brothers and Messrs. Mather and Platt which provided for an interchange of future improvements, and due acknowledgment of the original work of Professor Osborne Reynolds and of the improvements made by the two manufacturing firms.

A comparison of a four-chamber pump of the Sulzer design with the 1895 design showed three important differences. First, the body casting of the pump was constructed in one piece, with the intermediate pieces, guide-vanes, and impellers put in from one end.. Secondly, the impellers were shrouded and had backward-curved vanes; and, thirdly, the impellers were arranged back to back to compensate for the increased lateral end-pressure set up by the higher heads worked against. This arrangement of the impellers involved the use of somewhat tortuous passages in the pump to bring the discharge of the first impeller to the eye of the second, and so on. Moreover, these passages passing several joints increased the probability of internal leakage from one stage to another. The agreement between Messrs. Sulzer Brothers and Messrs. Mather and Platt came to an end by mutual consent in 1904, and after that date each firm further developed their pumps on their own lines.

Proceeding to discuss later designs of four-chamber pump, the authors showed that constructionally this pump differed principally in that the extended suction-end was shortened and was similar to the delivery-end. This enabled various classes of drives—motor, belt, or steam-turbine—to be better negotiated with a standard pattern. Successive chambers, instead of being secured to their neighbors by bolts and flanges, were held together by long bolts extending the entire length of the pump body and held only at the two ends (suction and delivery).

The impeller was of the shrouded type, having vanes bent well backwards and the guide-passages longer and more correctly divergent, whilst the return way to the eye of the next impeller was of a curved form and more in line and continuous with the receptive ports, thus preventing the abrupt right angle turn through the casing obtaining in the Reynolds pump. The losses in the Reynolds impeller through side friction in its casing were obviated, and any leakage from the periphery back to the suction was prevented or greatly minimized by the outer circumference of the impeller eye running in neck bushes with a very small radial clearance, amounting to less than 0.005 in. The importance of preventing this leakage was very great if high efficiency was to be secured. The impeller was turned all over outside to reduce loss by skin friction, and with the same object it was usual to use as many wheels as the circumstances would otherwise allow. The end or axial balance of the impellers was obtained by an automatic device, which acted well in practice, and compensated for wear and variable leakage taking place in the pump. In other respects the arrangement, direction or flow of water, and assemblage of the pump were the same as in the original Mather-Reynolds pump.

The authors concluded the paper with some examples of the application of turbine pumps for various purposes.

Experiments with the centrally hung lamps which have been carried out in Cheapside, King William Street, and Cannon Street, have been so successful that a scheme has been prepared by the Streets Committee to adopt this system of lighting in all the streets of the city of London. Under the scheme the lighting of the city will be divided almost equally between gas and electricity. The illumination will be increased from 668,405 candle-power to 1,270,160 candle-power, whilst it is claimed there will be an annual saving of $33,200.

SPECIFICATIONS.*

By Fred. S. Sells.

The author stated that in his view the accepted commercial meaning of the word "specification" was the written, printed, or "understood" construction of an article, piece of plant, or works, or the enumeration of the detailed requirements for the execution of a certain performance. In Germany, France, and America a specification as a rule was identical with standard practice, and in this country the want of standards and of recognized and acknowledged authorities was a great drawback. If those who were engaged in the carrying out of specifications had grievances against those who drew them up it must be admitted that the specifying engineer was heavily handicapped by the absence of standards, and that he must at times guard against the introduction of something which had never been tried, or with which he was not sufficiently familiar. On the other hand, where "standards" had been set up during the last few years they had not been accepted unquestioningly by the profession, and therefore the manufacturers had to be cautious in adopting them.

The next grade of specification was that drawn up by a professional man for the purpose of obtaining tenders. Such a specification should contain a detailed enumeration of articles required, stating where and how they were to be fixed. Each article should be described by an accepted nomenclature which assumed the existence of printed, written, or catalogued descriptions for the benefit of the tenderer. Should these not be accessible, corresponding matter might be added to the specification. Once such a specification was issued no deviation should be permitted unless it was clearly added from the outset that apparatus of similar construction, design, or capacity would be accepted.

The Consulting Engineer.—It was the endeavor of consulting engineers to advise their clients to have the most up-to-date, the most economical, and the best manufactured plant, but, unfortunately, the number of interpretations of these desiderata was almost equal to the number of consulting engineers in practice. Why? Not because the engineers were incompetent; not because they had not each of them wide and valuable experience; not because they, or most of them, had not done similar work before; not because of the absence of standards, and perhaps because of the absence of some uniformity of education and experience. The trouble might also be partly due to the aloofness of the average consultant from the work-shops of the manufacturer, and he felt certain that a closer and more regular intercourse between the manufacturer and consultant would result in benefit to both purchaser and contractor. The majority of manufacturers now gladly threw open their works to consultants at all times.

As technical knowledge and experience had developed during the last 25 years, so had the standard of commercial honor and integrity, and he did not think it either right or necessary that specifications should contain anything which was originally meant to prevent dishonesty, by which he meant the intention of not carrying out a specification as it was meant to be carried out, the use of insufficient material, flimsy construction, disregard of proportion, and the introduction of makeshifts leading to unsightliness. A large number of leading consulting engineers had already adopted broader-minded methods, but this course had not yet become general practice.

Would it not be better if consulting engineers, instead of drawing up specifications, each of which was a masterpiece of originality, were to adopt standards where standards were in existence; to accept standard practice where standard practice was established; and to ask the manufacturers in their specifications to put forward their own suggestions? Their work would then consist of going through all the various manufacturers' recommendations and suggestions, and of deciding which was the best designed and most serviceable plant at the prices submitted.

Municipal Engineers.—With reference to municipal and supply company engineers, the circumstances were in many cases the same as with consultants. The great difference lay in the fact that the municipal engineer had more frequently to be prepared for the acceptance of the lowest tender, without having the same opportunity as the consulting engineer to explain the difference in the offers; and as long as municipalities were governed as at present their engineers would not, as far as "detail" was concerned, be able to alter the present practice in this respect. The municipal engineer was even more a specialist in his particular work than the independent consultant, and in many cases he had more experience of what was actually required than the manufacturer. Especially where large stations were concerned his experience was valuable, and, if fully expressed in his specifications, it would help the manufacturer. Would it be possible through the medium of the existing organizations of municipal engineers to arrive at something like standard practice? It had been done in other countries, and had been done successfully.

Large corporations who had big laboratories with elaborate testing apparatus and a highly trained expert in charge had, of course, no difficulty in making fair and reasonable tests, but it was regrettable to find what tests were being made in some central stations in order to determine the candle-power of incandescent lamps and carbons, and what tests were sometimes applied to determine their life. They forgot that the products of the leading manufacturers were made to comply with the standards established by authorities such as the Engineering Standards Committee, the Admiralty, Post Office, large railway companies, and others.

* Abstract of paper delivered before the Institution of Electrical Engineers, Manchester local section.

PROVINCIAL POPULATIONS.

A special report of the census presented to Parliament gives the population by provinces as follows:

Province.	1911.	1901.	Inc.
Alberta	374,663	73,622	301,691
British Columbia	302,980	178,657	213,823
Manitoba	455,614	255,211	200,403
New Brunswick	351,889	331,120	20,769
Nova Scotia	492,338	459,574	32,764
Ontario	2,523,208	2,182,947	380,261
Prince Edward Island	93,728	103,259	*9,531
Quebec	2,002,712	1,648,898	353,834
Saskatchewan	492,432	91,279	401,153
Yukon	8,512	27,219	*18,707
N. W. Territories	16,951	20,129	*3,178
Totals	7,204,527	5,371,315	1,833,212

* Decrease. Total decrease 31,416

The rural population is 3,924,083, and the urban 3,280,441. The increase in rural population is 555,065 or 16.48 per cent., and in the urban 1,278,147 or 63.83 per cent.

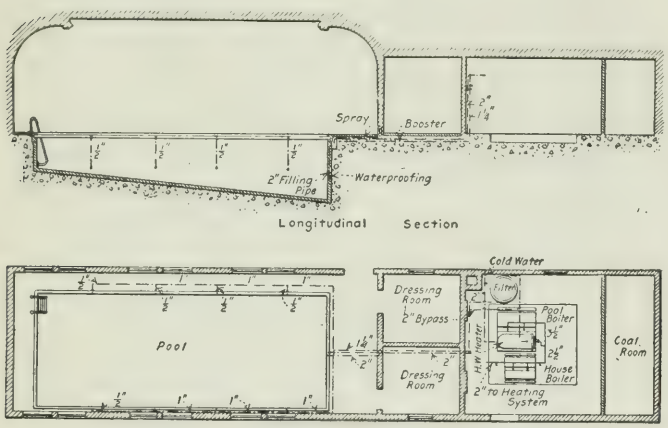
HEATING A SWIMMING POOL.*

By C. Teran.

A swimming pool is generally a luxury, not a necessity. For this reason not many are built, and a description of the system installed for Herbert Coppell at Tenafly, N.J., may prove of interest.

It is housed in a building of one story, and includes the pool room, two dressing rooms, boiler and coal rooms, all on the ground level. The pool is sunk below grade, is built of concrete, waterproofed and lined with English size enameled brick. It is 38 ft. long, 15½ ft. wide and 6 ft. mean depth below water level. The cubical contents are, therefore, 3,534 cu. ft.

The heating plant was designed to heat this volume of water in 10 hours, or at the rate of 353 cu. ft. an hour. Ten hours is a convenient length of time for heating the water, because the required apparatus is not specially large. If the apparatus was much smaller it would, of course, require a longer time to heat the water, and this time added to that necessary to empty and clean the pool would make the period of time which the pool would be out of commission too long. The time required to empty and clean this pool is 4 to 5 hours.



Plan.

The installation includes two cast-iron sectional boilers, a Berryman service heater and a filter. The water is reduced to 30 lb. pressure on entering the building. It is then heated in the Berryman heater by steam generated in the boilers, and then filtered and discharged into the pool. For filling, a main inlet is used; this enters the pool at the deep end near the bottom; there is also a nozzle above the water line which is used to produce a spray over the pool.

On account of the proximity of the walls of the pool to the outside ground a loss of heat in the water was anticipated and provision made to replace the loss. Careful consideration was given to the various methods that could be used to accomplish this purpose, and injecting water heated to a high temperature into the filled pool was decided upon. The reason for using a high temperature is that the water is not taken from the pool to be reheated, as this would necessitate a circulating pump, but fresh water is used, and by heating it to a high temperature a minimum quantity of water is required and less coal burned. The water is injected at four points on each side of the pool near the bottom, through nozzles passing through the brick lining and flush with it. This arrangement gives a good distribution, and is neat in appearance. It is found that during the winter months the water loses 2 to 3 deg. F. in 24 hours.

In filling the pool the water is heated to 75 deg. F., which, on account of heat losses in transit, etc., gives an ultimate temperature of 70 deg. F. The water injected to make up the heat loss is heated to 180 deg. F.

The large boiler is used to heat the water when the pool is being filled. This was computed as follows:

Contents of pool .....3534 cu. ft.
Water to be heated per hour.....353 × 62.4 = 22,027 lb.
Water to be heated per hour.....353 cu. ft.
Rise of temperature of the water.....40 to 75 = 35 deg.
Heat units transmitted to water per hour, 22,062 × 35.....771,000 b.t.u.
Coal necessary to be burned per hour 771 ÷ 8000.....96 lb.
Grate area, 96 ÷ 8 = ...12 sq. ft.

A boiler having a grate 40 in. wide by 48 in. long was installed. The other boiler shown is used to heat the building and the water injected into the pool to make up the daily loss of heat; by this arrangement, the necessity of keeping a fire in the large boiler is avoided. As there was no sure method of predetermining the loss of heat of the water in the pool, in selecting this boiler liberal allowance was made for this purpose above what is required to heat the building. The amount of direct radiation is 400 sq. ft., all behind screens; the boiler is rated at 1,000 sq. ft. and has a grate 21 × 27 in. or about 4 sq. ft.

The service heater was specified of proper size to heat 2,800 gal. of water per hour from 40 to 80 deg. F. with low-pressure steam, and it was left to the manufacturers who furnished it to design the proper size heater for this duty. The filter was specified in a similar manner. No automatic temperature control was installed, and none has been found necessary. An even temperature of the water is attained by maintaining a steady fire and regulating the flow of water by hand.

* A paper read before the American Society of Heating and Ventilating Engineers, New York City, Jan. 25th, 1912.

THE BRITISH ALL-RED WIRELESS TRANSMISSION SCHEME.

The proposal to connect all portions of the British Empire with wireless communication systems has at last taken definite form. A chain of 25 stations throughout the Empire are to be equipped with high power Marconi apparatus; the whole to be under the control of the General Post Office. The cost of construction is estimated at $6,000,000.00 and the yearly maintenance is placed at $1,000,000.00. The estimated revenue, according to predictions, will total $3,000,000.00 per year; considering 15,000 words a fair and conservative estimate to be transmitted from each and every station in the belt.

There is no other world power able to thus link up their overseas dominions, except Great Britain, as the lands of this empire lie in a continuous chain around the earth and sufficiently close together to overcome the problem of long transmission over water. There is one great advantage in this means of empire communication over the cable method, and that is the ability to reach and communicate with every ship on the seas properly equipped.

The stations are to be erected at Victoria, B.C.; Montreal, P.Q.; Glace Bay, N.S.; Jamaica, Barbados and other points in the West Indies; Bermuda; London, England; Bathurst and Sierra Leone, British West Africa; St. Helena, Capetown, Durban, Moneasa and Aden on the east coast of Africa; Mauritius; Cyprus; Malta; Bombay; Colombo; Adelaide; Singapore, and Hong Kong.

INDUSTRIAL ACCIDENTS IN JANUARY.

Industrial accidents occurring to 300 individual work people in Canada during the month of January, 1912, were recorded by the Department of Labor. Of these, 86 were fatal and 214 resulted in serious injuries. In addition 2 fatal accidents were reported as having taken place prior to the beginning of the month, information not having been received by the Department before January, 1912.

In the preceding month there were 84 fatal and 194 non-fatal accidents recorded, a total of 276, and in January, 1911, there were 91 fatal and 206 non-fatal accidents, a total of 297. The number of fatal accidents recorded in January, 1912, was, therefore 2 more than in the preceding month and 5 less than in January, 1911. The number of non-fatal accidents recorded in January, 1912, was 20 more than in the preceding month and 8 more than in January, 1911. Altogether there were 22 more industrial accidents recorded in January, 1912, than in the preceding month and 3 more than in the same month of the preceding year.

The following is a record of the accidents of the month by industries and groups of trades:—

Trade or Industry	Killed	Injured	Total
Agriculture	7	9	16
Fishing and hunting	2	..	2
Lumbering	4	7	11
Mining	14	15	29
Railway construction	9	12	21
Building trades	5	15	20
Metal trades	7	44	51
Woodworking trades	1	16	17
Printing and allied trades	..	..	..
Clothing	..	2	2
Textiles	..	1	1
Food and tobacco preparation	..	3	3
Leather	..	..	..
Transportation—			
Steam railway service	23	33	56
Electric railway service	..	8	8
Navigation	1	5	6
Miscellaneous	3	9	12
Public employees	1	13	14
Miscellaneous skilled trades	4	15	19
Unskilled labor	5	7	12
Total	86	214	300

ONTARIO'S PEAT BOGS.

It is announced by the Dominion Mines Branch that the associated manufacturers at Brantford, Ont., have become so convinced that the air-dried peat method employed by the mines branch can be made a commercial success that they have contracted with the government to continue the work at Alfred, Ont., and will spend over $50,000 in trying to improve peat machines. This action was decided on only after a thorough investigation. The machine to be used will have a capacity of 60 to 80 tons per day, as compared with the 30 tons the government turned out.

The government experimental plant at Alfred exhibited samples of machinery and of peat ready for market at the Ottawa fair. A thousand tons of peat were made up, which was sold at $3.25 a ton. The orders came with such a rush that the supply was soon exhausted. The peat was used in parlor grates, in kitchen ranges, and in furnaces. It burns to a fine ash, there being practically no residue, and is much cheaper than coal.

A NEW TUG FOR THE CITY OF TORONTO.

The city have under construction at the Polson Iron Works, a new steel tug to be used in the various engineering works projected and under construction about the city's water-front. There are several points about the vessel which have a tendency to make it unique in many particulars.

The material of construction in the hull is the best quality of Siemens-Martin open hearth mild steel; near the bow the material has been laid in such thickness as will permit the ship to be employed for ice breaking purposes when so required.

The propelling mechanism consists of a six-foot screw and a single cylinder high-pressure type, non-condensing engine. The diameter of the cylinder is sixteen inches and the length of stroke eighteen inches.

The boiler is of the Scotch cylindrical type, seven and a half feet long, and containing one hundred and fifty-two three-inch tubes; it has been built to pass government inspection for a working pressure of 150 pounds per square inch.

The illustration was made by the photographer a few hours previous to the launching, which took place on 8th March last. Before the hull could take the water a crew of twenty-two men and one horse worked for several hours to clear a space in the ice covering the bay, which, at this point, was almost thirty inches thick.

The draught of the vessel is six and a half feet when the bunkers are half filled with coal. The length is 70 feet, extreme beam 18 feet, and the depth at side (lowest point) 9 feet.

Mr. W. E. Redway, of the Polson Iron Works, is the designer and supervisor of the work on the tug, which has been named the "G. R. Geary." It is expected that it will be completed and ready for work about April 6th.

BUILDING FIGURES FOR SASKATOON.

In The Canadian Engineer, issue of February 29th, the building figures in twenty selected cities and towns throughout Canada were given. We have just received a letter from the city of Saskatoon, Sask., drawing to our attention the fact that figures for that city are not quoted, although "lots of other towns much smaller than this city are given."

We are very glad to remedy this omission. The following are the building figures for the months of January and February for 1911 and 1912 for the city of Saskatoon:

	1911.	1912.
January	$13,500.00	$13,800.00
February	9,950.00	69,700.00

Metallurgical Comment

Correspondence and Discussion Invited

THE IMPROVEMENT OF RAIL DESIGN AND SPECIFICATIONS.*

W. C. Cushing.

The period between 1893, the year of the adoption of the standard rail sections of the American Society of Civil Engineers, and the first annual convention of the American Railway Engineering and Maintenance of Way Association in 1900, was occupied by the railway engineers in the study of the behavior in the track of the rails rolled, according to the new designs, which were rapidly put into service by the different railways of the country.

A preliminary meeting of the railway engineers was held in Chicago on October 21, 1898, for the purpose of organizing the American Railway Engineering and Maintenance of Way Association, and at that meeting a committee was appointed to draft the constitution and by-laws.

On March 30, 1899, the permanent organization of the association was effected in Buffalo, by the adoption of the constitution and the election of officers.

As stated in the constitution, the object of the association was the advancement of knowledge pertaining to the scientific and economical location, construction, operation and maintenance of railways. The real and final object was, however, for the members to exchange information and experience with each other and to bring about the unification, as much as possible, of specifications for the purchase of the large amount of material and supplies used by railways, which ought to result in the mutual benefit of the manufacturers and the railway companies.

In order to hear the first reports of standing committees, the first convention was held in March, 1900, in Chicago, and among the standing committees was one on rail.

The report of the committee was largely historical, but it was developed at that and subsequent meetings that the subject was going to be one of the most important and most interesting of those to come before the association in the future.

The work of the committee of the American Society of Civil Engineers was undertaken with the object of improving the design or cross-section of rails, and did not undertake the preparation of specifications for their manufacture or inspection, but each railway issued its own specifications, which were not specifications for manufacture, but for inspection. These specifications differed from each other in various details, such at the method of testing, the allowable variations from the templates, the smoothness of the surface and the workmanship generally, while but little was said about the chemical composition. Indeed, this state of affairs must have been quite annoying and expensive to the rail manufacturers, and, as all railways were striving for exactly the same object, viz.: to obtain the best material which would make an absolutely safe steel rail, the unification of the specifications seemed to be very desirable, and if it could be brought about, the existence of the association would be entirely justified.

At the annual convention in 1901 it was ascertained that the rail sections or designs of the American Society of Civil Engineers were in use by about 70 per cent. of the railways of the country, and it soon developed in the discussion that the rail steel in use by the railways was not giving very good satisfaction. This dissatisfaction pertained to all sections of rails, and the railway engineers thought that the trouble was largely due to the temperature of rolling being entirely too high, leading to the expression of one member that "the material was squirted through the rolls." The engineers of the rail manufacturers, who were also members of the association, contended, on the other hand, that the fault was due to the rail sections, and especially to the thin base designs of the American Society of Civil Engineers. It thus developed that the railway engineers believed the trouble was entirely due to improper processes of manufacture while the rail manufacturers' engineers placed the fault on the design of the rail cross-sections.

It was apparent, therefore, that the committee must study both the question of design and the question of rail manufacture, the latter with the special object of devising tests and methods of inspection which would more surely determine whether the material came up to the requirements of service or not. It was quite evident that this work would be of long duration, because it was necessary that more study than ever before should be placed upon both the question of rail design and its manufacture, and it would be necessary to proceed slowly and carefully, in order to avoid the misinterpretation of statistics and information. Sir Lowthian Bell is reported to have said, at the London meeting of the American Society of Civil Engineers, in 1900, that "as he had been 25 years a manufacturer of rails and 25 years a director in the North Eastern Railway, he represented both maker and user, and he had at his disposal 35,000 analyses to go upon in making deductions. From these he could prove and disprove everything that could be said for or against any composition of a rail—a facility beloved by the expert." It is well for any investigator not to forget Sir Lowthian Bell's remark. It has been brought home to the rail committee many times in its prolonged investigation.

Prior to this time, so much has been said by railway engineers about the necessity for rolling at lower temperature that, in 1900, the Kennedy-Morrison process of holding rails just before the final passes until they came to the desired temperature, after which they were put through the final passes at that temperature, was introduced by the Carnegie Steel Company, and great expectations of the value of the results were held. At the same time other rail manufacturers began rolling at lower temperature and claimed to accomplish the same results. The process did not, however, give the results expected, as the effect was only skin deep, for when the skin wore off, the ordinary metal was exposed underneath. The rails rolled after its introduction developed rather more failures than usual, and since that time the value of rolling at low temperature has been rather uncertain. This experience is mentioned to show that the value of many changes in process of manufacture can only be developed after long experience, which is one of the reasons why an investigation of this kind is bound to cover a long period of time.

In 1895, at Zurich, Switzerland, the International Association for Testing Materials was organized to bring about "the development and unification of standard methods of testing, for the determination of the properties of materials of construction, and of other materials, and also the perfection of apparatus for that purpose." On June 16, 1898, or but a few months prior to the organization of the American Railway Engineering and Maintenance of Way Association, there was formed, at Philadelphia, the American section of

* Presented at the Indiana Railroad Commission's hearing on the rail question at Indianapolis.

the International Association, which, a few years later, was renamed The American Society for Testing Materials. The American section was composed of manufacturers as well as of consulting engineers, railway engineers and others, and had already begun the study of rail specifications. Therefore, at its annual convention in 1901, the rail committee of the American Railway Engineering Association submitted the rail specifications recommended by the American branch of the International Association for discussion, in order to get the subject under way.

Specifications for steel rails have always consisted of three general parts:

1. Chemical requirements or properties;
2. Physical requirements; and
3. Details of manufacture.

Up to that time the various railways emphasized one or more of these parts, according to their individual preference or experience. Some almost ignored the chemical requirements, others were more or less elaborate in their physical requirements, while some barely touched upon details of manufacture, and others treated the subject quite elaborately.

1. The chemical properties of those proposed specifications for bessemer steel rails were those of the Carnegie Steel Company, and they are to-day the standard chemical specifications of all the steel rail manufacturers, and of the American Society for Testing Materials, with scarcely any alterations. They were as follows:

	50-60 lbs.	60-70 lbs.	70-80 lbs.	80-90 lbs.	90-100 lbs.
Carbon	.35 to .45	.38 to .48	.40 to .50	.43 to .53	.45 to .55
Phosphorus, not over	.10	.10	.10	.10	.10
Silicon, not over	.20	.20	.20	.20	.20
Manganese	.70-1.00	.70-1.00	.75-1.05	.80-1.10	.80-1.10

The specifications for foreign use were practically the same.

The only changes which have been made in these specifications by the steel manufacturers and by the American Society for Testing Materials up to the present time, are to make the carbon for 60 to 70-lb. rail .35 to .45, and the manganese for 90 to 100-lb. rail .84 to 1.14.

With few exceptions, the railways of the United States have accepted these chemical constituents as recommended by the rail manufacturers, because they have considered that the chemical properties were only a minor part of the specifications for rail steel, compared with the physical requirements.

To show that the railway engineers have been justified in taking this view of the matter, the following quotation is made from an article in the Journal of the Franklin Institute by Captain R. W. Hunt, once a manufacturer of steel rails and now a steel rail inspector of wide experience:

"Rails made by John Brown & Co., of England, and put down on American railways some years ago, have been generally held up as ideal rails, and the American makers for a long time supposed that when these rails did wear out so that they could be analyzed the secret of their good service would be told. As an illustration of how little regularity or purity of chemcal composition influenced the wear, I call your attention to the analyses of thirteen of the John Brown rails, all of which had filled years of faithful service and have been selected as bright examples of what good rails should be,

	C.	Si.	Ph.	S.	Mn.	Cu.
1	0.35	0.08	0.128	0.068	0.742	0.048
2	0.30	0.071	0.156	0.155	0.662	0.32
3	0.36	0.103	0.125	0.060	0.815	Trace
4	0 70	0.306	0.111	0.008	0.681	0.016
5	0.36	0.069	0.153	0.131	0.621	0.043
6	0.44	0.208	0 098	0.059	1.046	None
7	0.45	0.102	0.128	0.105	0.616	0.056
8	0.36	0.087	0.148	0 181	0.625	None
9	0.24	0.068	0.131	0.104	0.645	0.033

11	0.32	0.089	0.145	0.077	0.745	Trace
12	0.35	0.069	0.077	0.099	0.945	None
13	0.28	0.032	0.084	0.053	0.312	None

"You will observe that carbon ranged from 0.24 to 0.70; silicon from 0.032 to 0.306; phosphorus from 0.077 to 0.156; sulphur from 0.050 to 0.155, and manganese from 0.312 to 1.046.

"These 13 rails, taken as a whole, were chemically a 'poor lot,' but physically, most excellent."

2. Two general methods for testing the physical requirements had been in use up to the year 1900, viz., a bending test of a small bar ½ in. to ¾ in. square and 10 in. to 20 in. long, and a drop test, which consisted in letting fall a weight of about 2,000 lbs. on a piece of rail with a span of 3 to 4 ft. Some railways used one method, some the other, and some both, but by 1900 the small bar test had been generally abandoned in favor of the drop test.

It was customary to make a test of every fifth heat of steel, and to let the weight fall from varying heights, according to the pleasure of the maker of the specifications. The proposed specfications of the American branch retained this method of testing the physical properties by dropping the weight of 2,000 lbs. on every fifth heat of steel, from a height of 16 ft. for rail weighing 55 to 65 lbs. per yard, 17 ft. for rail weighing 65 to 75 lbs. per yard, 18 ft. for rail weighing 75 to 85 lbs. per yard, and 19 ft. for rail weighing 85 to 100 lbs. per yard, but these conditions were not accepted by the American Railway Engineering Association, as there was a strong feeling among the railway engineers that more severe conditions of testing were necessary. They felt that the chemical properties could be left to the greater experience and chemical knowledge of the rail manufacturers, but that they must be the ones to prescribe the physical tests which the finished rails must stand in order to be accepted for such important service as carrying the railway traffic of the country. In 1904, therefore, the engineering association decided that each heat, instead of every fifth heat of steel, must be tested, and that the height of the drop should be increased.

It was also ascertained that the rail butts heretofore tested under the falling weight had been from the bottom of the ingot, and it was now made a part of the specifications that the test piece should be taken from the top of the ingot, on account of the probability that the metal would be less perfect at that end.

Testing every heat instead of every fifth heat, as formerly, was considered little short of a revolution in the method of testing at that time.

3. Except in the case of a few companies, the specifications in regard to details of manufacture were not elaborate, being confined almost entirely to allowing for variations from the standard template and from the length of the rail, to smoothness and perfection of finish, to branding, etc.

In view of the agitation for colder rolling, the Pennsylvania Railroad had introduced into its specifications, in 1900, a clause requiring that the rail at the last pass should be at a red heat, preferably a dull red, but in 1901 they replaced it with the so-called "shrinkage clause," which was intended to control the temperature of the rail when being finished, by prescribing that the shrinkage, after the rail was sawed, should not exceed a certain number of inches. This clause was also introduced into the proposed specifications of the American Railway Engineering Association, making an additional requirement in the details of manufacture.

Lately there has been a great deal of argument on the part of the rail manufacturers to have the railway engineers specify a definite percentage of discard from the ingot, in

order to cut off material which is more subject to segregation and more liable to have interior defects from the shrinkage cavity, gas bubbles, etc., but the railway engineers have rigidly set their faces against such a requirement, because they feel that they are much better safeguarded by the clause introduced into the specifications of the American branch of the International Association for Testing Materials, which was that "sufficient material should be discarded from the top of the ingots to insure sound rails."

When that clause was adopted, in 1901, and for a number of years afterwards, the positions of the rail manufacturers and the railway engineers were reversed, the railway engineers believing that it was best to specify a definite amount of discard, while the rail manufacturers took the opposite view. It was well expressed by an engineer of one of the steel companies, who said: "I do not think this association, nor any other should state definitely how much should be sheared from the bloom. The matter is entirely one-sided. If we agree here that 25 per cent. shall be sheared from the bloom, we might assume that would settle it, but it will not. The association will be perfectly safe in making the claim that sufficient shearing will be done to eliminate piping. If the manufacturers can remove the piping by shearing 15 per cent., they will not agree to shear 25 per cent. The object in shearing is to get rid of the piping, and the only matter of agreement will be to reach the point where sufficient shearing is done to remove the piping. For that reason, I think the association will make a mistake to demand that 25 per cent. be sheared off."

The railway engineers of to-day unanimously agree with that point of view, and their position has been further strengthened by an additional test, which will be described later. Furthermore, the records of rail failures which have been kept for a number of years disclose the incontrovertible fact that, where a 15 per cent. discard might do for one ingot, 50 per cent. would not be adequate for another.

In 1902 the American Society of Civil Engineers deemed it advisable, in view of the continual criticism of the sections of rail which they had previously designed, to take up once more the study, both of real design and specifications, and accordingly a committee was appointed for the purpose. The committee of the American Society for Testing Materials also continued its study of the rail question, and joint meetings of all three committees were held so that each would derive benefit from the work of the other.

On April 25, 1906, the committee on standard rail and wheel sections was appointed by the American Railway Association, and on October 24, 1906, the committee was directed to report in addition on the subject of specifications for the manufacture of steel rails, in connection with its report on standard sections. The rail manufacturers were asked to co-operate with the committee by sending representatives to study the question with it at its meetings, and in addition the committee employed disinterested men of national reputation for their knowledge of steel making and the properties of steel, to give expert advice on the subject. After many meetings together a report was submitted on October 30, 1907, containing the recommended rail sections and specifications, both for bessemer and open hearth steel.

Further advice was obtained from disinterested persons, who had a wide knowledge of the properties of steel and its manufacture, and a final report was submitted by the committee on April 22, 1908, with the recommendation that there were many details of the development and the following up of the results in service of the new types of sections, rolled under the new specifications, which would require considerable time and much careful study, and that they could be more efficiently and more appropriately handled by the American Railway Enginering Association. The sections and specifications were, therefore, referred to the American Railway Engineering Association, with the request that it follow up the question in its various details and keep a careful record of the results, with a view to determining whether any changes should be made, either in the specifications or designs.

As the question of discard was dealt with in these reports quite fully, it is advisable to make quotations therefrom, because the earnest consideration given to the question led to the development of an additional test, which is considered of great importance in determining the quality of metal by eliminating a large number of the so-called "piped rails," or rails with interior defects:

"In the matter of discard, there was a desire on the part of the railway members to arrange for a greater discard, and a strong disposition to insist upon a uniform minimum percentage. The manufacturers, however, presented considerable evidence which tended to show that a fixed minimum percentage requirement would be not only unfair but unscientific, claiming that the extent of piping and segregation is influenced by the size of the ingot, the rate of pouring into the mould and other details of mill practice.

With regard to the discard question, the committee has always been of the opinion that it would be preferable to test the finished product rather than specify as to details of mill manufacture.

"In pursuing its investigation of this discard question, the committee received a suggestion from William Metcalf to the effect that it would be reasonably practicable to apply the above theory to the manufacture of rails by arranging to test to destruction a number of rail butts representing a certain portion of the total output and to base rejections on the results of these tests.

"In order to avoid the unnecessary waste of good material, the committee set about to devise means by which the rejection of defective material could be insured without requiring an arbitrary and definite percentage of discard in every case, and a committee of the Pennsylvania Railroad, pursuing the same line of investigation, adopted a tentative specification which provided for a physical test of this nature, and which further provided that when physical defects were discovered all top rails of the heat should be rejected. This would result in a discard of about 25 per cent. to 30 per cent. of the entire metal in the heat whenever physical defects were discovered, and it was felt that a requirement of this nature would not only provide for the rejection of defective material, but would insure the greatest care on the part of the manufacturer.

"A trial lot of the rails of a section corresponding to type 'B' was recently rolled under these specifications as to discard, and the results convinced the committee that a development of this idea would prove the best solution of the discard problem."

In connection with the details of manufacture, an important addition was made by requiring that the brand on the rail should also contain a letter marking the position which the rail originally occupied in the ingot, so as to enable a study to be made of the effect of that position.

On June 5, 1907, a committee of civil and mechanical engineers of the Pennsylvania Railroad System and two rail manufacturers was appointed to take up the study of the rail question, and design new rail sections and recommend new specifications, with the object of improving the quality of material used in rails manufactured for that system.

The first meeting was held on June 12, 1907, and the new rail designs, known as "P.S." sections, were adopted on September 20, 1907. Tentative specifications were recommended on November 15, 1907, and 10,000 tons of rail

rolled in accordance therewith. The specifications were subsequently modified, on criticism of the manufacturers, and issued February 4, 1908.

The new rail designs of the Pennsylvania and the American Railway Association provided for a more even distribution of the metal in the head, web and base and for a thicker base, to meet the views of the rail manufacturers, who believed that a better distribution of the metal would result in an improved quality, due to more favorable rolling conditions. All of these sections are still in service and are being closely watched to determine whether the expected improvement will be realized.

The Pennsylvania Railroad System specifications have been modified several times, in the light of additional experience, and contain the improvements which have been brought about from time to time through the experiences and researches of its own committee and the committees of the other associations. So far as the chemical requirements are concerned, they are practically the same as adopted by the rail manufacturers, and the other associations. The physical requirements are determined by the drop test with the standard machine, and, in addition, the test piece is nicked and broken to reveal the presence or absence of interior defect. In the details of manufacture, the discard is required to be sufficient to secure sound rails, and the shrinkage clause to regulate the temperature of rolling is retained. The rails are marked for position in the ingot, for the purpose of subsequent identification, in order to study the effect of that position.

Similar studies and investigations are being conducted by the New York Central Lines, Harriman Lines, Baltimore & Ohio, Norfolk & Western, Lehigh Valley, Reading, and other companies, and the specifications are being improved as new knowledge is obtained. The first-named company has been foremost in the study of the effect of titanium in steel making.

Through the assignment of the rail question to the American Railway Engineering Association by the American Railway Association, the work of the committee was given official character, and its real work commenced. The first thing of importance accomplished was the introduction of a standard drop testing machine at all the rail mills, so that the results obtained at any one mill were comparable with those obtained at any other. Up to that time, 1908, machines of different design and setting were used, and the results were unreliable. With the year 1909 began the collection of a large amount of information, obtained from research work, bearing on the disputed points of rail manufacture and on proving or testing.

In 1910 the specifications for bessemer rail, formerly adopted by the American Railway Engineering Association, were withdrawn, and new ones, for both bessemer and open hearth, were presented for consideration by the association, which embodied all the improvements in the methods of determining the physical properties and the details of manufacture which had been brought forward up to that time. It was recognized, however, that numerous disputed points could only be cleared up by experimental research conducted by a trained engineer-physicist, and accordingly such an investigator was added to the committee to devote all his time to that work. The engineer of tests, M. H. Wickhorst, since his appointment, has been constantly busy with research work, and has added a great deal to our knowledge of the subject.

He has made reports on the following subjects: Influence of Carbon on Deflection; Drop, Bending and Tensile Tests on Bessemer, Titanium Bessemer, and Open-Hearth Rails; rolled by different mills, including chemical analyses and etched sections; Investigation of a Split Head Rail; Segregation, as influenced by Fire Clay on the Ingot; Strength of Rail Head; Drop Tests of Rails—Effect of Impact Energy variously Distributed; Flow of Rail Heads under Wheel Loads; Segregation and Other Rail Properties as influenced by size of Ingot; Tests of Steel Rail Ingots and derivative shapes made at Watertown Arsenal; Influence of Rolling Temperature on the Properties of Bessemer Rails.

In all of this work Mr. Wickhorst has been afforded every facility by the rail manufacturers for carrying on the investigations, and their machinery, material and laboratory assistants have been placed at his disposal. In addition, their officers have been freely consulted by the committee and have attended some of its meetings.

While at the present time the American Railway Engineering Association has not adopted standard specifications for rails, yet it has had constantly before it for consideration and study a set of proposed specifications which have embodied the best knowledge of the subject, and they have been changed from time to time in the light of new experimental investigation. The most energy has been devoted to the improvement of methods of testing to determine the physical properties, and practically no changes have been made in the chemical requirements from the standard specifications of the rail manufacturers. The railway engineers prefer to subject the finished material to such tests as will cast aside the defective rails. Their specifications, therefore, include many additional tests over those in use ten years ago. The results of the work of the American Railway Engineering association have been closely followed by the railway companies and vice versa, so that the specifications of the railways have been improved from time to time, and now embody the additional tests devised. Rails have been rolled in accordance with these new specifications for several years, and it is believed that a marked improvement is apparent in the rails being laid in the tracks since their adoption.

DETERIORATION OF COAL IN STORAGE.

The amount of deterioration of coal in storage has been determined by accurate tests made by the Bureau of Mines of the United States. The results of these tests are presented in a paper to the American Chemical Society by H. C. Porter and F. K. Ovitz.

Moisture, ash, sulphur and calorific value determinations were made on each sample, the last by means of the Mahler bomb calorimeter and a carefully calibrated Beckman thermometer. The calorimetric work on all except the Sheridan, Wyo., tests has been done throughout by one man, Mr. Ovitz, and with the same instrument. All the calorific values have been calculated to a comparable unit basis, viz., that of the actual coal substance free moisture, sulphur and corrected ash.

The results show in the case of the New River coal less than 1 per cent. loss of calorific value in one year by weathering in the open. There was practically no loss at all in the submerged samples and fresh water seemed to "preserve the virtues" of the coal as well as salt. There was almost no slacking of lump in the run-of-mine samples and the crushed coal in all cases deteriorated more rapidly than run-of-mine.

TITANIFEROUS IRON ORES.

Some 3,789 tons of titanic iron ore were shipped from the St. Urbain mines, Quebec, during 1911. This ore is used as an ore of titanium, in the United States, in the manufacture of special rail steel, and also enters into the composition of special carbons for arc-lights.

BREAK IN LARGE WATER MAIN.

A thirty-six-inch water main caused considerable damage to property when it burst in Toronto on the morning of March 9th last. The cause of the rupture has not definitely been determined, but it is thought that water hammer is responsible for the damage. The flowing water quickly flooded many cellars in the vicinity and necessitated a call

View Showing Flooding of Street Before Water was Shut Off.

being sent in for the steam fire pumps to remove the water from the damaged basements.

The break occurred at 11.30 a.m. and was flowing for about one hour, with the loss of about 1,000,000 gallons of water. The break was repaired by 8.30 a.m. March 11th, the total length of time the main was out of commission being less than 45 hours.

PROVINCIAL BOUNDARY EXTENSIONS.

The boundary extensions of Quebec, Ontario and Manitoba were discussed in the House at Ottawa this week. The government proposes that Ontario shall have a five-mile wide strip from the proposed boundary to the Nelson River; a frontage of ten miles along the east bank of the river for terminals, docks and elevators; a two-hundred-foot right-of-

way to the Hudson Bay Railway to connect with Fort Churchill; and exemption from taxes on land in Manitoba.

The boundaries of Manitoba and Quebec will also be extended. The subsidies to which Manitoba would be entitled apart from the present arrangement, on July 1st, 1912, would total for the year $883,438. This compared with the Alberta subsidy of $1,260,105 and Saskatchewan $1,551,820.

The present area of the provinces are about as follows:

	Square miles
Quebec	351,873
Ontario	260,860
Manitoba	73,732

The additional territory would represent (roughly) the following areas:

	Square miles
Quebec	355,000
Ontario	140,000
Manitoba	180,000

The accompanying sketch shows the new territory proposed to be added to the three provinces. Quebec gets Ungava, Ontario that share of Keewatin shown between dotted lines and Manitoba the territory to the north of her present boundary.

THE WRECK OF THE KNAPP ROLLER BOAT.

Our photographer, while engaged about his business near the water-front of Toronto, came upon the wreck of the old Knapp Roller boat frozen in the ice off the foot of Frederick Street. Our readers will remember the stir caused among engineers when the operating principle of this ship was first made public, about the year 1896, and the many prophecies and expectations that arose just previous to the launching and trial trip, which took place in the year 1897.

The wreck is little better than scrap now, the plating being wrenched off in places and almost entirely at one end. The method of operation whereby the ship was expected to move may be briefly stated thus: A large central drum was free to revolve within the outer casing. At the ends of the drum or tube, the propelling machinery was geared to the outer casing, which was furnished with blades in a manner similar to a paddle wheel of a ferry steamer. The trial trip was sufficient to show the impracticability of the project and the ship, instead of making about thirty knots, was unable to make efficient headway, even in a comparatively smooth expanse of water. Shortly afterwards the ship was abandoned, and now lies as depicted in the illustration. The wreck is in the direct path of the proposed government dock to be erected at the Polson Iron Works; and this will doubtless in the near future necessitate its removal. The experiment is reported to have cost about $15,000.

ENGINEERING NOTES.

Montreal, P.Q.—The Engineers' Club of this city are considering the building of an addition to their quarters on Beaver Hall Square. The improvements contemplated will increase the value of the property to $500,000.

Ottawa, Ont.—Hon. Col. Sam Hughes, at a dinner given to the Cavalry Association, stated that the time was coming when military engineers would lay out the public highways, national harbors, etc.

Hamilton, Ont.—A report states that the first macadam pavement to be used as a pavement in Ontario was laid in this municipality. It was placed in position in 1880 and is still in use in certain sections of the city.

Ottawa, Ont.—A delegation waited upon the federal government asking that body to subsidize a proposed tunnel to be built across the St. Lawrence River near Montreal. The tunnel would be used for steam and electric roads.

Great Britain.—Owing to the recent disastrous submarine accident there has been devised a new means of raising sunken vessels. In the operation of this a number of canvas bags are sunk and secured to the wreck by hawsers securely fastened by divers. Compressed air is then driven into the canvas bags or cylinders and the ship raised by means of the air.

Toronto, Ont.—The Board of Control have presented a report on the municipal hydro-electric system wherein they state that the work accomplished up to December 31st, 1911, included the completion of the Duncan Street sub-station building, the building of the high level station, the West Toronto station and the St. Lawrence Market station. The report states that the electrical work in the above mentioned stations is in a very advanced condition, in many cases being 80 and 90 per cent. completed. 198,228 feet of cable were drawn in; 1,251 joints were made; 228 joints were wrapped with asbestos, and 700 transformers were installed. 23,016 concrete and 7,986 wooden poles were erected and 2,151,511 pounds of wire strung.

Regina, Sask.—The municipal Fire, Light and Power Committee have prepared a new set of building laws for the city. The new laws provide that during street track construction no materials shall be deposited nearer than eight feet to the nearest rail; that no permit for sidewalk obstruction shall be valid for more than one week prior to the commencement of the excavation, nor shall the permit be valid for a period exceeding four months; it may, however, at the option of the committee, be renewed for a longer period. The concluding clauses dealing with the protection of the city from responsibility in case of accident and the penalty for non-observance of the by-law were rather indefinite in detail, and the by-law was referred back by the council to the city solicitor for alteration.

Mr. J. A. Brodie, of the Liverpool municipal engineering office, has been recommended by the Liverpool Health Committee to lay out the new capital of India.

PERSONAL.

Mr. L. W. Morden has been appointed sales engineer of the Packard Electric Company; his headquarters will be in Toronto.

Mr. C. C. Owens has recently been placed in charge of the Detroit District Sales Office of the Westinghouse Electric and Manufacturing Company, with the title of district manager.

Mr. E. R. Mathewson has been awarded the gold medal of the Institution of Mining and Metallurgy, London, England. Mr. Mathewson is the general manager of the Anaconda Smelting Works. He is a graduate of McGill University, Montreal, his native city.

Mr. H. E. Grant, sales agent in the light and power department of the B. C. E. R. Co., Vancouver, has been invited by the executive of the National Electric Light Association to read a paper on the education of central station employees at the approaching convention of the body in Seattle.

Mr. H. A. Whiting, of Bellingham, Wis., U.S.A., has been appointed construction engineer of Edmonds, British Columbia. He will have charge and be held responsible for all outside municipal work, while the work of planning new improvements and inspecting subdivision plans will be undertaken by the present engineer, W. A. McPherson.

Mr. Mieville, resident engineer of Messrs. W. H. Allen, Son & Company, of Bedford, Eng. (who are represented in Canada by Messrs. Chapman & Walker, of Toronto), has just left for an extensive tour of the West, and will call at all the leading towns en route.

OBITUARY.

The death is reported of **Mr. John S. Metcalf,** president of the John S. Metcalf Co., Ltd. His death occurred at his home in Evanston, Ill., on the evening of March 4th. Heart trouble and complications were the cause of death. Mr. Metcalf had devoted his life to the designing and construction of large grain elevators. Many of the largest elevators in Canada were his work. He was born near Sherbrooke, Que., in 1847. He leaves a wife and three daughters.

Mr. F. J. L. Tytler, civil engineer, of Vancouver, B.C., is dead in that city. His death was due to heart failure and occurred on Sunday, March 3rd, last. Mr. Tytler was born in India, his father being an officer in the British army. He came to Vancouver in 1890 and was for some time in the employ of the Provincial Government in the superintendence of dyking operations, principally in the Matsqui district. He was married a number of years ago to a sister of the late Captain Livingstone, of Hatzic, and leaves one child. Mr. Tytler was principal of the Technical School of Civil Engineering and Surveying.

MEETINGS.

Victoria, B.C.—The Road Superintendents' Conference was held in this city; Premier McBride and Hon. Thomas Taylor extended a welcome to the delegates. Mr. R. H. Thomson, chief engineer of the Seattle Port Commission, delivered an address in the course of which he stated that it was impossible to lay down any hard and fast rules for road construction. He showed how road engineering had advanced since the days of Telford and Macadam. He showed several lantern slides of roads in Europe to his audience. A number of municipal representatives were present, including Mayor Beckwith and several aldermen, City Engineer Smith and members of his department.

* * * *

A meeting of the Canadian Society of Civil Engineers was held at their rooms on Dorchester Street, Montreal, when considerable discussion was had on reports put in by committees appointed to draft standard specifications and classifications for railroad and road construction. Mr. J. M. Shanley presided over the meeting, and at the close refreshments were served.

* * * *

The fourteenth annual meeting of the Canadian Mining Institute was held in Toronto recently. The occasion was the cause of one hundred and eighty mining engineers and mining men concentrating and conversing on the mineral conditions of this country. Hon. W. H. Hearst, Ontario Minister of Lands, Forests and Mines, read the address of welcome to the delegation and then followed the reading and discussion of various papers. Among these papers were "Manganese and Tungsten Deposits in Nova Scotia," "Accident Prevention or the Conservation of Human Life," "Sanitary Conditions in Mining Camps."

The meetings terminated by a banquet, which was held during the evening of March 8th.

The elections resulted in Mr. G. G. S. Lindsey, K.C., being the new president.

LECTION OF DOMINION LAND SURVEYORS' ASSOCIATION.

At the annual meeting of the Dominion Land Surveyors' ssociation, held in Ottawa, March 6th, Mr. R. A. Belanger, Ottawa, was elected president. The other officers will : Vice-president, C. F. Miles, Toronto; secretary-easurer, E. M. Dennis, Department of the Interior, Ottawa; xecutive Committee, J. D. Craig, J. J. Steele, J. S. Nash, Ottawa; auditors. C. Engle, E. L. Burgess, Ottawa; cond vice-presidents, Ontario, C. F. Aylesworth, Ottawa; uebec, G. F. Lonergan, Buckingham; Manitoba, C. H. ayne, Winnipeg; Saskatchewan, R. H. Montgomery, Prince bert; Alberta, J. N. Wallace, Edmonton; British Columbia, F. Ross, Kamloops; Yukon, F. H. Kitto, Dawson.

TTAWA BRANCH CANADIAN SOCIETY CIVIL ENGINEERS.

An interesting lecture was delivered by Mr. A. A. Dion, perintendent of the Ottawa Electric Company, before the ttawa branch of the Canadian Society of Civil Engineers, March 6th. "The Choice of Current and Motors in ectrical Installations" was the subject. Mr. Dion lucidly scribed the properties of different currents, giving infor-ation of a most helpful kind for those who have to decide to what systems to use in installation of light or power. he lecture was illustrated by charts and apparatus.

COMING MEETINGS.

NATIONAL ASSOCIATION OF CEMENT USERS.—March, 11th-16th. nual Convention at Kansas City, Mo. Sec'y, Edward E. Krauss, Harrison dg., Philadelphia, Penn.

ALBERTA BUILDERS EXCHANGE.—Annual Convention to be held in thbridge, Alta., on March 16th, 1912. Business sessions will be brought to a se with a banquet.

CANADIAN INSTITUTE.—198 College Street, Toronto. Saturday Evening ctures, 8 p.m. March 16th,—"The Relative Blood Supply to the Various gans of the Body," by Prof. Brodie, Toronto University, March 23rd,—"Waste nd Problems,' by Dean Fernow, Toronto University.

ENGINEERING SOCIETIES.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—413 Dorchester Street est, Montreal. President, W. F. TYE: Secretary. Professor C. H. McLeod.

ICTORIA BRANCH—Chairman, F. C. Gamble; Secretary-Treasurer, R. W. Macintyre

UEBEC BRANCH—Chairman, P. E. Parent; Secretary, S. S. Oliver. Meetings held twice a month at room 40, City Hall.

ORONTO BRANCH—96 King Street West, Toronto. Chairman, T. C. Irving; Acting Secretary, T. R. Loudon, University of Toronto. Meets last Thursday of the month at Engineers' Club.

ANITOBA BRANCH—Secretary E. Brydone Jack. Meets every first and third Friday of each month, October to April, in University of Manitoba, Winnipeg.

ANCOUVER BRANCH—Chairman, Geo. H. Webster: Secretary, H. K. Dutcher, 319 Pender Street West, Vancouver. Meets in Engineering Department. University.

TTAWA BRANCH—
177 Sparks St. Ottawa. Chairman, S. J. Chapleau, Ottawa; Secretary, H. Victor Brayley, N.T. Ry., Cory Bldg. Meetings at which papers are read, 1st and 3rd Wednesdays of fall and winter months; on other Wednesday nights in month there are informal or business meetings,

MUNICIPAL ASSOCIATIONS

ONTARIO MUNICIPAL ASSOCIATION.—President, Chas. Hopewell, ayor, Ottawa; Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. homas, Ontario.

UNION OF ALBERTA MUNICIPALITIES.—President, H. H. Gaetz, Red eer, Alta.; Secretary-Treasurer, John T. Hall, Medicine Hat, Alta.

THE UNION OF CANADIAN MUNICIPALTIES.—President, W. Sanford vans, Mayor of Winnipeg; Hon. Secretary-Treasurer, W. D. Lighthall, K.C., x-Mayor of Westmount.

THE UNION OF NEW BRUNSWICK MUNICIPALITIES.—President, ouncillor Siddall, Port Elgin; Hon. Secretary-Treasurer, J. W. McCready, City lerk, Fredericton.

UNION OF NOVA SCOTIA MUNICIPALITIES.—President, Mr. A. S. lacMillan, Warden, Antigonish, N.S.; Secretary, A. Roberts, Bridgewater, N.S.

UNION OF SASKATCHEWAN MUNICIPALITIES.—President, Mayor ec, Lemberg; Secretary, Mr. Heal, Moose Jaw.

UNION OF BRITISH COLUMBIA MUNICIPALITIES.—President, Mayor lanta, Nanaimo, B.C.; Hon. Secretary-Treasurer, Mr. H. Bose, Surrey entre, B.C.

CANADIAN TECHNICAL SOCIETIES

ALBERTA ASSOCIATION OF ARCHITECTS.—President, G. M. Lang Secretary, L. M. Gotch, Calgary, Alta.

ASSOCIATION OF SASKATCHEWAN LAND SURVEYORS.—President, J. L. R. Parsons, Regina; Secretary-Treasurer, M. B. Weeks, Regina.

ASTRONOMICAL SOCIETY OF SASKATCHEWAN.—President, N. McMurchy; Secretary, Mr. McClung, Regina.

BRITISH COLUMBIA LAND SURVEYORS' ASSOCIATION.—President, W. S. Drewry, Nelson, B.C.; Secretary-Treasurer, S. A. Roberts, Victoria, B.C.

BUILDERS' CANADIAN NATIONAL ASSOCIATION.—President, E. T. Nesbitt; Secretary-Treasurer, J. H. Lauer, Montreal, Que.

CANADIAN ASSOCIATION OF STATIONARY ENGINEERS.—President, Wm. Norris, Chatham, Ont.; Secretary, W. A. Crockett, Mount Hamilton, Ont.

CANADIAN CEMENT AND CONCRETE ASSOCIATION.—President, Peter Gillespie, Toronto, Ont.; Secretary-Treasurer, Wm. Snaith, 57 Adelaide Street, Toronto, Ont.

CANADIAN CLAY PRODUCTS' MANUFACTURERS' ASSOCIATION.—President, W. McCredie; Secretary-Treasurer, D. O. McKinnon, Toronto

CANADIAN ELECTRICAL ASSOCIATION.—President, N. W. Ryerson, Niagara Falls; Secretary, T. S. Young, Canadian Electrical News, Toronto.

CANADIAN FORESTRY ASSOCIATION—President, John Hendry, Vancouver. Secretary, James Lawler, Canadian Building, Ottawa.

CANADIAN GAS ASSOCIATION.—President, Arthur Hewit, General Manager Consumers' Gas Company, Toronto; J. Keillor, Secretary-Treasurer, Hamilton, Ont.

CANADIAN INDEPENDENT TELEPHONE ASSOCIATION.—President, W. Doan, M.D., Harrietsville, Ont.; Secretary-Treasurer, Francis Dagger, 21 Richmond Street West, Toronto.

CANADIAN MINING INSTITUTE.—Windsor Hotel, Montreal. President, Dr. A. E. Barlow, Montreal; Secretary. H. Mortimer Lamb, Windsor Hotel, Montreal.

CANADIAN PEAT SOCIETY.—President, J. McWilliam, M.D., London, Ont.; Secretary-Treasurer, Arthur J. Forward, B.A., 22 Castle Building, Ottawa, Ont.

THE CANADIAN PUBLIC HEALTH ASSOCIATION.—President, Dr. Charles A. Hodgetts, Ottawa; General Secretary, Major Lorne Drum, Ottawa.

CANADIAN RAILWAY CLUB.—President, A. A. Goodchild; Secretary, James Powell, P.O. Box 7, St. Lambert, near Montreal, P.Q.

CANADIAN STREET RAILWAY ASSOCIATION.—President, D. McDonald, Manager, Montreal Street Railway; Secretary, Acton Burrows, 70 Bond Street, Toronto.

CANADIAN SOCIETY OF FOREST ENGINEERS.—President, Dr. Fernow, Toronto.; Secretary, F. W. H. Jacombe, Department of the Interior, Ottawa.

CENTRAL RAILWAY AND ENGINEERING CLUB.—Toronto. President, G. Baldwin; Secretary, C. L. Worth, 409 Union Station. Meets third Tuesday each month except June, July and August.

DOMINION LAND SURVEYORS.—President, Mr. R. A. Belanger, Ottawa; Secretary-Treasurer, E. M. Dennis, Dept. of the Interior, Ottawa.

EDMONTON ENGINEERING SOCIETY.—President, J. Chalmers; Secretary, B. F. Mitchell, City Engineer's Office, Edmonton, Alberta.

ENGINEERING SOCIETY, TORONTO UNIVERSITY.—President, W. B. McPherson; Corresponding Secretary, A. McQueen.

ENGINEERS' CLUB OF MONTREAL.—Secretary, C. M. Strange, 9 Beaver Hall Square, Montreal.

ENGINEERS' CLUB OF TORONTO.—96 King Street West. President, Willis Chipman; Secretary, R. B. Wolsey. Meeting every Thursday evening during the fall and winter months.

INSTITUTION OF ELECTRICAL ENGINEERS.—President, Dr. G. Kapp; Secretary, P. F. Rowell, Victoria Embankment, London, W.C.; Hon. Secretary-Treasurer for Canada, Lawford Grant, Power Building, Montreal, Que.

INSTITUTION OF MINING AND METALLURGY.—President, Edgar Taylor; Secretary, C. McDermid, London, England. Canadian members of Council:—Prof. F. D. Adams, J. B. Porter, H. E. T. Haultain and W. H. Miller and Messrs W. H. Trewartha-James and J. B. Tyrrell.

INTERNATIONAL ASSOCIATION FOR THE PREVENTION OF SMOKE.—Secretary R. C. Harris, City Hall, Toronto.

MANITOBA LAND SURVEYORS.—President, George McPhillips; Secretary-Treasurer, C. G. Chataway, Winnipeg, Man.

NOVA SCOTIA MINING SOCIETY.—President, T. J. Brown, Sydney Mines, C. B.; Secretary, A. A. Hayward.

NOVA SCOTIA SOCIETY OF ENGINEERS, HALIFAX.—President, J. N. MacKenzie; Secretary, A. R. McCleave, Assistant Road Commissioner's Office, Halifax, N.S.

ONTARIO PROVINCIAL GOOD ROADS ASSOCIATION.—President, Major. T. L. Kennedy; Hon. Secretary-Treasurer, J. E. Farewell, Whitby; Secretary-Treasurer, G. S. Henry, Oriole.

ONTARIO LAND SURVEYORS' ASSOCIATION.—President, T. B. Speight, Toronto; Secretary, Killaly Gamble, 703 Temple Building, Toronto.

THE PEAT ASSOCIATION OF CANADA.—Secretary, Wm. J. W. Booth, New Drawer, 2263, Main P.O., Montreal.

PROVINCE OF QUEBEC ASSOCIATION OF ARCHITECTS.—Secretary, J. E. Ganier, No. 5. Beaver Hall Square, Montreal.

ROYAL ARCHITECTURAL INSTITUTE OF CANADA.—President, F. S. Baker, F.R.I.B.A., Toronto, Ont.; Hon. Secretary, Alcide Chausse, No. 5. Beaver Hall Square, Montreal, Que.

ROYAL ASTRONOMICAL SOCIETY.—President, Prof. Louis B. Stewart, Toronto; Secretary, J. R. Collins, Toronto.

SOCIETY OF CHEMICAL INDUSTRY.—Dr. A. McGill, Ottawa, President; Alfred Burton, Toronto, Secretary.

UNDERGRADUATE SOCIETY OF APPLIED SCIENCE, McGILL UNIVERSITY.—President, J. P. McRae; Secretary, H. F. Cole.

WESTERN CANADA IRRIGATION ASSOCIATION.—President, Wm. Pierce, Calgary; Secretary-Treasurer, John T. Hall, Brandon, Man.

WESTERN CANADA RAILWAY CLUB.—President, R. R. Nield; Secretary, W. H. Rosevear, 115 Phœnix Block, Winnipeg, Man. Second Monday, except June, July and August, at Winnipeg.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand and projected, contracts awarded, changes in staffs, etc. Printed forms for the purpose will be furnished upon application.

PLANS AND SPECIFICATIONS ON FILE.

The following Plans (P.) and Specifications (S.) are on file for reference only unless otherwise noted at the office of The Canadian Engineer, 62 Church Street, Toronto:—

Bids close		Noted in issue of
3-18	Concrete reservoir (2,000,000 gallons' capacity), Moose Jaw, Sask.....(P. & S.)	2-22
3-18	Centrifugal pumps, motors, etc., Moose Jaw, Sask. .....(P. & S.)	2-22
3-18	Valves and Fittings, Moose Jaw, Sask. .....(P. & S.)	2-22
3-18	96,000 ft. of 18-in. Steel Pipe, Moose Jaw, Sask. .....(S.)	2-22
-15	Pavements, Welland, Ont. .....(P. & S.)	2-29
3-25	Prime mover equipment, electric lighting equipment, etc., Moose Jaw, Sask.....(S.)	3-7

TENDERS PENDING.

In Addition to Those in this Issue.

Further information may be had from the issues of The Canadian Engineer referred to.

Place of Work.	Tenders Close.	Issue of.	Page.

TENDERS.

Calgary, Alta.—Tenders will be received until March 25th, 1912, for the erection of a modern business block, 125 feet by 130 feet, three storeys high, in Medicine Hat. Plans, etc., at office of the architect, Mr. F. J. Lawson, Norman Block, Calgary.

Calgary, Alta.—Tenders will be received up to noon of April 15th, 1912, for the design, manufacture and erection complete on piers to be provided by the railway company, of steel highway bridges for the C.P.R. Company. Full instructions may be had on application to A. S. Dawson, Chief Engineer, C.P.R., Calgary, Alta. (See advt. in Can. Eng.)

Halifax, N.S.—Tenders will be received until March 27th, 1912, for the construction of a garbage incinerator and accessories complete in accordance with specifications on file at the City Engineer's office, where forms of tender, etc., may be obtained. J. J. Hopewell, Clerk of Works, City Works Office, Halifax, N.S.

Hamilton, Ont.—Tenders will be received by Mr. J. Wall, general manager of British Canadian Canners, Limited, Lister Block, Hamilton, Ont., for the several works required in the erection of canning factories, warehouses, etc., at Cobourg, Bowmanville, Port Robinson, Merlin and Highgate, Ont. Tenders close at noon, Saturday, March 23rd. Plans and specifications may be seen at the residence of the local manager at above places, at the company's offices at Hamilton, and at the offices of Munro and Mead, architects, Chancery Chambers, Hamilton.

Kerrisdale, B.C.—The corporation of the municipality of Point Grey invites tenders for the supply of pipes and all material and for the installation of a system of sewerage for Eburne district. Drawings, etc., may be seen at the office of the engineers, Messrs. Cleveland & Cameron, 506 Winch Building, Vancouver, B.C. Tenders to be received until March 18th, 1912. H. Floyd, clerk of municipal council, Municipal Hall, Kerrisdale, B.C.

Lethbridge, Alta.—Tenders will be received up to noon of Thursday, April 11th, 1912, for approx. 2½ miles of sanitary sewers; approx. 3½ miles of cement walks (curb and gutter in addition); approx. 7 miles of grading. Plans and specifications on file at the office of the City Engineer, A. C. D. Blanchard, also office of Canadian Engineer, Winnipeg. G. W. Robinson, Secretary-Treasurer. (See advt. in Can. Eng.)

Oakville, Ont.—Tenders will be received until April 1st, 1912, for the construction of main sewerage and sewage disposal works in the town of Oakville. Specifications may be obtained at the office of the engineer, T. Aird Murray, 303 Lumsden Building, Toronto. C. A. Bradbury, town clerk, Oakville, Ont. (See advertisement in Canadian Engineer.)

Ottawa, Ont.—The Dept. of Public Works invite tenders for the interior fittings to Post Office, Customs and Inland Revenue, Campbellton, N.B. Tenders to be received until March 18th, 1912. Plans, etc., at the office of Mr. John Quin, Clerk of Ways, Campbellton; D. H. Waterbury, Clerk of Works, St. John, N.B.; and office of R. C. Desrochers, Secretary Dept. of Public Works, Ottawa.

Ottawa, Ont.—Tenders will be received until March 14th, 1912, for the purchase of the damaged machinery of dredge "New Brunswick," stored in the Custom House at St. John, N.B. Forms of tender can be obtained at the office of G. G. Scovil, Esq., Supt. of Dredges, Dept. of Public Works, St. John, N.B. R. C. Desrochers, Secretary Dept. of Public Works, Ottawa.

Ottawa, Ont.—Tenders for the erection of a frame schoolhouse on the St. Mary's Indian Reserve near Fredericton, N.B., will be received up to noon of April 4, 1912. J. D. McLean, assistant deputy and secretary, Department of Indian Affairs, Otttawa.

Port Arthur, Ont.—Tenders for paving will be received until Monday, April 8th, 1912. Specifications, etc., may be obtained from L. M. Jones, city engineer, Port Arthur. J. McTeigue, city clerk, Corporation Offices, Port Arthur. (See advertisement in Canadian Engineer.)

Prince Albert, Sask.—Tenders will be received by C. O. Davidson, secretary-treasurer of this city, up to noon of Friday, March 29th, for the construction of sewers, sewage plants, and water mains and materials. (See details of tender in the advertising section of this issue.)

Saskatoon, Sask.—Tenders will be received until March 20th, 1912, for all trades above ground level, also basement interior fittings, for the parish church of St. John, Saskatoon. Plans, etc., at the Builders' Exchange, Winnipeg, and at the office of Messrs. Thompson, Daniel & Colthurst, Architects, 410 Drinkle Bldg., Saskatoon.

Saskatoon, Sask.—Tenders will be received up to noon of April 5th, 1912, for the laying of approximattely 23,100 sq. yds. of sandstone block pavement. All information may be had on application to Geo. T. Clark, City Engineer, Saskatoon. (See advt. in Can. Eng.)

Toronto, Ont.—The Dept. of Public Works invite tenders for the erection of an addition to the Registry and Land Titles Office, North Bay, including separate tenders for plumbing, heating and electric wiring. Tenders to be received until March 26th, 1912. Plans, etc., at the Registry Office, North Bay, also at the office of H. F. McNaughton, Secretary to Public Works, Ontario, Dept. of Public Works, Toronto, Ont.

Toronto, Ont.—Tenders for the construction of Section No. 15 (Rosedale Creek Syphon) High Level Interceptor, will be received until March 26th, 1912. Plans, etc., at the office of the City Engineer, Toronto. G. R. Geary (Mayor), Chairman Board of Control. (See advt. in Can. Eng.)

Toronto, Ont.—Tenders for the construction of the Garrison Creek Extension, Section No. 1, will be received up to noon, March 26th, 1912. Specifications at the office of the City Engineer, Toronto. G. R. Geary (Mayor), Chairman Board of Control. (See advt. in Can. Eng.)

Toronto, Ont.—Tenders will be received until March 26th, 1912, for one 30-inch Venturi water meter for the waterworks department. Specifications, etc., at the office of the city engineer, Toronto. G. R. Geary (Mayor), chairman, Board of Control, City Hall, Toronto.

Winnipeg, Man.—Tenders for supply of asphalt required by the city for paving purposes during the year 1912, will be received up to noon, March 20th, 1912. Specifications, etc., at the office of the City Engineer, 223 James Avenue, Winnipeg. M. Peterson, Secretary Board of Control Office, Winnipeg. (See advt. in Can. Eng.)

Winnipeg, Man.—Tenders for the supply of labor and materials required in the erection of approximately 10,560 feet in length of 36-inch wooden stave pipe line, will be received until March 19, 1912. Specifications, etc., may be obtained at the office of the City Engineer, 223 James Ave., Winnipeg. M. Peterson, Secretary Board of Control Office, Winnipeg.

Winnipeg, Man.—Tenders for the supply of one or more deep well turbine pumps, driven by electric motor and capable of pumping one million Imperial gallons per 24 hours, will be received until April 1st, 1912. Specifications, etc., may be obtained at the office of the City Engineer, 223 James Ave. M. Peterson, Secretary Board of Control Office, Winnipeg.

CONTRACTS AWARDED.

Athens, Ont.—Public Building.—Contractor: John Dillon, of Seeley's Bay, Ont.

Brantford, Ont.—Mr. T. A. Cowan, of Brantford, has received the contract for the supply of sewer pipes required by the city during 1912. Among other tenderers were the Hamilton and Toronto Sewer Pipe Co. and the Ontario Sewer Pipe Company. T. Harry Jones, City Engineer.

Brooklyn, N.S.—Supply of 20,000 bbls. of cement.—Contractors: Canada Cement Co., Ltd., of Montreal.

Courtenay Bay, St. John, N.B.—Breakwater, Wharves, etc., etc.—Contractors: Norton Griffiths & Co., Ltd., of Montreal.

Hamilton, Ont.—The Hamilton & Toronto Sewer Pipe Company have been awarded the contract for the supply of sewer pipe required by the city for 1912.

Kingston, Ont.—Mr. Michael Sullivan has been awarded the contract to erect the new dormitory of the Royal Military College in this city.

Port Stanley, Ont.—Breakwater and Dredging.—Contractor: M. J. Hogan, of Port Colborne, Ont.

Saskatoon, Sask.—Contracts for the construction of Saskatoon pavements have been awarded as follows: 63,000 yds. at $2.90, to the Bitulithic & Contracting Co.; 20,000 yds. asphalt concrete at $2.80, to the El Oso Paving Co., and 40,000 yds. sheet asphalt at $2.85, to the same firm.

Saskatoon, Sask.—Contracts for the construction of concrete walk and curbing have been let as follows: 14 miles to Western Pavers, Limited, Winnipeg, Man., at 17 cents per sq. ft. on walk and 32 cents per lin. ft. on curb; 7 miles to Robinson & Foster, Spokane, at 16¾ cents on walk and 32 cents for curb.

Toronto, Ont.—The Steel & Radiation Co. have just closed a contract for Crittall Metal Casement windows in the new Canadian Pacific Railway office building, Toronto. This is one of the largest contracts ever let in this type of window. Contract was settled entirely on the merits of the window.

Three Rivers, Que.—Additional filling at new coal docks.—Contractors: J. J. Collins and V. W. Giroux, of Ottawa, Ont.

Vancouver, B.C.—Mr. Bedford Davidson, contractor, has been awarded the contract calling for the erection of a building to be known as the James Borland block. The exterior of the structure is to be faced with buff Clayburn, pressed brick and terra cotta. Parr, McKenzie & Day are the architects.

Vancouver, B.C.—The contract for the construction of the James Borland Block on Hastings Street, was awarded to Mr. Bedford Davidson, contractor. Steel frame work, concrete and brick will make up the construction of the building. Exterior of building is to be faced with buff Clayburn pressed brick and terra cotta. Estimated cost, $85,000.

Vancouver, B.C.—Six-story hotel on Cordova Street, 25 x 122 feet; concrete, brick and mill construction; cost, $60,000; architect, Mr. J. R. MacDonald; contractors, Messrs. Baynes & Horie. Two-story store and office building, Homer and Water Sts.; brick and mill construction; contractors, the Burrard Construction Company; estimated cost, $30,000.

Vancouver, B.C.—The tender of the H. V. Tucker Company for providing crushed rock for all projected road work in North Vancouver has been accepted. It was the lowest of three tenders submitted, as follows: The Producers' Rock & Gravel Company, $120,350; Granite Quarries, Ltd., $110,655; H. V. Tucker Company, $89,285.

Barrett Specification Roofs

"Colonade" Apartments, Kansas City, Mo.
Sellers & Marquis, Roofers.
J. W. McKecknie, Architect.

Best for Apartment Houses.

THE "COLONADE" apartments in Kansas City, Mo., illustrated herewith, have Barrett Specification Roofs.

The owners selected this kind of roofing because they wanted first of all the least expensive roof which would give *proper protection*.

As a Barrett Specification Roof will last 20 years and over without care or attention and as its cost is less than that of any other permanent roof covering, they made no mistake on that point.

The owners wanted *low annual charges*, and Barrett Specification Roofs were satisfactory in that respect as they require no painting or care.

The owners also wanted *proper protection against fire* and as these roofs are considered by fire underwriters as slow burning construction, and as such take the base rate of insurance, everything was satisfactory on that point.

It's always the same story—when ultimate costs and satisfactory service are carefully considered, Barrett Specification Roofs are selected.

Further information about Barrett Specification Roofs will be supplied free on request.

Special Note

We advise incorporating in plans the full wording of The Barrett Specification, in order to avoid any misunderstanding.

If any abbreviated form is desired however the following is suggested:

ROOFING—Shall be a Barrett Specification Roof laid as directed in printed Specification, revised August 15th, 1911, using the materials specified, and subject to the inspection requirement

The Paterson Manufacturing Co., Limited

Montreal Toronto Winnipeg Vancouver St. John, N.B. Halifax, N.S.

Victoria, B.C. — The contract for the erection of the building of the New Method Laundry has been awarded to Messrs. S. and C. Carkreek. It is to be of brick, 114 by 48.

Winnipeg, Man.—Messrs. Seimans Bros. Dynamo Works have been awarded the contract to supply the transformers and switchboards for the city. This firm will install the above previous to June 30th, 1912.

Winnipeg, Man.—Erection of fender, Redwood Bridge; Messrs. Holmes Bros.; cost, $13,156.20.

Winnipeg, Man. — Twenty-four-inch disk rock crusher, Messrs. Mussens Limited; cost, $1,695.

RAILWAYS—STEAM AND ELECTRIC.

Province of Alberta.—The Grand Trunk Pacific Railway officials are desirous of completing the line to Lethbridge as soon as possible. The contract for the grading will be let March 15th, and the work is to be completed this fall.

Calgary, Alta.—The Canadian Pacific Railway are planning to construct fifteen additional sidings in a new yard to be opened adjoining the present one.

Medicine Hat, Alta.—Ald. Howland has made preparations for the introduction of a bill calling for the construction of a street railway in this city.

Port Arthur, Ont.—A report states that the Canadian Northern Railway officials are about to order the extension of their grain elevator at this point to a capacity of 24,000,000 bushels. The present capacity is 7,000,000 bushels. According to the report the work is to commence this spring.

Vancouver, B.C.—The municipal engineering staff under Mr. Fellowes, City Engineer, has been at work on the plans for the crossing projection of that city, in order to have them completed in time for presentation to the Railway Board when that body hold their meeting in Vancouver during the coming spring.

Western Canada.—The C.P.R. work on new stations in the West during the approaching summer will be extensive, and the officials at Calgary are making preparations for new erections at Webb, Namaka, Seven Persons, Winnifred, Danmore, Clive, Nevis, Lougheed, Aldersyde, Jaffray, Burmis, Galloway and Yahk.

LIGHT, HEAT AND POWER.

Berlin, Ont.—The Light Commissioners have decided to discard the gas producer plant and rely entirely on the power of the hydro-electric commission. The plant cost $80,000.

Brantford, Ont.—It is reported that the Lake Erie and Northern Railway will operate their system by means of the hydro-electric current, providing the prices offered are reasonable. This would mean that all towns between Brantford and Port Dover and Brantford and Galt would be along the line of the distributing cables.

Calgary, Alta.—During the month of February, 1912, this city used $8,149.20 of electricity for various power purposes. The receipts of the electrical department of the city for the month of February amounted to $21,417.75. This was made up as follows: Meter light, $20,110.62; flat rate light, $1,289.81; meter power, $9,879.32, and flat rate power, $138.

St. Marys, Ont.—The St. Marys Cement Company have signed a contract whereby that plant will in future be supplied with power from the hydro-electric commissioners. It is estimated the cost of the line and transformers will total $15,000. The original estimate of power rate to be charged was figured on the basis of the town using 500 horse-power. The estimated rate was $29.50 per horse-power. So far the town has been actually using only some 200 horse-power, and paying $38 per horse-power. With the Cement Company sharing the expense the rate will be reduced. It is anticipated that St. Marys will have a rate at least as low as $29.50.

Vancouver, B.C.—The British Columbia Electric Railway have started work on a new sub-station in the district of Collingwood. The cost of this with interior equipment is estimated at $100,000.

GARBAGE, SEWAGE AND WATER.

Montreal, P.Q.—Major Howard has recommended to the Board of Control, the building of about twenty miles of sewers as speedily as possible.

Port Stanley.—The by-law calling for the expenditure of $22,000.00 for waterworks improvement has been carried by the ratepayers.

Ridgetown, Ont.—Mr. F. W. Farncomb, C.E., of London, Ont., acting for the Town of Ridgetown has awarded the contract for the installation of the pumping equipment to the Canadian Fairbanks-Morse Company of Toronto for the sum of $7,500. The equipment will consist of one Fairbanks-Morse 60 H.P. natural gas engine, one Fairbanks-Morse 40 H.P. gasoline engine, two Smart-Turner double acting triplex power pumps and three Goulds deep well pumps. The installation to be complete June 1st, 1912. The contract for the power house and pump well has been awarded to Geo. Poag, of Ridgetown, Ont.

Regina, Sask.—City Commissioner McPherson has been investigating the municipal water supply, and has announced that there is available enough water for a population double that now in the city.

Victoria, B.C.—Ald. Cuthbert has made a motion in the council meeting that the city look for a new and additional source of supply for the water system of the city. Elk Lake has been mentioned as a probable site for a new intake. The Sooke Lake scheme will not be completed for two years at the least and the city's supply must be secured from Elk Lake unless it be augmented through the city's right to purchase water by the gallon from the Esquimalt Water Works Company.

Westmount, Montreal, P.Q.—The recent suit brought by the Montreal Water and Power Company against the municipality resulted in a decision being given in favor of the defendants. The dispute was in regard to the yearly assessment rate of water payment.

BUILDINGS AND INDUSTRIAL WORKS.

Guelph, Ont.—The Crowe Iron Works are about to make an important addition to their plant. Two new buildings and an extra story will be added to the core room, will be erected.

Hamilton, Ont.—The Gartshore Thomson Company are about to erect an addition to their plant. This has become necessary owing to the large contract recently secured from the municipality for cast-iron pipe.

Montreal, P.Q.—Mr. C. A. Reeves, architect, is at present preparing plans for a new school building for the Catholic School Commissioners of Maisonneuve. It will be three storys and basement; 186 x 70.

Montreal, P.Q.—Plans have now been completed for the utilization of the land recently given to McGill University by Sir William Macdonald. It is proposed to erect a gymnasium, swimming bath, a new grand stand to accommodate 8,000 people and new dormitories. The whole scheme is expected to cost about $250,000.

Ottawa, Ont.—The federal government have passed an order in council calling for the erection of the new department building on the Wellington St. site. The preparation of plans for the new building will be considered at once as the congestion existing in the different departments makes necessary the provision of additional accommodation as soon as possible. It is quite probable that either competitive designs will be asked or plans previously prepared on that basis utilized.

Port Moody, B.C.—The Port Moody Sand and Gravel Company has been organized to operate on these materials near this point. One of the largest hydraulic pumps in the province is to be installed by the company to lift the sand and gravel, which test borings have shown exist in immense quantities along the beach just below water level. The company will require 750 horsepower in electrical energy to operate the hydraulic pump and machinery at its bunkers.

Saskatoon, Sask.—Mr. W. R. Sherman of Calgary, has secured a lease of the building of the Star theatre, and announces his intention of spending a cosiderable sum of money to remodel the building.

48 in. CONTINUOUS STAVE LINE.

Manufacturer of
Galvanized Wire Machine Banded
WOOD STAVE PIPE
CONTINUOUS STAVE PIPE
RESERVOIR TANKS
For City and Town Water Systems, Fire Protection, Power Plants, Hydraulic Mining, Irrigation, etc.

Full particulars and estimates furnished.

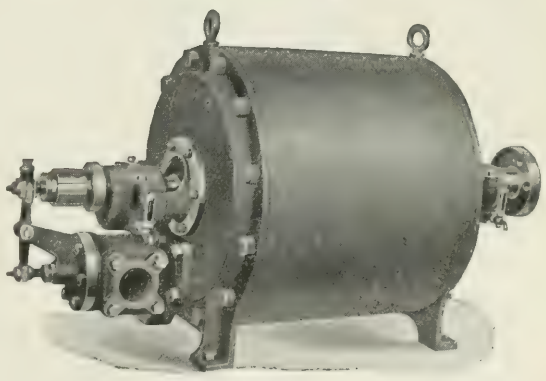
PACIFIC COAST PIPE COMPANY, LTD.
Factory: 1551 Granville Street, VANCOUVER, B.C. P.O. Box 563.

Kerr Turbo-Generators

FOR SMALL LIGHTING PLANTS

The Kerr Turbine is peculiarly suited to generator driving and our sets are made in suitable sizes to fill all requirements up to 500 kw. alternating and 350 kw. direct current. The operation is economical throughout a wide range of initial steam pressures, the steam economy is improved by superheat, and any exhaust conditions are permissible. When operating non-condensing, the steam consumption compares favorably with that of a high speed engine of the same capacity, while in condensing plants the economy at full loads equals that of the best compound engine and at fractional loads is much better.

A Kerr Turbo-Generator for lighting or small power or both is extremely profitable in any plant having power boilers, since the freedom of the turbine exhaust from oil makes reuse of the exhaust inexpensive and safe for boiler feeding or any other purpose where clean low pressure steam is desirable. See Bulletin No. 22.



KERR STEAM TURBINE

Works, 512 WILLIAM ST., MONTREAL

THE JOHN McDOUGALL CALEDONIAN IRON WORKS CO. LIMITED

St. Thomas, Ont.—The Hall and Market Committee of the city have been empowered by the municipal council to secure plans for a market shelter. The cost of this is estimated at $12,000. M. H. Baker, City Engineer.

St. Catharines, Ont.—A proposal to dispose of the present fire hall and erect a new structure has been approved by the council.

Stratford, Ont. — A movement is under way to secure funds for the erection of a $15,000 Salvation Army Citadel in this city.

Taber, Alta.—Messrs. W. W. Douglas, E. B. Tainter and J. T. Willard, are about to organize a company to erect a 200-barrel flour mill in this town. The capital will be all obtained from local sources.

Vancouver, B.C.—Mr. J. R. MacDonald is the architect for a new hotel now under construction on Cordova Street opposite the C.P.R. depot. The building material is to be concrete and brick and the plan calls for mill construction.

Vancouver, B.C.—Messrs. Summervell and Putnam are the architects for a large storage warehouse now under construction for Crane and Company. It is being built with a steel and concrete system of supports. It will have a height of seven stories and will present a face of buff pressed brick laid in an artistic manner. It is to cost $125,000.

Victoria, B.C.—Alexandra Lodge 116, Sons of England, have formed a committee to report on the building of a new hall. It is the intention to erect a handsome hall which will be for the use of the English societies of Victoria in general.

Victoria, B.C.—A site for the erection of a new Roman Catholic Cathedral has been purchased in this city. Bishop Alexander McDonald negotiated the property transaction. The plans for the new building, although worked out in the rough, do not call for the erection to proceed for a short time.

Victoria, B.C.—Messrs. Crompton and Barton are representing the promoters of a new steam laundry, to be known as the New Method. The contract for the erection of the building has been let to Messrs. S. and C. Carkreek.

Winnipeg, Man.—Messrs. Matthews-Laing & Company, of Toronto and Montreal, are planning to erect an eight-story building in this city.

BRIDGES, ROADS AND PAVEMENTS.

Bridgeburg, Ont.—Arrangements are being completed for enlarging the international bridge crossing the Niagara River between Bridgeburg and Black Rock, and a portion of the plant is already on the ground.

Coquitlam, B.C.—The provincial government announce that they will not construct a bridge over the Pitt River during the year 1912. They give as their reason that sufficient money was not appropriated in the estimates for this structure.

Fredericton, N.B.—The contracts for the construction of the following bridges have been awarded by the Provincial Board of Works: Hunter's Ferry Bridge, parish of Canning, Queen's County, awarded to Frank L. Boone, of St. Marys, price $23,000. Cole's Island Bridge, Queens County, awarded to Messrs. Robert and Charles Forbes, of Gibson, the contract price being in the vicinity of $10,000. Messrs. Forbes will also construct the Burpee Bridge in Queens County, the contract price being in the vicinity of $7,000; Mr. Boone has been awarded the contract for the construction of the Chase Bridge, also in Queens County, the contract price being about $3,500.

Province of Quebec.—The government programme of highway construction includes the building of main highways from Montreal to Quebec, Montreal to Rouses Point, to Sherbrooke, and from Quebec to Rimouski and other points, upon condition that the municipalities along the way agreed to pay one-half the interest charge.

Vancouver, B.C.—A conference will be held between the bridges committee and the officials of the Western Canada Power Company, regarding the construction of a bridge for railway purposes.

Welland County, Ont.—This community has prepared plans for road improvement, with the assistance of the government. The county expect to spend $100,000.

York County, Ont.—The York County Good Roads Commission have ordered the paving of the road from Humber Bridge to Mimico Asylum with tar surface concrete, at a cost of $10,000 per mile. The McKnight Construction Co., of Toronto, have secured the contract for the work.

FIRES.

Winnipeg, Man.—Fire damaged the premises of the Radford Wright Company, Ltd., sash and door manufacturers. Loss $50,000.

Winnipeg, Man.—Fire which broke out in the building occupied by Messrs. Gowan-Kent caused damage to the extent of $75,000. One half of the building was occupied by Messrs. Mason & Risch, piano merchants.

CURRENT NEWS.

Clayoquot, B.C.—Plans have been prepared for the construction of a gasoline-propelled cannery tender of about 100 tons register for use at Clayoquot. The power vessel is to be used to carry fish from the fishing grounds at the West Coast port to the cannery. It is expected that construction will be commenced in a few days on this vessel at one of the shipyards in Victoria.

Gloucester, Ont.—The council of this town have passed an order calling for the purchase of a quantity of dynamite to be used in breaking the ice in the Ottawa River.

Guelph, Ont.—The City Hotel was damaged by fire to the extent of $25,000 or more.

Prince Rupert, B.C.—A report states that Mr. D. C. Whiteford has discovered a valuable salt well on his claim at 46 mile, Grand Trunk Pacific Railway. A gallon of the water from the well when evaporated gives one-half pound of salt.

Medicine Hat, Sask.—This municipality will spend $200,000 on local improvements during the present year.

Province of New Brunswick.—A company is being formed to operate on the New Brunswick shales. They will apply for a charter from the legislative assembly. Messrs. Inches and Hazen, St. John, N.B., are the solicitors for the company.

Ottawa, Ont.—The proposed plan to appoint a city architect has taken definite shape. Ald. Nelson and Black are interested in the matter.

Owen Sound, Ont.—The ratepayers voted in favor of the three industrial by-laws as follows: The drydock and shipbuilding by-law, 1,794 to 85; the Aetna Rubber by-law, 1,863 to 28, and the cement by-law, 1,820 to 51.

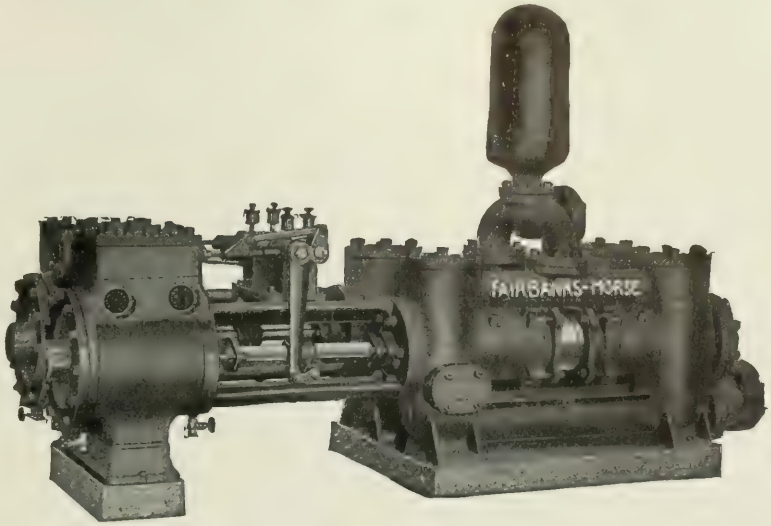
Porcupine, Ont.—The Bank of Toronto have just completed a new banking office in this town. This is the first brick building in Porcupine.

Port Alberni, B.C.—The proposed erection of the new public school at Port Alberni will not be proceeded with immediately, all of the tenders received in response to the government's invitation for bids being found disproportionately high. Fresh tenders will probably be asked for.

St. Catharines, Ont.—The ratepayers will vote on a by-law calling for the purchase of the plant of the St. Catharines Gas Company for $38,000.

Vancouver, B.C.—The Great Northern Railway Company improvements have been undertaken and are now well started. Considerable work of a preliminary nature has been done on the dock site, next to the British Columbia Sugar Refinery Company, and contracts have been let for some of the grading and filling for the False Creek project.

Victoria, B.C.—Mr. Louis Coste has presented his report on the cost of improving the harbor of this city. A breakwater to cost $1,250,000 and a pier to cost $400,000. As to the outer harbor, Mr. Coste does not think it advisable to recommend for the present the construction of such a breakwater as would be required to afford protection from the south-west. Such a breakwater would cost $2,500,000. as it would have to be 3,000 feet in length and to extend into a depth of water of 250 feet. Moreover, while protection in that quarter is desirable, the large steamers are not greatly



PUMPS

The superior excellence and splendid results shown by

"FAIRBANKS-MORSE"

pumping machinery are largely due to the fact that for many years we have manufactured Hydraulic Machinery of all descriptions. We are therefore able to build pumps which are properly designed and adapted to every-day use. This is of the greatest importance in a first-class pump, for the usefulness of an engine may be lost if the pumping machine is badly designed.

You will get all these important features when you purchase a "FAIRBANKS-MORSE" pump.

Let us solve your pump problems.

inconvenienced by the south-west seas. Protection from the more frequent south-east gales is much more necessary, and much easier.

Victoria, B.C.—The officials of the Pacific Coast Steamship Company have had plans prepared for the construction of two new ships. They have called for tenders to be in by March 20th. This line operates from Puget Sound to San Francisco.

A company has been formed in Paris, France, to operate and develop Canadian resources, chiefly minerals. It is proposed to increase the French population in this country by these means.

TRADE ENQUIRIES.

The following were among the inquiries relating to Canadian trade received at the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W., during the week ended February 12th, 1912. Fuller information may be obtained by communicating with the Department of Trade and Commerce, Ottawa.

A London firm desire to get into touch with Canadian importers of chemicals and oils.

A firm in Wales who specialize in zinc dross, zinc skimmings and sal skimmings, etc., wish to get into correspondence with a Canadian firm willing to enter into a mutual arrangement to work the business.

A London firm make inquiry for the names of Canadian importers open to appoint a buying agent in Great Britain.

From the branch for City Trade Inquiries, 73 Basinghall Street, E.C.:

A French manufacturing company seek supplies of Canadian balsam gum and invite prices and samples from producers.

A London firm manufacturing a specialty in desiccated yeast are looking for some suitable resident Canadian firm to undertake its introduction and sale.

ENQUIRY FOR "TIE PLATES."

Mr. F. C. Gamble, Chief Engineer, Dept. Railways, British Columbia, desires to ascertain the names of firms manufacturing railway tie plates of all descriptions and the prices of the same.

ORDERS OF THE RAILWAY COMMISSIONERS OF CANADA.

Each week on this page may be found summaries of orders passed by the Board of Railway Commissioners, to date. This will facilitate ready reference and easy filing. Copies of these orders may be secured from The Canadian Engineer for small fee.

16053—March 1—Directing that G.T.R. install gates to be operated from tower at point where its railways crosses Hope and Woodstock Sts., Tavistock, Ont., 20 per cent. from "Railway Grade Crossing Fund," remainder by G.T.R., 15 per cent. of cost of maintenance and operation of gates to be paid by village of Tavistock.

16054—March 1—Refusing application of J. M. Morin, K.C., for an Order to compel C.N.Q. Ry. to macadamize and keep in good repair highways and abutments of bridge between Bout de l'Ile and Charlemagne, Que.

16055—February 29—Authorizing C.P.R. to construct spur to premises of Canadian Equipment & Supply Co., Ltd., Calgary, Alberta.

16056—March 1—Authorizing C.P.R. to grant special rate to mining students of McGill University from Montreal to Rossland, Phoenix, and Greenwood, B.C., at $40 and return, and side trip, if desired, from Slocan Jct., to some point on Sandon Branch at rate of ¾ cent per mile each way, and providing that any other parties desiring to travel to B.C. or other mining district, be granted equally favorable terms, etc.

16057—March 1—Directing that K. & P. Rly. jointly with C.P.R. file within 40 days from date of this Order tariff establishing a rate of 10¾ cents per 100 on ex-lake grain, in carloads, from Kingston to Montreal, including stop-over at Almonte for milling purposes. Application, Wylie Milling Co., Almonte, Ont.

16058—February 13—Authorizing G.T.P. Ry. to cross highway in Parish of St. Francois Xavier, and to divert highway, mileage 119 to 119.3, Dist. of Winnipeg, Manitoba.

16059—March 4—Directing that rate of 80 cts. per 100 lbs. charged by C.P.R. on lumber from Port Arthur and Fort William to Vancouver be disallowed; and that C.P.R. within 30 days of Order substitute in lieu a rate of 55 cents per 100 pounds on lumber (including flooring) in carloads of a minimum of 40,000 lbs.

16060—January 12—Authorizing C.N.R. Alberta Ry. to cross with its main line the G.T.P. main line in S.E. quarter of Sec. 31, Twp. 53, R.10, West 5th.M. Interlocking plant to be installed.

16061—March 2—Directing that express classification for Canada No. 2 be amended making certain changes in newspaper rates from Winnipeg to Calgary; complaint of the Manitoba Free Press Co. of Winnipeg, Man.

16062—March 4—Approving location and revised location of C.P.R. Wilkie Northwesterly Branch (formerly known as Manitou Lake Branch) as follows: location from mileage 0 to 12.86 and from mileage 26.85 to 32.15; revised location from mileage 12.86 to 26.85.

16063—March 1—Authorizing C.P.R. to construct an extension of 150 feet to siding on Lot 15, Con. 1, Twp. of Trafalgar, County of Halton, Ontario.

16064—March 1—Authorizing Council of Mun. of Bridgeburg, Ont., to carry street over G.T.R. and M.C.R. in village by means of an overhead bridge.

16065—March 6—Authorizing G.T.R. to reconstruct swing bridge over Lachine Canal, in City of Montreal, Que.

16066—March 6—Exempting Vancouver, Victoria and Eastern Rly. from use of "zinc covering over caps and intersections," as required by Order No. 11446 of Aug. 2nd, 1910, where oil burning engines alone are used.

16067—March 5—Authorizing White Pass & Yulon Route to publish tariffs (special) within less than statutory notice, for excursion business, etc.

16068—March 5—Authorizing James Bay & Eastern (C.N.R.) (Roberval Extension) to construct bridge over Iroquois River, Twp. of Ashuapmouchouan, County Lake St. John, Que.

16069—March 5—Approving plans for lowering of three foot pipe under M.C.R. tracks in Twp. of Wainfleet, Ct. Welland, Ont.

16070—March 5—Authorizing G.T.P. and C.N.R. Rlys. to operate trains over interlocking plant authorized by Order No. 14304 of July 20, 1911, without coming to a stop.

16071-72—March 5—16073—March 6—16074—March 5—Authorizing C.P.R. to construct spur for City of Winnipeg, Manitoba, for Messrs. G. P. Sherwood and Company, Montreal, Que.; for Stoneclough Quarry Co., near Coldwater (G.B. & S. Ry.) Twp. of Medonte, Ct. Simcoe, Ont., and for siding with spurs therefrom for St. Mary's Portland Cement Company and rescinding Orders 15667 and 15969 dated respectively Dec 15th, 1911, and Feb. 13th, 1912.

16075—March 5—Approving portion of C.P.R. Swift Current Southeasterly branch from mileage 40 to 45, and to construct across three highways.

16076—March 5—Authorizing C.P.R. to construct across highways from mileage 0 to mileage 35.25 as shown on location plan No. 1105.

16077—March 4—Authorizing C.P.R. (G.B. & S. Ry.) to divert public road between Cons. 7 and 8, in Twp. of Eldon, County of Victoria and to construct tracks across said diversion at mileage 56.4 by means of overhead bridge. Compensation to be paid John McArthur for injury sustained to property and rescinding Order No. 15987.

16078—March 7—Authorizing C.N.R. to cross and divert public road on its Maryfield extension.

16079-80—March 5—Authorizing C.P.R. to construct spur for Sidney Brick and Tile Co., at Sidney, Man., and for Guelph Stove Co., Ltd., Guelph, Ontario.

16081—March 5—Approving location of C.N.O. Ry. (Sudbury-Port Arthur Line) from mileage 2 at Current River in City of Port Arthur to a point in Lot No. 5E in Twp. of McGregor, at mileage 6.49.

16082—March 7—Approving revised location of G.T.P.B.L. Co., Regina Boundary Branch, mileage 84.22 to 91.13, Sask.

16083—March 5—Authorizing Mun. of Twp. of South Gower to construct highway across C.P.R. Twp. of Oxford, Ct. Carleton.

16084—March 7—Approving revised location of G.T.B. B.L. Co., Regina Boundary Branch, mileage 17.02 to 84.22.

16085—March 7—Approving by-law of Central Ontario Railway authorizing George H. Shaw to prepare and issue tariffs of tolls.

16086—March 6—Approving location of C.N.O. Ry. (Montreeal-Port Arthur Line) through Twps. of Crerar, Dana, Janes and Davis, Dist. of Nipissing, mileage 386 to 406 from Montreal.

16087—March 6—Approving revised location of C.N.O. Ry. (Montreal-Port Arthur Line) through unsurveyed territory Sudbury District, mileage 191.6 to 193.7.

16088—March 7—Authorizing C.P.R. to construct industrial spur for Chinook Coal Co., Ltd., near Kipp, Alberta.

16089—March 8—Directing C.N.R. to cease from blocking lanes and streets in City of Brandon, Man., under penalty of $50 and that the company plank railway track before May 1st, 1912. Complaint, J. I. Parkin.

16090—March 8—Directing that rule be added to conditions of carriage and directions to agents in express classification for Canada No. 2, namely:—"A shipment tendered at a common point which cannot be carried to its destination except through a connecting company, which connecting company has also an office at the common point, must be refused, and the shipper be referred to the company which can give the through service; unless, having been notified of the charges by the joint route, he requests acceptance and specifies the route in writing, in which case the shipment may be forwarded at the sum of the local rates to and beyond the transfer point specified by the shipper." "The transfer point must be indorsed on the agent's receipt, and the shipper's written request attached to the way-bill."

16091—March 7—Authorizing South Ontario Pacific Ry. to operate connection of its Guelph Jct. to Hamilton Line with tracks of T.H. & B. Ry. for construction purposes only until 31st May, 1912.

16092—March 7—Authorizing Vancouver, Victoria & Eastern Ry. to open for the carriage of traffic its railway from Princeton to Coalmont, a distance of 13 miles.

16093—March 6—Authorizing C.P.R. to construct spur for City of Winnipeg, Manitoba.

An Engineering Weekly

PITOMETER SURVEY OF WATER MAINS.

The means of rapidly determining water losses by mechanical means will be greatly appreciated by waterworks engineers and others having occasion to give serious thought to the subject.

There has of late been brought to a very satisfactory state of perfection an instrument known as the pitotmeter, which is designed to indicate water waste and main losses. A great advance over other methods of water waste investigation has been brought about in this instrument, inasmuch as the main does not have to be cut. This instrument is primarily a rate meter, depending on the velocity of the water in the main. Two brass tubes bent at their lower ends with carefully formed orifices of ⅛-inch internal diameter are held in a suitable cap which screws upon a standard 1-inch corporation cock through which the tube may be readily introduced into any main and as easily withdrawn. Heavy cloth-insertion rubber tubing connects the orifice tubes with a long glass manometer oe U tube, and blow-off cocks are provided to remove the air from the instrument.

The Pitometer Company, 220 Broadway, New York, recently made a pitotmeter survey of certain sections of Toronto, and their report was made to the city a few weeks ago. Mr. E. A. Howland was in charge of the survey for the Pitometer Company.

A district about six blocks square (larger on matters according to the consumption) was taken and all the boundany valves closed except one. A photo recording pitometer was placed on this main and the flow gauged for forty-eight hours. If the district was residential and showed a high night rate between the hours of twelve and five, it was subdivided between those hours to find the cause.

The U-tube was filled with a mixture of carbon-tetrachloride and benzine having a specific gravity of 1.25 and when in use the water from the pipes filled the remaining space in the U-tube.

This was done by closing the inside valves supplying the various streets, and noting the drop in flow as the valves were closed.

If a street was found to have an abnormal flow, the curb cocks were closed, and if a house had any waste the amount would at once be shown by the fall of liquid in the manometer. The curb cocks were sounded with an aquaphone, before being closed, and if leakage was detected, again after. If the flow stopped on closing the curb cock, the leakage was evidently on the house side of the curb cocks. After all the curb cocks had been shut off the valve on the main supplying this street would be closed, if a drop in flow was then noted, it would be caused by leakage on the main or services up to the curb cocks. This could then be located by means of the aqua-phone and connections.

The orifices are set to receive the maximum velocity within the main, which is usually near the centre, and is indicated by the deflection in the manometer.

This deflection, by virtue of the differential action of the water and the slightly heavier and insoluble liquid, is just four times that due to the actual difference of water head on the orifices produced by the flowing stream.

The current impinges directly on one orifice, but the other is turned directly down stream and gives something less than the static head within the main, thus increasing the difference of pressure produced. This difference is then multiplied in the U-tube, the result being that a low velocity within the pipe produces a readable deflection.

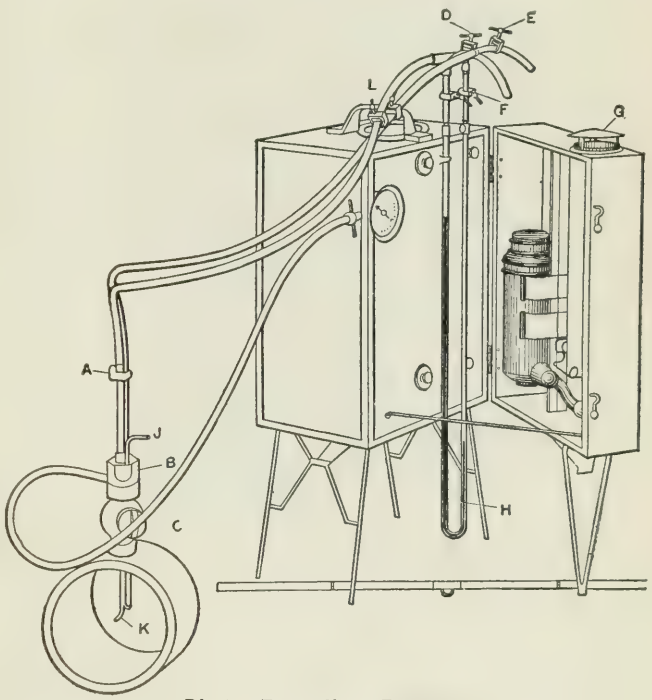

Photo Recording Pitometer.

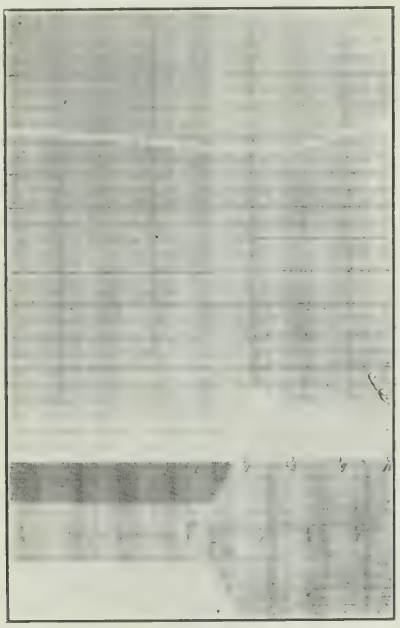
The photo recorder consists of a portable box in which a drum carrying sensitized paper revolves before a fine vertical slit just in front of which is locked one leg of the U-tube, in such a position that the rays of light from a lamp will be partly interrupted on their way through the colored liquid in the lower half of the U-tube. As the liquid rises and falls with the velocity in the pipes it will record a line or band of shade on the velox paper whose ordinates vary according to the well known formulae $v = c\sqrt{2gh}$ in which h is ¼ of the U-tube deflection in feet or half of the recorded ordinates on the paper, C=0.84 the calibration coefficient of orifices. A prism attachment records the full deflection at low velocities.

Autographic horizontal lines are formed by notches in the drum split, spaced so as to **correct** for the angularity of the light and enable the true deflection to be readily taken **from the diagram at any point.**

To determine the quantity of water being discharged, a traverse is first made of the pipe at the gauging point, and from this traverse the pipe coefficient (mean velocity divided by center velocity) is obtained. The orifices are then left at the center and the mean velocity at any rate of flow may always be found by multiplying the center velocity by this coefficient.

A preliminary test of the first district was made in August, 1911. There was then a steady flow between 1.30 a.m. and 5 a.m. at the rate of 395,000 gallons per 24 hours. The district was subdivided and it was found that this high night rate was quite evenly distributed over all the streets. The services were sounded with an aqua-phone and a large number of houses were found to have a continuous flow of water during the night. The mains were also carefully sounded and no evidence of leakage could be found. Inspection of the fixtures in the houses in this district showed a large number of leaks, but in several houses with a continuous night flow, the fixtures were found to be in good condition, thus showing wilful waste.



A Photo Record With Prism Attachment Recording Both Legs of U-Tube.

A district almost entirely residential was gauged, and the minimum night flow found to be 395,000 gallons per twenty-four hours, or about 77.75 per cent. of the mean flow.

A few services were found to be leaking between the curb cock and the main, and these were repaired. After these repairs had been made and the houses inspected, the night flow was again taken and showed a reduction of only 50,000 gallons per twenty-four hours.

As this district was still in a very unsatisfactory condition, the engineers took the streets with the heaviest night flow and shut off all the services; it was then found that the flow to these streets stopped. This showed that the waste was in the houses and that there was no leakage in the mains.

A leak of 170,000 gallons per twenty-four hours was found; this was caused by a break in a 1-inch service pipe, which singularly enough occurred just inside a sewer through which it passed.

The twenty-two districts gauged with the recording pitometer showed a total mean flow of 10,618,000 gallons per twenty-four hours, and a minimum night flow at the rate of 7,185,000 gallons per twenty-four hours, or about 67½ per cent. of the mean flow.

In the districts subdivided, it was found that the high night flow is almost entirely caused by waste inside the houses. This is due to leaking fixtures, careless and wilful waste, and can only be controlled by the installation of meters.

The mains in these districts are remarkably free from leakage, as shown by our tests, for after closing all the curb cocks the flow practically stopped, thus proving the mains to be tight.

CONCRETE ROADWAYS.

Concrete roads have been the principal type of road built by Wayne County, Michigan, and concrete roads are the accepted standard of construction. The road commissioners state that their aim is to provide the county with durable, permanent roads. They believe that the concrete road that they devised and built has accomplished their purpose, and that that type of road is the coming roadway. It is a road that is low in ultimate cost, pleasing to the eye, smooth, dustless, and affords excellent traction for all types of vehicles. While their early efforts at concrete road building were somewhat experimental they have devised several means in their methods of construction which will add materially to the life of concrete roads. Among the more important improvements have been.

(1) The increase of the amount of cement used in the mix, changing from 1-2-4 mix to 1-1½-3 mix;

(2) More stringent specifications as to quality of stone and sand;

(3) An increase in the depth of the work to not less than 7 inches;

(4) A protecting plate at the expansion joint.

The Eureka road in Wayne County is a typical example of the type of roads built. Eureka road is one of the principal roads leading into Wyandotte. It is built of concrete of a 1-2-4 mix with 12 feet of metal, 23 feet over all at its narrowest point. It was built last fall, and additional mileage will be constructed at an early date.

The following is a statement of the expenditures on Eureka road, a stretch one mile in length, up to and including September 30, 1911:—

Roadway Proper.	Cost.	
Teams	$ 980.00	
Other labor	3,364.15	
Pebbles, tons 2,014	1,657.78	
Sand, tons 700	684.94	
Cement barrels 1,218	1,723.97	
Coal, tons 60.75	189.45	
Expansion joints	77.60	
Lumber and engineers stakes	14.31	
Water supply	110.14	
Blue prints, advertising photos	11.47	
Lubrication, waste, etc.	48.51	
Liability insurance	49.41	
Hardware and repairs	27.50	
Express, messenger and auto	53.03	
Miscellaneous	48.81	
		$9,041.07
Drainage.		
Open ditch	$ 265.01	
Tile drains	48.84	
		313.85
Total cost of roadway proper with drainage		$9,354.92

SOME NOTES ON COLUMN DESIGN.

By F. Tissington.

During the course of some ten or twelve years structural designing the writer has found it necessary on more than one occasion to compare the different column formulæ that are being constantly used, in order to get a true idea of their respective values.

Nearly every handbook issued by the different steel companies, as well as most of the current text books on designing, specify a particular formula having its own peculiar merits, and these, together with government specifications, produce a most formidable array of figures, which, to the average draughtsman and designing engineer, makes it almost impossible for him to select a particular formula as most suitable to his case.

Some years ago the writer compiled a series of tables and curves relating to column and strut formulæ in use at that time in England, and he found there was a large difference of opinion between the various authorities as to what constituted a safe load for a particular case, and in consequence of this he came to the conclusion that the only remedy, in order to design in a safe as well as in a commercial sense, was to pick out one particular set of figures and stick to them.

Professor Fidler's formula was the one finally adopted, and this was chosen in preference to any of the others, in consequence of the fact that it made an allowance for initial set or eccentricity of loading, which is almost certain to occur in any strut or column from one of several causes. For instance, it is almost impracticable to produce commercially either a simple or compound strut perfectly straight, and with the centre of gravity of every cross-section exactly coincident with a straight line drawn from two points at either end of the member which do coincide with the centre of gravity at those points.

Again, no structural material yet produced has been perfectly homogenous throughout, and this state of affairs produces the same effect as that outlined above, even supposing the member could be made perfectly symmetrical with the centre of gravity line.

A slight modification was made to Fidler's formula by adopting a sliding factor of safety. This consisted of the following:

Factor of safety for dead loads $2.5 + .01\,h$

Factor of safety for live loads $3.0 + .015\,h$

where h = value $\frac{Z}{r}$

Z being unapported length in inches.

r = least radius of gyration.

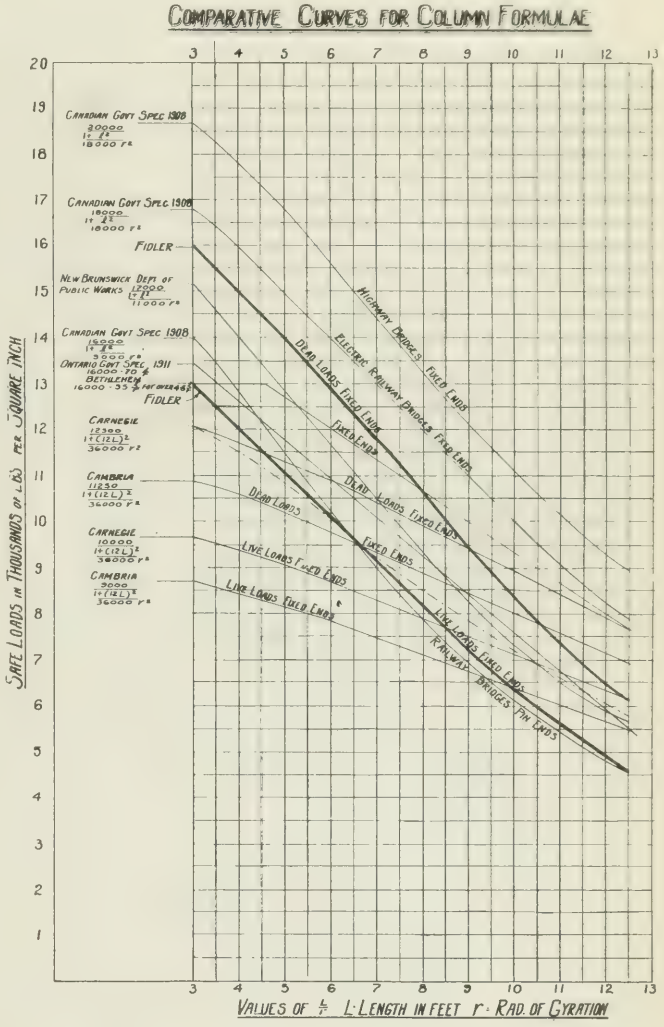
Since the writer has been over on this side he has found the same trouble, and nearly every design has to be figured on by a new set of column formulæ. The consequence is that there is very little practical value to be obtained from the compiling of tables of made-up struts and columns unless a new one is made for each new formula.

The diagram No. 1 will give a very good idea of what is meant, and the curves represent a fair sample of the different sets of figures the average designer meets in the course of a few months.

For the sake of comparison Fidler's formula, as used by the writer, has been plotted, and the two heavy lines represent the dead and live load curves for fixed ends as specified.

It will be noticed that the Canadian Government specification, 1908, for highway bridges for struts with fixed ends gives the highest value, but it should be remembered that there is an impact increment to allow for, consisting of $\frac{L^2}{L+D}$ where L = live load stress and D = dead load stress.

This, taken in a general way, reduces the allowable stress per square inch by about 35 per cent., in order to compare same with the other figures, and this new value is shown by the dotted line.



The other two curves belonging to the same specification—one for electric railway bridges and the other for railway bridges—would be reduced in a similar manner, but have not been shown.

The Cambria and Carnegie hand books give curves which represent very low values of permissible stress for low values of $\frac{L}{r}$ and relatively high values as the ratio $\frac{L}{r}$ increases.

This appears to the writer to be bad practice, as these formulæ do not take advantage of the stiffness of short columns and neglect to allow for the extra amount of flexure in long columns.

It was for this very reason the sliding factor of safety was adopted by the writer, although there is another point of view which ought to have some bearing on this as well.

For instance, if you take, say, a column of four square inches sectional area, and assume two cases,

(1) Where the value of $\frac{L}{r}$ is 3.

(2) Where the value of $\frac{L}{r}$ is 12

By using, say, the Fidler formula for live loads we obtain the following:

	Permissible stress, square inch.	Area.	Total load allowable.
(1).....	13000	4	52000
(2).....	5500	4	22000

Now, in computing loads, a great deal of guesswork has to be done for general designing, more particularly so far as wind and snow loads are concerned, and although our information on these points is getting more complete we are still likely to make mistakes, as is evidenced by the failures that take place from time to time.

Therefore, assuming that in this particular case we arrive at the correct loading by about 10,000 lbs, this would amount to, say, 20 per cent. increase in the first case, which is not very serious, and 50 per cent. increase in the second.

It will be seen, therefore, that if we calculated on the Carnegie formula for live loads factor of safety five, we should require 3.4 square inches @ 6,400 lbs. to carry the 22,000 lbs. load in the second case but with the increase of the load to 32,000 lbs. our stress on the 3.4 square sectional area would jump to 9,400 lbs. per sq. inch, whereas, with Fidler's formula the actual stress would be 8,000 lbs. square inch.

It is evident that a small increment of loading on a column with a large value of $\frac{L}{r}$ is likely to prove dangerous, but with small values of $\frac{L}{r}$ the percentage increase being considerably lower, this is not so serious, and, therefore, the most rational factor of safety is the sliding one of a similar type to that given above.

The curves given on the diagram No. 1 may all be quite safe if applied in the particular way intended, but are they all sound commercially? That is, can they be used in a competitive sense, and further, is the indiscriminate use of these formulæ to be recommended?

The writer is of the opinion that it would be an immense gain to the manufacturers in this country if a standard series of curves could be arrived at, and there does not seem to be any reason why one set of figures should not meet the case.

Starting, say, with columns for dead loads, fixed ends, it would be a simple matter to fix a reduction of so much per cent. for live loads and a further reduction per cent. for impulsive loads. The same could be done for pin ends, and the whole thing would then lend itself very well to the compiling of standard tables, which would count for efficiency and a great saving in labor in the designing office.

A LONG TUNNEL.

The Nepton tunnel, now being driven in the Pachuca, Mexico, district, will be over six miles long when completed. It lies at a depth of about 1,400 feet below the city of Pueblo. It was started 18 years ago, but only about two miles has been completed. It will drain the Pachuca mining district and afford an outlet for the different mines.

TELEPHONE COMPANIES OF CANADA.

Canadian Telephone statistics compiled to the end of June, 1911, have been completed by the Department of Railways and Canals, and issued in the form of a report. This is the first attempt of the Department to prepare statistics relative to the telephone in Canada, and it is to be regretted that more managers did not comply with the request of the Department in furnishing material for a more comprehensive and larger report. In all 537 companies forwarded a complete or semi-complete statement, and of these the province of Ontario was shown to have the bulk of Canadian telephone business by a great lead. The report, when divided into provinces, resulted as follows:

Ontario	319
Quebec	32
New Brunswick	16
Nova Scotia	14
Alberta	4
Saskatchewan	143
Manitoba	3
British Columbia	5
Prince Edward Island	1
	537

In the provinces of Manitoba, Alberta and Saskatchewan the Provincial Government has, in a certain measure, taken over the management of the telephone companies in their respective provinces. This is particularly the case in the two former provinces; as all the separate organizations which previously existed have been merged under the control of the government. In Saskatchewan the process of government absorption has taken definite form, but at the close of the month of June last there were still 142 companies holding their independence.

Of these 537 companies a great number are classed as rural, and these have, as a rule, an equipment of the lowest possible monetary value, and represent the so-called "party lines."

The combined capital of these 537 companies amounted to $40,043,982.29; of this total the province of Quebec had a combined capital of almost $19,000,000. This is the largest amount of money invested in telephones of any province of Canada, and may be accounted for by the fact of the heavy capitalization of the Bell Telephone Company in Montreal.

The gross earnings reported totaled $10,068,220, and of this sum $6,979,045 was operating expense; being a percentage of operating expense to income of 69.32 per cent.

At the close of June, 1911, the combined length of telephone wire of the various Canadian companies was represented by 687,728½ miles of wire, and to this length 302,759 instruments were connected. The mileage of wire was divided into 576,712¾ miles for urban use, and 111,015¾ miles for rural purposes.

The energy required to operate these instruments is derived from two sources, viz., central energy and magneto. Of these 174,994 were operated by the latter means and 127,765 by the former.

A FLOODED SUBWAY.

The Wellington Street subway of the Grand Trunk Railway in Montreal was so badly flooded by the thaw recently that street cars were held up, and passengers were put to much inconvenience. As soon as the drains were opened up the regular service was resumed.

REPORT ON VICTORIA HARBOR.

The report of Mr. Louis Coste, M.I.C.E., the engineer sent by the Public Works Department at Ottawa last December to investigate the requirements of Victoria, B.C., with a view to equipping this port for the great shipping development of coming years, have been made public. They outline the preliminary details for the construction of adequate harbor works for Victoria, the first part of a great scheme of development. Mr. Coste's plan is for progressive construction, making provision for enlargement as the trade develops, and no time is to be lost in beginning the work. Construction is expected to begin on the breakwater from Ogden Point, the first work, in the near future.

A breakwater of concrete blocks surmounted by a concrete wall, 2,500 feet in length, is to extend westerly from Ogden Point, with a concrete pier 1,100 feet long on the inner side, the breakwater to cost $1,250,000. Four other large concrete piers, with spacious warehouses and modern cargo-handling facilities, and a railway ferry slip where the car-ferries can load and unload their trains, will be built. The piers will be of 500, 700, 720, 800 and 1,100 feet in length, and these will be built immediately following a survey and borings, the construction of the first of the piers being hurried to increase the present accommodation for large ocean going steamers in view of the rapid increase of the shipping of the port. It is estimated that this pier will cost $400,000. The proposed piers will offer 6,400 feet of berthing for steamships and with the outer wharf piers accommodation will be provided for over a score of ocean-going steamers.

To connect the harbor works with the railroad terminals on the Songhees reserve a bascule bridge will be provided from the reserve to Laurel Point with trackage on Montreal Street to the various piers. The railroads will thus be enabled to move their trains to and from the seven great warehouses and the grain elevator to be provided.

For the growing coastwise trade the inner harbor is to be greatly developed, a comprehensive scheme for dredging, deepening and the clearance of obstructions being outlined. Much reclamation work is to be done, and the haror lines are clearly defined.

Mr. Coste recommends that the placing of the port under a harbor commission be considered. His reports follow:

The harbor of Victoria is situated at the southeast end of Vancouver Island, practically at the junction of the Strait of Georgia and the Strait of Juan de Fuca. This harbor is divided into two parts, known locally as the inner harbor and the outer harbor.

The inner harbor extends from Shoal Point on the east side and McLaughlin Point on the west side, to the east end of James Bay in an easterly direction, a distance of one and a half miles, and to Selkirk waters in a northerly direction, a distance of nearly two miles. The available depth of water, at lowest tide, in the channel, and close in to the principal wharves, is 20 feet, obtained almost altogether by dredging and blasting operations. This depth of twenty feet is, in my opinion, the maximum depth to which that part of Victoria harbor should be dredged, as the restricted area of possible navigable water limits the sizes of the steamers which can utilize it to a maximum length of 350 feet, and a draft of 17 feet.

This inner harbor is a very valuable asset to the city city of Victoria, to the province, and to Canada generally. Its coasting trade is very large, and is increasing annually at a rapid rate, but it is not possible to accommodate large ocean liners within its limits, and this has rendered necessary the creation of the outer harbor, with which this report deals exclusively in so far as required works are concerned.

The outer harbor of Victoria is immediately south of the entrance to the inner harbor. It may be said to extend from Shoal Point to Holland Point, on the east side, a distance of 6,000 feet, and from McLaughlin Point to Macaulay Point, on the west side, a distance of 3,000 feet, comprising an area of nearly 300 acres of water, varying in depth from 30 to 80 feet. In that harbor the spring tides rise 7 to 10 feet, and the neaps 5 to 8 feet, the low tides being very irregular. The datum for excavation by the Public Works Department is the zero of the gauge of the old customs wharf.

Mr. Coste suggests that a breakwater 2,500 feet in length should be built of a rip-rap foundation surmounted by a concrete wall protected on the seaward side by concrete blocks. This will protect all the wharves and the entrance to the inner harbor. The estimated cost of this breakwater is as follows:

Rip-rap stone, 365,000 cubic yards at $1.40.....	$ 511,000
Concrete wall, 36,000 cubic yards at $8.00.....	288,000
Concrete blocks, 4,000 cubic yards at $9.00.....	365,000
	$1,164,000
Superintendence and contingencies	86,000
	$1,250,000

The project of wharf development comprises a railway ferry slip, four piers respectively 500, 700, 720 and 800 feet in length, and in addition a wharf 1,100 feet in length along the inner face of the breakwater.

Among other things Mr. Coste recommends:

1. That the breakwater be built; cost, $1,250,000;

2. That a survey of the outer harbor be made at once to ascertain the cost of building wharves as shown on plan;

3. That, as soon as the survey is completed, pier No. 1 be built. Approximate cost, $400,000;

4. That negotiations be entered into with the Provincial Government, the Canadian Pacific Railway and the Canadian Northern Railway, with a view to affording rail connections to the outer harbor, by the construction of a bridge between the Songhees Point and Laurel Point or otherwise;

5. That the question of placing the whole of the harbor of Victoria in commission, be considered.

He also suggests for the inner harbor:

1. That a thorough survey of the harbor of Victoria be undertaken at once, boring being essential;

2. That the programme of works to be done by the plant owned by the government, recommended in this report, be approved, and instructions given accordingly for carrying it out;

3. That the shoal east of Songhees Point be removed by contract work as soon as the survey of the harbor is completed;

4. That that part of the harbor known as West Bay be thoroughly examined, to ascertain whether or not it is feasible to build in that bay a modern railway terminus, consisting of ferry slips and wharves.

As an emergency putty a new use was recently found for old newspapers. A party being in need of a crack filler and not being in a convenient position to obtain the real article made a boiling mixture of one pound flour and three quarts water and then soaked the paper, when the liquid had assumed a pasty condition.

The filler dried hard and did not shrink to any extent.

STEAM AND HYDRAULIC MACHINERY.

For many years Messrs. W. H. Allen, Son & Co., Ltd., of Queen's Engineering Works, Bedford, England, (and who are now represented in Canada by Messrs. Chapman & Walker, of Toronto) have occupied a prominent position as makers of high-speed vertical steam engines, steam condensers and their accessories, centrifugal and turbine pump and water power turbines. We therefore give below an illustrated account of some of the types of machinery just referred to which is certain to prove of interest to our readers, especially as Messrs. Allen's engines and pumps are to be found on all the leading ships in our navy, and on practically all the largest liners afloat.

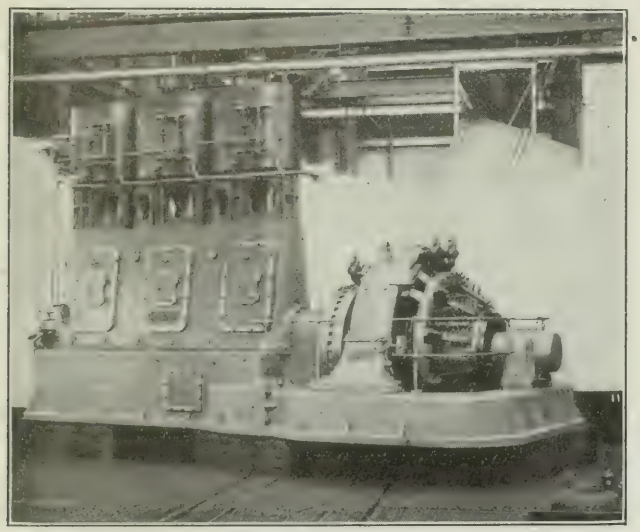


Fig. 1.

Engines.—These are built in both the open and the enclosed high-speed types. The enclosed high-speed engines are of the vertical forced lubrication type, the oil being supplied under pressure by a small valveless plunger pump driven direct from one of the main eccentrics. The cylinders stand upon a massive cast iron trunk, which completely encloses the working parts, the whole resting on a substantial cast-iron box section bedplate containing the oil pump, reservoir and filter, to which oil is supplied under pressure to the various working parts.

These engines are exceedingly neat in appearance and occupy the minimum floor space for the power developed, and are designed for use in connection with electric driving, and have been installed in large numbers in many of the leading British power stations where they are called upon to run for many months at a time without a stop.

The governor is of Allen's standard crankshaft type, and is fitted at one end of the crankshaft. It operates a double beat throttle valve situated next to the high-pressure valve chest. Hand gear is also provided by which the speed of the engine can be regulated while running through a considerable range above and below the average speed. A tachometer is fitted in close proximity to this wheel, which indicates the speed of the engine.

Figure 1 shows a three-crank compound high-speed enclosed engine in which the three cylinders are cast separately with their valve chambers.

The stuffing box packings, except where otherwise specified are of special metallic type.

Special care has been devoted by the makers to the question of balancing, the arrangement of the cranks and the disposition of the weights of the various parts being such as to ensure the very least possible amount of vibration. In the larger engines, especially those of the 3-crank type, both compound and triple expansion, special balancing weights are attached to the crankshaft, thereby reducing the unbalanced forces and couples to their least possible values.

Condensers.—For many years Messrs. W. H. Allen, Son & Co., Ltd., have made a specialty of condensing plants, and have built surface condensers together with air-pumps and circulating pumps, arranged to be driven either electrically or by steam, up to the very largest sizes required for modern power plant.

The condenser body and the water box are usually made of cast-iron, the tube-plates of rolled brass and the tubes solid drawn brass and fixed in the tube plates by means of tape packings and screwed brass ferrules.

The circulating water is drawn through the tubes by means of one of the "Conqueror" type centrifugal pumps either electrically or steam-driven, and the condensed steam and air are removed by means of an Allen-Edwards air-pump, which may be a single-cylinder, twin, or triple, according to requirements. Where the condensed water has to be delivered to a hot-well at a considerable height, an extra water force pump is provided for this purpose to relieve the air-pump valves of any water pressure.

The covers of the condenser water box are fitted with inspection doors, through which the water boxes can be cleaned.

The top of the condenser body is also fitted with a soda cock through which soda solution can be admitted to the condenser for the removal of any grease from the surface of the tubes.

Figure 2 shows a steam driven surface condensing equipment arranged to deal with 66,000 lbs. of steam per hour and maintaining a vacuum of 28 in. of mercury, with the barometer at 30 in.

The company also construct jet-condensers of a variety of patterns specially adapted to suit local conditions.

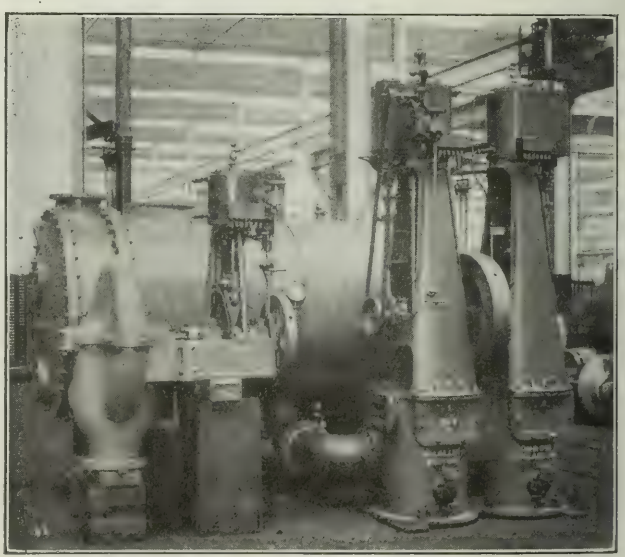

Fig. 2.

Centrifugal Pumps.—These pumps are particularly well adapted for conditions where the plant is required to run for long periods with the minimum of attention, and where limited space only is obtainable. Furthermore, with their large experience, Messrs. Allen have been able to continually improve the design of these pumps so that their efficiency is now brought to the very highest possible figure, while the design of the various parts has been improved along with the production of various improvements in the materials available for construction.

Fig. 3 shows a group of "Conqueror" centrifugal pumps coupled direct to continuous current motors. As will be seen, these pumps are so constructed that the casing is in two halves, one half being readily removable, thus permitting of easy access to the impeller and bearings.

The body and impeller can either be of cast-iron or gun-metal, and the spindle of steel or bronze according to the nature of the water to be dealt with.

All parts are finished to standard gauges and can easily be renewed. The pump is of the very simplest construction throughout, and at the same time has a good efficiency, and as there are no fine clearances the wear on the parts is practically nil, and the pump can consequently run for many years without incurring any costs for repairs or renewals, and is unaffected by water containing solid impurities.

Turbine Pumps.—Figure 4 shows a high-lift turbine pump and motor, the one illustrated being capable of delivering 525 gallons per minute against a head of 1,450 feet. These pumps embody all the latest improvements in turbine pump construction, and great care has been bestowed upon the internal design of the water passages and the selection of materials of construction, producing a pump of the very highest class and giving excellent results.

Owing to the very complete nature of the equipment of the workshops, the workmanship of these pumps is all that can be desired, the whole being finished to standard gauges.

This type of pump finds a large application in connection with mining work as it occupies a very small space and requires practically no attention whatever while running, the bearings being of the self-oiling type.

As these pumps have been designed to give the highest possible efficiency every care has been bestowed upon the finish and materials employed for the internal parts, the impellers and guide blades being constructed of high tension bronze and the spindle of nickel steel. An automatic arrangement is also provided to balance the end thrust upon the impellers and a ball thrust bearing is provided to maintain the shaft in its proper position.

All Allen's centrifugal pumps are adapted for driving either direct by a steam engine or electric motor, and can be arranged for rope or belt driving.

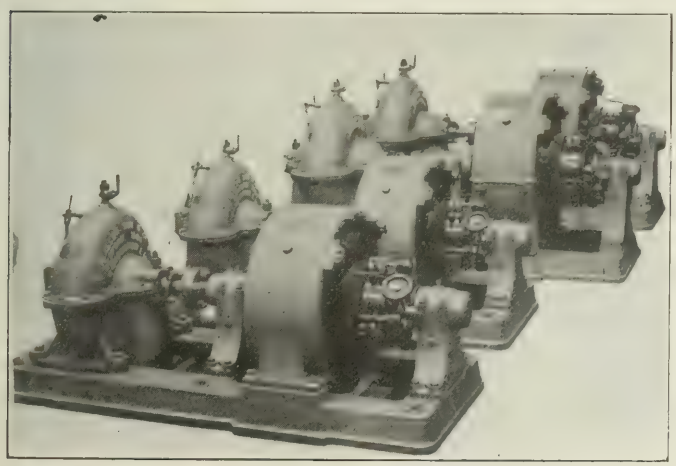

Fig. 3.

When necessary, foot valves can be fitted to the suction pipes or where steam is available an air ejector can be fitted for priming the pump, or the air exhauster may be of a special positive type, which can be driven direct from the pump shaft.

Water Power Turbines.—The increasing number of opportunities which now present themselves for the introduction of water turbines, owing to the opening up of so many districts where suitable supplies of water for driving water turbines are available, has led Messrs. Allen to give great attention to the further development of this class of machinery.

For water turbines up to 400 b.h.p. output Messrs. Allen design and construct their own special type of turbine, but for outputs above 400 b.h.p. and up to 10,000 b.h.p. in one unit, the company have a working agreement with the firm of Piccard Pictet & Co., of Geneva, Switzerland, under which they construct large turbines of their design.

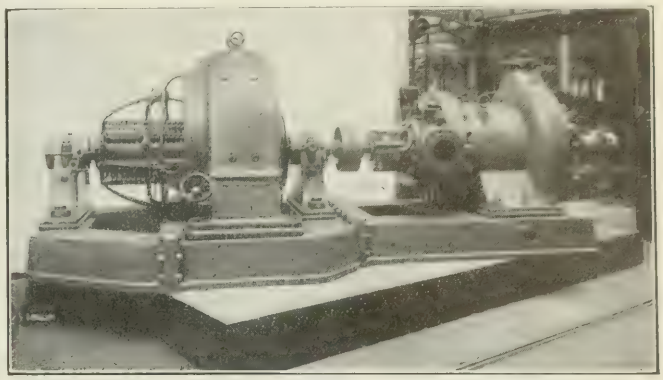

Fig. 4.

As the conditions may require, the turbines may be furnished with either an automatic governor or with regulation by hand only. If an automatic governor is fitted it is usually belt driven from a pulley on the main shaft of the turbine.

The governor, which is of a very sensitive design, by means of special gearing, actuates the regulating blades or shutters in the interior of the turbine, which control the admission of the water to the wheel as the case may be. The latest type of governor proper, which Messrs. Allen supply, is of a design in which the governor weights are suspended entirely by springs, thus eliminating all friction, inseparable from other designs of governors; it is not only a very cheap, but also a most sensitive governor, and is not subject to any wear. The auxiliary governors are either of the hydraulic or mechanical type.

DESIGNING OIL ENGINE PORTS.

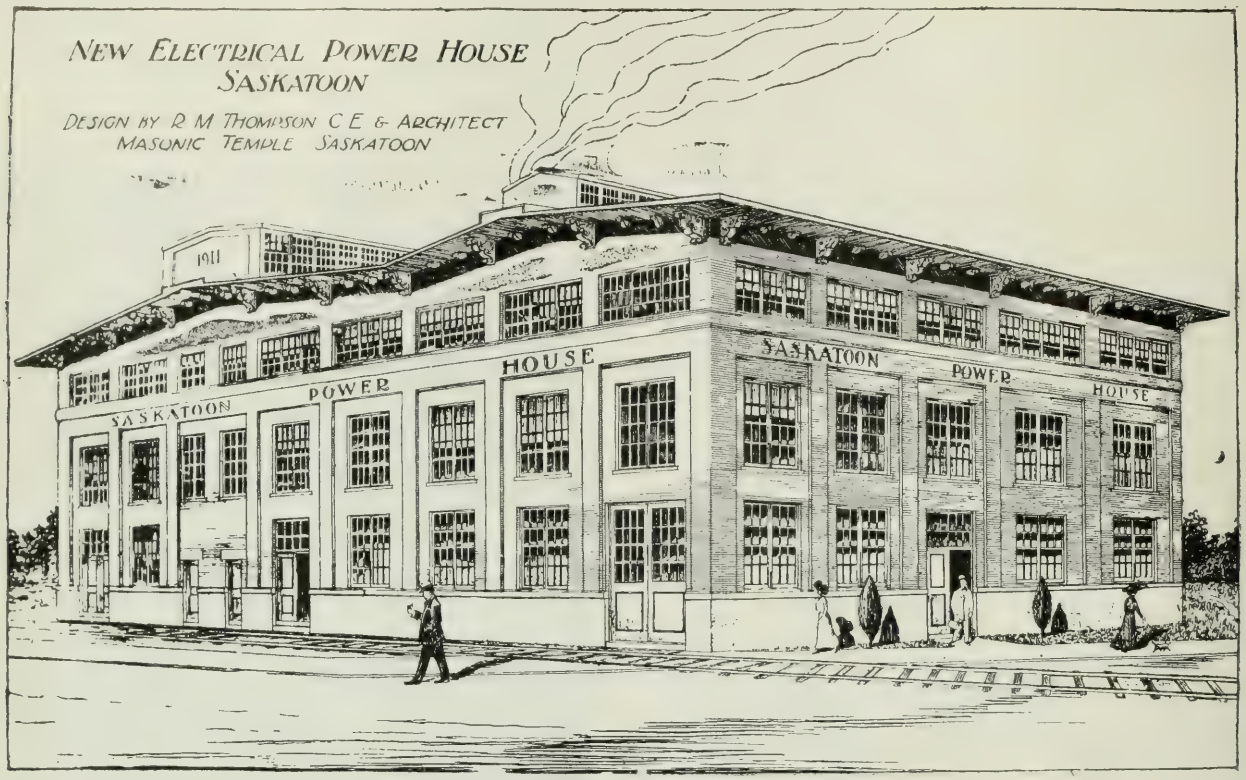
In a recent discussion regarding oil engine ports Mr. Wolcott Remington, designer of the two-cycle Blanchard Oil Engine, stated that in this type of oil engine the height of the exhaust port should be about one-seventh of the stroke of the engine. This, of course, is only general for average speed because the piston speed or the number of revolutions per minute of the engine would have to be taken into consideration in getting at the height of the exhaust port.

The height of the inlet port for average speed would be about half the height of the exhaust port. This is necessary in order to give the exhaust gases sufficient time to escape from the cylinder before the new charge of air starts to enter. These proportions are based on the supposition that the average charge of air will enter at about 5 lbs. pressure.

Mr. Remington is strongly in favor of the two-cycle engine as far as oil engines are concerned, as with the four-cycle type experience has shown that the collection of carbon causes valve cutting and leaky valves with a consequent loss of compression, the real governing factor of the efficiency of an oil engine.

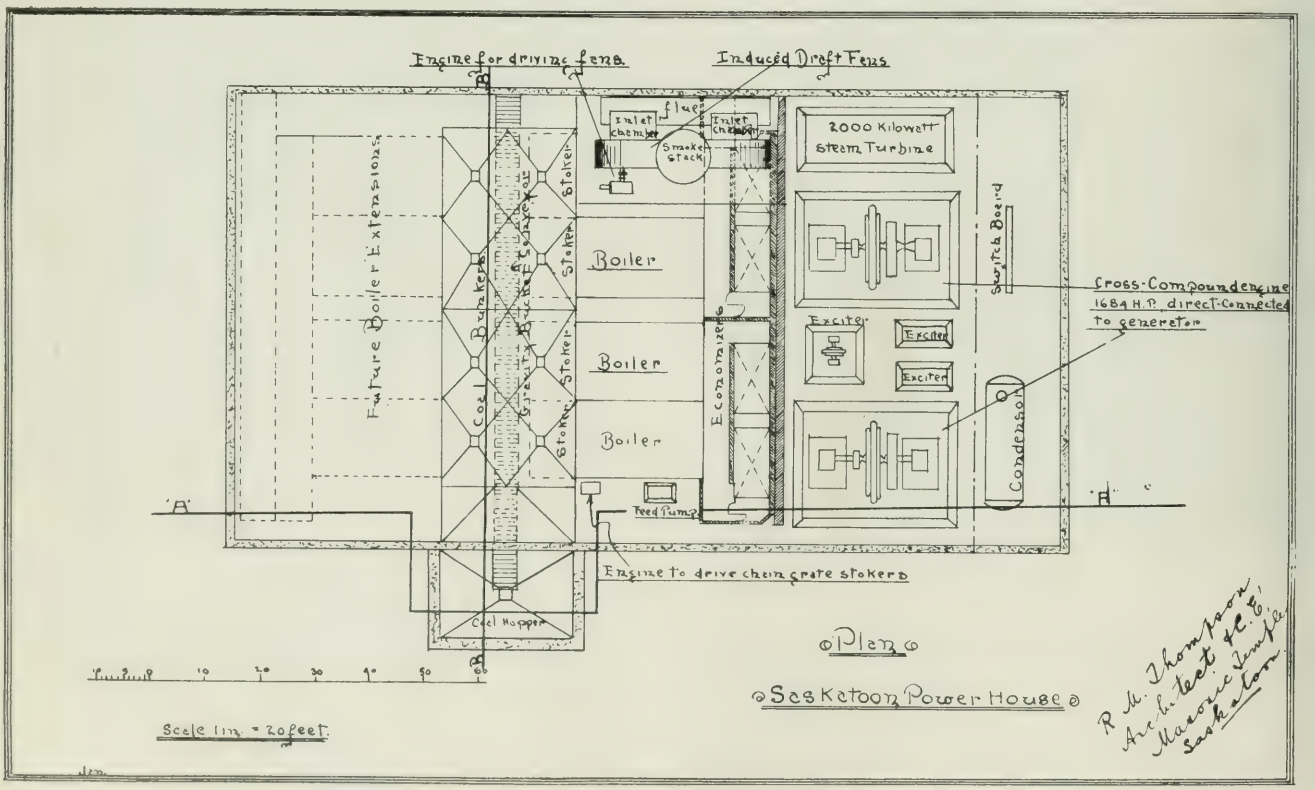
NEW POWER HOUSE AT SASKATOON.

The new power house stands on the corner of Spadina Crescent and Avenue A, Saskatoon, and is one of the show buildings of the city.



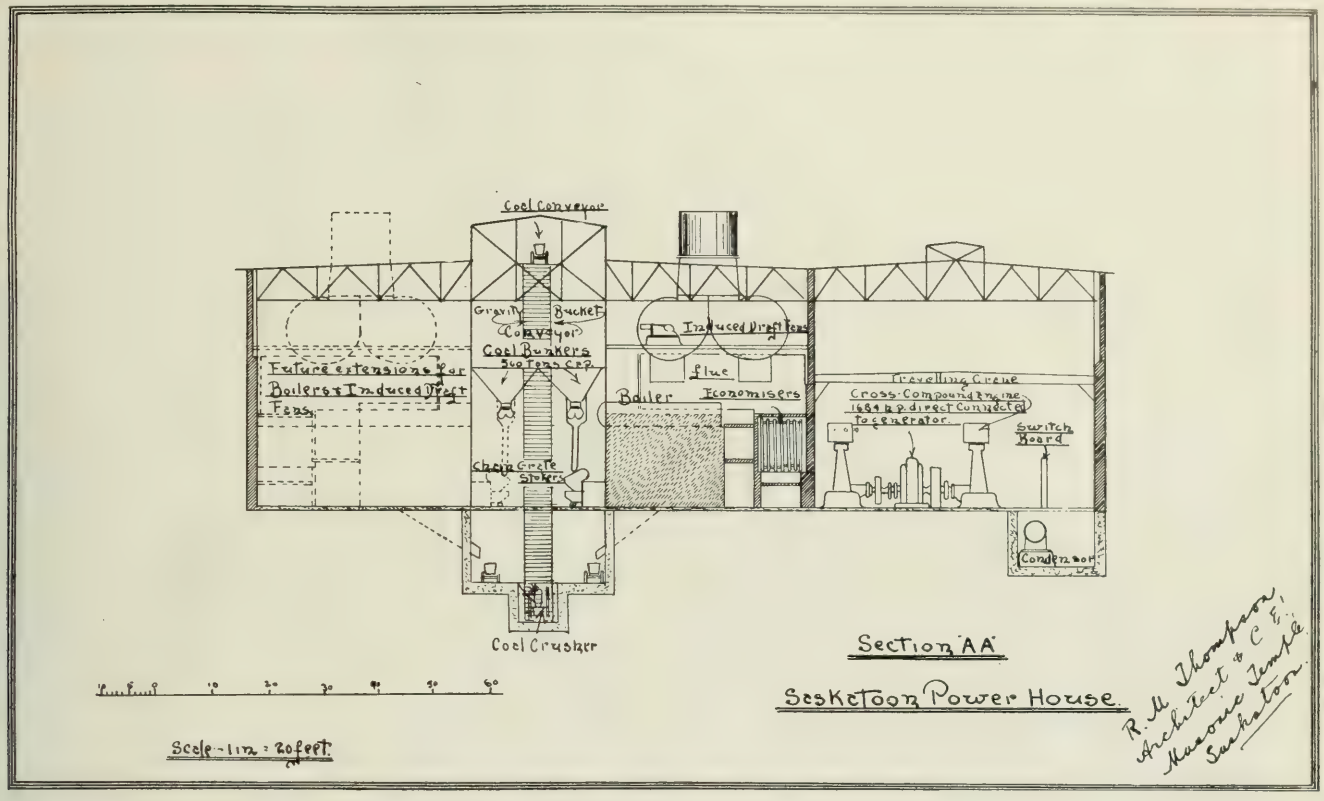
The construction is of steel, brick, and concrete, and is fireproof. The dimensions are 85 by 154 feet, and the walls are 42 feet high; the construction is of the most modern for buildings of this class, and is eminently fitted for the economical and convenient handling of the work. It is designed to admit of the extension of the plant up to 4,000 horse-power before any addition is made to the building, when, if additional space is required, the building will be extended in accordance with plans already in hand.

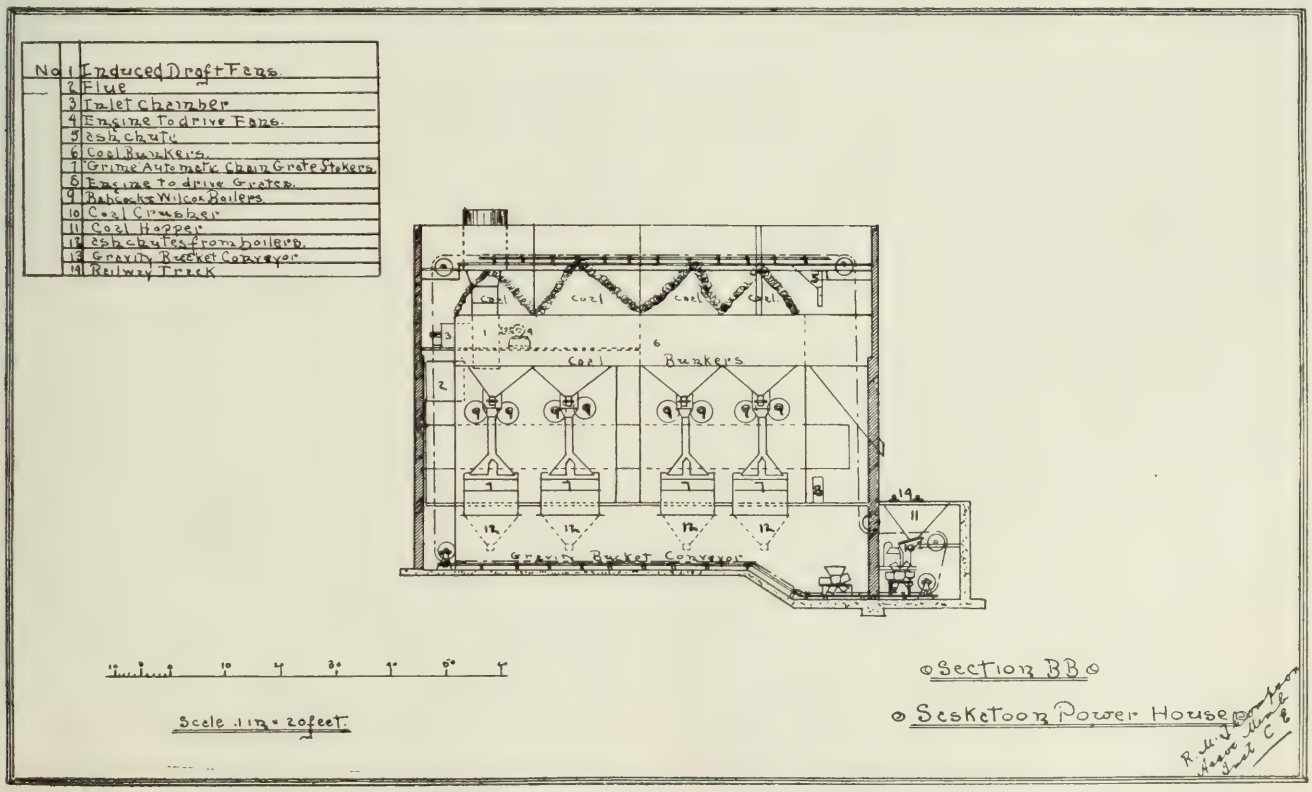
Equipment.—The equipment of the building with suitable machinery is the most important factor. Commencing in the boiler-room, the boiler equipment consists of three double cylinder water tube Babcock and Wilcox boilers, each of a rated capacity of 500 horse-power, but used in conjunction with the economizers, will deliver 650 b.h.p. to the engines, or a total of 2,000 horse-power. These boilers are equipped with Grime automatic chain grate stokers, which



are driven by an independent engine, and feeds the coal as required under the boilers to convey the coal to the stokers.

An elaborate system of coal handling appliances is being installed. The first provision in this connection is the erection of a set of steel coal and ash bunkers, which extend the full width of the building, and are placed immediately above the boiler fronts and stokers. From these bunkers chutes extend down to the hoppers of the stokers, and a steady flow of coal from above supplies the stokers at all times. The overhead bunkers are kept filled by a gravity bucket conveyer, which makes a continuous circuit from the coal hopper outside the building through and under the floor to the back of the building, thence upward and over the coal bunkers back to the hopper. Trips are located at intervals over the bunkers, and any or all of the bunkers can be filled at the will of the operator. Before the coal enters the conveyer, it is crushed to a size not exceeding two inches in a crusher located under the hopper outside of the building. Cars containing coal will be shunted on the track which passes over the hopper, and the coal dumped into same. The





coal ashes are handled in the same manner as the coal by the conveyer, and are elevated into bunkers at the front of the building, from whence they are loaded into cars or wagons by means of chutes.

By this system it will be readily seen that the work is entirely automatic, all manual labor being eliminated in firing the boilers.

The economizers are another distinctive step in the matter of economy in power production. They are set in the rear of the boilers, and all the feed water for the boilers passes through them. In the ordinary method of firing boilers, all the intensely heated gas produced by the combustion of fuel on the grates passes up the smoke stack and is entirely lost. By the use of economizers, the gas and heat is conducted from under the boilers through flues to the economizer chamber, where they are drawn by the induced draft through the economizer section, thereby heating—without further cost—the boiler feed water to a temperature of about 212 degs. F. This water, introduced into the boilers at so high a temperature materially reduces the quantity of coals required to convert the water into steam. The induced draft takes the place of a smoke stack, and the fans are automatically controlled by the steam pressure.

Engine Room.—The engine room is supplied with a traveling crane to facilitate the handling and erection of the heavy machinery. The equipment consists of a 1,684 horsepower Robb-Armstrong Cross compound engine, directly connected to a Canadian General Electric generator of corresponding power and efficiency. The exciter is operated by a direct connected engine, and will give better control of the generator than the belt-driven type.

The new switchboard is of the most modern construction, and besides various other features, has a Tirrell regulator which will keep the voltage steady. When this plant is in full operation, the large engine and generator from the old power plant will be installed in the new building, and used as a part of the equipment.

Large extensions to the plant are being considered for the year with a view of meeting the rapidly expanding demand for current in the city. Five new boilers are now on order and will shortly be installed.

Mr. A. G. Sangster, electrical engineer, designed the mechanical and electrical features of the plant. Mr. R. M. Thompson was the architect for the building.

SASKATCHEWAN FUELS AND GAS.*

By R. O. Wynne-Roberts.

Mr. Cleminsha asked me to act as his substitute tonight, and after rummaging through my notes, I consented to take duties in this capacity. The time, however, has been very limited for researches and inquiries, but the subject is sufficiently important to discuss in a rudimentary manner to commence with. So, to-night I will endeavor to talk on "Saskatchewan Fuel and Gas" in language that shall be, as far as possible, stripped of technical terms. It is a good policy and a desirable thing to utilize local fuel, if it is economical from a financial point of view. This postulation will, no doubt, be accepted by all. According to a report published by the Canadian Department of Mines, there are about 15,000,000,000 tons of lignite in this province. The population to-day is about 500,000, and if every man, woman and child was to consume, say, 10 tons per day there would be enough to last for 6,000 years. I express this fact so as to give you an idea of the quantity that is in this province, because the figure 15,000,000,000 is too great to be appreciated.

There is very little, if any, coal to be found in Saskatchewan, and probably a little peat. There is wood in the northern parts, and a huge pile of straw.

In this province straws of various grains are now lying in great piles about the country, and it has often been suggested that it would be available for conversion into briquets.

Before proceeding further, it is necessary, perhaps, to explain a few terms that will be used. When coal is thrown upon a fire a portion immediately flashes into flame and passes off in the form of vapor and gas. This portion is commonly called volatile matter. The solid fuel remaining is termed coke—it consists largely of carbon, but also contains some material that will not burn. This unburnable portion is the ash, clinker, or refuse that is removed from the grate or ashpit. These three parts of a fuel—volatile matter, carbon and ash—are the most important factors in determining the character of the product in the manufacture of gas, and in its use for heating boilers, etc.

When the coal is converted into gas there are constituents which are combustible and others which are not. For instance, hydrogen, carbon-monoxide, marsh gas, and ethylene are valuable gases, whereas nitrogen, carbon dioxide and oxygen are not so. It is, therefore, possible to judge the value of any gas by the proportion of these gases.

The Canadian standard of comparison of coals is called the split volatile ratio; it is based on the formula

$$\text{Split volatile ratio} = \frac{\text{Fixed carbon } \tfrac{1}{2} \text{ volatile matter}}{\text{Moisture } \tfrac{1}{2} \text{ volatile matter}}$$

According to this standard lignite appears to be less valuable as we trace it from near the Rocky Mountains eastward. Near Edmonton the split volatile ratio is 2.46, at Medicine Hat it is 1.96, Estevan 1.80, Souris River 1.42, and so on.

Lignite at present does not appear to be a popular fuel. A respected friend of mine told me that he gave it to his pigs, as they liked to chew it. There is, however, a limit to this use, for I was told of another farmer in the States who noticed that his pigs liked it, so he pulverized a quantity, which his pigs ate with regrettable results, for they all died. In the course of this talk I hope to show that lignite is valuable for other rational purposes.

In its raw state, lignite unfortunately contains about one-third its weight of water. So, in such cases, when it has to be carried a long distance, one-third of the freight charges are paid for what is not only a useless commodity, but this moisture is a detriment to its use.

Many Saskatchewan lignites do not contain so much water, and this, again, may have a bearing on its use for another process, which I shall explain. Lignite, when exposed to the weather, falls into fragments or slack. This is probably due to the evaporation of the moisture contained in it. If the lignite is stored in dry cellars it not only slakes less badly, but improves in quality. The less moisture it contains the better it is for heating. Lignite, in the condition which it is usually sold, therefore, has two defects, namely, it contains too much moisture, and it slakes badly. Many experiments have been made to improve lignite for heating purposes, first by removing a portion of the water, and secondly, by making it into blocks or briquets.

In Germany, for instance, lignite, or brown coal, has been made into briquets with great success. It has been found that when this fuel contains about 30 per cent. of moisture and a suitable amount of tarry mixture, it will make

* Paper before Regina Society of Arts and Science, March 8th, 1912.

excellent briquets without the use of additional binding composition. So moisture has some advantage in this respect, but in the process of manufacture two-thirds of the water is squeezed out, so it has only 10 per cent., which is about equal to ordinary coal. In Germany a large proportion of the people use lignite briquets as their principal domestic fuel and the industry has grown to be immense. In the United States of America experiments have been carried on by the government, and it has been proved that briquets can be made out of the poorest fuel, but each kind requires to be treated in a particular way. North Dakota lignite possesses similar qualities as Saskatchewan fuel, perhaps it is a little superior. Experiments have been carried on to ascertain what can be made of lignites.

The main reason why lignites are not found to answer in ordinary stoves, or under steam boilers, is because the grates are not designed for that purpose. Lignite, besides containing water, has a low percentage of fixed carbon, and a high proportion of volatile matter. So, when it is used in ordinary grates, it is found to be too flashy, and the draught is often too feeble.

In the first place, we will see what has been achieved by using lignite for steam boiler heating. There are a number of 250 horse-power boilers, sterling water tube type, installed in connection with the Williston irrigation scheme, and one of these boilers was set aside for practical experiments with lignite as fuel. A special furnace of a semi-producer type was built, lignite was fed onto the grate and there converted into gas. The gas then passed through a combustion chamber, where a quantity of hot air was mixed with it, and most of the gaseous combustible was burned. The gas then worked about the tubes and heated the water, on its way out it also heated the air tubes, where the air was heated for the furnace. The fire grate had rooking bars and a quantity of cold air was admitted under the grate bars to keep them cool and to prevent clinker from fusing onto them. There are many interesting points which could be referred to, but I am omitting them. Continuous tests were made, and it was found that the combination of boilers and furnace gave good results with North Dakota lignite. Steam could be made with fuel efficiency of 55 per cent. to 58 per cent. of the heat in the coal, and no difficulty was experienced in obtaining the full capacity of the boiler. The results obtained compared very favorably with those in average plant when the heat available to the boiler is considered.

Another way of using lignites is by making them into briquets. The development of briquet manufacture has been very great during the last few years. On the important coal fields of South Wales, in England, Germany, and the United States, waste fuel, amounting to millions of tons, has been utilized in this manner, with profit to the capitalists and to the communities. The United States Bureau of Mines carried out a large number of experiments. They installed a German machine, designed to make briquets solely by means of high pressure of 14,000 to 28,000 pounds per square inch. This press may be described as a square pipe, into which the crushed lignite is placed and a plunger forces it through. The pipe tapers at the middle and the lignite, as it was forced through, was reduced in size and was polished and smoothed by the heated sides. Lignites from Dakota and other States were experimented upon. Some samples were found to be incapable of being made into satisfactory briquets without some binding material, whilst others proved to be all that could be desired. The conclusions arrived at by the authorities were, that lignite ignited readily, made a hot fire, and burned freely until it was consumed. Little shaking or poking of the fire was necessary to obtain maximum efficiency. The loss of unburned fuel through the grate was from 6 to 8 per cent., which was not excessive, and could be reduced by using suitable grates. In these experiments the lignite was crushed into ⅜ in. diameter or smaller. Dakota lignite was found to be tougher than the rest. It was then dried and afterwards mixed and run into the pressing machine.

These briquets were tested to see how they would stand knocking about and exposure to the weather.

It is stated that lignite briquets can be made for $1.50 per ton; this does not include the cost of the fuel. Among the advantages to be obtained, it is stated that lignite briquets give about 50 per cent. more heat than the raw material; they will stand handling, and will resist weathering much better than the raw fuel. There would be a saving of about 20 per cent. on the freight charges.

Lignite can be made into gas. There are two ways of doing this, namely, by means of the ordinary gas-works plant, and also by means of producers.

Prof. Babcock, of the North Dakota University, carried out interesting experiments in connection with making gas. He had a small plant consisting of a retort bench, condensers, scrubbers, washers, purifiers and holder. These were constructed for the special purpose of seeing what could be done with lignite.

In an ordinary gas-works, the roal is placed in a fire-clay retort, which it like a pipe with one end closed up and the other connected to a pipe to take away the gas. When the retort is sufficiently full a lid is fastened on and no air is admitted. The retort is built in brickwork over a furnace which is heated to a temperature of about 2,200 deg. Fahr. The coal is burned in the hermetically sealed pipe and the smoke has to force its way up through the ascension pipe to the various parts of the work. This, of course, is a very simple description of a gas-making process; it is much more scientific and technical, but for our present purposes I am eliminating everything which might tend to make the process difficult to understand.

When Prof. Babcock was experimenting with lignite he found that it was not necessary to maintain such a high heat, he found 1,200 to 1,400 deg. Fahr. to be ample, so less fuel is required to fire the retort. The smoke that is discharged consists of tar, vapor, and gas. The tar and vapor are removed by means of condensers, scrubbers and washers. The gas is purified by means of lime and other materials, and then it was passed into the holder for use. It was found that the unpurified gas had about two-thirds the value of good coal gas, but when it was purified it was three-quarters as good. Tar and ammonia was also obtained and about half a ton of coke. The gas burned in an ordinary burner without smoking, and could be used like ordinary coal gas, but a greater quantity had to be used to get the same result. One ton of lignite yielded about 11,000 cubic feet of gas, which is about the same as with good gas coal.

The coke obtained, however, was not suitable for use in its ordinary condition, so Mr. Babcock made briquets of it by mixing pitch with it and passing the mixture through a machine. These briquets gave results equal to anthracite which I consider excellent.

With gas producers, air is admitted, so the gas is not of the same quality as when it is made in ordinary gas-works plant. In the suction producer, after a fire has been kindled and the engine started the suction of the engine causes enough gas to be generated as is required, but as lignite has not yet been used to any great extent I will not dwell on this class of producer longer.

The pressure producer, as its name implies, is not dependent on the engine for draught, but air is forced in. These producers are simply cylinders lined with fire brick, into which air and steam is admitted in suitable quantities, and after the gas has been passed through scrubbers and washers to take out the tar, it is passed into a holder for use as and when required.

Many experiments have been made with lignite for gas-making with this type of producer. A 250 horse-power gas producer of this type was installed by the United States Bureau of Mines, and it will be interesting to note what was done. A 235 barke horse-power gas engine was worked and this was connected by belting to a 200 kw. electric generator.

North Dakota, Texas, California, and other lignites were tried and a large number of ordinary coals. I shall take the results obtained with Pennsylvania coals for the purpose of comparison. With Dakota lignite they experienced no difficulty in keeping up full load, and they found that the gas had a calorific value equal to about one-fourth of ordinary coal-gas, that is, it had 145 to 164 B.t.u. per cubic foot. Texas lignite was very satisfactory, and they found that the heat value was greater than that obtained from ordinary coal.

The quantity of lignite used per electric horse-power was as follows:

North Dakota lignite	1.70 to 2.20 lbs.
Texas lignite	1.39 to 1.99 "
California lignite	2.06 "
Pennsylvania coal	1.01 to 1.50 "

The quantity of gas consumed per electric horse-power was:—

Dakota lignite	77.8 to 87.2 cubic feet
Texas lignite	81.3 to 84.8 " "
California lignite	87.7 " "
Pennsylvania coal	81.5 to 103.4 " "

The calorific value of the gas was:—

Dakota	6470 to 7830 B.t.u. per. lb. of dry fuel
Texas	7130 to 8100 " " " "
Pennsylvania	8310 to 13540 " " " "

Generally speaking, lignite used by means of gas producers gave 2½ times the power if used with steam boilers and engines. Furthermore, the experiments showed that low-grade North Dakota lignite developed as much power when converted into gas as did the best Virginia bituminous coal when utilized under steam boilers.

Expressing the results in another way, the efficiency of the entire plant, based on the electric horse-power, made commercially available and the fuel consumed was:—

Dakota lignite	9.2 to 12.7%
Texas lignite	9.9 to 11.9%
Ohio coal	11.1 to 14.3%
Pennsylvania coal	10.8 to 15.0%

So, it will be seen that North Dakota lignite, which is a near relative of Saskatchewan lignite, gave exceedingly good results when converted into producer gas.

There is another type of producer, namely, the down-draft, but this will not permit me continuing the discussion. I may state, however, that the air is admitted at the top and not at the bottom, as in the other producers, and this is for the purpose of burning the tar.

On the basis of the tests made, it will be interesting to note the difference in the various gases made by producers and ordinary gas plant.

Good bituminous coal will yield about 11,000 cubic feet of gas, and almost 1,500 pounds of coke, besides tar and ammonia; the calorific value of the gas is about 650 B.t.u. per cubic foot.

Ordinary bituminous coal converted into producer gas will yield about 120,000 cubic feet, some tar and ammonia, and the calorific value of the gas is about 150 B.t.u. per cubic foot.

Lignite will yield about 11,000 cubic feet of gas, some tar and ammania, and half a ton of coke, which can be made into briquets. The calorific value of the gas is about 500 B.t.u.

Lignite converted into producer gas will yield about 70,000 cubic feet, some tar and ammonia. The calorific value of the gas is about 160 B.t.u. per cubic foot.

Some authorities are sanguine enough to state that in the near future producer gas will be supplied for all purposes at such a rate that might seem incredible. Mr. D. B. Dowling, of the Canadian Geological Survey, in a paper read before the Canadian Mining Institute, wrote: "A town in the west supplied with lignite at from $3.00 to $4.00 per ton should have a producer gas plant to use lignite—heat the houses with gas at ten cents per 1,000, use the gas engine for electric lighting and water supply and run all the factories by the same means of producing power." I am not at present in a position to express opinions on this phase of the subject, but that lignite can be used for various purposes cannot be gainsaid. Producer gas will require larger mains to carry it and larger fittings to consume it than with ordinary coal gas, but when this matter is carefully gone into it may be possible to find compensatory factors.

In conclusion, what will be the advantages of using lignite in the various forms mentioned to-night?

Cheap gas would constitute an excellent attraction to manufacturers; it would also be a great convenience to our womenfolk. Lignite briquets would be cheaper than any other form of fuel, and would be found satisfactory if proper grates were used. Lignite gas would reduce the smoke nuisance. It would be handy for various industrial operations—annealing, japanning, soldering, brazing, drying, evaporating, for stoves, boilers, bakers' ovens, etc. Producer gas is being largely used for brick, lime and cement kilns; gas can be so easily distributed from any centre and to any part. Twelve per cent. of the producers in the United States are operated with lignite. As natural gas cannot be duplicated by any known process, we should make the best possible use of our natural resources of fuel.

Producer gas can be made from wood, sawdust, tan-bark, straw, hay, corn-cobs, and corn-stalks, and even leather scraps, but of course these fuels, with the exception of wood and sawdust, are not yet in extensive use.

The quantity of lignite mined in Saskatchewan appears to increase with the population; for instance in

	Population.	Tons lignite mined.
1891	40,520	20,000
1901	90,564	44,900
1906	257,763	170,582
1911	500,000	200,000 (about)

I wish it to be clearly understood that the remarks made to-night are exceedingly rudimentary. The subject is so full of technicalities that it is difficult to give expression to the essential facts without introducing terms which would require more time to explain than is available this evening. I hope, however, that what has been said will create a desire on behalf of the public for more and fuller information and details. I understand that the government proposes to make a full investigation into this most important matter, and it can be safely said that there is ample room for original experiments and tests.

The Canadian Engineer

ESTABLISHED 1893.

ISSUED WEEKLY in the interests of the CIVIL, MECHANICAL, STRUCTURAL, ELECTRICAL, MARINE AND MINING ENGINEER, THE SURVEYOR, THE MANUFACTURER, AND THE CONTRACTOR.

Managing Director: JAMES J. SALMOND.
Managing Editor: T. H. HOGG, B.A.Sc.
Advertising Manager: A. E. JENNINGS.

HARBORS ON THE PACIFIC.

The opening of the Panama Canal will herald the dawn of a new era for the west coast of the American continent. A great impetus will be given to the development of the mineral and agricultural resources; in the increased facilities available for marketing products at the great trading places of Europe. The United States recognized the necessity of providing means of transportation for the rapidly developing Western States additional to the transcontinental railway systems in operation now. The completion of the Panama Canal will be the initial realization of the satisfaction of the demand for a shortened and cheaper route to the eastern United States and the European markets.

The United States, appreciating the consequent necessity for adequate shipping facilities as a result of the completion of the canal, are now spending millions of dollars in deepening, enlarging and constructing their harbors on the Pacific coast, so that when the new waterway is ready immediate benefits may be received from its use.

The Canadian Government have been slow to perceive the necessity of immediate action, if Western Canada is to share in the new markets opened by the canal. We are glad to see that they are awakening, however. The report of the Government engineer, Mr. L. Coste, on Victoria harbor has just been published. An abstract of the report will be found in this issue of *The Canadian Engineer*. Mr. Coste recommends a very extensive programme for the development of Victoria harbor, a programme which, if followed, will place the city in a most enviable position for handling its share of the vast traffic which will develop in our Canadian West.

The Government must take steps to follow up the report with prompt action. Every day this work is delayed means increased strength to the American harbors on the Pacific coast. Once the lines of traffic have been laid, it becomes increasingly difficult to change them. To develop our Western provinces and to receive the maximum benefit from the new avenues of transportation, we must spare no exertion. Our harbors on the Pacific coast demand immediate attention if our share of the new prosperity is to be received.

COLUMN DESIGN.

The subject of column design is a very important one, not only from the point of view of safety, but also in the necessity for securing maximum efficiency in labor and material for the manufacturer. In this issue of *The Canadian Engineer* appears an article, entitled "Notes on Column Design." In our opinion the plea of the writer for uniformity in column formulæ is well justified. An examination of the formulæ in common use shows that the majority of designers are not so far apart as is generally supposed. The most commonly employed formula at the present time is that which has been made popular by the American Railway Engineering Association. This conforms tolerably closely to the actual results of tests, and with the extensively used formula of the New York Building Code. The former, and certain formulæ giving similar values, have been justly criticized on the ground of their severity for columns having high values of slenderness ratio.

The remark of the writer concerning the necessity for careful provision for extra amount of flexure in long columns while pertinent, should not be followed to the

extreme. Experimental investigations have shown that the allowable stress on steel columns depends quite as much on the make-up of the section as on the slenderness ratio, and that a short column will not necessarily carry a greater load in pounds per square inch than a column of considerably greater slenderness ratio. It might be remarked that a careful study of actual full-size column tests, made by the engineer members of the Citizens' Committee on the revision of the Toronto Building By-law, showed that a formula very closely approximating that of the New York Building Code fitted the results of tests better than any other, and a working formula was, therefore, proposed which does not differ materially from that formula.

While the practice as followed by the writer, of distinguishing the dead loads and live loads in column design has had very extensive following, it is both inconvenient and liable to lead to trouble. Modern specifications almost universally proportion for dead load and live load by the same formula, making proper allowance for the trying character of the live load by means of an impact formula. The actual simplification of design thus effected is of some importance.

In structural practice on this side of the water, sliding factors of safety are not popular. There is no very good reason why the proper factor of safety for all values of the slenderness ratio cannot be contained in the working formula, and such is the almost universal practice at the present time.

The above comments on this paper are not made in a critical spirit, for the work done and the conclusions arrived at deserve a good deal of attention at the hands of engineers. There is no question that a standard formula for column design (that of the American Railway Engineering Association, or a similar one) would be of great benefit to the designing engineer and the manufacturer. We are glad that the writer has presented his thoughts so clearly in this excellent paper, and we hope that some discussion will arise as a result.

THE RAILWAYS IN BRITISH COLUMBIA.

A vast prospect opens up in British Columbia as the result of the programme outlined in the Provincial Legislature for railway development. Legislation recently enacted provides for the closing link in the new route between the Kootenay and the coast by granting a cash bonus of $10,000 per mile for the continuation of the Kettle River line from Coldwater Junction to Hope. This joins up with the present boundary branch of the Canadian Pacific Railway to Coldwater by the line now under construction from Midway westward and from Penticton eastward. This new route will provide a far shorter and better location than the main line, with the advantage of easier grades.

The Provincial Government also announce the projected acquisition by the Canadian Pacific Railway of the former Great Northern right-of-way in the Kootenay Lake basin of the Slocan. The Canadian Pacific Railway will take over the right-of-way from the syndicate of Kaslo citizens, which took it, with Government backing, from the Great Northern last year. Under the new management the line will be re-built to standard gauge and joined to the Canadian Pacific Railway's Slocan system.

The above announcements, when crystallized in action, will have a great effect in developing the latent resources of British Columbia, as well as in the case of the short route to the coast, introducing the traveller to the developed eastern British Columbia instead of as at present to picturesque mountain scenery as a part of a lengthy journey. The improved shipping facilities should immediately increase the silver-lead and zinc shipments from the Slocan district.

There is no doubt that better railway facilities in British Columbia, combined with the improvement of the harbors and the opening of the Panama Canal, will cause a tremendous influx of capital with the consequent development of the rich resources of the province.

THE FAMINE IN CHINA.

There is a bad famine in China and immediate relief is necessary. Canada, we know will be among the first nations to give much needed assistance. A national movement is being inaugurated and money, wheat and flour will be dispatched to the responsible international committee in China, who will see to its proper distribution. The Canadian railways have promised to help, the leading Canadian milling companies will, if required, grind wheat at cost for shipment to China. Prominent citizens throughout the country will co-operate, and we must have the help and financial assistance of the Dominion Government. Talk is frequent regarding the bonds which exist between nations. Here is an opportunity for us to prove that the talk has a practical and sympathetic phase. From the humane viewpoint, there should be no hesitancy in sending a ship load of wheat, flour, and funds—a national gift from Canada to the famine-stricken Chinese.

Aside from the duty, which is apparent, there are many other good reasons for such action. First, we need the friendship of every nation we can secure. The Oriental labor problem has yet to be solved, and it will be easier to negotiate with an ally. Again, there must be removed from the average Chinese mind the impression that there is only an "America." We should tell the Chinese as a nation that on the North American continent is the great Dominion of Canada, rich in natural resources, and whenever occasion arises, wealthy in practical sympathy.

The suggested action by Canada would have another important bearing. Despite what is said by many diplomats, the Far Eastern situation in its relation to Great Britain and the Empire is by no means removed from the danger zone. The contribution to China, by the principal of the overseas empires should prove of considerable assistance in the future conduct of Empire diplomacy. Then there is the awakening of China to the imperative necessity of the application of modern science to national life. The floods are the cause of the present famine. Floods have proved a national disaster in China time and again. Engineering skill would mitigate, if not abolish altogether, this devastation. Engineering skill would improve the present unsanitary conditions existing in many parts of China and which, with the floods, are responsible for large loss of life. Canadian engineers can take their share of that work in China.

Here then is a worthy appeal to the people of Canada.. Immediate action is necessary. With that object in view, organization and national committees are being formed, the membership of which will probably be made known in a few hours.

EDITORIAL COMMENT.

The annual report of the Temiskaming and Northern Ontario Railway has recently been presented to the Ontario Legislature, and shows a gratifying increase in the total net earnings for the year. The net earnings have increased from $436,130.31 for 1910 to $593,152.69 for 1911, or an increase of about five per cent. The operating expenses have decreased in percentage from 73.2 to 66.4. An appendix to the report is a report from Engineer Ellis, who states that the mouth of the Moose River, on the James Bay, provides the only possible site for a harbor. He adds the opinion that the cost of making the roadstead available for vessels of reasonable draught might not be prohibitive.

* * * *

An inkling of the country's railroad needs is gathered from the statement of Vice-President Bury, of the Canadian Pacific Railway, that the company may spend, shortly, $60,000,000 on an entirely new line of railway from the prairies to the Pacific coast. It was Mr. Bury who recently emphasized the importance of mixed farming in Western Canada as a part solution of the crop movement problem. The growing of wheat, however, will for many years keep ahead of the cult of mixed farming. We cannot tell the Western grower to stop wheat production until railroad mileage, waterways and terminal facilities overtake him. Material and labor, rather than money, appear to be the railroads' trouble. This makes important the work of immigration. In turn, we must remember that railroad labor to-day may not have the same employment to-morrow. While there is need for caution in new tranportation plans, the double tracking of the Canadian Pacific Railway from Winnipeg to the Pacific coast appears to be a necessity. According to Mr. Bury's various calculations, based on the development of all the railways in Western Canada and a proportionate growth of the country, only 40 per cent. of the crop will be moved by the close of navigation this year. This is a problem upon which our governments and tranportation authorities may well concentrate effort.

LETTERS TO THE EDITOR.

Water Powers of Canada.

Sir,—In your issue of March 7th I note an appreciatory editorial respecting the report on Water Powers by L. Denis and A. V. White, recently issued by the Commission of Conservation.

You say: "There is one feature of the conservation question, however, which is lost sight of, and that is the absolute necessity of securing the highest possible economy of water in all water power developments," etc.

Our report not only shows the wasteful use of head, as illustrated by conditions at Niagara Falls, but, in addition, points out the necessity for providing for the possible use of all the power that may be made available at any particular water power site.

This is brought out on page 12 as follows:—

"The regulations respecting waters which are to be set aside for the development of power should be so framed as to require that the preliminary installation of dams and other main works necessary for the control of the waters be made with reference to the possible future development of the full water-power that may be available. For example, suppose a certain waterfall is capable of yielding 10,000 horse-power. If development rights are let to A. for 2,000 horse-power, to B. for 1,000 horse-power, and to C. for, say, 1,000 horse-power., and A., B. and C. are allowed to design and construct their respective works irrespective of each other, or of the possible development of the remaining 6,000 horse-power, then it will probably become quite impracticable to get anything like the remaining 6,000 horse-power because of the damage that would be caused to the plants of A., B. and C. On the other hand, if preliminary works were constructed with a view to utilizing any amount of power up to the full 10,000 horse-power, as occasion demanded, no such contingency as has been supposed could well arise."

James White,
Secretary Commission of Conservation.

Lethbridge Sewage Disposal Works.

The Editor:

Sir,—We have read the very interesting account of the new works in course of completion at the above, designed by Mr. Aird Murray, and described in your issue of February 1st, and as makers of the sprinklers and other fittings for the filters and tanks, we would like to add a few lines regarding these sprinklers, which we think would be of interest to your readers.

The three percolating filters are to be worked by our Patent Airlock "Cresset" Revolving Distributor with Canadian Patent Roof Support. The stationary centre column is extended to form what might be described as the tent pole, which extends to the apex of the roof, where the girders converge and are bolted to the lugs on the centre cap. The body of the sprinkler is so built that, by removing adjustable wedges, the double flanged piece in the column can be taken out; this action releases the weight on the ball bearings, so that they may be got at, cleaned and replaced without dismantling the whole of the sprinkler and consequently the roof.

Another valuable advantage which the "Cresset" has over all other makes is its lack of friction when in work owing to the airlock seal. This seal enables the apparatus to revolve with so small a head as 9-inch, and deliver almost any variation in volume required.

We are issuing a new pamphlet, wherein the mechanism of this apparatus is specified, and shall be pleased to send same to any of your readers on application. Yours obediently,

Adams-Hydraulics, Limited.

An interesting bill has been introduced by the Attorney-General of Saskatchewan. The measure provides for the appointment of a Fire Commissioner, whose foremost duty shall be to investigate the origin and circumstances in general connected with every fire which is believed to have been caused by incendiarism or negligence. He may issue subpœnas for the attendance of witnesses at such investigations. Deputies will be appointed throughout the province to furnish the Fire Commissioner with reports on every fire occurring in the various municipalities, where the damage is in excess of $100. They shall also advise him of any suspicious circumstances, and he will then be in a position to institute an investigation. This is most desirable legislation. Manitoba already has a fire commissioner, and Saskatchewan will likely be the next province. Ontario has discussed the matter for many years, but seems little nearer an actual appointment. With an annual fire waste in Canada of more than $20,000,000, every province can well afford to employ a fire marshal or commissioner.

THE PRINCIPLES OF SPECIFICATION AND AGREEMENT WRITING.

By C. R. Young, A.M. Can. Soc. C.E.

(Registered in accordance with the Copyright Act.)

Fifth Article.

GENERAL CLAUSES.—Continued.

The general clauses of the specifications differ from the specific clauses in that they refer to the general office and field relations of the parties rather than to particular operations or details. Where specific regulations are inserted in the general clauses they refer to matters which do not directly enter into the construction of the work but are preliminary or relative to the project. Provisions of this sort would concern such matters as instructions to bidders, security or payment to the Contractor.

There is some difference of opinion as to which of the general provisions of the contract should be incorporated in the specifications under the head of "General Clauses" and which should be reserved for the agreement. It is the writer's opinion that the division should be made on the basis of the uses to which the written contract will be put. The engineering staff, with the exception of the chief engineer or engineer in full charge of the project for the Owner, seldom requires to consult those stipulations concerning the legal or business responsibilities assumed by the Contractor, but any assistant engineer or inspector may require to inform himself respecting any feature of the construction of the work, the payments to be made for it, the direction of field operations, or, in fine, any provision defining the duties and authority of the Contractor or the representatives of the Owner on the work. For this reason, it would appear that all those clauses which concern the normal working of the contract, including such incidents as charges, extras or defective work should go in the specifications while clauses referring to legal or business responsibilities or to abnormal happenings, such as forfeiture of the contract or settlement of disputes, and with which only the original contracting parties and the chief engineer would have to deal, should be placed in the agreement. The specifications then become purely a code of working rules for those who may have to do with the actual prosecution of the work or design or construction, while the agreement becomes a document to which reference need be made only in case of serious disputes, unusual situations or the final settlement.

Of such great variety are the matters treated in the "General Clauses" of the specifications that it is impracticable to mention here more than a part of those which frequently find a place in specifications. The subjects which might advisedly be covered in the "General Clauses" of the specifications forming a part of a typical construction contract, and following the relationship between the specifications and the agreement outlined above, would be as follows:

(1) Definition of Terms.
(2) Contractor's Undertaking.
(3) Plans and Specifications.
(4) Character of Work.
(5) Inspection.
(6) Conduct of Work.
(7) Alterations.
(8) Extra Work.
(9) Duration of Contract.
(10) Powers of the Engineer.
(11) Estimates and Payments.
(12) Security.
(13) Instructions to Bidders.

(1) **Definition of Terms.**—The terms which require to be defined in the "General Clauses" of the specifications are principally those referring to the contracting parties or their representatives, technical terms presumably having been defined in the specific clauses. Thus, the word "Contractor" might be interpreted by an inspector to mean either the general contractor or a subcontractor, unless the particular one meant is explained in the specifications. "Corporation" might, unless limited in its application, refer to a contracting municipal corporation or to the private corporation with which it contracts. If there were more than one municipal corporation involved in the contract, it might refer to any one of them. "Company," "Board," "Commissioners" or any such bodies having mention in the specifications should for the convenience of those whose duty it is to enforce the contract be defined in the specifications and not merely in the agreement, which, indeed, they may never have occasion to examine. So many engineers are associated with a work of any magnitude that the word "Engineer" should be clearly defined. It might mean the Owner's engineer, any consulting engineer who might be retained for special services, a resident engineer or the Contractor's engineer. Definiteness is, therefore, imperative in this matter. "Inspector" should be defined so that, for example, any municipal councillor who chooses cannot hand out instructions to a Contractor under the pretext of being a special inspector.

(2) **Contractor's Undertaking.** — This description of what is to be undertaken by the Contractor does not refer, except perhaps indirectly, to the extent or character of the work which is to be finally delivered up to the Owner, but rather to those things which the Contractor must furnish in order that work of the kind required by the Owner may be secured. He must provide all material, labor, tools and appliances necessary to the completion of the work in accordance with the intention of the contract. It is also advisable to state that the provision of all these things is to be covered by the prices named by the Contractor in his tender, and that no further remuneration may be claimed under this head.

(3) **Plans and Specifications.**—The necessary general provisions relating to plans and specifications may be grouped roughly under the divisions of interpretation, conformity on the part of the Contractor, responsibility for accuracy and feasibility.

The engineer, as the author of the plans and specifications, should have the right of interpreting them, for he should know, better than anyone else, precisely what was meant. To him should be referred for rulings all questions of conflicting and erroneous statements, whether of graphical or written character. In decisions of this sort, it is obvious that the judgments of the engineer should be in strict conformity with the true spirit, meaning and intention of the contract as a whole, and it is the universal custom to specify that this broad view of the contract shall prevail. Errors and omissions in plans or specifications should therefore not be allowed to justify the Contractor in furnishing less than was clearly contemplated in the contract, and he should be called upon to perform all work which may reasonably be inferred as necessary for the complete fulfilment of the spirit of the contract, although certain requirements may, through oversight, not have been stated. In making such a ruling it would manifestly be dishonest for the

engineer to cover up his own carelessness or ignorance by requiring the provision of things which could not be read into the contract by any fair-minded person.

Strict adherence to plans and specifications and to the interpretations placed upon them by the engineer should be required in the contract. This is, of course, presupposed in the undertaking of the work by the Contractor, but it is nevertheless not amiss to point out in the general clauses of the specifications that he will be held rigidly to the written requirements and that he should in no case count upon the leniency of the engineer in releasing him from an onerous obligation.

Responsibility for accuracy of plans and specifications lies, in general, with the party who made them. If the work is done in accordance with the detailed instructions of the engineer and these are found to be erroneous, the Contractor is not liable, unless perhaps he had entered into the absurd agreement to guarantee the engineer's plans and specifications. If the Contractor prepares the detail plans, he, in this case, must assume the responsibility. Approval of these plans by the engineer does not release him, and it is generally so stated in the specifications.

The feasibility of a proposed scheme is in effect guaranteed by the party who proposes it. If the engineer requires a cofferdam to be constructed in a certain manner and it fails, his principal, the Owner, must bear the expense of the failure. If, on the other hand, the Contractor had put forward the proposal, even though the engineer had allowed the work to proceed without protest, the Contractor is responsible. Sometimes, also, the engineer accepts an entire scheme proposed by a Contractor, such as the finishing of new or special materials, machinery or devices, and since the Contractor is by reason of his special experience better acquainted than the engineer with the nature and performance of what he proposes to supply, the former may, by the specifications, be required to guarantee the workability of that part of the construction or equipment provided by him.

(4) **Character of Work.**—Apart from the description in the specific clauses of the specification of the kind of work required in each class, it is well to cover the character of all work in a general way, and in addition to establish the conditions which must be instituted and maintained by the Contractor as an essential of good work. He should be required not only to deliver up to the Owner in the completed structure the best materials and workmanship customarily obtainable, but he should be called upon to provide labor, tools and appliances of a character necessary for the performance of work of this class required. It should further be stipulated that all defective work must be removed and made good at the expense of the Contractor before final approval is granted. The possible refusal of the Contractor to do this should be anticipated by a provision that the Owner may remove such work himself and deduct the cost from any moneys due the Contractor.

(5) **Inspection.**—The fullest privileges of inspection must be retained by the Owner if entire confidence is to be placed in the work. To this end the Contractor should be required to furnish to the selection of the inspector samples of cement, sand, gravel, steel, and all other materials requiring laboratory examination. Sometimes, as in the inspection of structural steel at the mills, the contractor is called upon to provide the necessary testing machines as well. In field inspection, the right of opening up work which has been covered should be secured to the Owner, or his engineer, but if investigation shows such work to have been in accordance with the contract, the Owner should be required to pay for the cost of the opening up. No materials should be allowed in the work which have not had the final approval of the inspector before use. Cement, for example, might be thoroughly satisfactory as tested at the mills or as disclosed by samples taken from the cars, but due to careless handling or storage might be seriously impaired by the time it was incorporated in the work. It is a safe rule to specify, in addition, that all condemned material shall be immediately removed from the site of the work. If allowed to remain, it is surprising how readily it finds its way into the structure.

Many times in the experience of every engineer there arises the embarrasing situation where imperfect work has been approved by an inspector, or while, perhaps, not definitely approved, has been allowed to be put in without protest. In such circumstances the Contractor very naturally takes the position that the work has been done to the satisfaction of the engineer, or to that of his representative, and, therefore, ought not to be replaced. Such an attitude on the part of the Contractor is indefensible, for the reason that conformity with the contract is the standard of acceptance, and if it can be shown at any time before final approval of the work and the taking over of it by the Owner, that the work is not in accordance with the contract, the Owner may require the Contractor to make such alterations as may put it in a condition to satisfy the demands of that instrument. Approval of defective work through oversight or failure to point out faulty construction during its execution does not relieve the Contractor of the responsibility of providing at the close of the work precisely what the Owner called for in the contract.

(6) **Conduct of Work.**—Although, broadly speaking, the engineer is interested only in the character and acceptability of the completed work, he should retain sufficient powers over the Contractor's operations to not only ensure safety, speed and freedom from disputes during construction, but also to require reasonable assurance that the methods of the Contractor will result in ultimate success. At the outset, full protection of the public from accident by means of fences, barriers, covered passageways and lights should be demanded, and if reasonable safeguards for the Contractors own employés are not required, they at least should be required for the employés of other Contractors and for the representatives of the Owner. In addition, the stakes, hubs and marks placed by the engineer or his assistants should be the objects of protection. Work should be allowed to commence only at such places and times as may be mentioned in instructions from the engineer, and the order of prosecution of the work should be under his control. Only in this way would it be possible to have one Contractor conform to the needs of another and to the exigencies of the whole constructional scheme. Direction of the Contractor's forces should be in the hands of a competent and responsible foreman, satisfactory to the engineer. Whatever the character of the foreman may be, however, he should be constituted the official representative of the Contractor in the absence of the latter, and, therefore, qualified to receive instructions from the engineer. Otherwise, an unwilling Contractor might make it exceedingly difficult to deliver disconcerting instructions. In order that completion on time may be facilitated and the engineer's arrangements as a whole safeguarded, he should have the right to order an increase of the Contractor's force if thought necessary, and if the character of the Contractor's employés is objectionable and not suitable for the performance of the class of work required by the contract, the engineer

should be in a position to order their replacement by acceptable men. Order at all times should be obtainable upon direction of the engineer, and the Contractor should be required to so conduct himself and his employees that the interests of other Contractors will not be prejudicially affected.

But while these powers of direction should be secured to the engineer, it is possible to go too far in this respect. Beyond a certain degree of control the Contractor ceases to be an independent Contractor at all, and becomes merely the agent of the Owner. The latter then becomes responsible for the acts of the Contractor, who is under these conditions nothing more than the Owner's "other self." A typical clause of a specification, quoted by Mr. Daniel J. Hauer in the Journal of the American Society of Engineering Contractors for December, 1910, which confers on the engineer powers transforming the Contractor into the agent of the Owner is as follows:—

> "The engineer shall have entire charge of all forces employed under this contract, and shall direct their work and disposition, and shall order such forces increased or diminished as he shall deem expedient."

(7) **Alterations.**—The right to make such alterations or modifications in the plans or specifications as may appear desirable should be conferred on the engineer by the contract. It does not follow that these changes should be executed by the Contractor without extra charge, however, or that they should be considered as covered by the original contract. The limit of magnitude of alterations permissible without involving a modification of the contract should, therefore, be specified.

Where the changes are slight and do not necessitate a very much longer time for the execution of the work as a whole than was originally contemplated, it should be possible for the engineer to order changes, granting to the Contractor, where he thinks proper, extra remuneration or extension of time. If the changes are only of a trifling nature, not involving increased cost or additional time for execution, it should be permissible for the engineer to secure them without any extras or extension of time. In no case should the Contractor be allowed to make a claim for anticipated profits in case of a reduction in the amount of work.

In case extensive alterations are necessary, such, for example, as the relocation of a line of railway through new country, the Contractor should be entitled to demand a change in the contract or a supplementary contract to cover the new conditions. Likewise, if projected changes involve a change in the value of the work of over a certain percentage of the original tender price, the old contract should be altered. Large changes in quantities sometimes affect the unit prices for which work may be done to such an extent that a new contract would be the only fair method of dealing with the situation.

(8) **Extra Work.**—Any excess of the quantity of work as actually executed over the work as defined in the plans and specifications is called extra work. Such work is usually paid for at certain prices stipulated by the Contractor in his tender or fixed by the engineer in the specifications or notice to bidders. In case the work is reduced in quantity it is customary to specify that the Contractor's remuneration shall be diminished in accordance with the reduction in quantities and the unit prices for extras, or perhaps these prices reduced by 10 or 15 per cent.

Perhaps no single consideration pertaining to construction contracts is more provocative of disputes and litigation than the question of extras. The Contractor who has bid too low endeavors to the utmost of his ability to establish claims for extras in the effort to extricate himself from imminent financial loss. As a sort of safeguard against a possible error in his tender the Contractor will, if permitted, name high unit prices for extras, which, while not taken into account in comparing the tenders, may stand him in good stead if he is successful in establishing extras. The practice of the engineer fixing the extras is thus calculated to materially reduce the cost of the work.

In addition to this precaution, the engineer needs to exercise great care in framing all the clauses of the specifications which have any bearing on the question of extras. As a necessary condition to the consideration of any claim for extras, the Contractor should be required to show the written authority of the engineer. It should be distinctly understood in this connection that assent to alterations by the engineer does not constitute a sanction for extras. Some engineers, with good reason, require claims for extras to be presented monthly, so that the question may be investigated while the matter is fresh in mind, and perhaps before the work is rendered wholly inaccessible. Remuneration for extras must be determined by the engineer on the basis of the measured quantities and the prices fixed in the contract. The engineer should not be allowed to fix the prices of extras, since such procedure is illegal. Any work not foreseen in the list of extras inserted in the contract should be covered by Force and Material Account. In this way the Contractor is assured of the cost plus a fair profit, and the engineer may in a measure control the cost by requiring accurate account of the time of workmen and quantities of materials put into such special work.

(9) **Duration of Contract.**—In most contracts time is declared to be of the essence of the agreement, which signifies that there must be a prescribed time for commencement, a time for completion, and perhaps also a specified rate of progress. Without the latter it is difficult for the Owner to cancel the contract on the ground of slowness in the prosecution of the work, since this would only be possible by proving that the Contractor could not by any human means finish on time—manifestly a difficult thing to do. The effect of unusually adverse weather conditions, alterations and delays on the time of completion should be definitely covered. Slight alterations, not entailing extra work, should not entitle the Contractor to an exension of time unless the engineer judges such to be warranted. Where the Owner suspends or delays the work, it may be only common justice to not only grant an extension of time equal to the delay, but some extra allowance or compensation for the loss attending the tie-up of the Contractor's plant and organization during the delay, and for the interference with subsequent work to be undertaken by the Contractor.

(10) **Powers of the Engineer.**—If the Owner is to be assured of reasonable progress and despatch in the work, there must be one individual in supreme control, and that person the engineer. Questions of a purely business character might be satisfactorily settled by others, but all matters involving technical details should be subject to the final decision of the engineer in charge, who, for convenience, is usually the engineer who prepared the plans and specifications. Only an engineer, or his representatives, should, for example, be allowed to interpret the plans and specifications, or to pass on questions of measurement, classification or quality, or to make alterations or order extras. No one but an engineer should be given the power of general direction

of the work with certain rights over even the forces of the Contractor.

Upon the award of the contract the engineer ceases to be merely the professional adviser of the Owner, and takes upon himself new and onerous duties. He must then not only direct the work, but interpret and enforce the contract and become to a large extent the sole arbitrator of most of the disputes which are likely to arise between the two contracting parties. The anomaly of the engineer occupying this judicial position while being in the pay of one of the parties to the contract has frequently been pointed out, but no one has yet devised a better arrangement. Probably no better evidence of its practicability and of the tact and success with which the engineer has on the whole filled this dual and manifestly difficult position is needed than the fact that the practice of giving large judicial powers to the engineer still continues to be almost universal. Of course, if an engineer were to adopt the attitude of uncompromising partisanship on all matters, or seek to conceal his own errors and omissions under cover of his authority as engineer, great hardship might result to the Contractor, but if he is honorable and firm enough to be fair at all costs there is no reason why his interpretatioon of the contract should not be satisfactory to both parties.

(11) **Estimates and Payments.**—As a guidance to the engineering staff in general, it is desirable to incorporate in the specifications the provisions respecting estimates and payments. Usually, progress estimates of an approximate character are granted to the Contractor every month, and upon presentation of this to the proper authorities he is entitled to receive payment for the value of the work done during the previous month, less a certain drawback. The drawback, which runs from 10 to 20 per cent., constitutes a deposit to secure the Owner against loss due to defective work or other breaches of the contract. The percentage should not be large, and is preferably less than 20 per cent., since the tying-up of a large amount of the Contractor's money results in higher bids than would otherwise obtain. After a certain sum, depending on the size and character of the work, has been held back, it is unnecessary and undesirable to continue the deduction of the percentage, and the amounts due the Contractor on progress estimates should then be paid in full as they fall due. The final estimate is usually deferred till about one month after the work has been completed to the satisfaction of the engineer, during which time liens and other claims against the Contractor may be filed. Having then deducted all sums due the Owner or to creditors of the Contractor whose claims had been formally registered, the Owner makes the final payment in accordance with the estimate of the engineer.

(12) **Security.**—To ensure that the Contractor will formally enter into a contract if the work is awarded to him, it is customary to require either a deposit cheque or a guarantee from a surety company or a private individual. The amount of the cheque is usually about 5 per cent. of the tender price on contracts up to one thousand dollars and 2½ per cent. on contracts over that amount. If the bidder be unsuccessful, his cheque should be returned forthwith, but if successful, it is retained until he has formally entered into a contract with the Owner. While the deposit cheque is most commonly required, a guarantee is much less objectionable from the Contractor's point of view, as it obviates the tying-up of his money, which, if he had many bids outstanding at any one time, might be very extensive.

On important work, and generally on work of a public character, the Contractor is required to submit a bond for the faithful performance of the contract. This is preferably supplied by a surety company rather than an individual, since the status and solvency of the latter is sometimes difficult to prove. In any event, the bond should be drawn in such a way as to allow slight changes in the contract without releasing the surety.

(13) **Instructions to Bidders.**—The information which is incorporated in the "Notice to Bidders" should also be inserted in the specifications, and generally in somewhat greater detail. It is excellent practice to require all bids to be made on standard forms of tender supplied by the engineer. In this way irregular bids, errors and omissions are frequently avoided. Matters to which the attention of the bidder should be directed by this section of the specifications are the sealing and marking of bids; delivery to a specified address by a certain time; portions of the work open to tender of any one bidder; provision of the prescribed security; reservation of right to reject any or all bids; and items for which prices are to be quoted in the tender.

The series of articles by Mr. C. R. Young on **"Principles of Specification and Agreement Writing"** will soon be complete, and may then be obtained in pamphlet form from *The Canadian Engineer*. Orders will be received at any time.

MUNICIPAL WORK IN BASSANO, ALTA.

By-laws providing for an expenditure of two hundred thousand dollars upon waterworks, sewers, concrete walks, street grading and city hall are to be submitted to the ratepayers of Bassano, Alta., immediately. Such was the decision of the Bassano town council at a recent meeting.

With a view to aiding the town in the floating of their debentures, owners of subdivision property adjoining the present town limits voluntarily requested the council to extend the borders of the town, by taking in their property. This will be done immediately, and with the result that Bassano's assessment will immediately jump close to the two-million-dollar mark.

The source of water supply will be the Bow River, at a point 3½ miles southwest of Bassano, and in the vicinity of the C.P.R. irrigation dam, a large stand-pipe to be erected near the intake. The total cost of the water system, according to the present estimate, will be $83,391.10, while the cost of the sewer system will be in the neighborhood of $60,000. In the latter estimate provision has been made for disposal works to be located about two miles to the east of the town.

The main outfall sewer is to be constructed with a capacity large enough to serve a town of ten to fifteen thousand people.

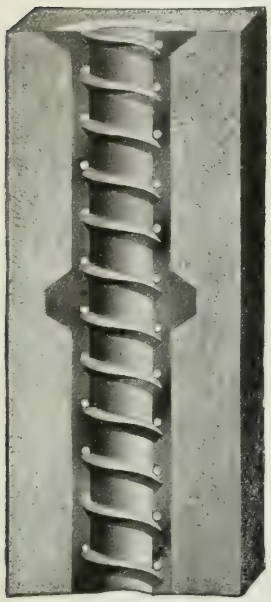
The by-law for the new $25,000 city hall, together with the $25,000 by-law for concrete sidewalks and street grading will be submitted at the same time as the water and sewer by-laws, and not later than April 6th. Immediately upon ratification by the ratepayers, work will be started and rushed to completion. The citizens feel confident that both water and sewer system will be completed and in operation early this fall.

REINFORCED CONCRETE TIES.

A substitute for the wooden railway tie has been long looked for. The Universal Concrete Tie Company, Whitney-Central Building, New Orleans, have furnished us with the following information concerning their new reinforced concrete tie. This will no doubt be of interest to everyone who is in touch with the tie question.

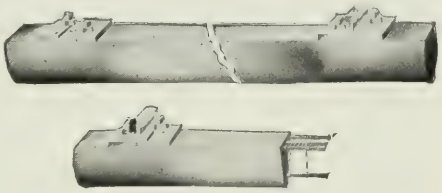
This company, which has now organized and opened its principal offices in New Orleans, is the outcome of fifteen years of strenuous labors on the part of the inventor of the well-known reinforced concrete tie and fastening or spiking device bearing his name. It is a coincidence that these ties should have been tried out and after more than five years of practical use under heaviest traffic conditions, been cordially recommended by the roads using them, and that a company has been formed to introduce them at the time when the eyes of the railroad world are seeking light on this subject. At their last meeting, the American Railway Engineering and Maintenance of Way Association apointed a special committee to investigate and make concise recommendations for next year's work, on a substitute for wooden ties. The necessity for a substitute for wood ties is conceded.

LATERAL SECTION OF REINFORCED SOCKET IMBEDDED IN CONCRETE TIE



The fundamental objection to the concrete tie is its want of resiliency. This criticism, however, is overcome in the construction and use of this reinforced concrete tie, which cushions the load effectively. This is proven by four to six years use of these ties under heavy traffic conditions on various trunk lines.

These ties are built upon the same principle as the best concrete construction, being reinforced by heavy corrugated steel bars, so tied together as to form a truss unit. They are moulded in specially designed moulds, and thoroughly matured before used, and with proper care in selecting and mixing the ingredients, permanency is assured. The rounded edges of the base of these ties, minimizes the weight and eliminates breakage of unprotected edges in handling, while the "V" shaped centres of base insure solidity in track, overcomes the vibration of motion, prevents sliding or slewing of track, and entirely eliminates centre binding, so common in all other ties.



These ties can be made at points along the track where needed, thus obviating the handling except on push cars, and by common labor of the section, when not otherwise employed. This must always be under proper supervision.

The weight of ties varies according to size, i.e., from 375 lbs. for ordinary roadbeds, to 450 lbs. for heaviest traffic conditions under trunk lines, while in terminals and grade crossings larger are used. Owing to their greater bed and face area, 2,600 of these ties will replace 3,000 wood ties to the mile under maximum traffic conditions.

The company recommend the 9 ft. 10 in. face tie for all terminal construction where traffic conditions demand permanency, and where, as in tunnels and causeways, the cost of changes always reaches extravagant figures and handicaps traffic. The hardwood cushions 2 in. by 14 in. by the width of the tie, are readily interchangeable by one man sitting on end of tie, and without interference with traffic, simply removing the two screw spikes which pass through holes in block or cushion, into reinforced babbit metal sockets previously imbedded in ties when moulded.

One company which has been using these ties for nearly six years states that the cushions, though regularly examined, are perfectly sound though "checked," and that spiking devices have never needed tightening and are holding rails firmly.

Experience under varying traffic conditions has proven that rails on these ties remain true to gauge, and that the track cannot spread since spiking device does not work loose.

This spiking device consists of a screw spike of varying lengths and diameter, according to its uses, which enters a reinforced non-corrosive socket imbedded into the concrete. This is suitable likewise for all kinds of cement construction, such as buildings, viaducts, street railways, etc.

THE CONFLAGRATION HAZARD.

With the idea of making impossible the repetition of such terrible catastrophes as those which have recently overtaken Baltimore, San Francisco, Bangor, Chelsea, and other unfortunate places, considerable attention has been given toward the development of fire breaks or stops which would make virtually impossible the repetition of such a disaster. Among the ideas which have met with expert approval might be mentioned the erection of solid lines of heavy fireproof buildings, roughly in the form of a Maltese cross, thus dividing the total area into sections separated by these massive bulwarks. This scheme, however, does not provide against the carrying of embers by a high wind to a long distance in advance of a conflagration.

The only apparent complete solution of the situation lies in equipping the principal buildings, certainly within the congested area, in such a manner that it will be virtually impossible for fire to obtain hold upon them, and thus advance another step in its progress of destruction. There are two general methods by which this may be done, but for most perfect protection they should be jointly adopted.

For fighting a fire on the inside of a building it is absolutely essential for best results that the building be equipped with an approved form of automatic sprinkler which, opening as soon as the temperature caused by the fire reaches a certain predetermined point, will flood that fire and thus automatically put it out. The secondary protection, which would come into play only when a conflagration is in progress or threatened, is a system of open sprinklers on the outside of the building, located one above each window or other exposed opening, and operated by means of a valve at some distance, turning water into the pipes and surrounding the building with a veritable curtain of water through which the fire cannot pass.

A splendid instance of this duplicate form of protection was in evidence at the Baltimore fire in the premises of the O'Neill Department Store. This building was equipped both inside and out as above described, the outside sprinklers covering no less than 98 windows in the six stories. It was directly in the path of the fire and was attacked by flames

which practically enveloped it, leaping more than 15 feet above the elevated sprinkler tank, the top of which is 30 feet above the roof. The cover of this tank was destroyed, while the tank and the timbers on which it rested were so badly damaged as to necessitate replacement. They were saved from total destruction, however, by blocking the overflow pipe and keeping water running in the filling pipe, thus overflowing the tank and keeping it wet. The cornice of the building was on fire a number of times, but four Grinnell automatic sprinklers in the attic prevented the fire from entering. The freight elevator caught fire, but two sprinklers at the top checked it here. The open sprinklers over the windows were put in operation fifteen minutes before the flames attacked the building, and such was the value of the screen thus formed that the store was open for business again two days after the fire. Thus the sprinkler saved not only the building and contents, but other buildings which, protected by this screen, were shielded from the direct force of the flames.

An interesting sidelight on this lies in the fact that a modern 11-story "fireproof" building directly across the street, equally exposed but not protected by sprinklers, was completely gutted.

NEW STEAMER FOR VANCOUVER.

A new twin-screw steamer the "Chelohsin" has been built to the order of the Union Steamship Company, of Vancouver, by the Dublin Dockyard Company, Dublin, and is described in a recent issue of Engineering. She is intended for the owners' passenger and light-freight service in the protected waters of British Columbia.

The dimensions of the vessel are 175 ft. long between perpendiculars, with a beam of no less than 35 ft., which was necessitated by the vessel's great height, there being four decks devoted to passenger accommodation, etc. She has been built under survey of the British Board of Trade and the British Corporation, and is specially strengthened with plating, doubled forward, to resist the impact of floating timber, and, for the same reason, aft, the propeller shafts are outwardly protected by bossing the shell, and the propellers are of strong section cast steel. A specially heavy belting surrounds the vessel, and the anchors are drawn up into recessed hawse-pipes forward so as to be under the flush of the shell plating, thus preventing damage to other vessels coming alongside. The hull has also been built of very stiff construction, all the four decks being completely plated with steel, and the whole bound together by a system of pillaring, the efficacy of which was found at the trials, which took place in rough weather, for there was then a total absence of the annoying vibration associated with high speed engines.

The first-class passenger accommodation is very comfortable, nearly all the state-rooms having only two berths on the awning and shade-decks. They are finished in oak, and in some of them both hot and cold water are laid on. Fourteen of the state-rooms have, in addition to the two open berths, a folding cabinet-bed on the American principle. The dining-room is situated on the main deck, with a companion-way to the awning-deck. It is square in shape and will accommodate 60 passengers, the tables being arranged for small parties of four, six, or larger numbers. The pantry and the galley are adjacent.

The ladies' saloon is on the awning-deck aft, attached to it being a tea-room and a reading-room, and also a ladies' retiring-room with toilet arrangements. There is also what is called a conversation-room on the awning-deck immediately forward of the range of state-rooms. It is spacious and has large sliding windows all round, through which the scenery, which is in many places very fine, may be viewed. This room also forms the principal entrance hall. The smoking-room is on the shade-deck forward of the funnel casing, and in this again the windows are of the sliding type. In front of the smoking-room is the chart-room, and in front of that the wheel-house. The second-class accommodation and that for the deck passengers are situated on the lower decks forward. The comfort and the convenience of the passengers has been well considered, there being a hot-water system, steam-heating system, and a complete electrical installation.

The propelling machinery has been supplied by Messrs. MacColl & Company, of Belfast, and consists of two sets of balanced-crank triple-expansion engines, supplied with steam at 185 lb. pressure per sq. in. from two specially large boilers, designed for burning inferior coal. The auxiliary machinery comprises centrifugal, circulating, feed, bilge, and sanitary pumps, evaporator, ash-ejector, etc.

Before leaving Belfast, the vessel ran her trials on the new measured mile in Belfast Lough, and obtained a speed of 14.29 knots in service conditions, and fully 13 knots with 300 tons of dead-weight on board, both speeds being in excess of that guaranteed, although the weather was boisterous at the time. The vessel was built to the specification of Mr. James Maxton, consulting engineer, Belfast, under whose supervision the trials were carried out.

The Chelohsin has made an excellent maiden-voyage, the long passage from Belfast to Vancouver being made in 72 days; and the vessel has not suffered in the least from her ocean trip. To economize coal on the voyage, steam was generated by one boiler only.

BUILD THE GEORGIAN BAY CANAL.

The following resolution was passed by the Ontario Associated Boards of Trade recently:—

"That the reports of engineers on the surveying and estimating for the Georgian Bay Canal show that the section from Georgia Bay to Lake Nipissing, through the French River, is comparatively easy of construction and not of excessive cost:

"That the making navigable of the French River would throw open to water competition in rates all that section of Northern Ontario tributary to Lake Nipissing, and would give the Temiskaming and Northern Ontario Railway, which serves the farming sections of the Temiskaming district, the lake port considered so desirable to the successful operation of that railway;

"That the Canadian Pacific and Canadian Northern Railways, serving what might be called the western portion of the clay belt, the farming section of the Sturgeon Falls district, centring as they do with the Grand Trunk Railway and T. and N.O. Railways at North Bay, would have the advantage of a lake port at North Bay and that this would work to the advantage of all lines of private enterprise that might be entered into in the north country;

"That the construction of the canal would develop the water powers of the French River, which are now held back from development by the Dominion Government because of the possible construction of the Georgian Bay Canal, and, therefore, would make available electrical energy to be used in manufacturing, mining or any enterprise in which power is used;

"Therefore, that the making navigable of this river is a most important factor in the upbuilding and development of all the eastern portion of Northern Ontario."

Metallurgical Comment

T. R. LOUDON, B.A.Sc.

Correspondence and Discussion Invited

RE-ROLLED RAIL BARS FOR CONCRETE REINFORCING.

Quite recently in the pages of one of our contemporaries, there appeared a discussion on the question of the advisability of using for the purpose of reinforcing concrete, bars that have been re-rolled from old rails. Some of the statements made in this discussion were, to say the least, rather sweeping and could hardly have been made with a full knowledge of facts.

At the outset, it is to be clearly understood that **the following is not a discussion as to the relative merits of low and high carbon steel for reinforcing concrete.** It is merely intended to point out a few facts that have come under the writer's observation and which it will be seen must necessarily have a great effect on the question as to the desirability of re-rolled rail bars.

Before discussing the re-rolling of rails, the writer would take exception to the following statement that appeared in the referred to articles and which is apparently given as a reason why re-rolled rail bars are as well made as other bars rolled from billets:

"It is a matter of common rumor, if not common knowledge, that the scabbed, piped and otherwise defective billets are used for rolling into reinforcing bars; also, in many cases, the crop ends from the ingot, rejected as not being good enough for a rail, are so rolled."

Such a statement, if true, would warrant a deep searching investigation—if true; but, the reader will see that the matter is one of "common rumor if not one of common knowledge." To the man who is accustomed to think, "common rumor" is a very dangerous and untrustworthy source of information. To the practical man, however, portions of the statement contain a refutation of their truth. It is a matter of practical knowledge that to roll steel containing a "pipe" means that the final metal will contain this same cavity in compressed and elongated form. The surfaces of the cavity do not weld together under rolling for the very good reason that they are generally badly oxidized. One can readily imagine the form of concrete bar resulting from this "piped" billet or from the rail crop end which is rejected because it contains the "pipe" of the ingot from which it is cut. It cannot be said with absolute certainty that no "piped" billets are ever rolled into concrete bars, just as it cannot be said that no "piped" rails are ever put out in service even after the greatest precautions; but, what is more to the point, it can be said that **great precautions are taken to prevent such a thing happening.**

To come back to the re-rolling question, it must be admitted that the proper re-rolling of a rail into a smaller rail section does give an extremely good and serviceable rail **provided the original rail was free from defects.** Re-rolling is not going to cover up those defects. On the contrary, it has been the writer's experience that the re-rolling in diagonal passes tends to uncover such defects as hidden "pipes," seams, etc.; so that the final inspection very easily eliminates the undesirable rails. This fact is used as an argument that the same thing will happen in re-rolling a rail into bar sections. To a very limited extent, this may be true. As far as the sound steel itself is concerned, the re-rolling certainly tends to give it a higher elastic limit and ultimate strength; so that, provided an engineer favors the use of "high elastic limit" steel, one apperently gets perfection in this product. But we must stop to consider that if the rail has a defect to begin with, say a small undiscernible open seam, this flaw will not be readily detected in the final bar. It is comparatively easy to inspect re-rolled rail sections; but, one would have to go over each foot of a re-rolled rail bar with extreme care in order to detect some of the fine seams that the writer has seen in these bars as resulting from a defect in the original rail. Supposing, however, for the sake of argument, that it is admitted that all the original rails are free from defects, there still exists a fact that must be recognized if one uses the re-rolled product.

In the table below the writer gives some analyses from actual rails that were selected at random from a pile of rails that had been re-rolled:

	Rail No. 1	No. 2	No. 3	No. 4
Carbon	.29	.31	.05	.51

The wide range in carbon content of these rails is at once apparent. The tests of the re-rolled product showed the consequent variation in strength that one would expect. But, it may be said that this variation is abnormal; rails are manufactured to-day under a very definite chemical specification. Quite true; but, if one will take the trouble to look up these specifications, such as those of the American Society Testing Materials, it will be found that in Bessemer rails there is a range of from .35 to .55 carbon for rails varying in size from 50 to 100 lb. section (the carbon content being given for the various sizes of rails); and, in open hearth rails, the range for the same rail sections is from .46 to .75 carbon. As rails used for re-rolling are of all sizes, it would seem to follow that one would get bars with varying strengths; **certainly the bars would not be all alike as far as carbon is concerned.** To such an argument as this, the answer might be that re-rolling mills sort the rails into piles according to section, etc.; but, it is seen that even if this is done, the rails may some of them be Bessemer and others Open Hearth, and a glance at specifications shows that, say for 80 lb. rails, Open Hearth shall be between .52 and .65, and Bessemer between .4 and .5 carbon, which gives a range of from .4 to .65 in 80 lb. rails piled without taking into account whether they were Open Hearth or Bessemer rails. Such argument might go on indefinitely. It is fact with which we are concerned.

It will be noticed that in the given analyses, one of the rails showed merely .05 carbon. In fact, this was an old wrought iron rail. The point is that these old rails (not necessarily wrought iron) are finding their way to the re-rolling mills, and with them there is absolutely no definite guarantee of carbon content, so that the final product is necessarily a variety. It is beside the question to say that the steel in rails is all of good tested quality; that these old rails are very good steel, etc. The steel is of good tested quality for rails, but, it does not necessarily follow that it will give an even quality of steel for bars.

If engineers wish to use steel whose carbon content is likely to vary widely, all well and good. They do so knowing that the steel they are using may have a wide range of strength. **This fact must be recognized and**

given its due place, even if, as someone has suggested, "Oh well, most of the steel is good; but, now and again soft or very hard bars creep in."

STEEL WHEELS.*

Chas. C. Bacon, Jr.

The wheel committee of the Master Car Builders' Association was instructed by the executive committee, last June, to consider the designs and specifications for steel wheels and to report at the convention to be held this coming June. The wheel committee held a meeting about two months ago at which were present, by invitation, representatives of the solid steel wheel manufacturers. Upon learning that the subject of specifications covering solid steel wheels had been under consideration for upwards of two years by a special committee of the American Society for Testing Materials, the M. C. B. committee very promptly determined to accept an invitation which was extended to have representation on that committee. This latter committee is well qualified to handle this important item intelligently, being composed of representatives of the manufacturers and of the railways which have had the longest and most extensive experience with solid steel wheels. It is but right

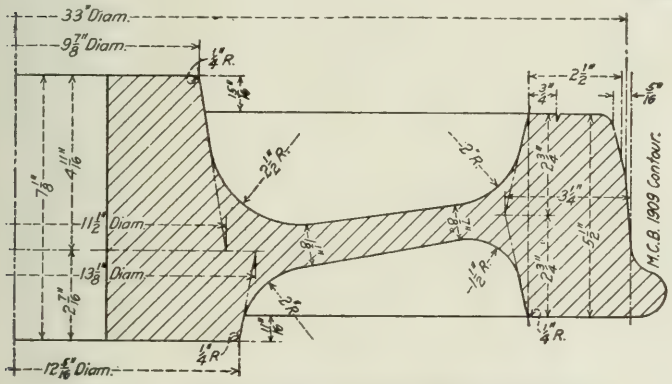


Fig. 1.—Typical Design of Solid Steel Engine Truck Wheel.

and proper that the question of design be thrown open to all, so that there may be full expression of opinion, and so that the manufacturers and the railways will reach agreements, or standards, at the earliest possible moment. The object of this paper is to place before you a list of twenty-one designs of solid steel wheels which long experience and careful study would seem to indicate are adequate standards in connection with more than ninety per cent. of the requirements of the railways of the United States to-day, and which would soon cover the other ten per cent. if railways would give attention to some points in connection with co-ordinate equipment; also to further place before you certain reasons why a study of the subject has convinced me that a total of eleven of these designs are all that are desirable or required.

A 33-in. steel engine truck wheel is shown in Fig. 1, which is representative of the other designs for different diameters of this type of wheel. Fig. 2 shows the design for a 33-in. tender, passenger car and freight car wheel. The salient point of difference between these two general classes is that wheels for engine trucks require inside hub faces of large diameter to provide adequate bearing surface. A total of eleven designs which I think are all that are desirable are, for engine trucks, 28½ in., 30 in., 33 in., and 36 in. For freight cars, tenders and passenger train cars, 28 in., 30 in., 33 in. (two designs) 36 in. (two designs) and 38 in.

One of the reasons for increasing the number of designs of wheels for engine trucks above the four above noted is that of the diameter of the inside face of the hub. It has long been considered by prominent roads, which have placed may thousands of solid steel wheels in engine truck service, that this dimension should properly be 12 5/16 in., but recently several large companies have called for engine truck wheels with inside hub faces of either 13 in. or 14 in.; in fact, one large system has issued a sheet setting forth that this dimension shall be either 11 in., 12 in., 13 in., 13½ in., or 14 in., under certain conditions. Ninety-five per cent. of the solid steel wheels which are in engine truck service in the United States to-day have 12 5/16 in. diameter of inside hub face. This dimension is standard with the roads which have had the longest and most extensive experience with solid steel wheels of this type and I am told that it has proved to be a proper and satisfactory dimension. The cost of manufacturing solid steel wheels, and therefore the price to the railways, is largely a question of the number of wheels produced per type, and this being the case it seems most important—particularly as regards engine truck

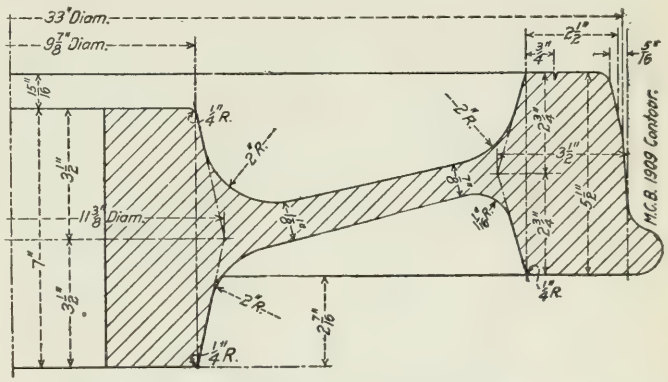

Fig. 2.—Steel Wheel for Tenders, Freight and Passenger Cars.

wheels of which the total number required is not sufficiently large to enable manufacturers, even under the best of conditions, to reduce the cost of production to the same level as that of the other classes of which larger quantities are used—that specific attention and study should be given to this dimension of inside hub face diameter, so that a standard can be adopted for the best interests of all concerned.

For a 6 in. x 11 in. axle the hub diameter is increased from 9⅞ in. to 11 in., to provide proper hub wall thickness and this brings up a point which I wish to make one of the principal features of my paper, i.e., what is the proper hub wall thickness for solid steel wheels?

A hub diameter of 9⅞ in. has long been recognized as all that is required in mounting solid steel wheels on 4¼ in. x 8 in., or 5 in. x 9 in., or 5½ in. x 10 in. axles, i.e., up to and including 7 in. diameter wheel-seats, for even in connection with the 5½ in. x 10 in. axle, and allowing for the eccentricity provided for in the specifications, a 9⅞ in. hub diameter means a minimum hub wall thickness of 1¼ in. on a 7 in. diameter wheel-seat. During the past few months, and under the leadership of one of our large systems, which, however, is basing its statements and acts on experience with comparatively few solid steel wheels, there

* Abstract of a paper read at the meeting of the Western Railway Club.

as been quite a move on the part of some roads, none of hose which have had long and extensive experience in the natter, however, to use wheels with 11 in. hub diameter on ¾ in. x 10 in. axles, and even on 5 in. x 9 in. axles, on the roud that 1¼ in. is not sufficient for a minimum hub wall hickness and tended to "loose wheels." From a manufacurer's standpoint I have no reason to take exception to his move. A heavier wheel means a higher price, and so ong as a railway wishes to pay for excess metal I do not now that it is within a manufacturer's province to object But as one of the engineers who has had to do with the olid steel wheel subject from its infancy, and who is more r less responsible for the dimensions, I wish to assume ust as definite and positive an attitude on this point as ords will permit me to express.

I have long been in touch with this particular point and ave had considerable personal experience in the boring and nounting of wheels, and since this question was raised ecently I have made a further study of it and consulted ith representatives of those roads which are qualified by ong and extensive experience to speak definitely and inelligently on the subject. I find that one large system, aving over 200,000 solid steel wheels in service, has had ess than a dozen loose wheels in the past six or seven ears, despite the fact that 1¼ in. minimum hub wall thickess has been the adopted practice, and that in the early ays of the solid steel wheel industry, when manufacture was ot as accurate in some ways as at present, many wheels ent into service with 1⅜ in. hub wall thickness. Of still reater interest, perhaps, is the fact that close investigation f each one of these few cases of loose wheels developed the act that the trouble was due, solely and entirely, to improper boring and mounting and had no reference whatsoever to the wall thickess of the hub of the wheel. From nother large system, with upwards of 90,000 solid steel heels in service, I learn that in six or seven years only hree or four cases of loose wheels have developed, despite he hub wall thickness of 1¼ in. minimum; investigation of hese few cases showed them to be due to improper boring nd mounting.

Such being the experience of those whose long and exensive use of solid steel wheels certainly qualifies them to now whereof they speak, I look upon it as a piece of undue ssumption when a road with a limited experience, both in ime and in quantity, sets out to be aggressive along a line ith which it is unfamiliar. A hub wall thickness of 1¼ n. is all that is required with properly designed and manufactured solid steel wheels mounted on axles with wheelseats up to and including 7 in. diameter; those who are roubled by loose wheels under such conditions must look o their own shop practice, to their boring-mills, their axlelathes, and their wheel-presses.

Some roads in wishing for something larger than a 5½ n. x 10 in. axle have, for reasons of their own, doubtless, neglected to adopt the M. C. B. standard, 6 in. x 11 in., and have gone to the use of sort of an "in-between," 6 in. x 10 n., which renders it necessary to add these two extra designs of wheels. As I am discussing wheels I do not like o encroach on another subject, but it seems to me that as much axle trouble is caused by over-heating as by lack of section, and that conditions are not much improved by increasing the section without proportionate increase in bearing. In other words, is there any great advantage in a 6 in. x 10 in. axle over a 5½ in. x 10 in., the adoption of the 6 in. x 11 in. axle, instead of a mere "in-between"? I refer to this as merely another one of those features which has its effect on the cost of manufacture, and therefore the price to the railways of solid steel wheels.

Another point is brought up by the suggestion that, though shown as standard designs, I would like to eliminate the 30½ in. engine truck wheel, 33½ in. engine truck wheel, and two of the wheels used for cars, solely because they mean the use of solid steel wheels with a 3 in. rim thickness. Experience tends to prove that a 2½ in. rim thickness in connection with solid steel wheels makes for efficiency and economy, and that the use of 3 in. thickness is to be avoided. In the first place, one must consider the rim of a solid steel wheel as being of two general parts, the allowable wearing-body, being that depth which can be properly used in service, and the minimum allowable rim thickness, which necessitates removal from service. For example, in a rim thickness of 2½ in., it may be said that there is 1½ in. of allowable wearing-body, with 1 in. thickness remaining which calls for removal from service under M. C. B. Rules. It must be borne in mind that this 1½ in. of allowable wearing-body cannot be entirely used in road service. From time to time while the wheel is in service certain deformations of contour will occur, after varying mileages and with correspondingly varying depths of metal worn from tread, which necessitate removal of the wheel from service for re-machining to restore the contour.

Long experience, with general averages on numerous roads and under varying conditions, indicates that the allowable wearing-body in a rim 2½ in. thick will split-up far more economically than the wearing-body in a 3-in. rim, or, to put it in another way, as a general average proposition a road will secure more actual sixteenths of an inch of wearing-body, and fewer sixteenths of an inch of waste metal in the allowable wearing-body of a 2½ in. rim than in a 3 in. rim. And though this broad statement of fact may seem to over-shoot the mark, and to evoke remonstrance from those who have not given the point specific attention, all I ask is the opportunity for co-operative study with any railway official of conditions on his road, and I will be able to clearly demonstrate the correctness of my statement. To properly meet the conditions a solid steel wheel should possess, throughout the depth of its allowable wearing-body, an attrition-resistance equal to that of the rail, and, to obtain this, certain limits must be recognized in rim thickness from a manufacturing standpoint. Not alone must a high degree of attrition-resistance be obtained initially, but it should be maintained, as uniformly as possible, throughout the allowable wearing-body: this quality is largely secured by the work, and the depth of penetration of the work, which is put upon the rim. There is no process of manufacture of solid steel wheels known to-day which will produce as good and serviceable a wheel with a 3 in. rim thickness as with a 2½ in. rim thickness. Based on the records of a good many thousand wheels which have been worn out in service, the mileage-life of a solid steel wheel with 2½ in. rim thickness is greater than one with 3 in. rim thickness, all other things being equal.

I have always been, and I am to-day, a strong and persistent opponent of the use of the term "shelling" in connection with solid steel wheels. There has been too much of a tendency to call all defects shelling, owing to either convenience or lack of familiarity with the subject, whereas proper analysis would have classed the defect under one of three or four other and more specific headings, which would have enabled the manufacturer to handle the matter far more intelligently and in a manner decidedly more for the benefit of the railway. Shellig may be the easiest thing to think of, or to say, but it is absolutely non-specific under normal conditions in connection with solid steel wheels, and in 99 cases in a 100 means nothing at all. The chilled por-

tion in the rim of a cast iron wheel extends at right-angles to the chill-block, and only to a certain depth, this depth being dependent on the quality of the iron, etc. The effect is a slight depth of metal with strong resistance, backed with ordinary gray iron of far less resistance, bordering, comparatively speaking, upon sponginess. When this strong surface metal had been worn so thin as to be unable to support the service-load which was on it, it would, having but a comparative sponginess or cushion beneath, mash-up and fall away in a manner which left the appearance of the outside of an oyster shell, and hence the term "shelling."

I have always opposed the use of the term "shelling" as applied to solid steel wheels, for I have believed, and my belief has been based on specific study, that no such condition should exist in properly designed and made solid steel wheels. But I must now go on record as saying that if some railway officials persist in using wheels with a 3 in. rim thickness, or over, and can succeed in inducing manufacturers to supply such types, then I must, though most regretfully, add the item of shelling to the liabilities of solid steel wheels, for close observation of many wheels of this type, not confined to any one manufacturer's product, convinces me that in a properly made solid steel wheel with a 2½ in. rim thickness there is good opportunity for knowing what you are getting, whereas with a 3 in. rim thickness you cannot be sure of anything, except that there will be a considerable percentage of dissatisfaction and trouble in the results. Let those who doubt the correctness of my position in this matter take note of the fact that the roads which have had the longest and most extensive experience with solid steel wheels have nearly all given up the use of wheels with a 3 in. rim thickness and have adopted the 2½ in. thickness as standard.

For years I have been an advocate of the idea of producing wheels so true to dimensions that the machine work was reduced to a minimum. I am still a firm believer in the theory, but only to the extent to which it can be carried in justice to the quality of the material produced. Machine work increases the cost of production, and it may often remove metal of particular service value, yet if the effort to produce material on which machine work is unnecessary opens the door to a product which lacks uniformity, lacks many of the other virtues which it should possess, and borders on the dangerous, then extreme caution should be used in order that a "penny wise, pound foolish" policy be avoided. It may be all right to produce some of the commodities of life on the basis of tonnage, or general average, but in dealing with wheels let us not forget that we are dealing with units, each and every one of which should possess integrity; otherwise, much time will be spent in settling claims for low mileage, in providing for adjustments covering defective material, and, worse yet, in explaining how wrecks occurred. Uniformity in manufacture is perhaps the feature most to be desired in connection with solid steel wheels. But uniformity of quality should be held as paramount to uniformity of mere dimensions.

The production of proper solid steel wheels does not entail the mere forming of a bulk of steel into the shape of a wheel. It carries with it far greater requirements and responsibilities. Proper production means not alone mere shaping, but, and particularly, the working into shape along such lines as tend to preserve and develop the virtues of the material for the service in which the finished product is to be used, and the doing of this in such a way as to assure uniformity and quality as between wheels which are subsequently mated in service. Irregularity of dimensions can be easily overcome by a few pennies' worth of machine work, but lack of uniformity in quality is incurable and is sure to assume more or less serious, if not actually dangerous, forms when the wheels go into service.

Manufacturers of solid steel wheels are particularly accommodating when engaged in close competition for an order, and it is for that reason that wheels of all sorts and sizes can be obtained. But clear-headed railway officials certainly realize that the production of small quantities of an endless variety of designs means a higher cost than when a minimum number of designs permits of proportionately larger quantities, and that cost is always reflected in price. They certainly realize that in the heat of close competition a sales department will frequently offer odd designs which may or may not have been thoroughly demonstrated as unifying the possibilities of proper manufacture and the requirements of service, and they surely appreciate how standardization of wheel designs is an end to which we all should strive.

ELECTRO-METALLURGY OF TIN.

In speaking of recent experiments upon the electro-metallurgy of tin, le Journal du Four Electrique (January, 1912), reaches the conclusion that the solution of the problem has been found as regards general lines of work, and that it remains only to study the minor questions of detail. The statement is made that the yield of tin ores is much increased by electric-furnace treatment, that the process is continuous as against intermittent smelting in the reverberatory, that the formation of "hardhead" is reduced greatly, and that the quantity of carbon necessary for reduction is no more than 14 per cent. in the electric furnace, as against 20 to 25 per cent. in the reverberatory. The floor space necessary for the installation is smaller, and the consumption of the electrodes is negligible.

Some calculations are given as to the energy required for the reduction of cassiterite; the basis of these calculations is as follows: For the reduction of 118 grams of tin from stannic oxide, 145,300 gram cal. are required. The reaction, $C+O_2=Co_2$, gives out 96,960 cal., and the reaction, $2C+O_2=2CO$, 58,000 cal. It is necessary. then, in order to set free 118 grams of tin that we should have, for the first reaction, 145,300—96,960 cal., or 409,661 kg.-cal. per kilogram of tin set free, and since 1 kw.-hr. equals 864 kg.-cal.. it is necessary per ton of tin to have 474 kw.-hr. of energy. This figure becomes 855 kw.-hr. if we apply the equations $2C+O_2=CO$. As in practice, each of these reactions gives about 50 per cent. of the reduction, it is necessary to count on the average as the consumption of energy required, which is 665 kw.-hr. per ton of tin. The temperature in the smelting zone is estimated at 1,400 or 1,500° C., and the calorific balance of the furnace is then as follows: For the reaction, 665 kw.-hr.; for heating the slag, 130; for the specific heat, 45; losses by radiation, 130; losses through hot gases, 130 kw.-hr.; a total of 1,140 kw.-hr. per ton of tin.

The experiments were made in the furnace like that of Harmet for the reduction of iron ores, constructed of magnesite brick. A product was obtained containing about 99 per cent. tin, little iron, and free from arsenic. At the beginning of the campaign, which usually lasted from 10 to 12 days, the furnace was heated for a day with wood and coke in order to dry the bricks and then charged with about 14 kg. of anthracite coal per 100 kg. of ore, this proportion, however, depending on the nature of the latter. A current was then passed of about 1,000 amp. at 60 v., these figures changing to 40 v. and 2,500 amp. when the reaction commenced. A half-hour afterward the slag commences to

form and its aspect alone suffices to show whether the charge is of the proper composition or not. Experiments have also been made to recover the tin from the furnace slags by an electrolytic method. These were fused with soda and the mass afterward dissolved in water and electrolyzed with plates of iron as a cathode. Excellent deposits of tin were obtained, but the yield was not high.

ONTARIO HYDRO-ELECTRIC LEGISLATION.

The following powers are conferred on the Hydro-Electric Commission by a bill introduced in the Ontario House to amend the Power Commission Act:—

To take over existing power transmission lines and to improve water powers, by assisting municipalities and others in the storage of water, making of sluices, etc.;

To expropriate a local distributing plant where a municapility has voted to enter into a contract with the commission for a supply of power;

To regulate installation of electrical equipment and installation of wires in all buildings including private houses;

To require the appointment by municipalities of inspectors to see that such regulations are carried out;

To order the removal and alteration of any works that are a menace to the public safety or endanger life;

To control absolutely light and power rates charged by municipalities whether those municipalities take power from the Commission or not;

To control the rates of any company or individual taking power from the Commission;

To prescribe a uniform system of bookkeeping on the part of power municipalities;

To direct the disposal of surpluses earned by municipal power plants supplied by the Commission. (In many cases these surpluses are now devoted to the building of sidewalks, street sweeping, etc.);

To order all wires under its jurisdiction underground in cities and towns;

With the co-operation of the Dominion Railway Commission to order underground all wires strung on streets where the municipalities construct tunnels or conduits to carry such wires;

To impose a penalty of $100 per day for any disobedience of any such order.

CEMENT PRODUCTION LAST YEAR.

Complete statistics have been received from the manufacturers of cement covering their production and shipments during the year 1911. These returns show that the total quantity of cement made during the year, including both Portland and slag cement was 5,677,539 barrels as compared with 4,396,282 barrels in 1910, an increase of 1,281,257 barrels, or 29 per cent.

The total quantity of Canadian Portland cement sold during the year was 5,635,950 barrels as compared with 4,753,975 barrels in 1910, an increase of 881,975 barrels, or 18.5 per cent.

The total consumption of Portland cement in 1911 including Canadian and imported cement and neglecting an export of Canadian cement, valued at $4,067 was 6,297,866 barrels as compared with 5,103,285 barrels in 1910, or an increase of 1,194,581 barrels, or 23.4 per cent.

Detailed statistics of production during the past three years are shown as follows:—

	1909. Barrels.	1910. Barrels.	1911. Barrels.
Portland cement sold	4,067,709	4,753,975	5,635,950
" manufactured	4,146,708	4,396,282	5,677,539
Stock on hand Jan. 1.....	1,098,239	1,189,731	844,741
" Dec 31 ...	1,177,238	832,038	903,590
Value of cement sold	$5,345,802	$6,412,215	$7,571,299
Wages paid	1,266,128	1,409,715	2,103,838
Men employed	2,498	2,220	3,010

The average price per barrel at the works in both 1910 and 1911 was $1.34, as compared with an average price of $1.31 in 1909 and $1.39 in 1908.

The imports of Portland cement during the twelve months ending December 31, 1911, were 2,316,707 cwt., valued at $834,879. This is equivalent to 661,916 barrels of 350 pounds at an average price per barrel of $1.26. The imports in 1910 were 349,310 barrels, valued at $468,046 or an average price per barrel of $1.34.

The imports from Great Britain during 1910 were 190,506 barrels, valued at $210,839; from the United States 441,317 barrels, valued at $575,768; from Belgium 2,683 barrels, valued at $2,019; from Hong Kong 22,059 barrels, valued at $38,292; and from other countries 5,351 barrels, valued at $7,962.

Following is an estimate of the Canadian consumption of Portland cement for the past five years:—

Calendar Years.	Canadian. Barrels.	Per cent.	Imported. Barrels.	Per cent.	Total. Barrels.
1907	2,436,093	78	672,630	22	3,108,723
1908	2,665,289	85	469,049	15	3,134,338
1909	4,067,709	97	142,194	3	4,209,903
1910	4,753,975	93	349,310	7	5,103,285
1911	5,635,950	89.5	661,916	10.5	6,297,866

TABLE SHOWING THE ANNUAL VALUE OF THE MINERAL PRODUCTION OF THE PROVINCE OF QUEBEC SINCE 1900.

(Compiled by Mines Branch, Province of Quebec.)

Year.	Value.
1900	$2,546,076
1901	2,997,731
1902	2,985,463
1903	2,772,762
1904	3,023,568
1905	3,750,300
1906	5,019,932
1907	5,391,368
1908	5,458,998
1909	5,552,062
1910	7,323,281
1911	8,567,143

In our issue of the 7th inst., through a mechanical error, we regret that the illustration of the new Watts Stadia hand level and of the Improved Abney level appeared upside down. We feel certain that our readers recognize that this was a typographical error and hope that they were not puzzled by what seemed to be an apparently peculiar construction of the instruments made by this well-known, reliable firm.

In addition to the instruments above mentioned, E. R. Watts & Son are offering at very reasonable prices a new pattern surveying compass and also a C.E. dumpy level having several special features.

HAMILTON'S HARBOR.

The development of Hamilton harbor is probable. A delegation from the city waited on the Prime Minister and the Minister of Works, at Ottawa, requesting various improvements. The importance to the shipping business at Hamilton was emphasized by Mayor Lees, and the certainty that this business would increase in the near future. He stated that Hamilton's shipping business was now second only to that of Montreal among the inland ports of Canada. To the present, improvements to the harbor had largely been made by the city or by private firms which had to carry out work to provide themselves with shipping facilities. The Federal Government had given some aid and the time had come when there should be more. Hamilton was a great manufacturing centre, and destined to become greater. What was now required was a two thousand foot extension of the revetment wall, widening of the entrance to the harbor and dredging along the south shore of the harbor. It is estimated that the improvements asked for will involve an expenditure of $400,000.

ENGINEERING NOTES.

In the course of an address given before the Engineering Society of the North Western University recently, Mr. H. G. Tyrell stated that most of the bridges in the United States are considered merely as objects of utility. Europe is much farther advanced on this score, for its bridge builders see in a bridge something that can be made to harmonize with beautiful surroundings or to beautify ugly ones. That such artistic forethought will add immeasurably to the beauty of the country is evident from the fact that we have now 80,000 iron bridges, not to mention thousands of wooden ones of every description.

Montreal, Que.—Principal Peterson, of McGill University, is reported to have stated at the closing exercises of the Technical School, that Canada is thirty years behind the world in technical education. He added that the governments at Quebec and Ottawa would have to come to the assistance of the people of Canada if they are to regain their place in technical and commercial education.

Province of Manitoba.—The financial statement of the province shows a balance of $492,426 as a surplus. The estimates for the present year call for an expenditure of $5,056,245, and of this amount $2,207,000 is for public buildings.

Ottawa, Ont.—Chief Engineer Armstrong, of the Hudson Bay Railroad, with headquarters in Winnipeg, has been notified by Hon. Frank Cochrane, Minister of Railways, to send out at once a party of engineers to the Hudson Bay, one party to go to Port Nelson and one to Fort Churchill. They will remain at the ports for a couple of months taking observations and making surveys as to the suitability of the ports for terminals.

The German government are considering the state ownership of petroleum, spirits, potash and matches.

Galt, Ont.—The municipal authorities of this progressive little town have turned their attention in a very serious manner to the question of municipal milk supply. An inspector was appointed and visited the source of the supply in many instances. In such cases as conditions were found to be below standard he displayed the progressive spirit that has been evident on other occasions, and distributed instructive literature to the owners of cattle dealing with the proper care of cows and dairy matters. The result showed that the effort produced better milk and less hard feeling than the older method of dealing with the offenders through the police court.

Fort William, Ont.—Mr. Farquharson, manager of the municipal electric light plant of this city, recently gave out some interesting facts regarding the meter and flat rate system of current sales. He stated that in Fort William there are now in use 1,648 meters. The meter is the strongest factor for holding down of the peak load, which without meters would have been close to 2,500 h.p. during 1911, and with no extra revenue. While we have flat rates on light that entitles the consumers to attach any load, either cooking utensil or heater, there will always be a large percentage of peak load consumed on prodigal use of light and stolen power, other than what is paid for. That there are a great many electric heaters in use by flat rate was noticed during the peak period, and whenever a cold spell would stop, aproximately 75 h.p. would drop off from the peak load. The people now do not object to meters as formerly, as they are beginning to understand that the meter is the only intelligent and economical way to purchase current.

The municipal electric light department of Fort William, Ont., earned a net surplus of $17,255.92 during the year 1911. The total working expense of distribution and operation per horse power purchased has been, interest and sinking fund included, $51.23, as against $50.70 in 1910, and $47.04 in 1909. Against this the earnings per horse-power in 1911 were $61.93, in 1910 $59.18 and $51.35 in 1909.

Montreal, P.Q.—The Ives foundry was the scene of a trial of the Uno-Rail system of car operation recently. The truck of this car is built so that the main load rests on the top rail, which is V shaped, and has two side rails of the same shape, for the purpose of preventing any derailment. One of the main features is the little space that it takes up, requiring a right of way of only eight feet. The facilities of climbing heavy hills are by means of the Roch rail and gear, which allows the truck to follow the contours of the ground very closely. The line can be built so as to cross, over or under railways, and across rivers and canals.

Work on the new high level bridge is well under way in Ottawa, Ont. The present swing bridge has been moved from the old stone pier sixty feet and has been placed upon a wooden pier, the stone piers being removed by blasting. To support the pier on the Driveway side of the bridge an immense concrete retaining wall will be built and upon this a great number of men are now working. The space between the bank and the wall will be filled in with earth and stone which has been taken from the bottom of the canal. This wall will be 200 feet long and will be finished before the water enters the canal in May.

The British Admiralty has now had complete plans drawn up for a specially built navy hospital ship, which is to be ready in June, 1913. The estimated cost is $500,000.

PERSONAL.

Mr. H. C. Tyrrell gave a lecture before the Engineering Society of the North Western University on March 12th last.

Mr. Angus Smith, city engineer of the city of Victoria, B.C., has tendered his resignation to the Board of Control.

Mr. Myer J. Sturn is making an inspection of the schools in the city of Regina regarding the matter of ventilation.

Mr. Francis P. Smith, M. Am. Soc. C.E., chemical and consulting paving engineer, New York City, on March 8th delivered an illustrated lecture on "Mixing Plants for Bituminous Pavements" before the graduate students in highway engineering at Columbia University.

OBITUARY.

A well-known civil engineer in the person of **Charles Thompson Harvey** has passed away. Mr. Harvey died in New York on March 13th last. He became prominent partly through the active part taken in the Sault Ste. Marie ship canal, and the first elevated railway to be constructed in New York. He was 83 years of age.

PERMANENT MANUFACTURERS' EXHIBIT OF RAILWAY SUPPLIES AND EQUIPMENT.

From March 16th to 23rd, inclusive, there is being held in the Karpen Building 900 South Michigan Boulevard, Chicago, Ill., an exhibit of railway supplies and appurtenances of interest to persons dealing in these materials. The exhibit occupies the entire twelfth floor of this building. The exhibition hall contains twenty thousand square feet of floor space. Arrangements have been made for the supply of steam, electricity and compressed air for the operation of working models. Every effort has been made to have the exhibit as complete and diversified as possible.

MEETINGS.

The Dominion Land Surveyors' Association held their annual banquet in Ottawa recently. The chair was occupied by the president, Mr. Thomas Fawcett. Among the guests were Senator C. P. B. Casgrain, D.L.S.; Mr. P. B. Symes, Dr. E. Deville, Dr. W. F. King, Dr. O. J. Klotz, and Mr. C. A. Magrath.

COMING MEETINGS.

CANADIAN INSTITUTE.—198 College Street, Toronto. Saturday Evening Lectures, 8 p.m. March 23rd, "Waste Land Problems," by Dean Fernow, Toronto University. March 30th, "Spectral Lines—their Arrangement and Constitution," by Prof. J. C. McLennan, Toronto University. April 13th,—"Lantern Experiments on Reaction in Non-homogeneous Systems," by Prof. Kenrick, Toronto University.

ENGINEERING SOCIETIES.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—413 Dorchester Street West, Montreal. President, W. F. TYE: Secretary, Professor C. H. McLeod.

VICTORIA BRANCH—Chairman, F. C. Gamble; Secretary-Treasurer, R. W. Macintyre

QUEBEC BRANCH—Chairman, P. E. Parent; Secretary, S. S. Oliver. Meetings held twice a month at room 40, City Hall.

TORONTO BRANCH—96 King Street West, Toronto. Chairman, T. C. Irving; Acting Secretary, T. R. Loudon, University of Toronto. Meets last Thursday of the month at Engineers' Club.

MANITOBA BRANCH—Secretary E. Brydone Jack. Meets every first and third Friday of each month, October to April, in University of Manitoba, Winnipeg.

VANCOUVER BRANCH—Chairman, Geo. H. Webster: Secretary, H. K. Dutcher, 319 Pender Street West, Vancouver. Meets in Engineering Department, University.

OTTAWA BRANCH—
177 Sparks St. Ottawa. Chairman, S. J. Chapleau, Ottawa; Secretary, H. Victor Brayley, N.T. Ry., Cory Bldg. Meetings at which papers are read, 1st and 3rd Wednesdays of fall and winter months; on other Wednesday nights in month there are informal or business meetings,

MUNICIPAL ASSOCIATIONS

ONTARIO MUNICIPAL ASSOCIATION.—President, Chas. Hopewell, Mayor, Ottawa; Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ontario.

UNION OF ALBERTA MUNICIPALITIES.—President, H. H. Gaetz, Red Deer, Alta.; Secretary-Treasurer, John T. Hall, Medicine Hat, Alta.

THE UNION OF CANADIAN MUNICIPALTIES.—President, W. Sanford Evans, Mayor of Winnipeg; Hon. Secretary-Treasurer, W. D. Lighthall, K.C., Ex-Mayor of Westmount.

THE UNION OF NEW BRUNSWICK MUNICIPALITIES.—President, Councillor Siddall, Port Elgin; Hon. Secretary-Treasurer, J. W. McCready, City Clerk, Fredericton.

UNION OF NOVA SCOTIA MUNICIPALITIES.—President, Mr. A. S. MacMillan, Warden, Antigonish, N.S.; Secretary, A. Roberts, Bridgewater, N.S.

UNION OF SASKATCHEWAN MUNICIPALITIES.—President, Mayor Bec, Lemberg; Secretary, Mr. Heal, Moose Jaw.

UNION OF BRITISH COLUMBIA MUNICIPALITIES.—President, Mayor Planta, Nanaimo, B.C.; Hon. Secretary-Treasurer, Mr. H. Bose, Surrey Centre, B.C.

CANADIAN TECHNICAL SOCIETIES

ALBERTA ASSOCIATION OF ARCHITECTS.—President, G. M. Lang Secretary, L. M. Gotch, Calgary, Alta.

ASSOCIATION OF SASKATCHEWAN LAND SURVEYORS.—President, J. L. R. Parsons, Regina; Secretary-Treasurer, M. B. Weeks, Regina.

ASTRONOMICAL SOCIETY OF SASKATCHEWAN.—President, N. McMurchy; Secretary, Mr. McClung, Regina.

BRITISH COLUMBIA LAND SURVEYORS' ASSOCIATION.—President, W. S. Drewry, Nelson, B.C.; Secretary-Treasurer, S. A. Roberts, Victoria, B.C.

BUILDERS' CANADIAN NATIONAL ASSOCIATION.—President, E. T. Nesbitt; Secretary-Treasurer, J. H. Lauer, Montreal, Que.

CANADIAN ASSOCIATION OF STATIONARY ENGINEERS.—President, Wm. Norris, Chatham, Ont.; Secretary, W. A. Crockett, Mount Hamilton, Ont.

CANADIAN CEMENT AND CONCRETE ASSOCIATION.—President, Peter Gillespie, Toronto, Ont.; Secretary-Treasurer, Wm. Snaith, 57 Adelaide Street, Toronto, Ont.

CANADIAN CLAY PRODUCTS' MANUFACTURERS' ASSOCIATION.—President, W. McCredie; Secretary-Treasurer, D. O. McKinnon, Toronto

CANADIAN ELECTRICAL ASSOCIATION.—President, N. W. Ryerson, Niagara Falls; Secretary, T. S. Young, Canadian Electrical News, Toronto.

CANADIAN FORESTRY ASSOCIATION.—President, John Hendry, Vancouver. Secretary, James Lawler, Canadian Building, Ottawa.

CANADIAN GAS ASSOCIATION.—President, Arthur Hewit, General Manager Consumers' Gas Company, Toronto; J. Keillor, Secretary-Treasurer, Hamilton, Ont.

CANADIAN INDEPENDENT TELEPHONE ASSOCIATION.—President, W. Doan, M.D., Harrietsville, Ont.; Secretary-Treasurer, Francis Dagger, 21 Richmond Street West, Toronto.

CANADIAN MINING INSTITUTE.—Windsor Hotel, Montreal. President, Dr. A. E. Barlow, Montreal; Secretary, H. Mortimer Lamb, Windsor Hotel, Montreal.

CANADIAN PEAT SOCIETY.—President, J. McWilliam, M.D., London, Ont.; Secretary-Treasurer, Arthur J. Forward, B.A., 22 Castle Building, Ottawa, Ont.

THE CANADIAN PUBLIC HEALTH ASSOCIATION.—President, Dr. Charles A. Hodgetts, Ottawa; General Secretary, Major Lorne Drum, Ottawa.

CANADIAN RAILWAY CLUB.—President, A. A. Goodchild; Secretary, James Powell, P.O. Box 7, St. Lambert, near Montreal, P.Q.

CANADIAN STREET RAILWAY ASSOCIATION.—President, D. McDonald, Manager, Montreal Street Railway; Secretary, Acton Burrows, 70 Bond Street, Toronto.

CANADIAN SOCIETY OF FOREST ENGINEERS.—President, Dr. Fernow, Toronto.; Secretary, F. W. H. Jacombe, Department of the Interior, Ottawa.

CENTRAL RAILWAY AND ENGINEERING CLUB.—Toronto. President G. Baldwin; Secretary, C. L. Worth, 409 Union Station. Meets third Tuesday each month except June, July and August.

DOMINION LAND SURVEYORS.—President, Mr. R. A. Belanger, Ottawa; Secretary-Treasurer, E. M. Dennis, Dept. of the Interior, Ottawa.

EDMONTON ENGINEERING SOCIETY.—President, J. Chalmers; Secretary, B. F. Mitchell, City Engineer's Office, Edmonton, Alberta.

ENGINEERING SOCIETY, TORONTO UNIVERSITY.—President, J. E. Ritchie; Corresponding Secretary, C. V. Ross.

ENGINEERS' CLUB OF MONTREAL.—Secretary, C. M. Strange, 9 Beaver Hall Square, Montreal.

ENGINEERS' CLUB OF TORONTO.—96 King Street West. President, Willis Chipman; Secretary, R. B. Wolsey. Meeting every Thursday evening during the fall and winter months.

INSTITUTION OF ELECTRICAL ENGINEERS.—President, Dr. G. Kapp; Secretary, P. F. Rowell, Victoria Embankment, London, W.C.; Hon. Secretary-Treasurer for Canada, Lawford Grant, Power Building, Montreal, Que.

INSTITUTION OF MINING AND METALLURGY.—President, Edgar Taylor; Secretary, C. McDermid, London, England. Canadian members of Council:—Prof. F. D. Adams, J. B. Porter, H. E. T. Haultain and W. H. Miller and Messrs W. H. Trewartha-James and J. B. Tyrrell.

INTERNATIONAL ASSOCIATION FOR THE PREVENTION OF SMOKE.—Secretary R. C. Harris, City Hall, Toronto.

MANITOBA LAND SURVEYORS.—President, George McPhillips; Secretary-Treasurer, C. G. Chataway, Winnipeg, Man.

NOVA SCOTIA MINING SOCIETY.—President, T. J. Brown, Sydney Mines, C. B.; Secretary, A. A. Hayward.

NOVA SCOTIA SOCIETY OF ENGINEERS, HALIFAX.—President, J. N. MacKenzie; Secretary, A. R. McCleave, Assistant Road Commissioner's Office, Halifax, N.S.

ONTARIO PROVINCIAL GOOD ROADS ASSOCIATION.—President, Major. T. L. Kennedy; Hon. Secretary-Treasurer, J. E. Farewell, Whitby; Secretary-Treasurer, G. S. Henry, Oriole.

ONTARIO LAND SURVEYORS' ASSOCIATION.—President, T. B. Speight, Toronto; Secretary, Killaly Gamble, 703 Temple Building, Toronto.

THE PEAT ASSOCIATION OF CANADA.—Secretary, Wm. J. W. Booth, New Drawer, 2263, Main P.O., Montreal.

PROVINCE OF QUEBEC ASSOCIATION OF ARCHITECTS.—Secretary, J. E. Ganier, No. 5. Beaver Hall Square, Montreal.

ROYAL ARCHITECTURAL INSTITUTE OF CANADA.—President, F. S. Baker, F.R.I.B.A., Toronto, Ont.; Hon. Secretary, Alcide Chausse, No. 5. Beaver Hall Square, Montreal, Que.

ROYAL ASTRONOMICAL SOCIETY.—President, Prof. Louis B. Stewart, Toronto; Secretary, J. R. Collins, Toronto.

SOCIETY OF CHEMICAL INDUSTRY.—Dr. A. McGill, Ottawa, President; Alfred Burton, Toronto, Secretary.

UNDERGRADUATE SOCIETY OF APPLIED SCIENCE, McGILL UNIVERSITY.—President, J. P. McRae; Secretary, H. F. Cole.

WESTERN CANADA IRRIGATION ASSOCIATION.—President, Wm. Pierce, Calgary; Secretary-Treasurer, John T. Hall, Brandon, Man.

WESTERN CANADA RAILWAY CLUB.—President, R. R. Nield; Secretary, W. H. Rosevear, 115 Phœnix Block, Winnipeg, Man. Second Monday, except June, July and August, at Winnipeg.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand and projected, contracts awarded, changes in staffs, etc.
Printed forms for the purpose will be furnished upon application.

PLANS AND SPECIFICATIONS ON FILE.

The following Plans (P.) and Specifications (S.) are on file for reference only unless otherwise noted at the office of The Canadian Engineer, 62 Church Street, Toronto:—

Bids close		Noted in issue of
3-18	Concrete reservoir (2,000,000 gallons' capacity), Moose Jaw, Sask.....(P. & S.)	2-22
3-18	Centrifugal pumps, motors, etc., Moose Jaw, Sask. .....(P. & S.)	2-22
3-18	Valves and Fittings, Moose Jaw, Sask. .....(P. & S.)	2-22
3-18	96,000 ft. of 18-in. Steel Pipe, Moose Jaw, Sask. .....(S.)	2-22
3-15	Pavements, Welland, Ont. .....(P. & S.)	2-29
3-25	Prime mover equipment, electric lighting equipment, etc., Moose Jaw, Sask.....(S.)	3-7
4-8	Paving, Port Arthur, Ont. .....(S.)	3-21
4-11	Grading, sanitary sewers, cement walks, etc., Lethbridge, Alta.....(P. & S.)	3-14

(Lethbridge plans and specifications are on file at The Canadian Engineer Office, 820 Union Bank Building, Winnipeg.)

TENDERS PENDING.

In Addition to Those in this Issue.

Further information may be had from the issues of The Canadian Engineer referred to.

TENDERS.

Brampton, Ont.—Tenders will be received up to 6 p.m. March 26th, 1912, for the construction and supply of the following:—

(a) Concrete reservoir.
(b) Two turbine pumps and motors.

Plans, etc., can be obtained at the Municipal Office of the Town, and from the Engineer. J. G. Roberts, Chairman, Brampton Waterworks Commission. Wm. Treadgold, Engineer.

Edmonton, Alta.—Tenders will be received up to noon of April 1st, 1912, for the tile and marble work in connection with the Parliament Buildings, Edmonton. Plan, etc., at the Structural Engineer's office, new Parliament Bldgs., Edmonton, or at the branch office of the Dept. of Public Works, Calgary. John Stocks, Deputy Minister of Public Works, Edmonton.

Edmonton, Alta.—Tenders will be received until April 1, 1912, for the supply of approximately 300,000 bricks for the Court House, Calgary. Specifications, etc., at the office of the Structural Engineer, New Parliament Buildings, Edmonton, and at the branch office of the Dept. of Public Works, Calgary. John Stocks, Dep. Minister of Public Works, Edmonton.

Hollywood, Man.—Tenders will be received until March 27th, 1912, for the erection of a solid brick school with full sized cement basement, in the village of Langruth, Man. Plans and specifications may be seen at the Municipal Office, Portage la Prairie, or at Langruth, Man. Address, G. G. Moorehead, Sec.-Treas., Hollywood, Man.

Moose Jaw, Sask.—Tenders will be received by the City Commissioners until March 29th, 1912, for the installation of approximately three miles of 8 and 10-inch sewer mains and 6-inch water mains. Plans, etc., at the office of J. Antonisen, City Engineer, Moose Jaw.

Moose Jaw, Sask.—Tenders will be received by the City Commissioners up to noon of March 25th, 1912, for the supply and delivery of 500 feet 2½-inch, 3-ply cotton, rubber-lined fire hose.

Moose Jaw, Sask.—Tenders will be received by the City Commissioners, Moose Jaw, until April 13th, 1912, for one year's supply (approximately 7,000 tons) of steam coal. Particulars with J. D. Peters, Electrical Supt.

Manotick, Ont.—The commissioners of Manotick Police Village are prepared to receive tenders for the construction of about 10,000 square feet of concrete walk. Tenders will be open until 23rd of March. Particulars will be furnished by the secretary, R. Gamble.

Niagara Falls, Ont.—Tenders will be received until April 1st, 1912, for the construction of approximately 75,000 sq. yards of pavement, in wire-cut paving block, vitrified brick, westrumite, bitulithic, asphalt block or concrete. Specifications at the office of the City Engineer, Niagara Falls, Ont. W. J. Seymour, City Clerk. (See advertisement in Canadian Engineer).

North Toronto, Ont.—Tenders will be received until March 25th, 1912, for concrete sidewalks and bridges. Wm. C. Norman, Clerk, North Toronto, Ont. (See advertisement in Canadian Engineer).

North Bay, Ont.—Tenders will be received until March 25th, 1912, for the erection and completion of an eight-room Public school, including heating and plumbing. Plans, etc., at the office of the architect, H. W. Angus, McCool Block, North Bay. Tenders to be received by E. H. Young, Secretary Public School Board, North Bay.

Ottawa, Ont.—Tenders will be received until April 15th, 1912, for the construction of an extension to the north breakwater and dredging, at Goderich, Huron County, Ont. Plans, specifications, etc., can be obtained at the offices of J. G. Sing, Esq., District Engineer, Confederation Life Building, Toronto; H. J. Lamb, Esq., District Engineer, Windsor, Ont.; Postmaster at Goderich, Ont., and at the office of R. C. Desrochers, Secretary, Department of Public Works, Ottawa.

Ottawa, Ont.—Tenders will be received up to noon of April 1st, 1912, for the charter to this department of one or two steamers for Fishery Protection Service on the Pacific Coast. Vessels should meet following requirements: Length between 140 feet and 200 feet; gross tonnage between 300 tons and 400 tons; maximum speed not less than 10 knots. Copies of the conditions of the charter may be obtained on application to the Naval Store Officers, H.M.C. Dockyard, Esquimalt, B.C. G. J. Desbarats, Dep. Min. of the Naval Service, Dept of Naval Service, Ottawa.

Ottawa, Ont.—Tenders will be received until April 15th, 1912, for the construction of an extension to the north breakwater and dredging, at Goderich, Huron County, Ont. Plans, specifications, etc., can be obtained at the offices of J. G. Sing, Esq., District Engineer, Confederation Life Building, Toronto; H. J. Lamb, Esq., District Engineer, Windsor, Ont.; Postmaster at Goderich, Ont., and at the office of R. C. Desrochers, Secretary Department of Public Works, Ottawa. (See advt. in Can. Eng.)

Ottawa, Ont.—Tenders will be received until the 20th of April, 1912, for the construction of a wooden lighthouse and dwelling combined on a concrete pier and protection work on Holland Island, Chatham Sound, B.C., and also for the construction of a reinforced concrete tower, double dwelling and a fog alarm building, at Point Atkinson, in the province of British Columbia. Plans, etc., at the office of the agency of the Department, Victoria, B.C.; Post Offices, Vancouver and Prince Rupert, B.C., and office of A. Johnston, Deputy Minister of Marine and Fisheries, Dept. of Marine and Fisheries, Ottawa.

Ottawa, Ont.—Tenders, bulk and separate, addressed to chairman of the Board of Control, will be received until March 26th, 1912, for the several works required in the erection and completion of a machinery hall in Lansdowne Park. Plans and specifications at the office of Architect Noffoke, 37 Central Chambers, Ottawa. John Henderson, City Clerk, City Hall, Ottawa.

Ottawa, Ont.—Tenders will be received by the Dept. of Public Works, Ottawa, until April 9th, 1912, for additions and alterations to the Fuel Testing Building, Ottawa. Plans, etc., can be obtained at this Department.

Prince Albert, Sask.—Plans for a large three-story police station, prepared by A. G. Creighton, architect, have been passed by the city council, and tenders are being called for the erection of the structure, by the police commission.

Prince Rupert, B.C.—Tenders for the supply of approximately 3,800 ft. of steel pipe, 18 inches in diameter, delivered on the wharf, Prince Rupert, will be received until March 25th, 1912. Full particulars may be obtained from Wm. Mahlon Davis, City Engineer. Ernest A. Woods, City Clerk.

Red Deer, Alta.—Tenders for all work except excavating and concrete walls and steel work to ground floor level and plumbing and heating for the Alberta Ladies' College, Red Deer, will be received until April 1st, 1912. Plans and specifications at the offices of C. A. Julian Sharman, architect, Red Deer; Barnes and Gibbs, architects, Edmonton; the Builders' Exchange, Calgary, and the Builders' Exchange, Winnipeg. J. Malcolm, Esq., Chairman Building Committee, Alberta Ladies' College, Red Deer.

Sudbury, Ont.—Tenders will be received until April 17th, 1912, for the following works:—

Contract "A"—Main Sewer, 8,555 ft. 20-in., 18-in., and 15-in.
" "B"—Sanitary Sewers and Force Mains.
" "S"—Sewer Pipes and Junctions.

Plans and specifications at the office of the Town Clerk, Sudbury, or at office of the Engineers, Mail Building, Toronto. Chipman & Power, Engineers.

St. Thomas, Ont.—Tenders will be received until noon on Friday, March 29th, for Port Stanley waterworks. For full particulars address Messrs. Jas. A. Bell & Sons, engineers, St. Thomas, Ont. (See advt. in Canadian Engineer).

Sydney Mines, C.B.—Tenders will be received until March 30th, 1912, inclusive, for building an "Annex" to "Harbor-View Hospital," Sydney Mines. Plans, etc., at the general office of the N.S.S. & C. Co., and at the Town Engineer's office, Sydney Mines; also office of Herbert E. Gates, Esq., Architect, Halifax. Edmund McDonald, Secretary to Trustees, H. V. Hospital, Sydney Mines.

Toronto, Ont.—Tenders will be received until March 26th, 1912, for the excavating, laying and joining a 24-inch cast-iron water main on Sumach Street from Queen Street to Wellesley Street. Specifications, etc., at the office of the City Engineer, Toronto. G. R. Geary, (Mayor), Chairman, Board of Control, City Hall, Toronto.

Toronto, Ont.—Tenders will be received until March 26th, 1912, for the construction of the following sewers:—Benson avenue, Christie to 114 ft. 6 in. W. of Arlington; Rushton road, Benson to St. Clair; Ilford avenue, Arlington avenue to east end; Shaw street, Tyrell to St. Clair. Specifications and forms of tender at the office of the City Engineer. G. R. Geary (Mayor), Chairman Board of Control, City Hall, Toronto.

Toronto, Ont.—Tenders will be received until April 9th, 1912, for the construction of storm overflow sewer, Main Garrison Creek, Section 1. Specifications, etc., at the office of the City Engineer. G. R. Geary (Mayor), Chairman Board of Control, City Hall, Toronto. (See advt. in Can. Eng.)

Vancouver, B.C.—Tenders will be received until March 25th, for the supply and delivery of 1 twelve-ton road roller, either single cylinder or compound steam or gasoline. D. G. Tate, City Clerk, Vancouver, B.C.

Westmount, Que.—Tenders will be received until March 28th, 1912, for intercepting sewer, also paving, Western Avenue. Specifications, etc., at the office of the City Surveyor, Arch. Currie, Westmount, Que. (See advertisement in Canadian Engineer).

Welland, Ont.—Mr. Robt. Cooper, County Clerk of the above, will receive tenders for road machinery comprising:

2 steam rollers, 10 tons each.
2 rock crushers (portable).
2 bins for stone storage (portable).
2 revolving screens.
2 chain elevators.
2 road graders.
2 sprinkling wagons.
1 traction engine, 18 h.p.
2 pick plows.
2 wheel scrapers.

Tenders to be in by noon, April 2nd next.

Welland, Ont.—Tenders will be received up to noon of April 2nd, 1912, for the following stone for building roads under the County Good Roads System:—Crushed stone, per ton, and rubble stone, per cord, f.o.b. cars quarry, and delivered in car lots at different points of the county of Welland. (Signed) Robert Cooper, County Clerk, Welland, Ontario.

A CORRECTION.

In our advance news service sheet of March 18th last a request from Messrs. McDougal and Forster was made. The address of this firm is Edmonton, Alta.

Tarvia

Preserves Roads
Prevents Dust

Lancaster St., Berlin, Ont. Constructed with Tarvia X Modern Pavement

Meets Modern Road Requirements

TARVIA is a powerful binder for the surfaces and foundations of macadam roads. It fills the voids and locks the stone in a tough, durable, plastic matrix.

A Tarviated surface is dustless and clean. It sheds water readily and is dry immediately after the rain, so that pedestrians are not inconvenienced. The surface never gets muddy or dusty.

On account of the Tarvia matrix, these roads will bear heavier automobile traffic than in a macadam because the surface yields instead of pulverizing under the strains. The Tarvia matrix prevents internal movement and grinding.

The plasticity of the Tarvia also makes these roads very quiet. Horses' hoofs make almost no sound on a Tarviated road. Tarvia is waterproof, and Tarviated roads, therefore, are protected against damage from torrents on grades.

Tarvia has no odor except when being applied. After it hardens, it has no injurious effect on shoes, clothing or vehicles. The cost of using Tarvia is not a factor for consideration, because it has been repeatedly demonstrated that it is cheaper to maintain a dustless road with Tarvia than a dusty one without it. Maintenance economies more than balance the additional cost.

Booklets on request. Address our nearest office.

Montreal Toronto Winnipeg Vancouver

The Carritte-Paterson Manufacturing Co., Limited
St. John, N.B. Halifax, N.S.

CONTRACTS AWARDED.

Province of British Columbia.—Sub-contracts for the construction of the main line of the Grand Trunk Pacific eastward to Burns Lake near Fraser Lake, have just been awarded by Messrs. Foley, Welch & Stewart, general contractors, as follows:—Aldermere East, John Bostrom, eight miles; Freeburg & Stone, ten miles; Hugh McLeod, four miles; Sheady & Smith, seventeen miles; John Albi, ten miles. Bulkley Summit, westward, Duncan Ross, ten miles. Bulkley Summit, eastward, John McLeod, five miles; A. L. McHugh, ten miles; Dan Stewart, ten miles; D. A. Rankin & Company, fourteen miles along Burns Lake and eastward.

Guelph, Ont.—The directors of the Guelph Radial Railway have awarded the following contracts:—Steel rails, Drummond & McColl, Montreal; ties, Contractors' Supply Company, Toronto; wire, Dawson & Company, Montreal.

Kamloops, B.C.—Of the ten tenders received for the construction of a covered concrete reservoir, capacity 1,500,000 gallons, that of the Graff Construction Company, Vancouver, was accepted, their price being $32,729.89.

Lindsay, Ont.—A report from this town states that The Toronto Construction Company have been awarded the contract for the construction of the new Canadian Pacific Lake Front line, a distance of 178 miles.

Montreal, Que.—The contract for the covering of 2,200 ft. of Little St. Pierre River with concrete and sides shored by wooden planking, has been awarded to Messrs. Haney, Quinlan & Robertson, for $75,500.

Montreal, Que.—A theatre for the Canadian Amusement Company, Orpheum Bldg., will be built by Contractor C. E. Deakin, 11 St. Sacrament St. The steel work will be done by the Dominion Bridge Co., Lachine. Estimated cost, $100,000.

Ottawa, Ont.—Messrs. McDougals, Limited, have received the contract for the supply and delivery of valves required by the corporation of the city of Ottawa, for $4,659.36.

Ottawa, Ont.—The Montreal Bridge Company have been awarded the contract calling for the erection of the park stand at Connaught Park.

Ottawa, Ont.—The construction committee of the Connaught Park Jockey Club have awarded the contract for the steel work in connection with the grand stand at Connaught Park to the Dominion Bridge Company, of Montreal.

Prince Albert, Sask.—The National Iron Works Co. have received the contract of supplying cast-iron water pipe required by the city during the year 1912. Contract price, $43.40 per ton.

Saskatoon, Sask.—The successful bidders for the supply of waterworks materials for Saskatoon, ars as follows:—

For cast-iron pipe, the Canada Iron Corporation.	$72,200.00
For valves & hydrants, Messrs. Drummond, McColl	10,700.00
For corporation brass, the H. Mueller Mfg. Co. ..	3,000.00
For lead and iron pipe and service boxes, Messrs. Jas. Robertson Co.	8,500.00

Saskatoon, Sask.—The contract for the superstructure of the new Y.M.C.A. building has been awarded to the Frid-Lewis Co., Ltd., of Winnipeg, their tender being the lowest received, $69,300.

Saskatoon, Sask.—J. H. Simmons, of Winnipeg, has secured the contract for the construction of an express building and of outward and inward freight sheds.

Swift Current, Sask.—A six-stall engine house and express building will be constructed by J. McDiarmid Co., of Winnipeg.

St. John, N.B.—Mr. Hartman, of Montreal, P.Q., has been awarded the contract to erect a new sardine factory in this city. The plant is for the Canadian Sardine Co., Ltd., of which Mr. McColl is the manager at this point.

Truro, N.S.—The contract for the construction of a brick and stone civic building to cost $45,000 has been awarded to Messrs. Rhodes, Curry & Co., of Amherst, N.S.

Toronto, Ont.—The County of Hastings, Ontario, have awarded a contract for the supply of a concrete mixer to Messrs. Wettlaufer Bros., who will supply a No. 4 heart-shaped mixer.

Toronto, Ont.—The contract for the new Canadian Pacific Lake Shore road, which will branch from the present Toronto-Montreal line at Agincourt and rejoin it at Bathurst, west of Smith's Falls, a total distance of 198 miles, has been let to Messrs. Deeks & Hinds. The value of the contract is about $10,000,000. The construction work includes a number of tunnels, the longest being 850 feet.

Vancouver, B.C.—Contracts for the construction of additions to the Florence Nightingale and Cecil Rhodes schools were awarded to Robert McLean & Co. The tender on the former was $56,300 and the latter $53,000.

Vancouver, B.C.—The tender for hauling the Seymour Creek pipe has been awarded to Mr. F. C. Lane, at the price of $3.90 per ton.

Vancouver, B.C.—The Terminal City Iron Works were awarded the contract for the supply of hydrants for this city. Their prices were $41.50 for 200 ordinary hydrants, and $76.50 for hydrants with crane attachments. The Robertson Godson Company in competition tendered $40 and $68 for the same.

Vancouver, B.C.—The Terminal City Iron Works will supply 200 hydrants (without cranes) for Water Works Distribution System Extensions, at $42.50; and the Robertson-Godson Company, 40 hydrants (crane attachment) at $68.

Victoria, B.C.—The contract for the erection of the new high school has been awarded to Messrs. Dinsdale and Malcolm of this city, their price being $344,000. The various bids received were as follows: On the original specifications and as an alternative, Norton-Griffiths Steel Construction Co., $358,000-$337,000; Messrs. Dinsdale & Malcolm, $344,-000-$329,000; Thomas Catterall, $368,000-$348,073; Messrs. Bayne & Horie, $355,000-$337,800.

Victoria, B.C.—Messrs. Dinsdale & Malcolm have been awarded the contract for the new high school building, their tender of $344,000 being the lowest of four submitted.

RAILWAYS—STEAM AND ELECTRIC.

Collingwood, Ont.—A report states that a party of surveyors has completed a line of projected railway to this town. The plan shows a point named Baxter on or near the Toronto-Sudbury section of the C.P.R. as the start.

Coquitlam, B.C.—The Coquitlam Terminal Company are building a two-mile belt to serve factories and other buildings along the industrial sites of the Pitt River. It is to connect with the spur of the Canadian Pacific Railway on the north side of the main right-of-way.

Guelph, Ont.—At the annual meeting of the directors of the Guelph Radial Railway Company the following officers were elected:—J. W. Lyon, president; W. E. Buckingham, vice-president; C. E. Howitt, treasurer; J. U. Pequegnat, secretary. The company will do considerable construction work during the coming season.

Hull, P.Q.—The municipal council have advised that the Canadian Pacific Railway authorities be requested to build a station in proportion to the size and imporantce of the city.

Moose Jaw, Sask.—The plans of the entrance for the Grand Trunk Pacific Railway to this city, show that the railway will enter the city at Eighteenth Avenue, from which it will pass through Hillcrest in blocks 40, 39, 38, 37, 36 and 46. It then goes west through the Ross estate, crossing Main Street directly north of the exhibition grounds, goes west through several blocks in Lynbrook Heights, and passes out of the city through Victoria Heights.

Midland, Ont.—The Midland Terminal Railway has changed its name to the Midland-Simcoe Railway Company and has had its charter extended for three years.

Ottawa, Ont.—The name of the Ottawa, Smith's Falls and Kingston Railway has been changed to the Ottawa, Rideau Lake and Kingston Railway Company.

Port Colborne, Ont.—On March 27th the ratepayers will be asked to vote on a by-law fixing the assessment on all Grand Trunk property in that town at $16,000 for a period of twenty years, and also giving the company permission to close two streets and to move two others.

Saskatoon, Sask.—A bridge on the line of the Canadian Northern Railway was recently damaged by the breaking of one span. A number of passengers were killed in the fall and burning of the Pullman car.

48 in. CONTINUOUS STAVE LINE.

Manufacturer of

Galvanized Wire Machine Banded

WOOD STAVE PIPE

CONTINUOUS STAVE PIPE

RESERVOIR TANKS

For City and Town Water Systems, Fire Protection, Power Plants, Hydraulic Mining, Irrigation, etc.

Full particulars and estimates furnished.

PACIFIC COAST PIPE COMPANY, LTD.

Factory: 1551 Granville Street, VANCOUVER, B.C. P.O. Box 563.

GLENFIELD & KENNEDY make VALVES

of the following types:

Draw-off; Regulating; Screw-Down; Self-Closing; Sludge; Sluice; Tide; Air; Back-Pressure; Ball; Ball-Check; By-Pass; Check; Double-Slided; Exhaust; Flap; Flat-Outlet; Flushing; Foot; Gas; Globe; Hydrant; Isolating; Junction; Loaded; Relief; Steam-Top; Throttle.

The very best obtainable material and superior workmanship characterize our valves. EVERY ONE TESTED.

Our goods are sold in Canada by

JOHN T. FARMER, 428 Coristine Building, Montreal, Que.

WALTER CLOUSTON, Chaplin Building, St. Johns, Newfoundland.

A. E. MYLES, 311 Enderton Building, Winnipeg, Man.

A. J. FORSYTH & CO., Vancouver, B.C.

Telegraphic Address "GLENFIELD," KILMARNOCK

Prices and full particulars may be obtained by application to any of the above Canadian firms.

SEND FOR COMPLETE BOUND CATALOGUE

Stratford, Ont.—The committee dealing with questions relative to the street railway will make application to the municipal council asking that body to prepare and present a by-law calling for the raising of $30,000 for this utility.

Sudbury, Ont.—Mr. Chas. McCrea has made application to the legislature for the incorporation of the Sudbury Copper Cliff Railway, capital $250,000. The lines of this road are not to exceed twelve miles distance from Sudbury.

Toronto, Ont.—A report states that a company are preparing to start a motor bus line in this city at an early date. They expect to have 50 cars to start with.

LIGHT, HEAT AND POWER.

Niagara Falls, Ont.—The city has approached the Provincial Government, and the Queen Victoria Park Commission, to secure permission for the erection of a new power house and pumping station. The plans call for four generators, water-wheels, pumps, penstocks, etc., to be placed at the bottom of a shaft. The total projected development is about 4,000 horse-power, near the site of the present pumping station. Mayor C. C. Cole, and Water Commissioner R. P. Slater, are looking after the city's interests. Mr. John Kennedy, Montreal, is the consulting engineer.

Ottawa, Ont.—The charter granted to the Orillia Power Company embodied the proposal of Hon. Adam Beck, calling for the surplus of all power plants to be used in the extension of the plant making the surplus.

Quebec, P.Q.—At a meeting of the Dorchester Electric Company preliminary details of the new concern were finally arranged, and it was announced that the new concern would be generating power by Sept. 15 next. The board of directors, as elected, consists of Ald. James Robinson, of Montreal, president; the Hon. N. Garneau, of Quebec, vice-president; Dr. W. D. Hart, G. E. Tanguay, T. N. King, J. S. Bosse, F. G. Lyman and G. Proteau.

St. Thomas, Ont.—A report states that the London Electric Company has offered to illuminate the streets for $3,000 per year less than the estimate of Hydro-Electric Commission.

Toronto, Ont.—The hydro-electric commission will undertake the farm power experiments, initiated about a year ago, during the coming spring.

Vancouver, B.C.—The British Columbia Electric Railway Company will erect a sub-station at the junction of Earle road and its Westminster interurban right-of-way, to cost $100,000.

GARBAGE, SEWAGE AND WATER.

Berlin, Ont.—The municipal authorities have had their plans approved by H. G. Hodgkins, C.E., of Syracuse, N.Y., who has advised them that the water supply, if expediently used, will serve the city for the next ten years.

Lethbridge, Alta.—Mayor Hatch is interested in a proposal to construct a new filtration plant in this city. The system at present in use allows the water to become polluted, as shown by chemical and bacteriological examinations.

North Toronto, Ont.—The town solicitor will prepare a by-law for the ratepayers calling for the expenditure of $60,000 to provide a pumping plant to supply the town with water from Lake Ontario. The project to obtain a supply from certain springs at Lemmonville has been blocked by the Private Bills Commitee of the Provincial Legislature.

Sarnia, Ont.—The provincial medical health officer has recommended that the future water supply of the above municipality be obtained from Lake Huron. There has been a great deal of annoyance of late, owing to the present condition of the river intake and the bacteriological state of the water.

Sydney, C.B., N.S.—The business of the Dominion Iron and Steel Company was interrupted recently by the breaking of a large water main. The break took place in the main pipe between the blast furnace and the bessemer plant, and at a depth of 28 feet, which rendered its repairs most difficult.

BUILDINGS AND INDUSTRIAL WORKS.

Battleford, Sask.—The Battleford Curling Club expect to erect a large rink for their own use.

Calgary, Alta.—A by-law to raise the sum of $20,000 will be discussed at a meeting of the aldermen. The money is to provide an asphalt plant for the city.

Calgary, Alta.—The rough preliminaries in connection with the plans for a new police station have been completed and competitive plans will be called in a few days. The station will have accommodation for one hundred prisoners and cost about $125,000.

Edmonton, Alta.—Mr. J. H. Gariepy will erect a six-story building on the south side of Jasper Avenue, between Fifth and Sixth Streets. The estimated cost of the work is $250,000.

Fonthill, Ont.—The Dominion Canners Co. are preparing for the erection of a large cannery at this point. The plant is to be finished this year.

Fort William, Ont.—The Board of Education will call tenders for an addition to the Collegiate Institute. It is estimated that the work will cost $20,000.

Ladner, B.C.—Plans are being prepared for a new municipal hall. A by-law calling for the erection of this building will be presented to the ratepayers at an early date.

Montreal, P.Q.—A company taking the name of the Centre-Freeze Ice Company has been formed in this city to manufacture ice from sterilized water. Mr. L. O. Geoffrion, of the Montreal Harbor Board, is interested in the matter.

Montreal, P.Q.—Plans for the erection of a ten-story building on the site now occupied by the Castle Blend block are prepared. The sale of the property was concluded by Mr. John J. Louson, representing Mr. James Buchenough, who, in turn, was acting for one of the largest trust companies operating in Montreal.

Preston, Ont.—Tenders will be called for the erection of a new addition to the Public school. H. C. Edgar, Town Clerk.

Regina, Sask.—The Saskatchewan Motor Company have purchased a site on which they will commence the erection of a four-story garage.

Saskatoon, Sask.—A report states that negotiations are closed for the erection of the mills of the United Flour Mills Co., of Minneapolis, U.S.A.

Toronto, Ont.—A report is in circulation that a tall building will be erected on the site now occupied by Messrs. Rice Lewis and Company. It is said that the Standard Stock Exchange are to be the owners of the new structure.

Toronto, Ont.—The National Iron Works, Ltd., are preparing plans and specifications which, when completed, will double the present capacity of their plant. Mr. Gordon F. Perry, manager of these works, is superintending the details of these plans.

Toronto, Ont.—Work on the new St. Alban's Cathedral (Anglican) will be started at an early date.

Vancouver, B.C.—Plans for a large building are prepared. It is to be erected at 506-14 Cordova Street.

Vancouver, B.C.—A report states that the Dominion Bed Manufacturing Company may erect a branch factory in this city. There is a branch of this company in Kent, Washington, at the present time.

Vancouver, B.C.—The Dietrich Saw Works, of Galt, Ont., will establish a branch in Vancouver. A permit has been taken out for a $10,000 warehouse. It will be enlarged later.

Welland, Ont.—The Holman Sign Company will occupy the premises recently used by the Electro Steel Company. Forty men will be employed.

BRIDGES, ROADS AND PAVEMENTS.

North Toronto, Ont.—A road through the Mount Pleasant Cemetery will be constructed in the near future. An overhead bridge will be erected in connection with this over the tracks of the old Belt Line Railway. The General Burying Ground Trust and the town of North Toronto will share the cost, which comes to about $15,000. Mr. E. A. James is the town engineer of the above.

THE TRIPLEX BLOCK

A Triplex Block hung from a temporary rigging and used for laying pipe.

What is the Life of a Triplex Block?

WE don't know. Triplex Blocks built by the Yale and Towne Co. at the very beginning—twenty-five years ago—are still in actual use. The Triplex Block of to-day possesses greater lasting powers. With its steel parts—its chain superior to any other—its non-wearing gear movement—and the guarantee of a rigorous test before shipment under a fifty per cent. overload. It will outlast the man who buys it, no matter how young he may be.

The Canadian Fairbanks-Morse Company

LIMITED

Fairbanks Standard Scales — Fairbanks-Morse Gas Engines
Safes and Vaults

MONTREAL ST. JOHN OTTAWA TORONTO WINNIPEG
CALGARY SASKATOON VANCOUVER VICTORIA

Province of Saskatchewan.—The Government of this province will consider the granting of $5,000,000 for road improvement.

Victoria, B.C.—Plans for a concrete bridge to replace the present wooden structure over the Gorge Road Ravine are being considered by the council. The estimate for a 60-foot span the full width of the roadway and the reinforced concrete arch with the necessary walls is $24,371. A steel bridge with a 120-foot span, having the necessary approaches at each end, the bridge taking the full width of the roadway, will cost $32,300. The engineer, Mr. Angus Smith, recommends the former.

FIRES.

Ottawa, Ont.—The establishment of Messrs. Parsons & Company was damaged by fire to the extent of $5,000 on February 9th last.

St. Catharines, Ont.—About $6,500 damage was caused by fire to the premises and stock of the Martin Electrical Store in this city.

TRADE ENQUIRIES.

The following were among the inquiries relating to Canadian trade received at the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W., during the week ended February 12th, 1912. Fuller information may be obtained by communicating with the Department of Trade and Commerce, Ottawa.

The following were among the enquiries relating to Canadian trade received at the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W., during the week ending March 4th, 1912:—

A Dundee firm of jute manufacturers wish to appoint a reliable Canadian agent.

A Scottish firm manufacturing split lentils are anxious to develop trade connections in the Canadian North-West.

A London firm manufacturing automatic packing machinery would like to hear from Canadian firms likely to be interested.

Enquiry is made by an English manufacturer for the names of parties in Canada having alkali properties to dispose of.

A London correspondent is desirous of purchasing Monel Metal, and would like to hear from Canadian manufacturers.

A West of England correspondent is open to represent Canadian firms desirous of doing business in Great Britain.

A Scottish firm manufacturing a new improved diaphragm suction pump are open to appoint Canadian agents.

From the branch for city trade enquiries, 73 Basinghall Street, London, E.C.:—

A Midlands firm manufacturing horticultural brass foundry (syringes, pumps, sprayers, etc.), invite correspondence from Canadian importers.

CURRENT NEWS.

Calgary, Alta.—Many tenders were received for the municipal paving. The prices ranged from $2.36 to $2.85 per sq. yd. for bithulithic; $3.50 to $3.75 for wood blocks; $2.05 to $2.40 for sheet asphalt; $2.12 for asphalt concrete, and .09⅛ to 10¾ for concrete sidewalks.

Calgary, Alta.—The municipal authorities are preparing to spend the sum of $84,000 on park improvements during the coming season. The plans call for the construction of asphalt walks and driveways, the erection of band stands, electric lighting extensions and the installation of two or more fountains.

Ottawa, Ont.—Over 100 dwelling houses belonging to the C.P.R. and situated near the old St. Lawrence and Ottawa tracks on the block bounded by McTaggart, Redpath, Cumberland and Dalhousie Streets, were condemned by the medical health officer as the result of not being equipped with sanitary conveniences. The C.P.R. was instructed to install improvements, but this would have required running a sewer down the street, and to this expense the company was not prepared to go. As a result the houses will all be knocked down, the material in them being sold to the highest bidder.

Ottawa, Ont.—Railroad officials are to make a request to the federal government that steel rails from the United States be admitted into Canada duty free during the coming year, owing to the inability of Canadian makers to supply the demand.

Toronto, Ont.—An architectural competition will take place in connection with the new Technical School to be erected on Harbord Street. Plans must be in the hands of the committee of awards previous to June 15th next. Although the treatment will be left to the discretion of the designers, a few suggestions have been made. Among these it is stated that good light is important; brick material is recommended for the facades and the structure is to be five stories in height. The board of assessors has been thus named:—Dr. A. C. McKay, principal of Toronto Technical School; Mr. P. E. Nobbs, of McGill University, and Mr. Frank A. Wickson, Toronto.

Vancouver, B.C.—The Wallace Shipyards, North Vancouver, has received instructions to fit the tug Point Grey with oil-burning apparatus, and also an order from the Terminal Steamship Company to fit the sternwheeler Baramba with oil fuel apparatus.

ORDERS OF THE RAILWAY COMMISSIONERS OF CANADA.

Each week on this page may be found summaries of orders passed by the Board of Railway Commissioners, to date. This will facilitate ready reference and easy filing. Copies of these orders may be secured from The Canadian Engineer for small fee.

16094—March 6—Authorizing G.T.P.B.L. Co. to construct spur for Yellowhead Pass Coal & Coke Co., Ltd., on Alberta Coal Brch.

16095—March 7—Authoriing C.N.O. Ry. to take portion of Lot 9, Brokenfront Con. Town of Trenton, for diversion as approved by Order 12480.

16096—March 6—Authorizing Midland Rly. (G.N.R.) and G.T.P. Ry. to operate trains over crossing in Parish Lot 55, St. Boniface, Man., pending completion of interlocker.

16097—March 8—Authorizing G.T.R. to construct branch line of railway through Holmedale District in City of Brantford, Ont., and across Hydraulic Canal and the Grand River to a connection with its Brantford and Tillsonburg Branch (20th Dist.) and to close streets and highways in the city. Compensation to be paid A. J. Wilkes for land taken.

16098—March 11—Approving revised location of C.N.O. Ry. (Montreal-Port Arthur line) through Twp. of Capreol, dist. of Nipissing. Mileage 426.53 to 429.29 from Montreal.

16099—March 9—Substituting plan "A" for plan filed and approved by Order 15280 of Sept. 11th, 1911, C.N.R. spur H.B. reserve in city of Edmonton, Alberta.

16100—March 9—Authorizing Central Vermont Ry. to reconstruct bridge over Little Montreal River, between St. Lambert and Chambly, Que.

16101—March 9—Directing C.P.R. within 90 days to install electric bell at crossing known as Concession Road between Cons. 4 and 5 in Twp. of Cumberland, County Russell, Ontario.

16102—March 4—Authorizing C.P.R. to construct subway at Decarie Ave., Montreal, Que., to include diversion of Prudhomme Avenue by means of Western Avenue, $10,000 from Rly. Grade Crossing Fund, one-fifth of balance by city of Montreal.

16103—March 7—Directing G.T.R. at once to arrange that train No. 7 stop at Paris, Ont., to let off passengers from Toronto and points east thereof; complaint Board of Trade, Paris, Ontario.

16104—March 11—Authorizing C.P.R. to use and operate bridges at mileages 0.5, 94.3 and 81.4, Windsor sub-division.

16105—March 11—Authorizing C.P.R. to use and operate bridges at mileages 40.3, 42.1 and 43.8, on London sub-division.

16106—March 11—Authorizing C.N.O. Ry. to cross public road in Twp. of Trafalgar, county of Halton, Ontario.

16101—March 14—Dismissing application of United Fruit Co.'s of Berwick, N.S., on rate of apples to Winnipeg, Man.

THIS CANCELS FORMER SUMMARY OF ORDER NO. 16101.

16107—March 11—Approving by-law of Bay of Quinte Ry. authorizing Geo. H. Shaw to prepare and issue tariffs of tolls.

16108—March 7—Directing G.T.R. to before May 1st, 1912, install electric bell at crossing west of Bainsville station, Twp. of Lancaster, Ct. Glengarry, Ontario. 20 per cent. from Railway Grade Crossing Fund.

16109—16110—March 12—Authorizing C.P.R. to use and operate bridges 8.2 and 9.2 on Cranbrook S.D. and bridges 80.5 and 62.8 on its Sirdar sub-division.

16111—March 4—Authorizing G.T.R. to take lands in the Twp. of York, county of York, Ont., in connection with Toronto grade separation scheme.

16112—March 5—Relieving G.T.R. from further protection of crossing of Richmond Road, Twp. of Nepean, Carleton Ct., Ont.

16113—March 4—Approving standard station designs for Algoma.

16117—March 4—Eastern Railway Company, and for Algoma Central and H.B. Ry.

Volume 22. Toronto, March 28, 1912

STEREOGRAPHIC MEASUREMENT.

By C. R. ANDERSON, M.A., Associate Professor of Photography, University of Toronto.

The problem of deducing measurements from a photograph is the inverse of that of producing a perspective drawing from the known dimensions of an object, for the image produced by the lens on a photographic plate is a true perspective if the lens be free from spherical aberration and astigmatism.

If the plate be assumed vertical then the nodal point of the lens is the point of view, the plate is the picture plane, and the focal length of the lens is the distance line. The optic axis of the lens intersects the plate in the principal point and a horizontal line drawn through this point is the horizon of the perspective. Having given the horizon line of a photograph the principal point and the distance line, that is the focal length of the lens, the problem of estimating the object in all its parts is, however, indeterminate, for we have two unknown quantities, viz., the distance of the object and its dimensions, which are dependent on each other. But if we are provided with two perspectives of the same object from suitable stations, the problem may be solved by plane table methods.

The use of photographs in surveying dates back as far as 1858 or 59, about which time Colonel Laussedat executed numerous experimental surveys with the camera, the results of which were communicated to the Academy of Sciences and received the endorsation of that body. Subsequently the method was taken up by Meydenbaur in Germany, and was used to some extent in military work during the Franco-German war, later it was exploited by Finsterwalder, Koppe, and others. It was also used in Austria, Sweden, Switzerland and Italy during the seventies and eighties. Perhaps the most extensive work by the photographic method was in the Rocky Mountain survey and the Alaska boundary delimitation (Canadian section) under Deville, Surveyor-General of Dominion Lands; this work was begun in 1888 and continued up to about 1897, and was most successful.

In all this work extending over a period of 30 or 40 years the methods employed for reduction of the photographs, though differing much in detail, were all what may be fitly termed **monocular**; that is to say, a single photograph was in itself a unit and the determination of any magnitude was arrived at by the comparison of two or more units. The various methods are all somewhat intricate and laborious, and, moreover, the identification of terrestrial details as viewed from two or more stations at different angles is often very difficult. Again, the method is not self-contained, for the camera stations and other central points must be determined by triangulation or other extraneous method.

This plan of taking a single photograph as a unit is analagous to that of a man who views an object with one eye closed and then moves to a new view point and makes a similar observation, instead of using both eyes from one station. It seems all the more remarkable that the binocular method was not introduced when the plastic properties of a stereograph were so well known; for the invention of the stereoscope dates back to 1838.

The first suggestion of utilizing stereoscopic photographs for measurement of distance by means of a comparator seems to have been made by Dr. Pulfrich, of the scientific staff of the Zeiss works, in 1901. (See "Naturwissenschaftliche Rundschau," 16, p. 589. From that time on numerous articles have appeared in scientific periodicals dealing with the problem and meantime the firm of Carl Zeiss has steadily improved the original apparatus until a permanent form of both camera and comparator have now been reached, both of which are of great perfection.

In this paper I purpose to deal with the question of measurement only, assuming that means have been used to secure accuracy in the setting of the camera.

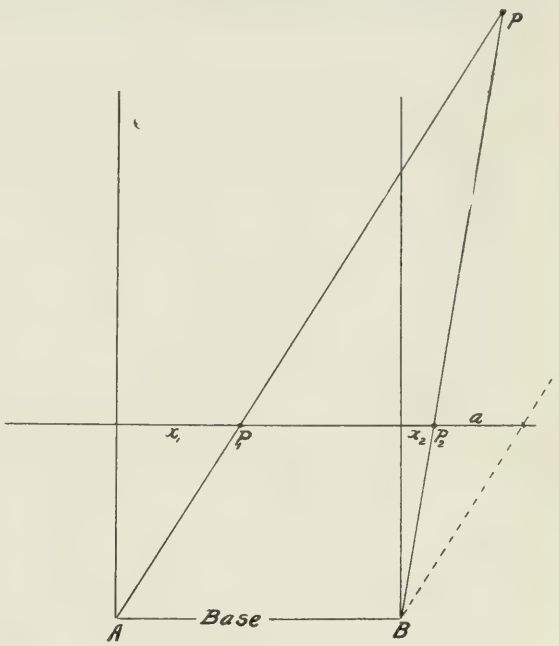

Fig. 1.

Consider a single photograph and let lines be drawn on it representing the horizon and principal line of the picture. This will divide the photograph into quadrants and the coordinates x and y of any point therein may be measured by means of a comparator. The actual values of these quantities cannot, however, be determined until their distances from the station are measured and this distance may be obtained from a stereoscopic pair.

The method of measuring the depth of field to any point from a stereograph requires a linear measurement of the parallax of that point. The relation between parallax and depth of field may be illustrated by the accompanying diagram, Fig. 1.

Let A and B be the two points of observation, and let P_1 and P_2 be the images of the distant point P on the picture plane, then x_1 is the ordinate of left image, and x_2 of the right and the difference between AB and P_1 P_2 is the parallax and is obviously equal to $x_1 - x_2$. Let the parallax be denoted by a, equal to the algebraic difference of the ordinates. It is clear that when the parallax a equals O the point P must be at infinity, and that a increases as P approaches AB, also that all points lying on a vertical plane through P parallel to AB have the same parallax.

Fig. 2 exhibits the parallax of various points in an actual stereograph. The base of the pair of photographs was 2.438 m. and the focal length of the lens was 141 mm.

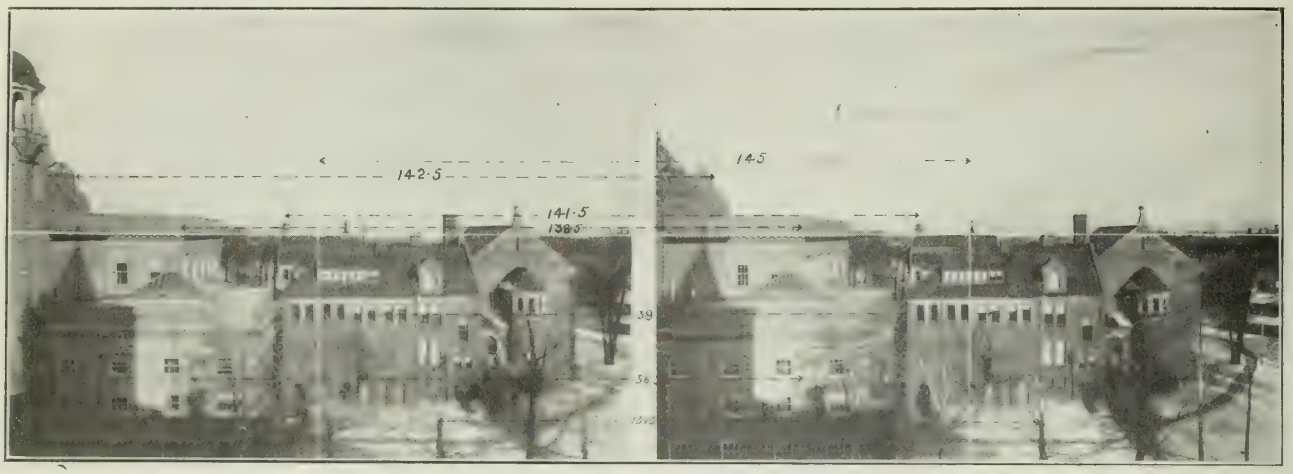

Fig. 2.

Base = 2.438 metres, f = 141 mm.

As the picture is mounted the base is represented by a distance of 145 mm., and the distances between various pairs of points are shown on the figure, from which it is seen that the nearer the points lie to the station the greater the parallax. It must be observed, of course, that the parallax is not a measure of the distance directly to the distant point, but a measure of the perpendicular distance between two vertical planes, one of which passes through the station points and the other through the distant point parallel to the first, in other words the "Z" of a rectangular system of co-ordinates.

In the taking of the photographs it is necessary that the plates be vertical and that they lie in one plane; the stations may be on the same or different levels. The length of the base and the focal length of the lens are required. By convention the left station may be conveniently taken as the point from which measurements are to be made, hence the co-ordinates x and y will be measured from the left plate and the parallax from both.

It now remains to show how the actual co-ordinates of a point in space may be determined from the co-ordinates as measured on the stereograph. In Fig. 3:

Let P be the point whose position is to be determined and which is represented on the plates by the images P_1 and P_2; let the ordinates of these points be x and x^1, (x^1 being negative), let B be the base and f the focal length of the lens. Then, from similar triangles it is evident that Z the distance of a plane through P $= B \frac{f}{x + x^1}, = B \frac{f}{a}$

$$\text{also } X = Z\frac{x}{f}$$

$$\text{and } Y = Z\frac{y}{f}$$

mirrors M_1 and M_2. Each plate may be rotated in its own plane by screws S_1 and S_2, so that the horizons of the two plates may be accurately adjusted. Also, the right plate P_2 may be moved parallel to its length by the screw H so as to

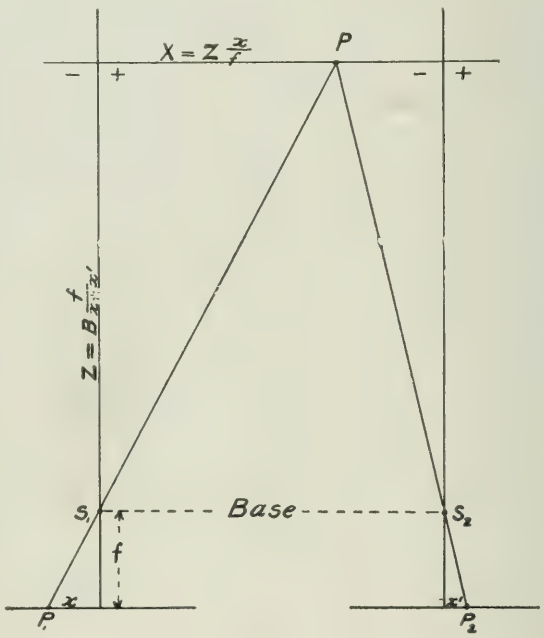

Fig. 3.

compensate for difference in level of the two stations. In the optical planes of the microscope are two balloon marks which appear to coincide when the instrument is in accurate adjustment and may be set so as to apparently coincide with any point on the stereograph whose position is required.

Fig. 4 shows the latest model of the stereo-comparator destined for the precise measurement of stereographs, one of which has lately been added to the photographic equipment in the University of Toronto. The instrument is provided with a binocular microscope magnifying eight times, of which the objectives are shown by O_1 and O_2, the eye pieces by E_1 and E_2. The microscope may be focussed on the plates by a screw not visible in the figure, and the eye pieces may be separately adjusted to compensate differences in the eyes of the observer and are also adjustable to different interocular distances.

The plates P_1 and P_2 are rigidly held in place by metal clamps, and are illuminated from beneath by adjustable

The screw A moves the entire bed plate, carrying both plates to the right or left, and its movement is indicated on the scale X. the screw B moves the microscope at right angles to the bed plate, and its motion is indicated in the scale Y, and the screw C moves the right plate to the right or left independently of the other plate, and its movement is indicated by a scale and divided screw head Z. All three scales read to 1/50 mm., and by estimation to 1/100 mm. Thus, by means of the scale X the distance of any point to left (+) or right (—) of the optic axis is measured by means of Y the height of any point above (+) or its depth below (—) the horizon is measured, and lastly, by means of Z the parallax of any point is determined. From these three measurements made on the photographs the actual co-ordinates in space are at once determined by means of the simple formulas already given.

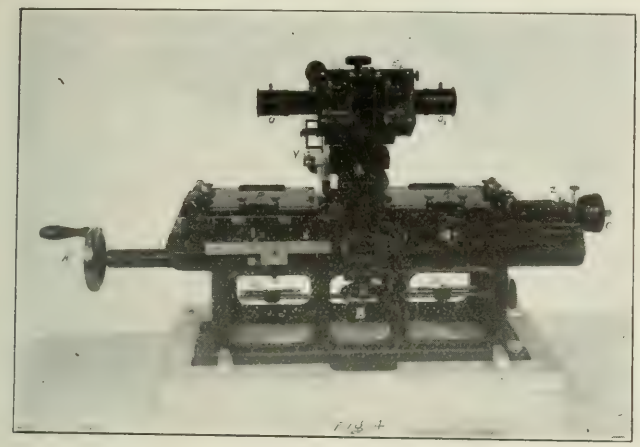

Fig. 4.

The great simplicity of this method as compared to that of plotting by means of the plane table will be at once apparent, and the precision secured is much superior and comparable to that of any other method of survey in ordinary country, while in mountainous districts it ensures results that cannot otherwise be secured except at very great cost.

The application of photogrammetry to stereographs is not confined to survey work alone, but may be used for any purpose where measurement is required. For example, if two cameras are used and simultaneous exposures are made the method becomes applicable to moving objects, and may be employed to indicate the position at any instant of military forces during manoeuvres in the field or of vessels at sea, or to determine the altitude of clouds, aeroplanes or the flights of birds. In a similar way the method becomes readily applicable in astronomy. In architecture it may be employed to examine and measure details which are not readily accessible. Again, the method may be modified by taking two photographs from the same point at different times when any changes in the view will be at once made evident, this will find application in estimating relatively small changes, such as glacier motion, local variations in contour of the earth's surface, subsidence of structures, progress of earthworks, etc., or in the direction of spurious coins or counterfeit bank notes.

At the close of the construction season of the present year the Grand Trunk Pacific and its ally, the National Transcontinental, will be in a position to carry telegraphic despatches from 150 miles west of Yellowhead Pass to Cochrane, a point 900 miles east of Winnipeg, a distance of 1,975 miles, over its own lines. Besides this the Grand Trunk Pacific will build over 700 miles of telegraphic lines on branch lines and, from the Prince Rupert end of the Grand Trunk Pacific, a total of 830 miles in all.

THE PRACTICAL DESIGN OF REINFORCED CONCRETE FLAT SLABS.*

By Sanford E. Thompson.†

The purpose of this paper is to present material covering the practical task of designing flat slab floors for reinforced concrete structures. The requisite thickness of slab, amount of reinforcement, and size of column head, for different loadings and different spans, are given in a table; and the theories and assumptions involved in the computation are briefly discussed. Values not included in the table may be worked out from the formula, finding the desired values of C_s and Ce from the diagrams.‡ Curves are given also for the constants used in the design of members with steel in top and bottom, and apply not only to flat slabs, but to any beam or slab reinforced both in compression and tension.

For reinforced concrete buildings, the flat slab, or girderless floor,—as it is sometimes called,—is as cheap, and frequently cheaper, than beam and girder construction. The smooth ceilings with no intersecting beams allow better distribution of the light. The expense and complication of installing sprinkler systems is lessened. The clear headroom for the same story height is increased, or else, on the other hand, the story height may be made less without reducing the effective headroom. This last consideration alone is often important enough to dictate flat slab floors.

With flat slab floors the entire load is supported directly on the columns, which are usually spaced about equally in both directions. The column heads are enlarged so as to give increased resistance in shear and bending at the points where this is most needed. The reinforcing bars run through the slabs over the column in four directions, two rectangular and two diagonal.

The simplest way of considering the flat slab is to assume that a portion of the slab extending a certain distance out from the column is a flat, circular plate, similar to a Japanese parasol, but with no slope to its surface. This plate is fixed to the column and is assumed to extend out from it on all sides like a cantilever as far as the line of inflection of the slab, which line,—as in other forms of monolithic construction,—is about one-fifth of the net span away from the support. The rest of the slab may be considered as entirely separate from the flat circular plates but simply supported from their outer edges or circumferences.

This is no new theory, but is somewhat similar in effect to that of a uniformly loaded, fixed or continuous beam. To illustrate this in practical fashion, we will take an ordinary beam uniformly loaded and fixed at both ends. This illustration does not in any way show the methods of determining a bending moment in the flat slab, since, as stated below, the actual bending moment is dependent upon the elastic theory. It does, however, show quite clearly that we are justified in assuming the slab to be cut through on the line of inflection.

We know from simple mechanics that the moment at the support of an ordinary or uniformly loaded or fixed continuous

* Presented at the eighth annual convention of the National Association of Cement Users, March 11-16, 1912, Kansas City, Mo.

† Consulting engineer, Newton Highlands, Mass., U.S.A.

‡ For an example of flat slab design worked out in detail see Taylor and Thompson's "Concrete, Plain and Reinforced," 2d edition, 1911, pages 487 and 488.

beam is Wl/12* and, at the centre, is Wl/24. Now, suppose at the points of inflection, which also by mechanics we know to be located at a distance 0.2113l from each support, we cut the beam completely through so as to have a cantilever at each end with a simply supported beam between. The bending moment of the cantilever at its support, due to the load upon it, is $0.2113W \times 0.2113l/2$, and the moment at its support due to the load on the supported beam between cantilevers, is $\frac{[1-2(0.2113)]}{2} W \times 0.2113l$. The sum of these two moments is $0.0223Wl+0.0610Wl=0.0833Wl$ or Wl/12. In other words, while this analysis is not that which can be used for a flat slab, because of the extra strength of the flat slab due to the multiple reinforcement, the division into sections corresponds to our assumption in the flat slab theory. In the same way we might show that the centre moment of the simple beam supported by the two ordinary cantilever beams is Wl/24.

Tests of the flat slab construction at Minneapolis† indicate that the line of inflection of a flat slab floor is substantially the same as in a fixed beam, or about 1/5 the net distance between supports, although, as would be expected, the bending moment is entirely different.

Problems of Design.—The problem of the design of the flat slab, then, resolves itself into (1) a determination of the proper thickness and reinforcement required at the support for the cantilever circular plate supporting its own load and also the load of the rest of the slab, and (2) a determination of the thickness and reinforcement at the centre of the span required for the simply supported section lying between the circular plates.

Various Methods of Design of Slab.—Various methods have been advanced for the design of the flat slab. Some are based merely on deflection tests, which give no true basis for computations; others compute the steel carefully at the centre of the slab, which is not the critical part; others consider the construction to consist of beams between columns with a slab between, thus obtaining ultra-conservative results; while a plan still more common is to take the moment at the suports arbitrarily without regard to the size of the column head. The shear or diagonal tension near the column head is frequently disregarded altogether.

Shear at the Support.—The direct shear at the support, as in any mechanical construction, is equivalent to the total load supported by the column. This shear is readily borne by the concrete and steel. The diagonal tension, however, which, as in a beam, may be considered as measured by direct shear, must be carefully considered. To reduce the diagonal tension and also to increase the resistance to bending of the slab, the column head is enlarged. To still further increase the resistance, a part of the bars in the top of the slab over the supports may be bent down just outside of the supports and then carried along in the bottom of the slab.

In either case, the shearing stress should be limited to definite units, although it seems permissible to use a somewhat higher stress than in a beam.

The diameter of the enlarged column head, which is the actual support of the slab, should be governed by the shearing stress either at its circumference or at a short distance outside of it.

Bending Moment at Support.—The theory of flat plates, which must be used in designing a circular plate, is not yet clearly established. By the use of what is termed, in mechanics, the elastic theory, we have a fairly good working hypothesis. The analysis solved by Prof. H. T. Eddy* offers, in the writer's judgment, the most rational solution of the problem yet advanced

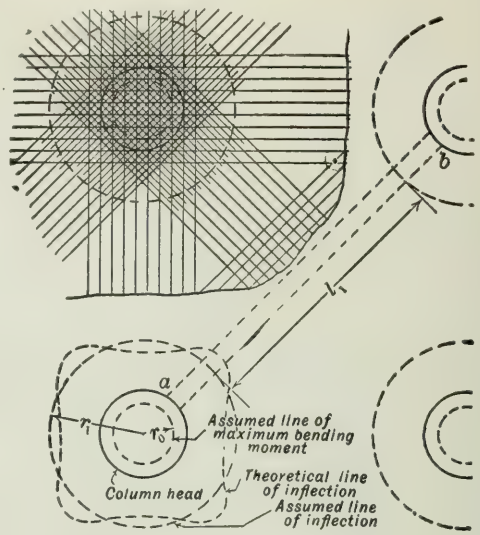

Fig. 1.—Plan of Flat Slab.

In the design of the flat slab, therefore, the author† has started with Prof. Eddy's analysis of stresses in a homogeneous circular plate, and from his general formulas has deduced by mathematics other formulas applying to circular plates free on their edges and clamped around the columns In a flat slab thus supported there are horizontal stresses at right angles to each other. The effect of these lateral stresses has been taken into account, this being expressed by Poisson's ratio, which is the ratio of the lateral deformation to the deformation in the direction of the stress

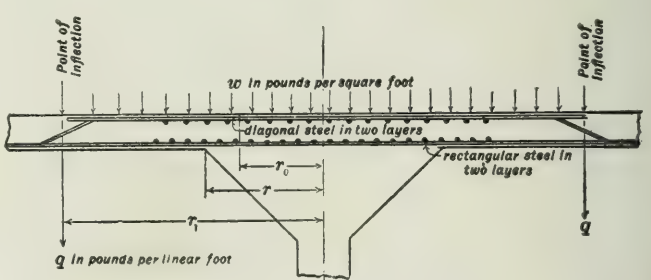

Fig. 2.—Section of Flat Slab.

The value of this ratio is taken as 0.1, which has been shown by experiments to be a fair value for concrete of 1:2:4 proportions.

It has been found possible to reduce the complicated formulas derived by the Eddy analysis into four formulas which are comparatively simple although still rather complicated for practical use. These formulas are for four bend-

---

* W = total live plus dead load. l = distance in feet between supports.

* Engineers' Society, University of Michigan, 1899.

† The author is indebted to Mr. Edward Smulski for the computations involving intricate analyses by higher mathematics; also to Mr. John Ayer for further studies in the practical design.

ing moments and can be applied not merely to the slab at the support, but to any point in the circular plate surrounding the column. The four moments are as follows:

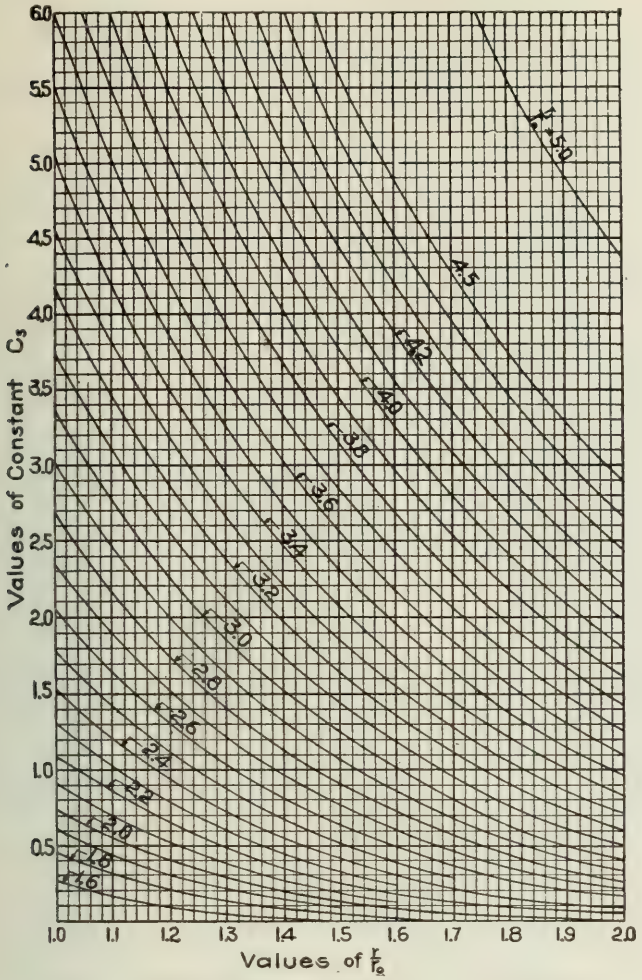

Fig. 3.—Diagram Giving Values of C_s in Formula.

M_1 = moment produced by the loading that is uniformly distributed over the circular plate and causes circumferential fibre stress.

M_2 = moment produced by this same loading but which causes radial fibre stress.

Ma = moment produced by the loading from the rest of the slab that is distributed along the outer edge of plate, and causes circumferential fibre stress.

Mb = moment produced by the latter loading but which causes radial fibre stress.

A study of the analysis, however, shows that the two circumferential moments are a minimum at the support and may be safely disregarded. The two formulas for the radial moment may be combined and still further reduced to the following simple form which can be used for a circle of any radius, r, within the circular plate. The meaning of the symbols is made clearer by reference to Figs. 1 and 2, which show the plan and the section of a flat slab.

Let

q = uniformly distributed load around the outer edge of the plate in pounds per foot of length.

w = uniformly distributed load on surface of plate in pounds per sq. ft.

r_0 = radius in feet to line of maximum bending moment (which is within the column head).

r_1 = outer radius of assumed plate in feet.

r = any radius in feet where moment is to be computed, for critical section, r is radius of column head.

C_s, Ce = constants given in Figs. 3 and 4.

Mr = total radial bending moment to be used ordinarily.

l_1 = distance in feet between lines of inflection.

Then total radial moment at any point of plate is

$$Mr = wr_0C_s + qr_0Ce$$

For convenience in computation, values of the constants C_s and Ce, for various values of the ratios r_1/r_0 and r/r_0 are plotted in the curves given in Figs. 3 and 4.*

$$Mr = w\,r_0^2C_s + q\,r_0\,Ce$$

r_0 = radius in feet to line of maximum bending moment.

r_1 = outer radius of assumed plate in feet.

r = any radius in feet where moment is to be computed; for critical section, r is radius of column head.

$$Mr = w\,r_0^2C_s + q\,r_0\,Ce$$

r_0 = radius in feet to line of maximum bending moment.

r_1 = outer radius of assumed plate in feet.

r = any radius in feet where moment is to be computed; for critical section, r is radius of column head.

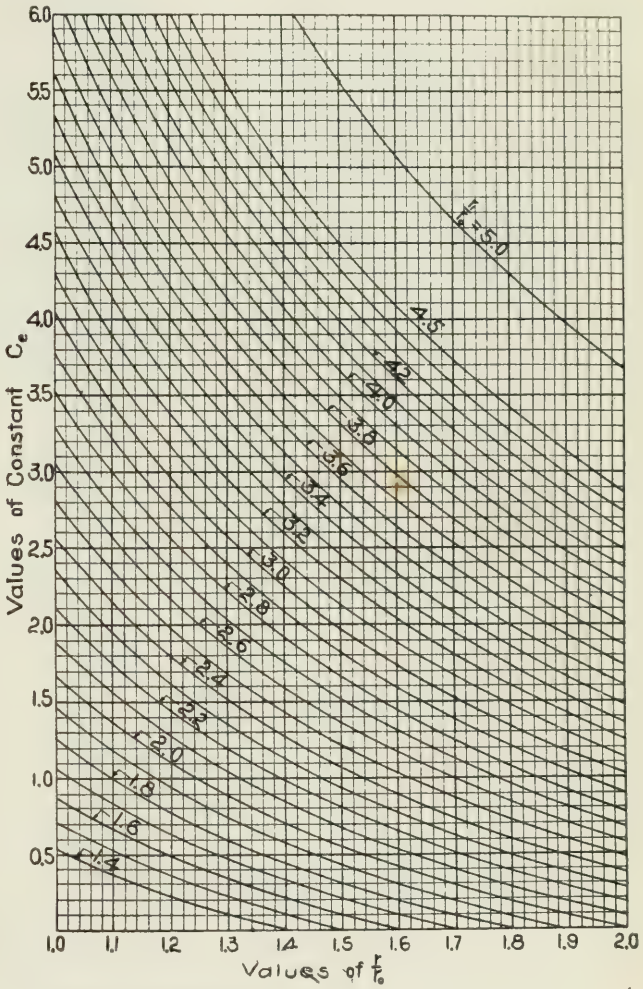

Fig. 4.—Diagram Giving Values of Ce in Formula

With q expressed in pounds per foot of length, w in pounds per square foot, and r_0 in feet, the moments are in foot-pounds per foot or inch-pounds per inch.

Position of Maximum Bending Moment and of Maximum Stress.—As commonly constructed, the column head flares at the top and is therefore more or less flexible. For this reason the line of maximum bending moment will be located, not at the extreme edge of the column head, but a little

* These are drawn up from values in tables in Taylor and Thompson's "Concrete, Plain and Reinforced," 2d edition, 1911, page 518.

within it. The maximum stress, on the other hand, will not be on the line of the maximum bending moment because the strength there (since it is within the head) is increased due to the greater depth of concrete. It is fair to assume, therefore, that the maximum stress is at the edge of the column head, and we may assume the "critical section" as on this line. The exact location of the line of maximum moment is indeterminate. Under ordinary conditions it appears fair to assume its location as within the column head, a distance equal to the thickness of the slab. Therefore, Mr is figured for a value of $r = r_0 + t$. In figuring this moment, values of the constants C_s and Ce should be taken from the curves in Figs. 3 and 4. As in an ordinary fixed beam, this bending moment is negative, so that the upper side of the slab is in tension and the lower in compression. Having found the moment, the design of the reinforcement and the thickness of the slab may be worked out as for an ordinary beam.

The curves in Figs. 5 to 8 inclusive will be found of assistance in working out the design.

Steel in Column Head.*—The slab at the column head might be designed with the steel all in the top of the slab running in four directions provided the slab is thick enough so that the concrete will not be overstressed in compression. In order to reduce the thickness of the slab and therefore save the additional cost and weight of concrete over the entire floor, it is economical to place steel in the bottom of the slab as well as the top, and figure it as assisting the concrete to take compression. Since a portion of the bars need to extend only far enough beyond the column head to furnish suitable bond, the cost of this additional steel will be much less than the cost of an additional thickness of concrete over the entire slab.

To make it easy to place the concrete and also to bring the entire gravity of the steel as near to the surfaces of the slab as possible in order to give the longest moment arm, and thus a thinner slab, two layers of steel may be placed in the top of the slab and two layers in the bottom. The relation of the quantity in the top and bottom must be determined by the design. If a thin slab is desired, even more steel may be placed in the bottom than in the top. In the tables, three ratios of steel are given and the percentages selected are those that will give the required working stresses in the concrete and the steel.

The Minneapolis test already referred to shows that not only the steel directly over the column head, but the steel for a considerable distance each side, takes tension. In view of this test and of the tests made at the University of Illinois,† it is safe to assume that the steel may be spaced over a distance at least equal to the diameter of the column head plus three times the thickness of the slab.

The determination as to whether the diagonal or rectangular steel should be placed at the top is governed by the relative quantities of each. More steel is required for the diagonal direction through the slab, hence the layers which are largest in section may be run diagonally.

Agreement with Minneapolis Tests.—By our theory it is possible to compute the stresses not only next to the column head but at any point in the slab. In several cases, knowing the exact location of the points where the deformations were measured in the Minneapolis tests, we have computed the stresses at these points. Using 5.6 in. as the moment arm, and including the radial bars as assisting to take tension, we figure the maximum stress in the steel over the edge of the column as 25,000 lb. per sq. in. under the normal load of 225 lb. per sq. ft. as compared with 20,700 lb. per sq. in. given by Mr. Lord as the actual maximum stress in the floor. This is no greater difference than there ought to be between design and test and shows our method to be slightly more conservative than the actual test.

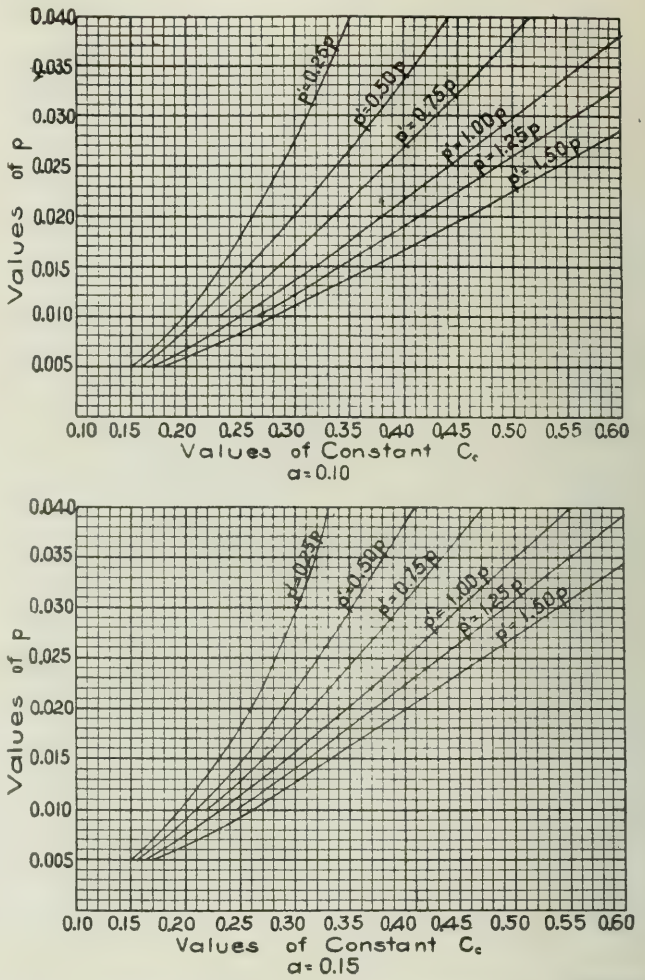

Fig. 5.—Diagram Giving Values of Constants in Formula.

$$f_c = \frac{M}{C c b d^2} \quad \text{for } a = 0.10 \text{ and } a = 0.15$$

$$a = \frac{\text{Depth of Steel in Compression.}}{\text{Depth of Steel in Tension.}}$$

$$p = \frac{\text{Area of Steel in Tension.}}{\text{Area of Concrete above Steel.}}$$

The compression in the concrete is more difficult to check since the exact locations of the test points are not given. Computations, however, show unquestionably that our methods are conservative enough to allow for the irregularities in concrete mixtures, and the danger of not having perfect concrete at the critical section.

(To be continued.)

Calgary street railway receipts for the month of February show an increase of almost 100 per cent. over the receipts for the same period last year. Last year's earnings amounted to $19,383.21. The figure this year reaches a total of $37,545.45.

* Certain features of flat slab reinforcement are covered by letters patent No. 1,003,384 of C. A. P. Turner.

AN ELECTRICAL ADDITION TO A STEAM PUMPING PLANT.

The northern section of the city of Toronto has been the scene of great residential building operations during the past few years. At a point about three miles north of the water-front the land rises abruptly to a height of one hundred and fifty feet at places, and upon this ridge many high-class residential districts have been opened.

The main pumping station is situated at the foot of John Street, almost at the water's edge, and in order to relieve the work of this plant a high level station was constructed. The original plant consisted of two pumps operated by two steam engines of the Corliss type; these pumps possessed a pumping capacity of 7,500,000 gallons per twenty-four hours, and were installed in the year 1890.

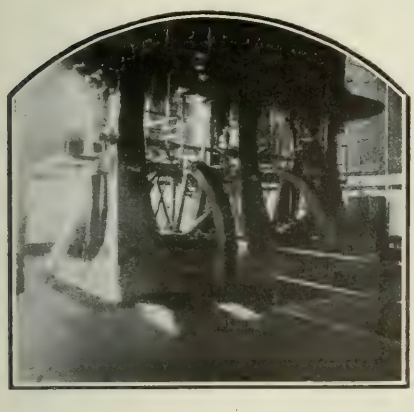

Fig. 1.

In 1905-08 these pumps were found to be greatly overtaxed and two compound units, one of which is illustrated by Figure 1, were installed. The combined pumping capacity of the plant was then increased to 19,500,000 gallons per twenty-four hours.

About eighteen months ago the water consumption of the city showed the necessity of again increasing the capacity of the northern station; this time, however, the former policy of strengthening the steam units was abandoned.

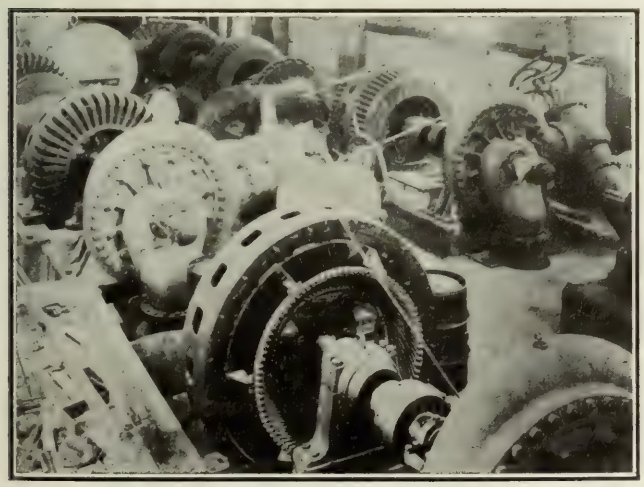

Fig. 2.

Three years ago the municipality voted in favor of adopting the hydro-electric policy. During the construction of the various sub-stations, etc., required before the high pressure current of 110,000 volts could be lowered to such pressure as would allow it to be employed for domestic purposes, it so happened that the electrical engineers selected a site on which to erect the north step-down sub-station, directly adjoining the above mentioned pumping plant.

After due consideration, the waterworks engineers decided to increase the capacity of the high level station by installing electrically operated centrifugal pumps; also to increase the pumping facilities to such an extent that they would be adequate for many years to come.

At present the addition presents the appearance indicated by Figures 2 and 3, which illustrate the equipment and give a fair idea of the undertaking.

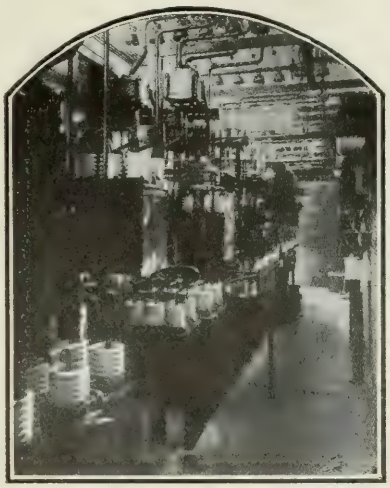

Fig. 4.

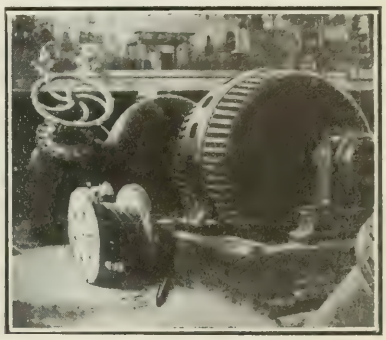

Fig. 5.

A synchronous motor is an alternating current dynamo operated as a motor, and although somewhat complicated to start, as compared to motors of other types, runs at a perfectly constant speed at all loads, providing that the operating current does not change its factors. Synchronous motors are designed to operate on single-phase or polyphase circuits; as a rule, however, they are confined to the single-phase mode of driving.

Synchronous motors are so named owing to their ability to operate in synchronism with the source of current supply. When a synchronous motor is operating without load, the field current may be so regulated that the current consumed by the motor is almost nil; its counter e.m.f. is almost sufficient to oppose the intake. This allows the motor to operate when not loaded for short periods without seriously affecting the operating costs and also does away with the trouble of starting.

When starting the motors of this type in the plant in question an auto-transformer is made use of. The current on the primary is under pressure of 2,200 volts; the secondary is so connected that a pressure of 440 volts is used to drive the current through the rotor or moving portions of the machine, when the motor speeds up the pressure is raised to 880 volts, then to 1,600. When this voltage is arrived at the machine is running at almost full speed and another switch throws the transformer out and the full voltage (2,200) through the rotor and stator. The direct current from exciters at 125 volts passes through the stator during starting.

During the operation of starting the outlet valves of the pump are closed and the water churns around in the pump;

when the motor is operating across the high tension mains the outlet valve is opened and the unit is in operation. For a steady operation during a fluctuation in the pumping the synchronous motor is very desirable.

The induction motors are started by the operating current under full pressure (2,200 volts) but their operation is very unsteady and disturbs the step-down station to a more or less extent.

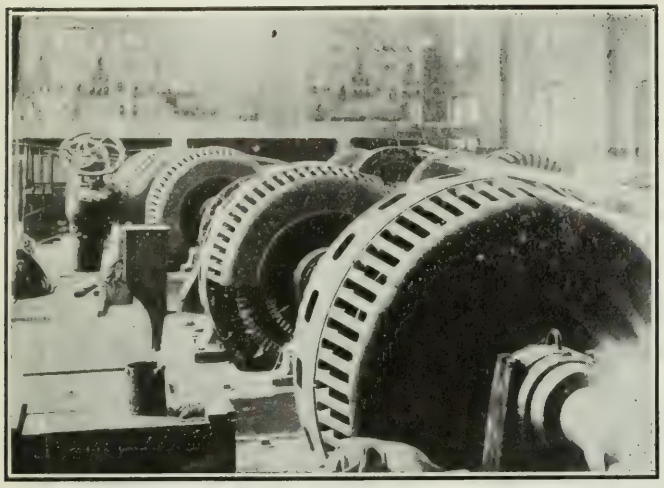

Fig. 3.

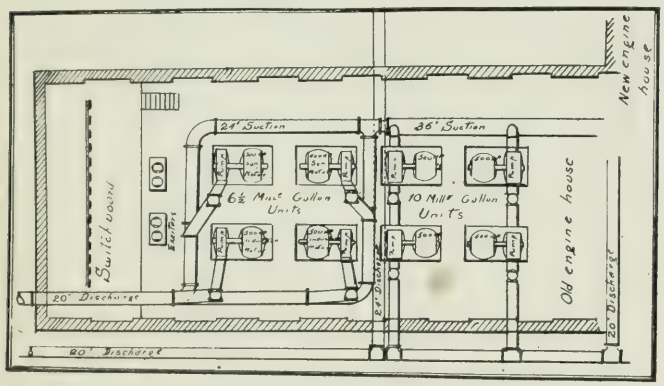
These pumps are eight in number, four having a capacity of six and a half million gallons and the balance a capacity of ten million gallons each. The combined capacity of the new addition is sixty-six million gallons per twenty-four hours. When the units are completed the capacity of the combined electrical and steam units will be 85,000,000 gallons.

The switch-board, seen in the rear of Figure 3 and in Figure 5, has control of the entire mechanism, including the opening and closing of the gate valves; motors of one horse-power being geared to the various valves and water controls. Means of operating these by hand have also been provided, as shown by the large valve wheels in some of the cuts,



particularly in Figure 5, which illustrates one of these units. The valve wheel for this pump is between twenty-four and thirty inches across.

The motive power which drives the pumps is supplied by induction and synchronous motors, each of five hundred horse-power. The design has been so prepared that the induction motors occupy the south half of the building and the synchronous motors the northern portion. The division of the pumps, however, is not similar; the six and a half million units being placed in the western half, while the ten million gallon units occupy the eastern side of the new wing. It will be readily seen that this division of pumps and motors provides that the pumps of the lesser capacity are driven by two induction and two synchronous motors. This is also the case with the ten million gallon units.

Two exciter sets have been placed on the main floor just forward of the switchboard platform; the motors furnishing current to the fields of the large pumping motors have an output of 33,000 watts.

Woodwork about the building has been used very sparingly, being confined almost entirely to the window frames and doors. The intake and discharge mains within the building are housed beneath the floor in concrete partitions; the concrete supports for the pumping units elevate the machines ten feet above the lower floor level. A large traveling crane has been installed to facilitate the placing of the huge castings and other parts, also to simplify any future changes or additions that should arise, the crane clears the switch-board platform by nine feet and the platform is eight feet above the main floor level.

LANDSCAPE ART AND CITY DESIGN.*

By Malcolm N. Ross, Park Superintendent, Regina.

The term landscape art in the above connection must be considered in its broadest sense, embracing as it does not only the things usually associated with landscape effects, such as trees and grass, but including all the objects that go to make up the surroundings of a city, for it is only by a clear understanding of the effects of each of these upon all the others that it is possible to arrive at any scheme for improvement in the general attractiveness of a city as a whole.

There is probably no great organized movement so generally in evidence in all civilized parts of the world at the present time as that which has for its object the provision for such conditions and surroundings in our cities and towns as will increase the health and happiness of their people; of course these conditions have always been among the main ideals of life to individuals of all classes, but it is only within recent times that attempts have been made to analyse and specify the things that will produce these results for the benefit of the whole of the people, and to outline the processes by which we may logically expect to be able to permanently ensure them. The important point to keep in mind is that while favored individuals everywhere have been able to secure the fullest enjoyment, the present feeling is that every man, woman and child is entitled to have a share of the good things that are provided by nature.

The surroundings of those who live in the country are naturally healthy, and afford many possibilities for enjoyment to those who have been taught how and where to look for them, the unhealthy and unsatisfying conditions of town surroundings are entirely due to artificial causes that we are only beginning to thoroughly understand, and which can be remedied.

The subject of city design, by means of which we hope to be able to reach our object, is so complex that it is difficult to take a definite line for discussion, and not to be drawn away from it; at present the various branches of work that must be considered in detail in defining schemes for general city improvements are comprised under the term

* Paper read before Arts and Literature Society, Saskatoon, on Jan. 26th, 1912.

"Town Planning." Speaking roughly they include provision for sanitary drainage, means of communication (roads and car lines), suitable buildings, spaces for recreation and the supply of those conveniences such as water and light, which we have come to regard as a matter of course, though occasionally such ideas are rudely dispelled, even in such cities as New York and parts of London.

Unfortunately enthusiasts on certain phases, or often details of city conditions, have taken them up and magnified their importance out of all proportion to the relations they should bear to other phases, and have attempted to force regulations and improvements for one particular purpose only, with the inevitable result that many persons are now inclined to be prejudiced as soon as the term town planning is brought up. I mention this because I find that it is a common practice to talk about "beautifying the city" as if it were something separate and apart from all other branches of municipal progress; something to be tacked on, to conceal or offset the work that must be carried out, and which they think must necessarily be ugly.

My understanding of the matter is this, that the effect on the general appearance of any city depends chiefly on the accuracy and efficiency with which any construction work is done. Not only must the design or plan of the architect or engineer be exactly suited to the work in hand, but the actual workmanship must be equally as good in its way; compare, for example, the general effect of the electric car construction work on Albert Street, where we have carefully designed and accurately placed posts and wires, with the appearance of streets in other cities where crooked and disproportioned wood poles are used, placed at any angle and only in an approximate line; there is nothing beautiful or artistic about the iron poles, but they are correctly designed for the purpose for which they are intended, and can only become annoying by their constant recurrence, which entails monotony.

As a matter of fact, so far as we are influenced by our surroundings, this very point of monotony is probably at the bottom of the situation in the modern town. An object may be perfect in design and composition, but a seemingly endless number of reproductions would soon become offensive, Nothing can be more monotonous than the ordinary long straight roads in our new cities, and all we can say about those in the older cities where they are lined with trees is that they are less monotonous than those along which there are no trees. Contrast and variety are essential in obtaining pleasing results over a large area, and these constitute controlling features in all good modern plans and in practically all of the older cities noted to-day for their attractions apart from historical or other such interests.

Cities always have attracted and will continue to attract people from the country, and they will continue to increase in size, but in order that individual cities may continue to attract and to hold those who come to them they must provide those things that people want, and those cities whose builders can foresee most clearly what these things are and are likely to be, and to make full provision for them, will become the most prosperous and famous as time goes on.

Possibly the best way to determine what these things are is to make a mental survey of the progress of cities in the past and the present to as great an extent as we can, and to follow up the stages through which successful individuals have passed in their search for enjoyment. While not assuming that I have reached a correct conclusion on such a large matter, I venture to say that my impression is, that the desire of the great majority of civilized persons is to secure the greatest amount of personal comfort while at the same time they can surround themselves with the beautiful things provided by nature and art, and the more we examine the lives of men who have become wealthy and so have secured what they desire, the stronger must such a conclusion become, and it seems to hold good in almost all parts of the world, and being so general in so many nationalities I think we may safely accept it as a guide. If we do, then we must decide that the plan on which we must develop our cities is one which will supply the desired comforts and at the same time provide the greatest possibilities for enjoyment to be derived from beautiful surroundings, both artificial and natural.

One of the most significant points in connection with modern town planning is that it is being increasingly guided and developed by landscape architects or in accordance with plans drawn up by them, and the time is almost passed when the engineer or the architect will be employed to design large construction works to be ornamented and relieved at some later date by the landscape designer, for he is now, and will be more in the future, called upon to work conjointly with men of the former profession and his judgment will be considered as having equal, and often controlling, weight, as compared with theirs whenever it is desired to produce the best results, both when individual houses and comprehensive schemes for town development are considered; in fact as far as I am aware practically all the large schemes for remodeling cities in the United States and to a great extent in Europe are in the hands of landscape architects at the present time.

The present rectangular plan of the American and Canadian cities is uneconomical and unsatisfying. However, so far as it exists it must be accepted and methods devised for modifiyng as far as possible its most objectionable features. Almost everyone realizes it. There is sufficient information to hand to enable practical steps to be taken to remedy the objectionable features, and there can be no question that Regina must necessarily take steps to keep up with work of this kind that is being done in practically every city of any importance, and I cannot imagine any more desirable field for investigation and debate than this. In connection with this I should like to read some extracts which seem to me to be peculiarly fitting and accurate and to which considerable weight may be attached, coming as they do from an address made by such a man as Charles W. Elliott, President Emeritus of Harvard University: "I suppose the rectangular lay-out of a city without diagonal or radial avenues is the stupidest thing the American people has done on a large scale and under different natural conditions. Yet to-day city planning must take account of these adverse conditions."

Later on in the same address we find his conclusions as derived from the evidence prepared by counsel for Harvard for the tax commissioners: "The best existing test of the quality of a city or town as a place to live in is the proportion of exempted territory to unexempted. All open spaces such as parks, public gardens, playgrounds, or water areas, schools, colleges, etc., promote the general health of the citizens and give them pleasure." It is not that engineers who have laid out these cities are individually less appreciative of beautiful surroundings than other people, but their training and bent of mind is almost exclusively mechanical and mathematical and their operations are carried out almost entirely according to the standard that at the particular moment is considered to be the most mechanically efficient, and they frequently are unable or else refuse to recognize, that a plan which may be mathematically accurate on paper or when staked off on the ground may produce a composition which will be anything but satisfactory as far as its general appearance is concerned when it is completed and seen in the mass.

The great difficulty here in formulating any plans for improvements is to overcome the opposition of the "practical" man, the man who prides himself that he is above all such petty matters as those which we have been considering; his imagination as far as real estate values are concerned seems to be unlimited, but it all seems to have to run to that line of thought. I suppose the persons who have recently proposed to destroy the boulevard on Victoria Avenue would consider themselves eminently practical individuals, they cannot therefore complain if they are asked to give an answer to the practical question as to what, having proceeded to destroy, for all time, the existing possibilities for a treatment which should make the avenue distinctive and attractive, they would propose to substitute to the people of the city to replace these advantages.

No sane man will pretend that we should spend lavish sums on purely ornamental parks and surroundings while money is urgently needed for such essentials as water and roads, but the danger is that having spent our money on these things and having provided all the means whereby population may be attracted and money made, and having later obtained both, we may then be disappointed to find that there is something missing, and that it is the very thing that we have been unconsciously striving and fighting for all our lives. Is it not time to realize this and to take some active measures to ensure that we and others coming after us will not be so disappointed.

We must get away from the idea that interminable paved streets and concrete sidewalks, accompanied by equally interminable grass strips and rows of trees spaced at equal distances from each and other, varied by an occasional open space in which are a few flowers and shrubs will constitute a satisfactory place to live in, they never can; we must have more originality, variety and change, and get away from the present idea of uniformity in every thing, uniformity becomes only another name for monotony when it is carried out far enough and is used as a very convenient catch word for those who wish to avoid too much work and thought, as it is manifestly more trouble to make plans showing constant variety and change than it is to have one or two stock plans that will with few modifications be applied under all conditions.

Variety will certainly entail a great deal more thought and work and exercise of imagination, but in no other way can we reach a better condition. I particularly emphasize the use of imagination, as it has been the neglect of its use that has brought about the present condition of affairs in most new cities, and it will require the utmost exercise of our imagination if we are going to decide correctly what individual characteristics Regina has or should have and then develop our plans to permanently define these. At present we seem to be simply copying the same system as is being employed in other towns regardless of the peculiar conditions of either Regina or the other places.

England is generally considered to be the country in which the best examples of purely landscape effects are to be found, and there is certainly no other country where landscape gardening has been carried out to so great an extent. But in looking for specific examples of good composition and design we do not find them in the public grounds except to a very limited extent. We are obliged to go to private places, many of which however are open to the public at stated times. The very opposite condition exists in Europe, and although in certain instances we find some of the classic examples of certain schools of landscape architecture owned by private individuals it is to the cities that we must go to see it applied on a large scale. This is probably due to the fact that from one cause and another the educated and wealthy man in Europe has gone to the city to live and in doing so he has demanded to be surrunded by beautiful objects both natural and artificial, harmoniously arranged, and we find public buildings, parks and gardens designed on a general system, which combine to form a beautiful picture in such a way as we are seldom able to find in England.

In the United States we find the improvement of the large cities being taken up in a comprehensive manner, and while there are a few isolated cases where private individuals are going to enormous expense to lay out magnificent grounds and parks it is not thought probable that they will ever be so generally distributed or on such a scale as in England, owing to the uncertainty of ownership due to the absence of any laws of entail; educated people must and will have these things, and the consequence is that most of the cities are now developing large schemes for their general improvement. The result will be that while England must remain the country of beautiful private places, the United States will become the country where the most enjoyable cities for the average man are to be found; in the one case the landscape work is limited mostly to landscape gardening, in the other it is extended to the application of the science and art of landscape architecture over the whole area of public property, and where necessary to the control of private enterprise where it may affect the public interests.

Remarks by Mr. W. R. O. Wynne Roberts, M.Inst. C.E.

Regina may be congratulated, for the persons who had the original laying out of the city, had great foresight in dividing it into residential and commercial sections, providing wide streets, etc. But on the other hand the ideals they then had and some now cherish do not conform with those of the present day. Ideals, like everything human, change with time. When Sir Titus Salt built Saltaire in Yorkshire, the arrangement and conception was highly commended, but to-day they are considered as antiquated and unsatisfactory. When Montreal was in the early stages of development, there was an excellent opportunity for an ideal city, but unfortunately despite the favorable local conditions, Montreal has been built in the usual haphazard way to the regret of its citizens. The destruction which was caused during one of the revolutions in Paris gave Napoleon an opportunity to build the boulevards and provide the magnificent open spaces which make Paris famous among cities. When London was almost burnt about three centuries ago, Sir Christopher Wren advocated building wide avenues, but the opportunity was lost and London is now a depressing mass of bricks and mortar with scarcely a redeeming feature so far as landscape art is concerned. Sixty pears ago the then city engineer of Liverpool recommended the construction of an avenue 180 feet wide and 6½ miles long round the town. It was not adopted, and it is now considered to be an irreparable loss to the city. It will now cost more to widen a 40-feet street to 70 feet for one mile than it would have cost to build the whole avenue.

Those lost opportunities bring in their trail grievous disadvantages. London is willing to spend any amount to rectify the errors of the past. Leeds has now to pay a tax equal to six mills in the dollar to pay for the omissions of the past.

In the West where towns and cities grow with such rapidity there is no excuse for ignoring the lessons to be learnt from the experience of older cities. There is danger that these lessons are not appreciated by the general public, and it may possibly be that in the near future some of our cities will find it necessary to adopt remedial measures.

Take another view of a city expansion. Nature as you all know abhors corners, it is only in crystals we see anything approaching squares and angles. Nature builds up graceful curves, and even the most desolate places can show something of beauty. When man endeavors to carry out some idea it is usually reduced to straight lines, possibly because it is easier, simpler and perhaps cheaper. Mankind nevertheless delights in relief, yet straight lines and squares do not afford it. Streets of houses and villas built to plans of uniformity, even by the most capable architect or engineer fail to impress you. What then will afford relief? Carefully thought out plans of landscape design and a relaxation of the rigid and uniform straight lines and squares will contribute to that end. Encourage the planting of a variety of trees, laying out of boulevards, which will soon be the pride of the city, relieve the flatness of the prairie by sweeping crescents, beautify the open spaces and adorn the avenues with stately buildings.

Winnipeg already finds that laying out of the city is not what it should be, and a commission has been appointed to consider the best way to provide radial and circular roads. I suspect that when Regina grows into the country around, it will be found that the street lines between the suburbs and the central business parts will be too tortuous, and that new avenues will be necessary. Provide these in the early stages o fthe city's expansion and the city will be made more beautiful. It is most desirable. Regulate the buildings, prevent the creation of slums, and encourage everything that will lead to the artistic as well as utilitarian developments of a city.

UNIT COSTS OF REINFORCED CONCRETE FOR INDUSTRIAL BUILDINGS.*

By Chester S. Allen.†

Unit costs are, in a way, like strong drink, harmless where used with judgment and prudence, but likely to bring remorse and anguish where employed promiscuously. Rare and talented, indeed, is the man who possesses the experience, judgment and intuitive sense to know when, where and how to properly modify any tables or statements of unit costs to meet the peculiar conditions of each individual case. While the figures given in this paper are all taken from structures erected during the past two years under the writer's supervision, the wide range of territory, local conditions, and different seasons of the year under which the various pieces of work have been executed is so great as to render the information given of value only in a very general way.

As a general proposition, we have found that reinforced concrete is the lowest priced fireproof material suitable for factory construction, and while it is true that its first cost will generally run from five per cent. to 20 per cent. higher than first-class mill construction, we have recently had several instances where, with lumber at a high price, reinforced concrete has worked out cheaper than brick and timber. It is especially adapted to heavy construction and for heavy loads of 200 pounds per square foot and over where the spans are eighteen to twenty-foot centres not even timber can compete with it.

The unit costs of projected or completed buildings are commonly figured, either as so much per cubic foot or so much per square foot of area occupied. Table I. gives the unit costs, both on the square foot and the cubic foot basis, together with a general description, of a number of reinforced concrete industrial buildings of different types erected during the past two years. It will be seen from an examination of this table that the average cost per square foot of these buildings, excluding the one-story structures, was $1.12, while the average cost per cubic foot was 8.7 cents. The one-story structures both had reinforced concrete sawtooth roofs and the average cost per square foot was $1.77, while 8.5 cents was the average cost per cubic foot. The above costs are for the finished buildings, including plumbing, but do not embody heating, lighting, elevators, sprinklers, and power equipment. The cost per square foot of floor area was obtained by dividing the cost of the building by the total number of square feet of floor area exclusive of roof area, but including basement floors and the cost per cubic foot by dividing the cubical contents into the cost of the structure.

While no coal pockets are included in Table I., it has been our experience that above 3,000 tons capacity reinforced concrete elevator coal pockets cost from $5.50 to $7.50 per ton of capacity. Standpipes, exclusive of the foundations, average from 2½ to 3 cents per gallon of capacity.

On much of the reinforced concrete work which has been done under our supervision it has been possible, owing to the contract being either on a percentage or cost plus a fixed sum basis, for us to obtain quite accurate and comprehensive cost data. This data, of course, is only of particular value where all the local color of each specific case is known, but the average results are at least interesting.

The average unit cost of the 1:2:4 concrete in the floors including the beams, girders, and slabs was $6.10 per cubic yard, and for the columns $6.70 per cubic yard. Where 1:1¼:3 mixture was used for the columns the average cost was $7.60 per cubic yard. This cost was made up of the items of cement, sand, stone or gravel, labor, and plant. The cement, of course, varied greatly with the demand, but the average net cost was $1.35 per barrel including three cents for tests. The sand averaged 80 cents per cubic yard and the crushed stone $1.25 per cubic yard. The cost of labor of unloading the materials and mixing and placing the concrete varied from 65 cents to $2.90 per cubic yard. The cost of plant, consisting of freight, depreciation or rental of mixing and hoisting towers, erection of same, power and coal, and losses and waste on the small tools ranged from 50 cents to $1.50 per cubic yard of concrete placed.

Next to the proper design of the structural features of a concrete building the economical design of the form work is of paramount importance. The truth of this statement is borne out by the fact that on the average job the cost of the forms amounts to about one-third the cost of the entire structure. On the buildings under consideration the average cost of the forms for the floors, including beams, girders, and slabs, was 10 cents per square foot, and for the columns 13 cents per square foot. The lowest cost was in a building of the so-called "mushroom" or flat slab type of construction where, by the intelligent use of corrugated iron for the slab forms, the cost of the floor forms, including

* Presented at the eighth annual convention of the National Association of Cement Users, March 11-16, 1912, Kansas City, Mo.

† Lockwood Greene & Co., Boston, Mass.

wall beams, was 7 cents per square foot, and the highest cost was for an artistic, but not elaborate, overhanging cornice on a 12-story building, which was 32 cents per square foot. This last item rather forcibly demonstrates that any attempt at architectural development is very apt to be a costly proposition.

The cost of the labor of making, erecting and stripping the forms varied according to the price of lumber, design of the structure, method of forming, character of the supervision and the skill of the workmen from 4¾ to 12 cents per square foot. The cost of lumber, nails and oil, divided by the square feet of forms, averaged from 2¼ to 4½ cents per square foot.

The cost of bending and placing the reinforcing steel, including the necessary wire, average $10 per ton, the range being from $5.75 per ton to $17.20 per ton.

Granolithic floor finish 1¼-inch thick, when laid before the concrete below it had set so as to form one homogeneous slab, cost on the average of 4½ cents per square foot. When put on after the rough concrete slab the cost averaged 7 cents per square foot.

Inasmuch as the only economical design of a reinforced concrete structure is one which closely resembles that of the steel skeleton type, the relative cost of the various materials commonly used for curtain walls under the windows, may be of interest. The writer has used brick, vitrified tile, concrete blocks, cast concrete slabs and solid concrete walls for this purpose.

The most common type of curtain wall has been either an 8-inch or 12-inch brick wall resting on the concrete wall beam. The average cost of these walls has been 45 cents per square foot. There is practically no difference in cost between the 8-inch and the 12-inch brick curtain wall, as the saving in material is offset by the great amount of extra labor in culling and laying the thinner wall.

An excellent and inexpensive spandrel wall is constructed by using 8-in. by 12-in. by 18-in. vitrified tile. This is a non-absorbent wall, and when properly laid in cement mortar makes a tight weather-proof curtain wall. The cost of this wall averages about 25 cents per square foot. If the tile is plastered both sides, the cost is about 38 cents per square foot.

Where 8-inch concrete curtain walls were cast in place after the skeleton frame was completed, the average cost was 40 cents per square foot, and when poured simultaneously with the columns 48 cents per square foot. Four-inch cast concrete slabs cost about 35 cents per square foot.

While concrete blocks make a very cheap and light curtain wall, the price being about the same as for the 8-inch tile, the writer's experience with them has been rather unfortunate on account of their extreme porosity.

Where the location of the buildings have demanded special treatment of the exposed surfaces, we have generally specified rubbing with a block of carborundum. The average cost of this work has been 4 cents per square foot. In two instances portions of the structure have been bush hammered with a resulting average cost of 7 cents per square foot.

Concrete piles were used on the foundation of several of the buildings, and the average cost of the piles was $1.15 per linear foot.

The most common methods of waterproofing concrete structures are by the introduction of foreign ingredients into the concrete, by the application of a compound to the concrete surface, by the use of paper or felt waterproofing, and by accurately grading and proportioning the aggregate and the cement.

Where an addition of hydrated lime in the proportions of 10 per cent. to the weight of the cement has been used the added cost to a cubic yard of 1:2:4 concrete has been 50 cents. Patented compounds similar to Hydrolithic cement have cost from 25 to 35 cents per square foot of surface covered. On horizontal or inclined surfaces we have sometimes used a granolithic surface of rich mortar of Portland cement and sand, or Portland cement and screenings in the proportions of 1:1 laid at the same time as the base and troweled as in side walls construction. The cost of this work has been about 5 cents per square foot.

Taken as a whole, the lowest possible cost on a reinforced concrete building can be obtained only by a careful study of each particular case to determine the cheapest type of construction and most economical spacing of columns. As a general proposition, we have found that for light loads with ordinary beam and girder construction the most economical spacing of columns has been 18 feet each way, and for flat slab construction 20 feet each way. For heavy loads, such as 300 pounds per square foot and over, it has been our experience that the cheapest column spacing for beam and girder construction is 15 feet by 15 feet, and for flat slab construction 17 feet by 17 feet. In arriving at the most economical layout it is always well to bear in mind that the construction which allows the greatest simplicity of form units together with the maximum number of repetitions of same is invariably the one that will work out cheapest in the end. The fact that the actual amount of concrete or steel required for a certain floor construction is less than that required in another by no means implies that this is actually the cheapest floor construction, as the unit labor of the form work may easily have been increased out of all proportion

ROAD-OILING BY MOTOR-TRUCK.

The motor-truck has evidently come to stay. Its uses are constantly increasing. One of the interesting conditions under which motor-trucks have been used successfully is in the spreading of oil and binder for roads. In a recent report on the macadam roads of Jackson county, Montana, details regarding the methods and costs of treating the macadam roads during the year 1911 are given. The facts recorded are of interest to the municipal and highway engineer as instancing the efficiency to which the motor-truck has arrived. The macadam was thoroughly swept with a rotary street broom hitched to a motor-truck, after which the one side of the road, including the dirt, was oiled and immediately spread with fine grit or dust screenings. After an interval of three days the other side was oiled. In some instances the length of the haul was fifteen miles, the oil being delivered in tanks on side tracks at the railroad station, from which it was pumped into the motor-truck tank. The dust was all hauled by motor also. Oil was applied to over 150 miles of road during the year, having an aggregate area of nearly six and a half million square yards. The actual cost, not including the first cost of the motor-trucks, was about seven-tenths cent per square yard. This cost includes oil, labor, surfacing dust, freight, chauffeurs, repairs to trucks, storage and gasoline for operating. It would appear that the field for the use of motor-trucks is constantly increasing, particularly with regard to municipal operations. No doubt in the future there will be widespread use on road-making, oiling, street-cleaning, and the many other phases of city work.

NORTHERN ONTARIO.

The report on the natural resources and trade prospects of Northern Ontario, issued by the Toronto Board of Trade last week, is another vivid reminder of the pioneering work in Canada yet to be accomplished. There are 20,000,000 acres of good agricultural land to be settled in that region alone. Then we have the Peace River district; the new portions of Manitoba, Ontario and Quebec, given under the recent boundary agreement; large sections of British Columbia and Saskatchewan. When past achievements are considered, they are almost overshadowed by thoughts of the great areas still to be settled and cultivated. This is work for both the present and future generations.

The report on Ontario's Northland presents an idea of the natural resources and of the trade prospects of that country, and it was thought well to quote certain statistics relating to Canada as a whole and others showing Old Ontario's contribution. In this way it is possible to judge what Ontario has accomplished with only the lower portion of the province developed and cultivated. On that basis, and in view of the great natural wealth of the Northland, one is able to realize to some extent the great agricultural and industrial possibilities which exist there and the consequent opportunities for trade.

Emphasis has been placed in the report upon the necessity for the settlement of the land for agricultural purposes. This is done without wishing to minimize the immense importance to Canada of the mining industry. The point which it is desired to make is that to a large degree the business of towns depending for their existence on mining camps must necessarily be to some extent of a temporary nature. On the other hand, those communities backed by extensive agricultural areas, well settled and well tilled, possess a permanent basis.

The principal points of the report may be summarized as follows:—

The railroad mileage, finished and under construction, is sufficient to induce a large agricultural settlement. The outlook for further railroad construction is good. With the completion of the Grand Trunk Pacific and the proposed Canadian Northern Port Arthur to Montreal branch, the railroad steel will run through the northern and the southern borders of the great clay belt, while the Ontario Government railroad connects Toronto and Old Ontario with these developments.

With the continued production of silver in the Cobalt region, there appears to be an opening for a local smelting industry, which would be largely assisted by the adequate water powers in the immediate neighborhood.

The timber wealth of Northern Ontario is the basis of new industrial development. Not only have the total exports of pulp and paper by the United States decreased, but the imports into that country have largely increased, and notably those from Canada. The possibilities of pulp and paper manufacture in the north are such as would seem to demand aggressive action with a view to exploiting the timber resources in that direction.

In view of these considerations, the provincial regulation prohibiting the export of spruce and other woods suitable for pulp, cut on Crown lands, seems amply justified. An analysis of the timber situation in Northern Ontario reveals a need for capital for the development of these resources. Up to the present the capitalists who have interested themselves in this industry have chiefly confined thetir attention to Quebec province. The Northland offers investments equally as good as those of the neighboring province. The desirability of reduced timber dues may be discussed in this connection.

The wooded condition of the large land areas makes adequate fire protection of towns and forest lands imperative.

The available water powers of Northern Ontario are unique, being found among the pine and hardwood forests, and in many cases contiguous to mineral deposits. The raw material and the power for their manufacture are thus side by side. They are the basis of much possible industrial development.

The 20,000,000 acres of agricultural lands offer great inducements to the prospective settler. Land can be taken up within a reasonable distance of railroad facilities and a town. The markets await the produce of the farm-to-be. The land is well timbered, and, while it has to be cleared, offers an unlimited supply of fuel and gives the settler an immediate merchantable asset in the shape of pulpwood.

Considerable assistance is required from the provincial government in cutting roads in the agricultural regions where it is desired to settle. It appears unfair to place almost the entire burden of this work upon the incoming settler himself. Only two government roads cross the last 114 miles of the government railway.

It might prove desirable to consider the appointment of a Northern Ontario colonization commission, whose duty would be to handle the entire question of the agricultural settlement of the Northland. The membership of the commission would naturally include representatives of the various provincial government departments now interested individually in this matter.

The importance of good roads in the Northern bush country cannot be over-estimated. That and similar assistance to the incoming settler is an imperative duty on the part of the Ontario provincial government.

TAR TREATMENT FOR ROADS.

There has been a good deal of discussion among engineers concerning the advantages to be gained by the use of tar as a coating for macadam road surfaces. The consensus of opinion is that tar treatment is justified, although there has been very little evidence from engineers showing the efficiency of the method as to cost.

The City Engineer of Bristol, acting under instructions from the Council, has made an investigation to determine the results of the tar treatment on macadam road surfaces, and has prepared a statement showing the cost of road maintenance each year since the tar spraying was adopted. The report appears in this issue of *The Canadian Engineer*, and shows conclusively that tar treatment under certain conditions is amply justified. On well-laid macadam with light traffic and medium grades excellent results were secured. While little actual saving in cost was shown as a result of the treatment, still the dust nuisance has practically disappeared, and the streets and roads generally are cleaner than ever before. The City Engineer states that there is little question that there has been considerable saving, although it is hard to put it in figures.

EDITORIAL COMMENT.

Toronto's new trunk sewer system will soon be in operation. All that remains to be done is the installation of the pumps at the sewage disposal works and the completion of the high-level intercepting sewer. This will be one step towards the freeing of the water supply of Toronto from contamination and the improvement of Toronto Bay, as the sewage effluent after passing through the disposal works will be discharged into the lake below the city. It is a question, however, whether it will not be necessary to complete the purification by chlorinating the effluent before discharge.

* * * *

There is a bill before the Legislature of Saskatchewan for the protection of persons employed in the construction of buildings. This has been brought in as a result of the many accidents to workmen engaged in the building trades. The bill recites certain regulations which will apply in the erection, alteration, repair, improvement or demolition of any building to prevent accident. The measure authorizes the Lieutenant-Governor-in-Council to appoint inspectors to enforce its enactments in any part of the province. This bill, if carried, will do much towards lessening the accident list in the Province.

* * * *

A peculiar condition of affairs has arisen in New York as a result of an order of the Supreme Court reinstating Mr. James G. Collins as head of New York City Highway Bureau. Mr. Collins was deposed from the Bureau of Highways eight years ago and a successor appointed. Since that time there has been constant litigation between Mr. Collins and the city of New York, with the final judgment of re-instatement with the right to collect salary and interest for the past eight years. The extraordinary feature of the case is that the office of the Bureau of Highways no longer exists, having been abolished a year or so ago, so that Mr. Collins has been reinstated to a position which does not exist.

THE STORAGE OF PORTLAND CEMENT.

Portland cement is easily affected by moisture. It is purposely made so; for, combined with water and other substances, it forms the best of all building materials—everlasting concrete. But moisture must be kept away from cement until it is needed for actual use. This means that cement must be stored in places which are and can be kept absolutely dry. Upon the proper storage of cement are dependent the reputation of the contractor or builder, the trade of the local dealer, and the satisfaction of the user.

Cement on the Work Piled Properly on Wooden Platform.

Temporary Sheds for Contractors and Builders.—On account of the quantity which they keep on hand, dealers and contractors often build special houses for the storage of Portland cement. Almost any material will do for the construction provided it will shed water and will remain weather-proof. Frequently, for temporary storage, contractors build sheds of "up and down" plank covered on the outside with one or more thicknesses of tarred paper. The floor must be above possible high water and open so that the wind can circulate under it. To make the house more completely damp-proof, the floor should be double or its equivalent. Often the same effect is obtained by a makeshift double floor of loose timbers and boards laid upon the regular floor. For such a temporary shed, there is nothing better than a well-made one-way-slope tarred paper roof on sheathing laid with tight joints lengthwise or in clapboard fashion crosswise. Let the roof have a drip or over-hang of at least a foot on all sides. See that it is absolutely water-tight, that the rain cannot beat in under the eaves, and that the roof is fixed so firmly that a wind-storm will not raise it. It is advisable to put no windows in such a house and to have the door so securely hinged and fastened as to keep out intruders. Where use of cement in the work is dependent upon acceptance by test, provision for piling should be made in accordance with instructions given below for dealers.

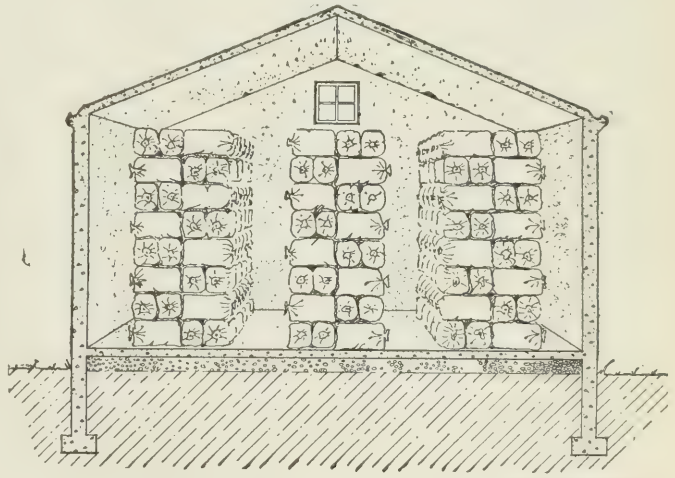
Storage Houses for Dealers.—The same general principles stated above apply to storage houses for dealers. Naturally the house is made more permanent in character. Consequently, it should be supported by a concrete foundation extending into the ground below the frost line. Likewise, for a permanent building, there is no material so good as well-proportioned concrete. Place the concrete floor on sufficient coarse, compacted gravel or broken stone fill to bring the floor level a foot above the surrounding ground. Slope the surface of the floor toward the door. For a one-story building, a 6-inch reinforced wall is strong enough. With a reinforced concrete roof, the cement will be protected from all possible danger of dampness.

Since Portland cement weighs practically 100 pounds per cubic foot, the beams of the floors elevated above ground must be heavy and be supported at frequent intervals by concrete piers. If window openings are necessary, do not use sash. A strong door hinged at the top and capable of being fastened on the inside is much better for keeping out dampness. Often the building has a solid or skeleton lining on the inside, for reasons given under directions for storing cement. It should be well sway-braced on the inside to prevent springing of cracks or bulging.

The size of the house is dependent upon the extent and character of the dealer's trade. An average carload of Portland cement contains about 175 to 200 barrels of four bags each. In determining the necessary size of the cement sheds, consider that each bag of cement stored will occupy one cubic foot. Do not build too small. There is an increasing demand everywhere for Portland cement and the trade of local dealers is far surpassing expectations.

The character of trade has much to do with fixing the size of the storage house. Especially dealers who supply contractors should have sufficient room to keep every shipment separate; for cement used by contractors and builders must often pass a seven or twenty-eight-day test before being used. Moreover, every cement storage house should be large enough to have aisles between the piles of various shipments, so that cement may be removed from storage in the same rotation as it was put in.

Storage for Users of Cement.—Many users of Portland cement need to store it only for the short intervals between the time of hauling it from the dealer and using it in the concrete work. Any building with a good roof, tight sides, walls, and a dry floor will do. Make a temporary double floor by means of small beams or logs and loose boards. See that driving rains or damp air cannot reach the cement.



Cross-Section of Concrete Storage House with Cement Correctly Piled.

Directions for Storing Cement.—Portland cement weight nearly 100 pounds per cubic foot, therefore judgment must be exercised in loading the floor. Likewise, on account of its weight and possible damage from dampness, do not pile

the cement against the sidewalls of the building, unless the house is full-lined or skeleton-lined on the inside. Store the cement so as to leave an open space or an aisle along the side-walls and aisles at places necessary to separate shipments. Get rid of all possibility of the cement piles toppling over by laying the bags, as a mason would say, "headers and stretchers," that is, alternately lengthwise and crosswise, so as to tie the pile together. Examine the building frequently to see that there are no leaks in the roof or side-walls.

Even on the work, never pile cement on the ground or on bricks. Throw down a few blocks, lay boards upon them and make a dry floor for the cement. Have just enough cement on the work to keep things going. A good tarpaulin is handy to cover up the cement in case of a sudden shower. Always buy cement from the dealer who has a dry store-house. If the cement in the bag has been wet, it is hard as a rock: do not use it under any circumstances. However, do not mistake lumps caused by pressure in the store-house for "set-up" cement. Such lumps crumble easily and the cement is perfectly good. Take care of the Portland cement just as carefully after receiving it as a good dealer does, and, properly mixed with sand and stone or gravel, it will yield a binding material proof for all time against fire and repairs.

COST OF ISOLATED PLANT POWER.

The following is a report prepared by the American Engine Company, Pound Brook, N.J., on the cost of isolated plant power, as generated by non-condensing engines with exhaust steam used for heating during the winter season:

Where steam heating is required, electric power may be generated as a by-product of the heating plant, at a cost of less than two cents per kilowatt hour in the majority of cases. The reasons for this low cost of generation may be summarized as follows:

(1) The fixed costs, which go to make up a large share of the cost of power, are chargeable only against the additional investment for the plant by which electric power is generated, over and above the investment for the low pressure steam heating plant.

(2) The coal cost chargeable against electric power is reduced, during those periods when the exhaust steam is used for heating, to a small percentage of the coal consumed, representing that part of the heat in the steam which is lost between the high pressure boiler and the heating system.

(3) The labor charge comprises only the additional labor required, as compared to a low pressure heating plant. Furthermore, by reason of the additional labor, which is of a higher grade, greater economy is obtained in fuel consumption, amounting to a saving in coal of 5 to 15 per cent., which, in a plant of fair size, will pay the wages of an engineer.

(4) While the charge for oil, waste, repairs, and miscellaneous items is incurred entirely through the installation of the engine and generator, they mount up to but a small proportion of the total expense.

Every isolated plant with exhaust steam heating must be considered as a separate problem, because of the wide variation in load, cost of coal, water, labor, etc. The following case, which may be presented as a typical one, will serve to outline the calculation whereby the cost of power may be determined, and secondly, to indicate the influence on the cost per k.w. hour of the three most important factors, i.e., the fixed charges, the price of coal and the amount of exhaust steam used for heating.

Fixed Charges.—An industrial plant operating 3,000 hours per year, with an average load of 200 kw. will be assumed. Two 100-kw. and one 50-kw. engine driven dynamos installed with suitable piping and appurtenances may be set down at $11,000.

Two 200-h.p. boilers would be required. However, the total cost of these boilers would not be chargeable against power since boilers would also be required for the low pressure heating plant. The cost per h.p. of low pressure boilers, grates, stack, etc., is about the same as a similar high pressure equipment. However, as heat is lost and consumed between the high pressure boiler and the heating system, a somewhat greater boiler capacity must be installed when power is to be generated. As the exhaust from an engine contains 80 to 90 per cent. of the heat given it, in the boiler, an increase of boiler capacity of 25 per cent. over the low pressure equipment will easily take care of this item and also any additional cost of a h.p. boiler as compared to a low pressure equipment. Setting down $18.75 per horsepower, including boiler, grates, stack setting, piping and labor of installation, the additional boiler cost is 400 h.p. × 20% × $18.75 = $1,500.

This additional boiler cost will vary, in fact in plants already equipped with low pressure boilers, it will pay to replace the equipment with high pressure boilers and utilize exhaust steam for heating. The effect of thus increasing fixed charges on the boiler plant equipment will be demonstrated in connection with the charts to be presented.

The two largest items of additional first cost, totaling $12,500, have been considered. It might, of course, be profitable to install other apparatus in a plant of this character, as for instance a feed water heater. But as that piece of apparatus should pay for itself out of the coal saved, it will not be considered under the items of additional first cost.

Of the total additional cost of $12,500, a certain fixed percentage must be charged off every year against the cost of power. The fixed charge may be set down as follows:—

Interest at	5%
Depreciation at	5%
Insurance, real estate, upkeep, obsolescence	5%
Total	15%

And 15% of $12,500 = $1,875.00.....(1)

is the fixed charge per year against the additional investment for apparatus to generate power as a bi-product of the heating system.

Labor, Oil, Waste, Miscellaneous.—The cost for additional labor may be taken as one man at $800 per year, while repairs, oil, waste, packing, etc., may be set down as $250, making a total of

$1,050 ..... (2)

Coal.—The coal chargeable against power comprises the coal equivalent of the heat lost between the high pressure boiler and the heating system when the heating season is on, and when no heating is being done, all of the coal burned under the boiler is chargeable against power.

The cost for coal will, therefore, depend upon (a) the steam consumption of the engines per kw. hour; (b) the efficiency of the boiler, or pounds of steam per pound of coal; (c) the cost of coal, and (d) the percentage of the total amount of steam generated which is used by the heating system.

Item (a). The steam consumption of an American-Ball Angle Compound Engine—the engine for isolated plant work—is 26 lbs. per horse power hour (non-condensing), or 40

lbs. per kilowatt hour. In order to be on the safe side and to take care of the effect of reduced and fluctuating loads on steam consumption, assume 60 lbs. of steam per kw. hour.

Item (b). Assume boiler efficiency as 60%, or about 8 lbs. of steam per pound of coal.

Items (c) (d). The cost of coal and the proportion of the total steam generated which is used in the heating system are both variable.

In the table given herewith, the cost of coal ranges from $1 to $5. The amount of steam used in the heating system is taken care of by considering it, as the number of months of the year when the exhaust steam is used for heating. During those months it is assumed that all the exhaust steam is used by the heating system. Strictly speaking, at the beginning and end of the heating season, there are periods when only a moderate amount of heating is required and only a portion of the steam exhausted by the engines is utilized. This decrease in heating load may be taken care of by assuming a shorter heating season. For example, suppose that for four months during the winter, all the exhaust steam was used in the heating season, and that for one and a half months before and after this season the amount of steam used in the heating system varied from zero to full capacity. It would, then, be quite accurate to assume that the heating season of seven months would be equivalent, so far as amount of steam used for heating, to a season of five and a half months, in which the heating load was always equivalent to the full exhaust of the engine.

Water.—An average price for water is 10.0 cents per 1,000 gallons. During the heating season it is assumed that only 80 per cent. of the water is returned to the boiler. During other periods all the water is lost.

It should be noted that it is assumed that in a low pressure heating system all the water is returned to the boiler, that is, there is no loss, and in setting down the additional cost for water when power is produced as a by-product, it is assumed that condensation in high pressure steam piping, condensation in the engine, etc., results in a 20 per cent. loss during the heating season, and when the steam is exhausted to atmosphere, a 100 per cent. loss.

With the fixed costs, labor cost, already given, and calculating the coal and water charges for given conditions, the table and charts shown were obtained. The following example will serve to explain in detail the method of obtaining these figures.

Example.—Assume the heating season equivalent to six months of full load steam heating, during which all the exhaust is used. During this period the coal chargeable against power is the equivalent of the steam and heat lost between the high pressure boiler and the heating system. Assume that 20 per cent. of the heat of the steam is lost in this manner. The other factors entering into the coal cost have already been given, i.e., load 200 kw., steam consumption 60 lbs. of steam per kw. hour, coal consumption 1 lb. of coal per 8 lbs. of steam, hours per year, 3,000. With coal at $4.00, we then have the cost for coal during the 6 months heating period, as follows:

$$\frac{200}{2} \times \frac{3{,}000}{8} \times \frac{60 \times 20\% \times \$4.00}{2{,}000} = \$900.$$

The part of the year when there is no exhaust steam heating, and those parts of the year when only part of the exhaust steam is used for heating, are equivalent to six months of straight non-condensing operation. The cost of coal is therefore:

$$\frac{200}{2} \times \frac{3{,}000}{8} \times \frac{60 \times \$4.00}{2{,}000} = \$4{,}500.00.$$

To this coal cost must be added the cost for water which may be set down at 10 cents per thousand gallons. During the heating season the heating system returns 80% of the boiler feed. The cost for water is then:

$$\frac{200}{2} \times \frac{3{,}000}{8.33} \times \frac{60 \times 20\% \times 10¢}{1{,}000} = \$43.20.$$

Table I.

Cost of power per kw. hour in a typical isolated plant. Average load 200 kw.:

Months of Exhaust Steam Heating.	Price of Coal $ Per Ton.					
	$0	$1	$2	$3	$4	$5
2	.550	.880	1.200	1.525	1.850	2.175
4	.540	.820	1.090	1.365	1.640	1.915
6	.531	.755	.983	1.205	1.431	1.656
8	.521	.700	.871	1.046	1.221	1.396

For the other six months the cost for water is as follows:

$$\frac{200}{2} \times \frac{3{,}000}{8.33} \times \frac{60 \times 10¢}{1{,}000} = \$216.00.$$

We may now set down the total charges for generating power at the rate of 200 kw. for 3,000 hours a year, as follows:

Fixed charge	$1,875.00
Labor, oil and miscellaneous	1,050.00
Coal	4,500.00
	900.00
Water	216.00
	43.00
Total	$8,584.00

During the year there are developed 3,000 × 200 = 600,000 kw. hours, giving a cost per kw. hour of

$8,584 ÷ 500,000 = 1.431 cents per kw. hour.

In the same manner it is found that when heating season is equivalent to only two months of full-load heating the cost per kw. hour is 1.85 cent. For the same conditions when the price of coal is $5.00 instead of $4.00, the cost per kw. hour is 2.175, and in this way the table shown was compiled.

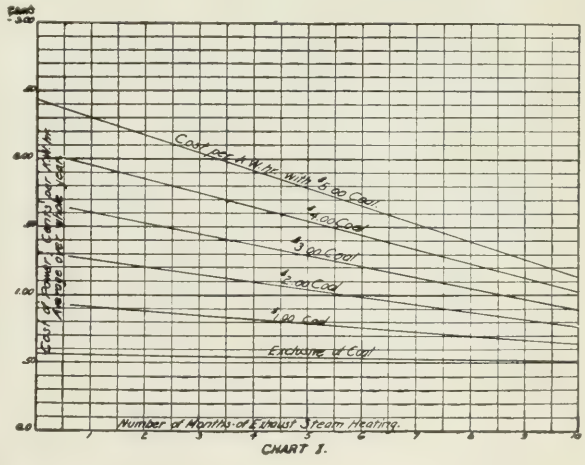


CHART 1.

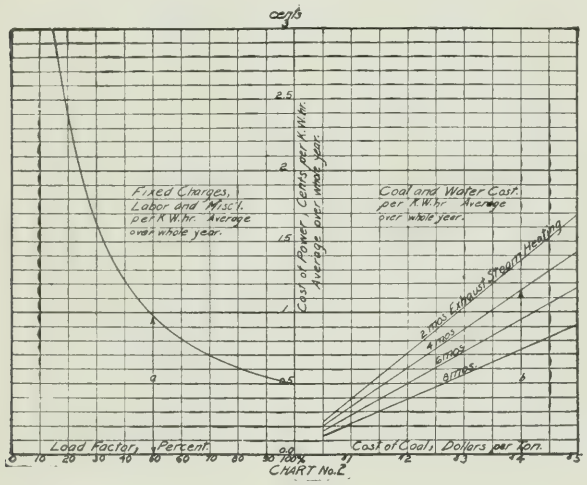
Charts.—From this data the charts of Figure 1 and Figure 2 were prepared. In Figure 1 the cost of power in cents per kw. hour (average over the whole year) is plotted against the number of months that exhaust steam is used for heating, each line represents a different price of coal. With this chart in hand, we can study the influence of coal

cost, length of heating periods and also the influence of first cost, and also of percentage of that cost which should be charged off per year, in order to take care of interest, depreciation, etc.

Suppose, for instance, as has already been suggested, that instead of considering the additional cost of a high pressure boiler plant, and engine, as against a low pressure boiler plant, we desire to find out the cost of power in a plant where a low pressure boiler is already installed and must be replaced. The additional first cost of the high pressure boiler over and above the low pressure boiler taking into account the fact that a boiler of higher capacity would be required, was set down in the foregoing analysis at $1,500. Assume that an entire new boiler would be needed, costing five times this amount, or $7,500. This would increase the additional first cost of the plant by $6,000 and the additional yearly charges by 15 per cent. of $6,000, or $900, making the total fixed charge $2,775, instead of $1,875, and for 600,000 kw. hours per year, would increase the fixed charge per kw. hour from .312 cents to .462 cents, or an increase of .150 cents. The influence of this additional charge of .150 cents upon the cost of power with $4 coal, and when three months' exhaust steam heating is used, is therefore an increase from 1.75 cents to 1.90 cents per kw. hour.



Fixed Charges, Labor and Misc'l. per K.W.hr. Average over whole year.
Coal and Water Cost per K.W.hr. Average over whole year.
Average Cost of Power per K.W.hr. Cents
Load Factor, Percent.
Cost of Coal, Dollars per Ton.
CHART No. 2

In the chart of Fig. 2 the cost per kw. hour is plotted against the cost of coal in dollars per ton, and each line represents the cost for different lengths of heating periods. This chart is useful for investigating the effect of the price of coal and also the comparative effect of length of heating season and price of coal. For instance, the cost per kw. hour is practically the same for an eight months solid heating season with $4 coal, as it is with a two months heating season with $2 coal.

On reference to this chart it will be noted that the cost exclusive of coal and water are considered separately, being plotted against load factor.

A load of 200 kw. 3,000 hours per year is considered as 100% load factor (although the plant capacity is 250 kw.). At 100% the fixed charge, labor charge, etc., per kw. hour is $\frac{\$1,875 + \$1,050}{600,000} = .488$ cents. Similarly at 50% load factor the cost per kw. hour, exclusive of coal and water, is $\frac{1,875 + 1,050}{300,000} = .976$ cents.

By similar calculations the complete curve is plotted, which may be used in connection with the curves at the right in order to study the cost of power under various conditions. Suppose, for instance, that the load factor is 50%, then the ordinate "a" = 98 cents = fixed charge, labor, etc.; if the coal cost is $4 a ton and the number of months exhaust steam heating is 4; then the coal and water cost per kw. hour is given by "b" which equals 1.17 cents and the total cost of power per kw. hour equals a + b = 2.15 cents.

Now, the question that naturally arises in the mind of the consumer of electric current is this:

If the isolated plant with its small capacity and efficiency, further decreased by the fact that it must exhaust its steam for a part of the year to atmosphere, can generate power for two cents a kw. hour, why is it that the central station, in which maximum economy is obtained by cutting down all losses, generating in large units, operating, condensing, etc., cannot generate power at a far less cost than this and sell it for a price approximating one to two cents per kw. hour?

The central station can produce power **at its own switchboard** for a cost including both operating and fixed charges of one cent per kw. hour. But this is only a part of the total cost to the consumer, since it is necessary to have an elaborate and expensive transmission and distributing system of copper cable, feeders, sub-stations, etc., in order to deliver the power. The power house furnishes electricity to the distributing system, which acts as a carrier, and which must pay interest, depreciation, franchise and maintenance charges, just as must a railroad. As with the railroad, there is a natural tendency towards rate discrimination, and it is only the favored consumer who obtains power at a reasonable charge, while the other man bears the burden.

COMING EFFICIENCY IN WATERWORKS MANAGEMENT.*

By W. H. Richards.

Much has been written of late of scientific efficiency, the aim being to get a greater return with less effort, but behind this movement is the increasing desire to promote that efficiency which saves material as well as labor and thus reduces cost of output. So strongly has this idea taken hold of the people that the day is not far distant when the management of at least all the larger corporations, both public and private, will be judged by the resulting cost.

So far as water departments, either public or private, are concerned, this will first manifest itself in the cities of medium size. And it is important that this society conside. some of the ways in which this demand must be met, and it is with this in view that this paper is presented.

Whatever of criticism will be found in this paper applies with equal force to private companies or public corporations, as lack of efficient management is found as often in one as in the other, and in the final analysis the public pays in each case.

To promote the greatest efficiency the board of managers or commission, by whatever name it may be called, should be non-political and its duties should be strictly separated from the executive part of the work, being confined to matters of general policy, approval of expenditures, appropriations, general plans, formulation of rules, etc., appointment and removal of subordinates being made only on recommendation of the general manager, superintendent, engineer, commissioner or whatever title may be given to the executive head, for upon the latter rests, or should rest, mainly the responsibility for the efficiency of the work. For the

* Paper read before the New England Water Works Association and printed in the Journal of the Association.

remainder of this paper he will be referred to as the superintendent.

What kind of a man should the superintendent be? Not necessarily an engineer in the sense of being a graduate with a "sheepskin," but he certainly should be an engineer in the larger sense that he should be ingenious, capable of interpreting a drawing or making one if necessary, with a thorough knowledge of construction and tools, and he must have or immediately acquire a knowledge of the fundamental principles of hydraulics, and over and above all else he should understand the principles of business management. Such a man, it is perhaps unnecessary to state, cannot be secured for $1,200 or $1,500 per year. If the organization be a new one, several years must elapse in experiments, and usually the "fads and fancies" of the superintendent have to be tried out and their utility tested. Even with the above qualifications he has much to learn, for the management of waterworks requires much special knowledge.

The powers of the superintendent should be large, and to secure the greatest efficiency he should have a voice in the appointment of his subordinates, as well as the power to recommend discharge after proper hearing, for efficiency cannot be secured without discipline by a single responsible head. With such an organization the economy in conducting the work will be improved from year to year; efficiency without economy is impossible. Many policies have been settled by experience, and most of them have been put in print, but there remains much that is experimental, and the solution of many problems must be left to the ingenuity of the superintendent as they arise. For instance, while the efficiency of the cast-iron mains has been pretty thoroughly tested with most waters, the life and coatings of steel mains are still problematical. The size of mains necessary in certain places offers a wide field for ingenuity and thought on the part of the superintendent; so with the service pipe; except in special qualities of water, lead is almost universally used, yet the regulation of the size is subject to wide variation dependent on the pressure and quantity of water necessary or desirable to be supplied in a given time, and the regulation of the size calls for even more consideration than the size of the mains, for the theory that a certain quantity of water will go through a certain-sized hole regardless of the length of the pipe is one of the most common errors of the ignorant and unthinking.

I believe no one has yet discovered the best water meter, yet there is a chance to exercise considerable judgment of the kind or type for different circumstances or uses, and if the board of management insist on selecting the cheapest without regard to material or construction, the result will be disastrous to the efficiency of the meter department.

The conclusions of sanitary experts are changing every minute, and the superintendent must have a very logical mind to separate the theoretical from the practical.

What about the composition of the board of directors? The corner grocery or professional politics do not usually fit men for undertaking large affairs, and a man who never handled a hundred dollars in his life is somewhat bewildered when given $100,000 to spend. Some men are so constituted that they magnify a dollar to cartwheel size; others have so little knowledge of its value, especially when it belongs to some one else, as to ignore its size altogether. The first, while saving cents, will lose dollars, and the second will lose both. The best proof of a man's ability to manage large undertakings for other people is that he has managed his own large business successfully. A board of managers, for instance, when buying land or rights, may in their effort to drive a sharp bargain, overreach and get into a law suit which will cost many times the amount saved. Another board may saddle the city or company with a filter or an expensive reservoir unnecessary for the time being at least.

In construction or extension of the work where it is necessary to engage a designing engineer, the superintendent may give advice which should always be given consideration. For the design of work is one thing and the care of it another. Many a superintendent has been worried into the grave trying to adapt an impractical scheme designed by an engineer without experience in management.

The board, when selecting its designing or consulting engineer, might remember that a six weeks' trip to Europe does not make an engineer, and might well consider if an expensive filter or massive dam is necessary. The interest account of many a city or company is burdened with the cost of an extravagant structure built but to gratify the fad of the designing engineer.

A celebrated foreign engineer, on viewing a large waterworks dam, once said that "any fool could build a dam if he could use a large enough factor of safety."

It should be borne in mind that every gallon of water has a fixed value, and that that value is dependent on the cost and capacity of the work and the expense of maintaining it. No work can be run efficiently until this fact is recognized and understood. If the rates are so regulated that one man gets two gallons for the price of one, then the man who uses one gallon and pays for it pays part of the other man's water rate.

The cost of the water system and its maintenance should be borne by the consumer of water and, except as to that part of the expenditure necessary for the extinguishment of fires, in proportion to the amount of water used.

The practice of furnishing water free to the city departments, hospital and other institutions which may make a plausible plea to the board, as well as the practice of furnishing extra fire protection free to certain parties who are patrons of certain insurance companies, is not only unjust to the ratepayers, but makes a statement of the measure of efficiency impossible.

If it is thought necessary to lay out a park or pleasure ground on lands controlled by a public water department, why not charge it to the park department? What has tree culture to do with the conduct of a water system?

Many cities have tons of lead service pipe where they will never be used, laid with the expectation of preventing the disturbance of the pavement which other public service corporations dig up without hindrance. It has become necessary in one large city to expose the mains and shut off these unused extra service pipes to prevent leakage.

Few water departments make any account of water furnished to other city departments, and, on the other hand, few water departments make remuneration for damage to streets. A precise system of accounting would stop many leaks in a waterworks system. In fact, it is usually impossible to tell whether the works are efficiently managed or not from the published accounts. A balance sheet is of rare occurrence in a water report, and an inventory or any charge for depreciation still more rare.

The president of one water company furnishes all water pipe used, and a relative furnishes all coal, without competition; the water taker pays for both, in high rates. The superintendent has been dismissed, being of a too prying disposition. Another water company has all outside work done by a relative of the president on a percentage. What is more common than for one member of the board to interfere with details of the management of a department?—and the more ignorant he is the more likely he is to interfere.

Of what use is a meter system when 30 per cent. of the water is wasted by poorly jointed pipe and 20 per cent. by the waste in public buildings?

Efficiency can only be effected by order and system coming through one responsible head, and that head must be more or less of an autocrat, each subordinate being in turn responsible to the one above.

In this age, when improvements in methods and means of transacting business are constantly being introduced, it requires constant study and clear discernment to find and apply the device or method necessary for the particular work.

In a city of considerable size it is impossible for the superintendent to observe every detail of the work, and he will accomplish more in his office than in his automobile, but he must first acquire a knowledge of the work and his subordinates by observation. At his desk he decides a multitude of problems, from the color of paint to quality of yarning, from the probable registry of an obstructed meter to the efficiency of his pumps; and all the time he must know what each subordinate is doing and what he is going to do the next day.

This in general is an outline of some of the things necessary to have and a few of the things to avoid in an efficient waterworks system, and the efficiency is measured by the cost of the water supplied, taking into consideration its quantity and the necessary expense to secure and distribute it.

As mentioned above, the time is fast approaching when the constantly increasing indebtedness of water supply systems will attract the public attention and managers will be held strictly accountable to the public. Until that time comes, the following description of the waterworks superintendent by President Alvord, of the American Water Works Association, will hold good: "He has held out to him no alluring pension as a reward for the honest, faithful and nerve-racking care and service he gives, but is haunted day and night by fear of a broken main, failure of water supply, or of disease tracable to the water. He has trouble securing funds for procuring the necessary equipment, and, above all, has to deal, always courteously but firmly, with the ever-present infuriated citizen who insists he is not getting his just dues from a government he helps to support."

How can efficiency be best promoted? I should say by system carefully thought out, by having order everywhere, and by well-defined rules thoroughly and impartially enforced.

COMBUSTION OF PULVERIZED COAL.

In a paper read before the American Institute of Chemical Engineers, L. S. Hughes summarized the advantages of using pulverized coal and discussed the difficulties encountered in its use. The chief difficulty has been the destruction of the firebox and crown-sheet. Both bricks and steel "melted" little by little, which effect has been attributed to the high temperature of the flame produced by pulverized coal.

When the temperature of the flame was reduced, the grate bars, crown-sheet and walls of the firebox became covered with a vitreous, adherent coating of slag or clinker. This clinker is similar to the slag produced in blast furnaces and is evidently formed by the action of the silica of the ash with iron oxide forming a complex fusible silicate. The silica would also act on the firebrick by reducing its melting point.

The remedy suggested and tried consisted in introducing powdered limestone with the coal dust. A simple air-blast injector fed the coal into the firebox and a small amount of limestone, roughly equal in weight to the ash of the coal, was introduced with it. Immediately the character of the ash formed changed from a sticky shower to a dry, pulverulent dust which displayed no tendency to cohere or clinker in any way.

ONTARIO'S MINERAL PRODUCTION.

The total value of the mineral production in Ontario, as shown by the figures appended, was $41,432,898, an increase of $2,119,003, or 5.38 per cent., as compared with 1910, when the output had a value of $39,313,895, or an advance of 25.62 per cent. over the production of 1909, which was $32,981,375. There are seven mineral products that each had a value of one million dollars or over during 1911. Of these which show an increase in value of output over that of 1910 are silver, pig iron, common brick, Portland cement and natural gas. Nickel and copper show a decrease.

In compiling statistics of value, the basis adopted by the Ontario Bureau of Mines is the value of the several products in the form produced, and at the point of production. Were the methods of computation employed by the Department of Mines of Canada, or some of the other provinces, adopted, Ontario's mineral output would be shown to have a considerably higher value.

The greater part of the production came from Porcupine, being derived from the small test mills at two or three properties. The fire destroyed these mills and thus caused the output to be smaller than it otherwise would have been. The two or three large mills that were in course of construction were also destroyed. The new mills at the Dome and

Hollinger mines are nearing completion and will be in operation about the end of the first quarter of the year. The branch of the Ontario Government railway, the Temiskaming and Northern Ontario, is now in operation to South Porcupine, and is almost completed to the townsite of Timmins. The plant of the Canadian Exploration Company at Long Lake, near the Sault branch of the Canadian Pacific Railway, is nearly completed. As soon as electric power is available the mill will begin operations. Toward the end of the year, the St. Anthony mine at Sturgeon Lake, northwest of Port Arthur, was unwatered, and milling of ore has begun. The Belmont or Cordova mine, in Hastings County, has, after being idle a number of years, begun operations under new owners. There was a small production of gold from seven or eight mines, in addition to those mentioned, in other parts of Northern and Northwestern Ontario.

The entire production came from the mines of Cobalt and surrounding region. The output in 1911 was 31,507,791 ounces, this being the greatest annual production since the beginning of mining at Cobalt, exceeding the production of 1910 by approximately one million ounces. The shipments of bullion from Cobalt increased greatly during the past year, owing chiefly to the operations of the refinery of the Nipissing mine. The process employed by that company is somewhat unique, being a combination of amalgamation and cyanidation. There was a shortage of power during the early part of the year owing to an accident to one of the large plants. The power situation has since been satisfactory. The extension of the concentration process has brought about a change in the character of the shipments. Instead of much low grade ore being shipped from Cobatl, the shipments now embrace a large quantity of high grade concentrates. That silver is produced at a very low cost at Cobalt is shown by the last annual report of one of the companies, the Coniagas, which produced metal throughout the year at an average total cost of 8.8 cents an ounce, including mining, concentrating, freight to smelter, sampling, assaying, and treatment charges and all head office expenses and royalties.

At Cobalt in 1911 there were seven mines which each produced 1,500,000 ounces or more of silver. In order of production they are as follows: Nipissing, 4,627,043; La Rose, 4.090,157; Crown Reserve, 3,430,902; Coniagas, 3,273,464; McKinley-Darragh, 2,551,884; Kerr Lake, 2,238,353; Buffalo, 1,644,245. Three other mines produced over a million ounces each.

Two properties at Gowganda were producers during the year, as were also two in South Lorrain.

Refineries at Copper Cliff, Deloro, Thorold and Orillia continue to treat the greater proportion of the high grade ore shipped from Cobalt.

The dividends paid by the companies operating at Cobalt and in South Lorrain in 1911 amounted to $8,588,916, or over one-half of the total value of the silver produced. The total dividends distributed up to the end of 1911 amounted to $30,391,095, not including profits made by two or three privately owned mines or close corporations. For the whole period since the mines were opened at Cobalt, there has been produced from this part of Ontario 125,571,980 ounces of silver, which brought the mine owners $64,317,352.

The quantity of cobalt in crude material shown in the table is only that part of the output which mining companies were paid by purchasers of ore. A much larger quantity was shipped out, but, for the most part, brought no returns. The table also shows the quantity and value of cobalt oxide, cobalt nickel oxides, and other cobalt-holding material shipped by the refineries of the Province. The market for cobalt oxide continues depressed.

The nickel mines and smelters in the vicinity of Sudbury had a smaller output in 1911 than in 1910. Toward the end of the year, however, the output was increased, and the two operating companies are preparing to still further increase it. The Mond Nickel Company is arranging for the erection of a plant with increased capacity at Coniston, east of Sudbury, at the junction of the Canadian Northern with the Canadian Pacific Railway.

The nickel contents of the silver-cobalt ores, which yield nothing to the mine owners, are not here included in the output of nickel.

The copper produced in Ontario last year came from the nickel-copper mines at Sudbury. The two metals, copper and nickel, occurring together, the output of the former rises and falls with that of the latter. In 1910 the production of copper was 9,630 tons, in matte. In 1911 it was 8,966 tons. The price of the copper in the table of statistics, like that of the nickel, is based on its value in the matte and not on its refined value.

In 1911, all the hematite shipped came from the Helen mine of the Lake Superior Power Company. The quantity was 137,377 tons, an increase over the shipments of 1910, which amounted to 112,246 tons. Three other mines shipped a total of 38,254 tons of magnetite.

The 526,610 tons of pig iron produced came from the following companies, viz., Hamilton Steel and Iron Company, Atikokan Iron Company, Standard Chemical Company, Canada Iron Corporation, and the Algoma Steel Company. The Hamilton Steel and Iron Company were also producers of steel. Of the ore smelted, 67,631 tons were of domestic and 848,814 of foreign origin.

Discoveries of metals, not hitherto found in economic quantities in the province, include mercury and tungsten. The former metal occurs in the silver-bearing Cobalt ores, and the latter in the mineral scheelite, in certain gold-bearing quartz veins at Porcupine.

The value of the building materials, such as brick and Portland cement, produced in 1911 shows a material increase over that of 1910. There is an increasing demand for suitable stone for road-making, and arrangements are being made for opening quarries to supply the needs of the older part of the province. Marble from the quarries near Bancroft, in Hastings County, is being employed for the decoration of the interior of buildings.

The production of petroleum continues to decline. The output during 1911 amounted to 10,102,081 Imperial gallons, as compared with 11,004,357 in 1910.

In contrast to petroleum, natural gas shows an increased production year by year. In 1911 natural gas from Ontario wells had a value of $2,068,429, while in 1910 its value was $1,490,334, and in 1909 considerably less, $1,188,179.

By counties, the new producing wells of 1911 are distributed as follows, viz., Welland 26, Haldimand 124, Brant 60, Norfolk 19, Wentworth 9, and Elgin 16.

Among the products of lesser value, calcium carbide shows a decrease in 1911 as compared with the preceding year. This is due to the absorption of Ontario plants by an extra-provincial company and the closing or partial closing down of the works during a part of the year. Talc shows a considerable increase in quantity and value of output, as does iron pyrites. Another acid plant, which will use pyrites as a raw material, was erected in the province during 1911. There are a number of industries which, owing to abundance of raw material, are capable of great expansion. These include gypsum and salt, both of which show an increased output during the past year.

Ontario's mineral industry is characterized by the variety and uniqueness of its products. Moreover, it is characterized by rapid increase in the value of annual output during recent years, and it offers great scope for increase in the future.

ENGINEERS' LIBRARY

Any book reviewed in these columns may be obtained through the Book Department of The Canadian Engineer.

SEWAGE SLUDGE.

A Review by T. Aird Murray, M. Can. Soc. C.E.

"Sewage Sludge" is the title given to a volume publish- by the McGraw-Hill Book Co., of New York, (price .50.) The volume is divided into four parts, viz., "Treat- ent and Utilization of Sludge," by Alexander Elsner; The Drying of Sludge," by Dr. Mg. Fr. Spillner, Essen- uhr; "Results of the Operation of Some of the Mechanical wage Clarification Plants of the Emscher Association," Dr. Mg. F. Spillner and Mr. Blunk; and "Sludge Treat- ent in the United States," by Kenneth Allen, M. Am. oc. C.E.

The first two parts are translated from the German by enneth and Rose S. Allen, while the third part is trans- ed by Emil Kuichling, M. Am. Soc. C.E.

The four parts of the volume, although distinct and mplete treatises in themselves, offer a combination and ity of comprehensive treatment which has not hitherto en attempted in connection with this special subject from e standpoint of actual results in practice, experimental ta and general observation.

To the engineer, the practical and efficient dealing with e sludge question has now assumed greater importance an hitherto. The general crystallization of the important ws and features, both chemical and biographical, in con- ction with the removal of putrescibility from sewage, has ade itself more apparent of late. Apart from the academic rries which scintillate about some of the more abstruse d impish problems and doctrines affecting the why and e wherefore of certain effects, the ordinary sanitary en- neer, who is not constituted as a sort of chemical intro- ective Hamlet, weighed down by indecision, feels that he n design some sort of a sedimentation tank which will ep back a goodly proportion of the suspended solids, as ell as some sort of a continuous filter which may last a nsiderable period without choking, and so turn out some rt of an oxidized sewage effluent which will not do much arm. But, all this done, there are yet these suspended lids, no longer suspended perhaps, but slightly more con- ntrated and waiting patiently at the base of the tank ask- g the question, "Now, what are you going to do with e?"

It is no longer possible for the engineer to simply say, Oh! I have designed a septic tank. If you will only not ouble the solids, they won't trouble you. These solids re- ain, accumulate, and with their awkward mixture of any- ing from 75 to 95 per cent. of water, have to be eliminated omewhere and somehow, with the least possible odor, fly other nuisance. They have got to be disposed of, rendered offensive, dried, buried by land or sea, burnt, in fact ther naturally or artificially, as sewage solids, annihilated.

Our English contemporary "The Surveyor" recently tated: "The solution of the sludge problem is the most ressing question of the day, and a little practical assist- nce in this direction from our scientists would be of much reater value than all the learned dissertations in theories nd doctrines with which we have been favored in recent years." The sludge question, like the poor, we have al- ways with us. The proof that the subject is of no mean importance is found in the numerous schemes, both natural and mechanical, which have been tried, suggested and ex- perimented with for the one purpose of changing this slimy, viscous, greasy, useless semi-liquid, with something of a more wholesome, or more useful character.

The first three portions of the volume under discussion will be of considerable interest and practical use to en- gineers, as they deal principally very fully with the practical and experimental work in Germany, both with reference to the final disposal of sludge, the reduction of its water con- tent, by pressing, incineration, exposure, and centrifugal appliances. The fourth portion is also of interest from the American point of view, although the author is very much handicapped in the fact that little or no attention has as yet been given to the practical dealing with sludge by me- chanical methods in the States.

The introduction of the centrifuge, after the principle of the cream separator, is of German origin, and efficiencies in results and cost operation are given and compared with other methods, such as pressing. Germany is the banner country of scientific domestic economy, and the whole ques- tion of the utilization of sludge or its products for purposes of fertilization is fully dealt with. Generally speaking, this is the saddest chapter in the story, as in almost every case, the adoption of very expensive methods to make sludge as attractive a soil manure as possible, have resulted in practically bribing farmers to use it after it has been simply thrown at them. The attempts to extract what was once valuable grease from the sludge have, generally, only resur- rected a sort of a ghostly grease with a foul smell which no decent grease should have.

Quoting from page 125, we have the sad experience of Cassel in Germany, "at a cost of $47,600 a reduction plant was built where grease was recovered by the use of benzine after most of the water had been removed by filter presses, and the residue was used as a fertilizer. From 65 cu. yds. of wet sludge 6½ cu. yds. of dry sludge was expected, from which 1,650 lbs. of crude grease and 10,750 lbs. of fertiliz- ing sludge was looked for. The latter was estimated at 32½ cents per 100 lbs. to be worth $34.88. From the crude grease 990 lbs. refined grease was realized, which was estimated at $4.87 per 100 lbs., to be worth $48.20, and 495 lbs. of tarry residue which was estimated at 41.6 cents per 100 lbs. The total revenue from 65 cu. yds. of wet sludge was, therefore, estimated at $88.14. In spite of this, the expenses were greater than the receipts, and the plant was abandoned and taken down. One reason for the failure, aside from the high cost of drying, was that the grease obtained was not marketable, on account of its disagreeable odor."

Apart from any wish to depreciate the value and pos- sible good results which may yet attend the utilization of products derived from sewage sludge and lead to economy in methods of effective disposal, such examples of failure are of obvious value to Canadian engineers, who are, in many cases, approaching a comparatively speaking new en- gineering issue, as far as this country is concerned.

In the future, just as it has been in Great Britain and European countries in the past, many very exaggerated opinions will be held as to the possible values of sewage with reference to its fertilizing and other attributes. It behoves the municipal engineer to prepare himself with what data there exists of value upon this subject. It is not only a question of utilization of by-products, but the much more important question of so disposing of the retained suspended solids of sewage in a clean and efficient manner to meet both the æsthetic and the hygienic requirements of a neighborhood.

The volume under consideration is certain to become a standard for reference and most certainly meets a demand at the psychological moment of requirement. The student will find the whole subject carefully and fully dealt with. The problem of incineration and its many difficulties, owing to the low calorific value of sludge and the presence of water; the difficulties to be met with in pressing sludge without the admixture of chemicals, the comparative qualities of various sludges as presented by ordinary sedimentation tanks, septic tanks and the newer forms of tanks which allow of separate sludge digestion. Perhaps not the least interesting and valuable data presented is that appertaining to clarification of sewage in the Emscher district in Germany.

BOOK REVIEWS.

The Corrosion of Iron and Steel. By J. Newton Friend. Published by Longmans, Green & Co., London; 290 pages; price $1.80.

It can be safely said that no subject is of more practical importance than that dealing with the corrosion of iron and steel. It is a subject that has engrossed the attention of numerous investigators, with the result that many theories as to the cause of corrosion have been advanced. Within recent years, though, the results of practical tests under actual service conditions have been given their due amont of weight, so that a reasonable agreement seems to have been reached in the various theories. There is one obstacle, however, that confronts the new investigator at the present time, namely, that a great deal of previous work has been very loosely recorded, if, indeed, any record of it has ever been made. In his treatise Dr. Friend has made an attempt to gather together the data of research carried on up to the present. The work is not purely historical, however. A great deal of very practical information is distributed throughout the book.

The practical standpoint of the book is indicated in the discussion on the value of the so-called acceleration test. It is clearly pointed out that this test, leaving out of account as it does many of the factors that enter into the commercial problem, is by no means a true criterion of the relative values of iron and steel in resisting corrosion.

Beginning with a history of the iron industry, the book contains fourteen other chapters dealing with: The Action of Air and Water upon Iron; The Action of Steam upon Iron; Various Theories of Corrosion; Is an Acid Essential to Corrosion? Factors Influencing the Rate of Corrision of Iron Exposed to Natural Forces; The Action of Acids upon Iron; The Action of Alkalies upon Iron; The Influence of Aqueous Solutions of Single Salts upon Iron; The Influence of Aqueous Solutions of Two or More Electrolytes upon Iron; The Action of Oils upon Iron; The Passive State of Iron; The Influence of Chemical Composition upon the Corrodibility of Iron; Electrical and Galvanic Action; The Relative Rate of Corrosion of Iron and Steel.

One criticism that might be made, is that the book would have been more commanding in appearance had the page size been 6×9 instead of 5×7½.—T. R. L.

Reinforced Concrete Construction in Theory and Practice. By Henry Adams, M.Inst, C.E., etc., late Professor of Engineering at the City of London College, and Ernest R. Matthews, Assoc. M.Inst. C.E., etc., borough engineer and surveyor of Bridlington. Published by Longmans, Green & Co., London. Size 6×9 inches; 310 pages; price $3.25.

In this volume the authors deal lightly with pure theory, and have only stated such theoretical principles as are needed to enable readers to understand the calculations necessary for beams, columns, and certain special constructions. On the other hand, they have evidently taken a great deal of trouble in the collection of particulars, including numerous illustrations of reinforced concrete structures in this country and abroad. While valuable for the useful summary of data and principles in the earlier chapters, it appears to us that the chief value of the book will be found in the records presented in the succeeding chapters. These deal with practical examples of construction in accordance with the best-known British, American, and foreign systems, the types of construction including reservoirs and tanks, culverts and conduits, swimming baths and other forms of municipal engineering work, railway bridges, tunnels, buildings, and permanent way construction, wharves, jetties, groynes, sea-walls, storage bins, retaining, sea and other walls, grand stands, and various types of building construction. The illustrations are very numerous, many of them having been reproduced from working drawings, which are more serviceable to technical readers than photographic views. Interspersed among the descriptive matter are notes which should be of practical service to municipal engineers, and the volume appropriately concludes with a chapter discussing matters connected with the practical execution of works in reinforced concrete.

Heat and Thermodynamics. By F. M. Hartman. Published by McGraw-Hill Book Company, New York; 336 pages; 6×9; fully illustrated; price $3.

The subject of thermodynamics has been written on by so many that there is very little outside of rearrangement that can be accomplished by a new writer. The preface to this book contains some hints that might be well followed by many instructors, outstanding among which is the following that perhaps illustrates the standpoint of the book: "It is the author's opinion that the best that can be done in any technical course is to thoroughly teach the fundamental principles underlying the subject, and that it is impossible to give a training which makes the student a practical engineer."

The book has taken up the theory of thermodynamics in a very clear manner, the arrangement being such that the student works from the purely theoretical to the more applied side of the subject, the final chapter on Steam Turbines giving a rather concise exposition of the theory underlying the construction and operation of steam turbines.

The transference of heat through solids is taken up from the usual standpoint of conductivity. It is not out of place to point out here that it is time some one included in a treatise, the method of calculating heat flow through solid bodies from the standpoint of thermal resistance as continually outlined by various investigators. The method is so simple when applied to electrical work as to merit its being taught to students.

As a text for the student, this book should be very easy o follow. especially if used in conjunction with a series of ectures.—T. R. L.

ndustrial Drawing and Geometry. By Henry J. Spooner; published by Longmans, Green & Co., London. Boards; size 6¾ × 9¼ ins.; 168 pp.; price, 75c.

This little volume comprises an introduction to the arious branches of technical drawing. It contains 620 figures nd 320 exercises, and is intended as a text book of geo- netrical and mechanical drawing in the curricula of ele- nentary and secondary schools and to lead up to works on nachine construction and drawing, on building construction nd other branches of technical drawing.

A B C of Hydrodynamics. By R. de Villamil; published by E. & F .N. Spon, London; size 5¾ × 8½; 132 pages; 48 illustrations; price $2.

This book is intended as an introduction to the study of Hydrodynamics. There is not very much that is new in t, but the facts are presented very clearly and concisely. Quotations are used throughout the book rather fully; the uthor states that the views on viscosity are based on those of Newton.

The Elements of Structures. By Geo. A. Hool, S.B., first edition; published by The McGraw-Hill Book Company, New York; cloth 6¼ × 9¼ ins.; 188 pages including index; price $1.75.

This forms the first volume of the Engineering Educa- ion Series prepared by the University Extension Division of the University of Wisconsin. It is published in two orms; as a regular text book and in assignment pamphlets or correspondence study work, with loose leaf binding. The present text is an excellent example of the character of the series. It covers the fundamentals of structures in a prac- ical way, assuming only an ordinary knowledge of mathe- matics, drawing and strength of materials. The book is ntended for students who have had an ordinary training in nathematics and has been developed solely with the idea of using it in correspondence study.

Standard Forms of Field Notes for Civil Engineers. By Charles C. Anthony; published by McGraw-Hill Book Company, New York; size 4½ × 7; 56 pages; price $1.

The object of this book is to present forms for note- aking and such necessary instructions in the use of them hat an engineer can take a complete set of notes and re- cord the results of a survey in neat and workmanlike manner. It is a very common thing to see an engineer called into the office to explain his notes to the draftsman, or a party returned to the field to get information that should have been taken in the original survey. This little volume should do much towards simplifying and standardiz- ing note-taking in the field. It is heartily recommended to all civil engineers and students.

Synchronous Motors for Power Factor Correction is the title of Special Publication R.L. 57, issued by the Railway and Lighting Department of the Westinghouse Electric and Manufacturing Company, East Pittsburg, Pa. This book- let, which has an art cover contains some of the most valu- able, common-sense data on the phenomena of power factor and on the bad effects of low power factor and its power factor correction with synchronous motors that has ever been printed. That it is being distributed without charge and apparently at much expense, furnishes an illustration of the policy of some of the present-day manufacturing com- panies of spending considerable money to educate the pos- sible buyer as to the selection and application of equip- ment that is not generally understood.

Besides a discussion of power factor and its correction by Nicholas Stahl, the publication gives much specific data on and illustrates many synchronous motor installations made for improving low power factors.

Curves and diagrams are given whereby one can deter- mine with a few simple calculations, the capacity of a syn- chronous motor necessary to correct a given load from and to given power factors. Directions and diagrams are given for solving by inspection the other problems that arise in connection with power factor phenomena. The features of the booklet that will be appreciated by practical engineers is the simplicity of the treatment of the many examples illustrating the use of the data and curves. This book should be in the hands of every man that has to do with alternating current.

"5,000 Facts About Canada" for 1912. The 1912 edi- tion of that popular and indispensable booklet, "5,000 Facts about Canada," compiled by Frank Yeigh, the widely known writer and lecturer, and author of "Through the Heart of Canada," is now out and is replete with new matter, in- cluding an outline map of Canada, a calendar and the new census figures. In compact form is found a wealth of facts and figures of the Dominion that will provide a revelation of our natural resources and growth. The mass of informa- tion gathered with infinite pains, should be in the hands of every intelligent Canadian, and the wide sale and popularity of the publication is easily understood. Copies may be had for 25 cents from The Canadian Facts Publishing Company, 667 Spadina Avenue, Toronto.

The Signal Dictionary. 9 in × 12 in. 600 pages. 3,899 illustrations. Simmons-Boardman Publishing Company, New York and Chicago. Leather, $6. Cloth, $3.50.

The Railway Signal Association Signal Dictionary, first published in 1908, has been revised and published in the second edition (1911-12) under the supervision of a commit- tee of the association. The aim in revising the book, as stated in the preface, has been to "retain descriptions and illustrations of apparatus which, although no longer made, is and will remain for some time in rather extensive use, as well as to reflect the latest work of the manufacturers." That the book is not merely a catalogue of manufacturers' devices is shown, however, by the fact that it contains practi- cally all of the standards adopted by the Railway Signal Association and a great many standards of signal depart- ments of prominent railways of this country and England. Another change which will be found almost as valuable as the addition of the up-to-date apparatus and standards is the re-arrangement of the material in a form which is well adapt- ed for ready reference. The descriptive part of the book is divided into five sections which are clearly marked by title pages and subdivided so as to arrange each branch of the subject under distinct heads. The definition section has been amplified by the addition of a large number of the terms used in connection with the generating and distri- bution of alternating current. This part of the book con- tains full reference to descriptions included in the descrip- tive part, and a complete cross reference index is added. The divisions of the descriptive part are: (1) Signal Sym- bols and Signal Indications; (2) Block Signaling; (3) In- terlocking; (4) Highway Crossing Signals, and (5) Acces- sories. The last named division contains 18 subdivisions in which the apparatus and devices used in railway signal- ing are illustrated and described.

PUBLICATIONS RECEIVED.

The Prevention of the Pollution of Canadian Surface Water. By T. Aird Murray. A pamphlet issued by the Committee on Public Health of the Commission of Conservation, Canada, being a reprint of a series of three articles written for the Toronto Globe and published early in January, 1912. Copies may be obtained from James White, secretary, Commission of Conservation, Ottawa.

Report on the Mining Accidents in Ontario, 1911. By E. T. Corkill, chief inspector of mines. Bulletin No. 9, of the Bureau of Mines, Dept. of Lands, Forests and Mines, Ontario.

Fifth Annual Report of the Game and Fisheries Department, 1911, Province of Ontario.

Mechanical Stresses in Transmission Lines. By A. Guell. Bulletin No. 54, University of Illinois, Engineering Experimental Station. Copies may be obtained for 20 cents by addressing The Engineering Experiment Station, Urbana, Ill.

Inductance of Coils. By Morgan Brooks and H. M. Turner. Bulletin No. 53, University of Illinois, Engineering Experiment Station. Copies may be obtained for 40 cents by addressing The Engineering Experiment Station, Urbana, Ill.

Preliminary Review and Estimate of Mineral Production for Year 1911. By Wm. Fleet Robertson, Provincial Mineralogist. Preliminary review printed by authority of the Legislative Assembly of British Columbia.

Papers and Reports Relating to Minerals and Mining. Comprising statement by the Minister of Mines, report on the gold fields, report on coal mines, state coal mines, New Zealand.

CATALOGUES RECEIVED.

Municipal Supplies. Catalogue No. 41 of Mussens, Limited, Montreal. Listing their municipal machinery and equipment. Copies may be obtained from Mussens, Limited, Montreal.

Lea High-Duty Turbine Pumps. The Lea Equipment Company, manufacturers of high-duty turbine pumping machinery, 90 West Street, New York, forward Bulletin K, illustrating the different types of their turbine pump.

Railway Signals. The General Railway Signal Company, Rochester, New York, forward loose leaf catalogues A and G, mechanical, interlocking machines and accessories, and electric interlocking machines and accessories.

Pure Water.—The Roberts Filter Manufacturing Company, Darby, Philadelphia, Pa., forward latest catalogue illustrating their water filters, pressure and gravity types, and filter appurtenances. The catalogue contains a great deal of valuable data useful for design and estimating, as well as illustrations of many installations of their apparatus.

The Improved Concrete Machinery. Wettlaufer Bros., Toronto, Ont., forward catalogue illustrating different types of their concrete mixers and their block machines.

Pumps. The Luitwieler Pumping Engine Company forward their general catalogue No. 11, illustrating their system of non-pulsating pumping machinery. General offices and factory 122 Aimes Street, Rochester, N.Y.

Good Roads Machinery. The Sawyer-Massey Company, Hamilton, Canada, forward folder illustrating different machinery and apparatus made by them for use on good roads. This includes screens, crushers, portable bins, graders, scarifiers, etc.

Twist Drills. The Morris Twist-Drill & Machine Company, New Bedford, Mass., forward catalogue illustrating their drills, reamers, milling-cutters, taps, dies, etc.

THE TAR TREATMENT OF MACADAM ROAD SURFACES.

The following report by the city engineer (Mr. L. S. Mackenzie) was presented at the last meeting of the Bristol (England) Corporation.

In accordance with the instructions of your committee, your engineer has carefully studied the results so far of the tar treatment of macadam road surfaces, and he has prepared a statement showing the cost of road maintenance each year since the tar spraying was adopted in 1906, and for the sake of comparison has also shown on the statement the average cost of maintenance during the three years prior to the system being adopted. The expenditure during the current year up till the 11th January is also included, and on the basis of this expenditure he has estimated the total for the year; but, although this shows some very satisfactory results, he does not propose to draw any comparisons from these estimated figures, but to limit his remarks to the period terminating on 25th March, 1911.

The average cost of cleansing the whole of the streets in the three years prior to the adoption of tar treatment was $145,360; for the year ending March, 1911, the cost was $140,875, showing a saving of $4,485; but a more striking and satisfactory result is that no fewer than 15,852 fewer loads of slop and sweepings had to be carted to tip; this is very important, as a large proportion of this slop is pulverized road stone. The average cost of street watering in the three years above referred to was $21,255, while in the year ending March, 1911, it was only $14,035, a saving of $7,220. The cost of macadamizing, however, shows an increase of $6,075, but, whereas the total quantity of hard stone is practically the same, the weight of limestone used was 5,599 tons less. However, included in the amount is the cost of converting nearly three miles of old pitching to tar macadam, costing $8,000, also the laying down of an experimental length of "pitchmac," costing approximately $3,000, so that in reality the cost of macadam maintenance for the year is $5,000 less than the average for the three years prior to the treatment. Then, again, the cost of using tarred material for binding purposes has increased the cost of macadamizing. The cost of the tar treatment for the year under consideration was $37,880, and the total cost of the work on the road was $335,965, against $303,715, the cost prior to the use of tar showing an increased cost of $32,250, or, deducting the cost of special works, $21,250. During the period under revision 19 miles of private streets have been added to the highways.

Although from these statistics no actual saving can be shown, your engineer submits the following points for consideration:—

1. The dust nuisance has practically disappeared.
2. The surface of secondary roads has been enormously improved.
3. The streets generally are cleaner than ever they were before.
4. Watering and cleansing have been extended into outlying districts, where hitherto the water-cart had never been seen.
5. Tips are becoming fewer and farther away, tending to increase the cost of haulage.
6. Cost of material has increased.
7. Conditions of traffic have entirely changed, and it is impossible to say what extra cost the city might have been put to if the tar spraying had not been introduced.

It was remarked that on a well made road accommodating light traffic only, tar was an excellent coating; on a badly constructed surface a coating of tar made the road worse than ever.

EARNING AND OPERATION EXPENSES

The aggregate earnings of Canadian railways from all sources for 1911 were $188,783,493—an increase of $14,777,276 over 1910. This was equal to 8.7 per cent. Operating expenses amounted to $131,033,784, which sum was $10,628,343 larger than for 1910—or 8.8 per cent. Thus the increase in gross earnings was not quite equal to the increase in operating cost. The ratio of operating expenses to gross earnings was 69.4; or .2 higher than for the year preceding.

The difference between gross earnings and operating expenses was $57,698,708, as compared with $53,550,776 in 1910. This difference is popularly regarded as net operating income; but that is not a correct assumption. Certain deductions, such as taxes, rents, interest on funded debt, etc., must be allowed before the true net income is ascertained. That income represents the amount available for dividends and the balance carried forward to profit and loss.

The net earnings of $57,699,708 were equal to $2,271 per mile of line—an increase of $105 over 1910. In this connection it must not be forgotten that a considerable number of railways either failed to make ends meet or barely did so. More than 95 per cent. of the balance as between income and outgo, given above, was really earned by twelve reporting roads.

The amount paid out in dividends during the year was $30,577,740, of which $11,485,740 was on preferred and $19,092,000 on common stock. After all proper reductions had been made the amount carried forward to profit and loss for the year was $14,808,566.

The railways of Canada in 1911 earned $19,444,893 from outside operations, with expenses attached thereto of $14,150,464. This left a balance of $5,294,428 to be credited to profit on that account.

The gross earnings for 1911 were equal to $7,430 per mile of railway, showing an increase of $396 over the preceding year.

The earnings from passenger service per passenger train mile were $1.348, and from freight service per freight train mile $2.376.

The gross earnings in 1911 came from the following sources:—

	1911
Passenger	$ 10,566,393
Mails	1,869,413
Express	4,674,135
Baggage, parlor cars, etc.	1,207,555
Freight	126,570,533
Station and train privileges	826,251
Telegraphs, rents, etc.	3,018,709
	$188,733,493

Operating expenses in 1911 amounted to $131,034,784 or $10,629,344 more than for the year 1910. This increase was equal to 8·8 per cent. The operating expenses per mile of line were $5,158, showing an increase of $290 over 1910.

A comparison of gross earnings, operating expenses and net earnings per mile of line since 1907 gives the following result:—

	Gross earnings per mile	Operating expenses per mile	Net earnings per mile
1907	$6,535.64	$4,620.90	$1,914.73
1908	6,397.21	4,673.30	1,724.90
1909	6,017.89	4,339.53	1,678.40
1910	7,033.93	4,868.60	2,165.83
1911	7,430.45	5,158.85	2,271.64

The equipment reported for the year 1911 was as follows:—

	Number	Increase
Locomotives	4,219	140
Cars in passenger service	4,513	193
Cars in freight service	127,158	7,445
Cars in company's service	9,578	930

The aggregate mileage of revenue trains, passenger, freight and mixed, in 1911, was 89,716,533—an increase of 4,307,292 miles.

In addition, the mileage of non-revenue trains was 4,478,705. Of the revenue train mileage, 232,341 was classified as special.

The capacity of freight cars of the various classes, with a comparison for the years since 1907, is shown in the following statement:—

	1907		1908		1909	
	No.	Capacity in tons	No.	Capacity in tons	No.	Capacity in tons
Box	66,934	1,848,987	72,862	2,048,227	74,479	2,130,145
Flat	20,118	535,167	21,781	592,496	21,220	584,455
Stock	4,731	122,550	5,047	133,578	5,561	150,800
Coal	10,060	291,638	11,616	362,233	11,721	379,981
Tank	132	2,632	197	4,000	197	4,012
Refrigerator	1,745	48,745	2,423	69,000	2,465	71,085
Other	1,820	59,200	1,941	67,410	2,273	64,835
Total	105,540	2,908,903	115,867	3,277,394	117,916	3,385,313

MICROGRAPHICAL EXAMINATION OF METALS.

The advantages of the use of the microscope in addition to chemical analysis and mechanical tests in the examination of metals are set forth in an article by J. S. Primrose in a recent issue of Engineering. In the case of fractures, not only can the examination be made right up to the fracture itself, but also incorrect heat treatment or the presence of fatigue may be detected. Microphotographs are given illustrating the causes of a number of failures in iron and steel, which were revealed only by this method of analysis. These include the fracture of a wrought-iron angle bar which caused a boiler explosion; a mild steel plate which fractured on bending, although the test piece had passed the specification tests; a locomotive axle which broke while the engine was traveling at express speed; and a motor-car steering rod, the fracture of which was shown to be due to imperfect case-hardening. Attention is called to the fact that a piece of work may often be examined by the microscope before putting the material into service to determine whether it is in the proper structural condition for use.

ENGINEERING NOTES.

Japan.—Dr. Fengoku and party, president of the Inamashura Power Company, is making a tour of several cities in Canada and the United States to investigate the long distance transmission of electricity. It is understood that large contracts for the supply of electrical equipment are to be let in Canada or the United States at an early date.

Ottawa, Ont.—The promoters of the dry dock for Quebec have made an application to the Federal Government for an amendment of the charter in order that the subsidy of 3 per cent. may be made on the sum of $5,000,000 in place of $4,000,000 as first mentioned. There is a clause in the laws governing the granting of subsidies which does not allow government aid on a sum exceeding $4,000,000, and it is to overcome this that the promoters are requesting that the law be amended.

Manchester, England.—The municipal authorities have made preparations for a novel test that is expected to decide the question of the relative merits of gas and electricity as an illuminant of city streets. To each system has been allotted a certain section of the city for experimental purposes. The competition will be conducted by the city itself and will be entirely unbiased. Each faction must light the section which has been assigned to it, to the best of its ability. In making the final decision, the city council will take into account the initial expenditure, cost of maintenance, and quality of illumination.

Victoria, B.C.—Certain farmers resident in the vicinity of this city have made application to the municipal council that the city garbage, instead of being dumped at sea, as is done at present, be shipped to their districts and utilized as land manure and for fertilization purposes. The matter is in the hands of the health committee, who will make a report on the proposition as regards the sanitary side of the question.

Ottawa, Ont.—A deputation from North Bay waited upon the Federal Ministers to present a request that a canal be constructed from that municipality to the lakes. This would be in conjunction with the Georgian Bay canal scheme.

Calgary, Alta.—The plans for the new building to be erected for the management of the Canada Life Insurance Company show a building that should be a credit to any municipality. Messrs. Brown and Vallance, Montreal, the designers, have used the arch to an advantageous extent. The lower portion is composed of bold stone work, and from the lines started by the three main windows and door on the first floor (all similar in appearance) long panel windows make their way to the upper story. A cornice surmounts the whole and the effect is unique in many ways.

Quebec, P.Q.—The Canadian Northern Railway have introduced a novelty in the method of train propulsion in this country. A sub-company has been reorganized and will operate a passenger car to Lake St. Joseph from Quebec. The car will be operated by electricity generated on board by a gasoline engine. The car will run on the rails of the ordinary steam lines. It weighs forty tons, will make fifty miles an hour, will seat fifty at ordinary times, and will make from six to ten trips per day a distance of twenty-two miles.

Montreal, P.Q.—The motor boat show held in this city during the past few days, has brought out many interesting features among gas propelled craft and vehicles. Among these exhibits was an automatic starting auto truck that was so constructed as to use the surplus energy of the self-starter to operate electric search and tail lights and also to operate electric signs advertising the goods of the owner of the truck.

Montreal, P.Q.—Plans for the new Canadian Northern passenger station have been issued. The station will be one of the finest in America when completed, and will be one of the architectural attractions of Montreal. Access to the subway, through which the electric-driven trains of the railway will run, connecting the model city at the back of the mountain, and the business district of Montreal, will be obtained by means of stairways leading to platforms over the trains. An up-to-date system of ventilation will be employed to keep the air in the tunnel pure and fresh. The main entrance will be from Dorchester Street, about the middle of the block, but access to the new station will also be possible from St. Monique and Mansfield Streets, while another large entrance will be available on Lagauchetiere Street.

PERSONAL.

Mr. A. J. McPherson, city commissioner of Regina, has placed his notice of resignation before the municipal council.

Mr. C. W. P. Ramsey, who has been in the employment of the C.P.R for many years, has been appointed engineer of construction for eastern lines, with offices at Montreal.

Mr. E. L. Cousins, engineer to the Harbor Board of the city of Toronto, will make an inspection of several harbors along the waterfronts of certain cities in the United States.

Dr. M. Fengoku, Dr. J. Takashara and Mr. M. Ohiu spent a few days in Toronto to gather information relating to the hydro-electric system of Ontario. All these gentlemen are prominent Japanese. Dr. Fengoku is president of the Inamashura company which contemplates generating 50,000 electrical horsepower 150 miles from Tokio to supply that city. At the present time no attempts have been made to transmit current for long distances in Japan and the party has come to America in order to study the problem. Previous to coming to Toronto the party visited Schenectady, Buffalo and Niagara Falls.

OBITUARY.

The death of **Mr. David D. Drummond** has been announced. Mr. Drummond was vice-president of the Chicago Portland Cement Company; his death occurred at his home, Oglesby, Ill., on March 8th last.

James Newark Leitch, C.E., B.A.Sc., is dead from pleuro-pneumonia. He was engineer in charge of the Public Works Department of the New Government House in Toronto. Mr. Leitch was a son of James Leitch, Esq., K.C., chairman of the Ontario Railway and Municipal Board. He was 25 years of age.

MEETINGS.

A society has been formed in Regina with the intention of becoming the Saskatchewan branch of the Canadian Society of Civil Engineers. For the purpose of drawing up a constitution, a committee was formed to which the following representatives of the various local branches of engineer-

ing were appointed: A. J. MacPherson, chairman, ex-officio; Carpenter, Government; Smith, contracting; Ball, electrical; Wynne-Roberts, consulting; Blackburn, mechanical; Riley, surveyors; Thornton, city; Daniel, railways; Wenger, heating.

ANNUAL DINNER OF ENGINEERS' CLUB, TORONTO.

The Engineers' Club, of Toronto, held their annual dinner in the dining parlors of the club rooms on the evening of March 21st last. About eighty members were in attendance and listened with pleasure to the addresses of Dr. Ellis, Toronto University; Mr. C. H. Rust, city engineer, Toronto; Mr. A. F. Macallum, city engineer, of Hamilton, Ont.; Mr. C. H. Hays, and A. L. McAllister.

In addition to the above mentioned gentlemen, Mr. D. G. Boyd, Mr. R. A. L. Gray and Mr. Geo. C. Ruff entertained the meeting with singing and literary selections.

Mr. Willis Chipman, president of the club, occupied the chair.

At the meeting of the Engineering Society of the University of Toronto Mr. J. E. Ritchie was elected president of the association. Mr. William Curtis was elected to the office of first vice-president, and Mr. H. R. Mackenzie will be the treasurer of the organization during the coming year.

COMING MEETINGS.

CANADIAN INSTITUTE.—198 College Street, Toronto. Saturday Evening Lectures, 8 p.m. March 30th, "Spectral Lines—their Arrangement and Constitution," by Prof. J. C. McLennan, Toronto University. April 13th,—"Lantern Experiments on Reaction in Non-homogeneous Systems," by Prof. Kenrick, Toronto University.

ONTARIO MUNICIPAL ASSOCIATION.—Annual convention will be held in the City Hall, Toronto, on June 18th and 19th, 1912. Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ont.

THE CLEVELAND ENGINEERING SOCIETY.—Regular Meeting, Tuesday, April 9th, 1912, Chamber of Commerce Bldg., Cleveland, Ohio. Symposium on the Elimination of Grade Crossings. F. W. Ballard, Secretary.

ENGINEERING SOCIETIES.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—413 Dorchester Street West, Montreal. President, W. F. TYE: Secretary. Professor C. H. McLeod.

VICTORIA BRANCH—Chairman, F. C. Gamble; Secretary-Treasurer, R. W. Macintyre

QUEBEC BRANCH—Chairman, P. E. Parent; Secretary, S. S. Oliver. Meetings held twice a month at room 40, City Hall.

TORONTO BRANCH—96 King Street West, Toronto. Chairman, T. C. Irving: Acting Secretary, T. R. Loudon, University of Toronto. Meets last Thursday of the month at Engineers' Club.

MANITOBA BRANCH—Secretary E. Brydone Jack. Meets every first and third Friday of each month, October to April, in University of Manitoba, Winnipeg.

VANCOUVER BRANCH—Chairman, Geo. H. Webster: Secretary, H. K. Dutcher, 319 Pender Street West, Vancouver. Meets in Engineering Department. University.

OTTAWA BRANCH—
177 Sparks St. Ottawa. Chairman, S. J. Chapleau, Ottawa; Secretary, H. Victor Brayley, N.T. Ry., Cory Bldg. Meetings at which papers are read, 1st and 3rd Wednesdays of fall and winter months; on other Wednesday nights in month there are informal or business meetings,

MUNICIPAL ASSOCIATIONS

ONTARIO MUNICIPAL ASSOCIATION.—President, Chas. Hopewell, Mayor, Ottawa; Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ontario.

UNION OF ALBERTA MUNICIPALITIES.—President, H. H. Gaetz, Red Deer, Alta.; Secretary-Treasurer, John T. Hall, Medicine Hat, Alta.

THE UNION OF CANADIAN MUNICIPALTIES.—President, W. Sanford Evans, Mayor of Winnipeg; Hon. Secretary-Treasurer, W. D. Lighthall, K.C., Ex-Mayor of Westmount.

THE UNION OF NEW BRUNSWICK MUNICIPALITIES.—President, Councillor Siddall, Port Elgin; Hon. Secretary-Treasurer, J. W. McCready, City Clerk, Fredericton.

UNION OF NOVA SCOTIA MUNICIPALITIES.—President, Mr. A. S. MacMillan, Warden, Antigonish, N.S.; Secretary, A. Roberts, Bridgewater, N.S.

UNION OF SASKATCHEWAN MUNICIPALITIES.—President, Mayor Bec, Lemberg; Secretary, Mr. Heal, Moose Jaw.

UNION OF BRITISH COLUMBIA MUNICIPALITIES.—President, Mayor Planta, Nanaimo, B.C.; Hon. Secretary-Treasurer, Mr. H. Bose, Surrey Centre, B.C.

CANADIAN TECHNICAL SOCIETIES

ALBERTA ASSOCIATION OF ARCHITECTS.—President, G. M. Lang Secretary, L. M. Gotch, Calgary, Alta.

ASSOCIATION OF SASKATCHEWAN LAND SURVEYORS.—President, J. L. R. Parsons, Regina; Secretary-Treasurer, M. B. Weeks, Regina.

ASTRONOMICAL SOCIETY OF SASKATCHEWAN.—President, N. McMurchy; Secretary, Mr. McClung, Regina.

BRITISH COLUMBIA LAND SURVEYORS' ASSOCIATION.—President, W. S. Drewry, Nelson, B.C.; Secretary-Treasurer, S. A. Roberts, Victoria, B.C.

BUILDERS' CANADIAN NATIONAL ASSOCIATION.—President, E. T. Nesbitt; Secretary-Treasurer, J. H. Lauer, Montreal, Que.

CANADIAN ASSOCIATION OF STATIONARY ENGINEERS.—President, Wm. Norris, Chatham, Ont.; Secretary, W. A. Crockett, Mount Hamilton, Ont.

CANADIAN CEMENT AND CONCRETE ASSOCIATION.—President, Peter Gillespie, Toronto, Ont.; Secretary-Treasurer, Wm. Snaith, 57 Adelaide Street, Toronto, Ont.

CANADIAN CLAY PRODUCTS' MANUFACTURERS' ASSOCIATION.—President, W. McCredie; Secretary-Treasurer, D. O. McKinnon, Toronto

CANADIAN ELECTRICAL ASSOCIATION.—President, N. W. Ryerson, Niagara Falls; Secretary, T. S. Young, Canadian Electrical News, Toronto.

CANADIAN FORESTRY ASSOCIATION—President, John Hendry, Vancouver. Secretary, James Lawler, Canadian Building, Ottawa.

CANADIAN GAS ASSOCIATION.—President, Arthur Hewit, General Manager Consumers' Gas Company, Toronto; J. Keillor, Secretary-Treasurer, Hamilton, Ont.

CANADIAN INDEPENDENT TELEPHONE ASSOCIATION.—President, W. Doan, M.D., Harrietsville, Ont.; Secretary-Treasurer, Francis Dagger, 21 Richmond Street West, Toronto.

CANADIAN MINING INSTITUTE.—Windsor Hotel, Montreal. President, Dr. A. E. Barlow, Montreal; Secretary. H. Mortimer Lamb, Windsor Hotel, Montreal.

CANADIAN PEAT SOCIETY.—President, J. McWilliam, M.D., London, Ont.; Secretary-Treasurer, Arthur J. Forward, B.A., 22 Castle Building, Ottawa, Ont.

THE CANADIAN PUBLIC HEALTH ASSOCIATION.—President, Dr. Charles A. Hodgetts, Ottawa; General Secretary, Major Lorne Drum, Ottawa.

CANADIAN RAILWAY CLUB.—President, A. A. Goodchild; Secretary, James Powell, P.O. Box 7, St. Lambert, near Montreal, P.Q.

CANADIAN STREET RAILWAY ASSOCIATION.—President, D. McDonald, Manager, Montreal Street Railway; Secretary, Acton Burrows, 70 Bond Street, Toronto.

CANADIAN SOCIETY OF FOREST ENGINEERS.—President, Dr. Fernow, Toronto.; Secretary, F. W. H. Jacombe, Department of the Interior, Ottawa.

CENTRAL RAILWAY AND ENGINEERING CLUB.—Toronto. President G. Baldwin; Secretary, C. L. Worth, 409 Union Station. Meets third Tuesday each month except June, July and August.

DOMINION LAND SURVEYORS.—President, Mr. R. A. Belanger, Ottawa; Secretary-Treasurer, E. M. Dennis, Dept. of the Interior, Ottawa.

EDMONTON ENGINEERING SOCIETY.—President, J. Chalmers; Secretary, B. F. Mitchell, City Engineer's Office, Edmonton, Alberta.

ENGINEERING SOCIETY, TORONTO UNIVERSITY.—President, J. E. Ritchie; Corresponding Secretary, C. V. Ross.

ENGINEERS' CLUB OF MONTREAL.—Secretary, C. M. Strange, 9 Beaver Hall Square, Montreal.

ENGINEERS' CLUB OF TORONTO.—96 King Street West. President, Willis Chipman; Secretary, R. B. Wolsey. Meeting every Thursday evening during the fall and winter months.

INSTITUTION OF ELECTRICAL ENGINEERS.—President, Dr, G. Kapp; Secretary, P. F. Rowell, Victoria Embankment, London, W.C.; Hon. Secretary-Treasurer for Canada, Lawford Grant, Power Building, Montreal, Que.

INSTITUTION OF MINING AND METALLURGY.—President, Edgar Taylor; Secretary, C. McDermid, London, England. Canadian members of Council:—Prof. F. D. Adams, J. B. Porter, H. E. T. Haultain and W. H. Miller and Messrs W. H. Trewartha-James and J. B. Tyrrell.

INTERNATIONAL ASSOCIATION FOR THE PREVENTION OF SMOKE.—Secretary R. C. Harris, City Hall, Toronto.

MANITOBA LAND SURVEYORS.—President, George McPhillips; Secretary-Treasurer, C. G. Chataway, Winnipeg, Man.

NOVA SCOTIA MINING SOCIETY.—President, T. J. Brown, Sydney Mines, C. B.; Secretary, A. A. Hayward.

NOVA SCOTIA SOCIETY OF ENGINEERS, HALIFAX.—President, J. N. MacKenzie; Secretary, A. R. McCleave, Assistant Road Commissioner's Office, Halifax, N.S.

ONTARIO PROVINCIAL GOOD ROADS ASSOCIATION.—President, Major. T. L. Kennedy; Hon. Secretary-Treasurer, J. E. Farewell, Whitby; Secretary-Treasurer, G. S. Henry, Oriole.

ONTARIO LAND SURVEYORS' ASSOCIATION.—President, T. B. Speight, Toronto; Secretary, Killaly Gamble, 703 Temple Building, Toronto.

THE PEAT ASSOCIATION OF CANADA.—Secretary, Wm. J. W. Booth, New Drawer, 2263, Main P.O., Montreal.

PROVINCE OF QUEBEC ASSOCIATION OF ARCHITECTS.—Secretary, J. E. Ganier, No. 5. Beaver Hall Square, Montreal.

ROYAL ARCHITECTURAL INSTITUTE OF CANADA.—President, F. S. Baker, F.R.I.B.A., Toronto, Ont.; Hon. Secretary, Alcide Chausse, No. 5. Beaver Hall Square, Montreal, Que.

ROYAL ASTRONOMICAL SOCIETY.—President, Prof. Louis B. Stewart, Toronto; Secretary, J. R. Collins, Toronto.

SOCIETY OF CHEMICAL INDUSTRY.—Dr. A. McGill, Ottawa, President; Alfred Burton, Toronto, Secretary.

UNDERGRADUATE SOCIETY OF APPLIED SCIENCE, McGILL UNIVERSITY.—President, J. P. McRae; Secretary, H. F. Cole.

WESTERN CANADA IRRIGATION ASSOCIATION.—President, Wm Pierce, Calgary; Secretary-Treasurer, John T. Hall, Brandon, Man.

WESTERN CANADA RAILWAY CLUB.—President, R. R. Nield; Secretary, W. H. Rosevear, 115 Phœnix Block, Winnipeg, Man. Second Monday, except June, July and August, at Winnipeg.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand and projected, contracts awarded, changes in staffs, etc. Printed forms for the purpose will be furnished upon application.

PLANS AND SPECIFICATIONS ON FILE.

The following Plans (P.) and Specifications (S.) are on file for reference only unless otherwise noted at the office of The Canadian Engineer, 62 Church Street, Toronto:—

Bids close		Noted in issue of
3-25	Prime mover equipment, electric lighting equipment, etc., Moose Jaw, Sask.....(S.)	3-7
4-8	Paving, Port Arthur, Ont. .....(S.)	3-21
4-11	Grading, sanitary sewers, cement walks, etc., Lethbridge, Alta.....(P. & S.)	3-14

(Lethbridge plans and specifications are on file at The Canadian Engineer Office, 820 Union Bank Building, Winnipeg.)

TENDERS PENDING.

In Addition to Those in this Issue.

Further information may be had from the issues of The Canadian Engineer referred to.

Place of Work.	Tenders Close.	Issue of.	Page.
Calgary, Alta., designs for aqueduct	May 1.	Feb. 22.	70

TENDERS.

Calgary, Alta.—Tenders will be received until May 1st, 1912, for concrete structures in about half of the area comprising the eastern section of the C.P.R. Company's Irrigation Block, Alberta. Plans, specifications, and full information will be furnished after April 1st, 1912, on application to A. S. Dawson, Chief Engineer, C.P.R., Calgary, Alta. (Advt. in Canadian Engineer).

Hamilton, Ont.—Separate tenders will be received until 5 p.m., April 10th, 1912, for the laying of a 48-inch steel intake pipe 2,200 feet in Lake Ontario from the Hamilton waterworks filtering basins, with gate house, crib, piling, etc. Also for the laying of a steel and concrete conduit from the Beach Pumping Station to the filtering basins, with gate house, piling, manholes, etc. Specifications, etc., on file at the office of A. F. Macallum, City Engineer. S. H. Kent, City Clerk, Hamilton, Ont.

Hamilton, Ont.—Tenders for approximately 6,500 concrete poles will be received by the City Clerk, Hamilton, up to 10.30 a.m., April 10th, 1912. Plans and specifications may be secured at the Hydro-Electric Department Office, City Hall, Hamilton. E. I. Sifton, Consulting Engineer; Geo. H. Lees, Mayor.

London, Ont.—Specifications and forms of tender for the following material may be obtained on application:—100 tons 18-inch cast-iron pipe; 450 tons 12-inch cast-iron pipe; 25 tons 10-inch cast-iron pipe; 5 tons 8-inch cast-iron pipe; 65 tons 4 to 6-inch cast-iron pipe; 35 tons special castings of various types and sizes. H. J. Glaubitz, General Manager.

Medicine Hat, Alta.—Tenders for the construction of a brick and stone church for the parish of St. Barnabas, Medicine Hat, will be received up to noon of April 12, 1912. Plans and specifications may be seen in the office of Turpin Bros., Medicine Hat; at the Builders' Exchange, Calgary, and at the office of James C. Teague, architect, 312 Dominion Bank Bldg., Calgary. J. H. Collier, Secretary to Vestry, Medicine Hat, Alta.

Montreal, Que.—Tenders will be received until April 3, 1912, for laying a water pipe for the village of Dorion. Plans and specifications may be seen at the office of the engineer. V. H. Dupont, 62 St. James, Montreal.

Moose Jaw, Sask.—Tenders will be received up to noon of April 17th, 1912, for contract "D" consisting of :—

Sec. 1—Water-tube boilers and accessories.
Sec. 2—Mechanical draft equipment.
Sec. 3—Fuel economizer.
Sec. 4—Coal and ash handling equipment.

Specifications and all information obtained on application to J. D. Peters, Electrical Superintendent, Moose Jaw. City Commissioners, Moose Jaw.

Ottawa, Ont.—Tenders will be received by the Department of Public Works, up to 4 p.m., of April 3, 1912, for in-

terior fittings post office, Port Colborne, Ont. Plans and specifications to be seen on application to Mr. Wm. Armstrong, caretaker, Port Colborne, Ont.; Mr. T. A. Hastings, Clerk of Works, Postal Station F, Toronto, and at Department of Public Works.

Ottawa, Ont.—Tenders will be received at the office of Public Works until April 9th, 1912, for the construction of machinery for a 3½ yard dipper dredge. Plans, etc., at offices of J. L. Michaud, Esq., District Engineer, Merchants' Bank Building, Montreal; J. G. Sing, District Engineer, Confederation Life Building, Toronto, and Office of Department of Public Works, Ottawa.

Ottawa, Ont.—Tenders for the supply of 5,000 tons (of 2,000 lbs. per ton), more or less best quality screened ¾ lump steam coal, to be delivered where mentioned in form of tender, will be received until April 10, 1912, at the office of R. C. Desrochers, Secretary, Department of Public Works, Ottawa. Specifications, etc., at the offices of J. L. Michaud, Esq., District Engineer, Merchants' Bank Building, St. James Street, Montreal; J. G. Sing, Esq., District Engineer, Confederation Life Building, Toronto, and Department of Public Works, Ottawa.

Ottawa, Ont.—Tenders will be received by the Department of Public Works, Ottawa, until April 3rd, 1912, for dredging required at Toronto, Ont. Specifications, etc., at the office of the Secretary, Department of Public Works, Ottawa. (See advt. in Canadian Engineer).

Ottawa, Ont.—Tenders will be received until April 16th, 1912, for the construction of an extension wharf at Lion's Head, Bruce County, Ont. Plans, etc., at the offices of J. G. Sing, Esq., District Engineer, Confederation Life Bldg., Toronto; H. J. Lamb, Esq., District Engineer, Windsor, Ont.; on application to the Postmaster at Lion's Head, Ont., and office of R. C. Desrochers, Secretary, Department of Public Works, Ottawa.

Ottawa, Ont.—Tenders will be received by the Dept. of Public Works, until April 9, 1912, for dredging required at St. John Harbor, N.B. Combined specifications and form of tender can be obtained on application to the Secretary, Dept. of Public Works, Ottawa.

Ottawa, Ont.—Tenders will be received until April 15, 1912, for the construction, in accordance with the plans and specifications of the Commissioners, of a reinforced concrete sewer at St. Boniface. Plans, etc., may be obtained at the office of Mr. Gordon Grant, Chief Engineer, Ottawa, and Mr. A. G. Macfarlane, Dist. Engineer, St. Boniface, Man. P. E. Ryan, Secretary, the Commissioners of the Transcontinental Railway, Ottawa.

Ottawa, Ont.—Tenders will be received until April 18, 1912, for the construction of a wharf and dredging basin at Sarnia, Lambton County, Ont. Plans, etc., at the offices of H. J. Lamb, Esq., Dist. Engineer, Windsor, Ont.; J. G. Sing, Esq., Dist. Engineer, Confederation Life Bldg., Toronto; and on application to the Postmaster at Sarnia, Ont. R. C. Desrochers, Secretary Dept. of Public Works, Ottawa.

Toronto, Ont.—Tenders will be received until March 29, 1912, for the several trades required in the erection of new school building on Manning Avenue; new school building on Morley Avenue, and for vacuum cleaning apparatus complete for five schools; manual training fittings at Brown School. Specifications, etc., at the office of the Superintendent of buildings, City Hall. W. W. Hodgson, Chairman of Committee; W. C. Wilkinson, Secretary-Treasurer.

Toronto, Ont.—Tenders will be called for shortly for the erection of the new St. Alban's Cathedral. Messrs. Symons & Rae, architects.

Toronto, Ont.—The Chairman of the Board of Control, City Hall, Toronto, will receive tenders for the construction of concrete walks, up to noon of April 19, 1912. Specifications may be seen and forms of tenders obtained at the office of the City Engineer, Toronto. G. R. Geary (Mayor), Chairman of the Board of Control, Toronto.

Vancouver, B.C.—Tenders will be received until April 2nd, 1912, for the construction of a section of the Bridge Street trunk sewer, between Tenth and Sixteenth Avenues, and for a section of the China Creek trunk sewer, from Seventh Avenue to Eleventh Avenue. Plans and specifications for these sewers may be seen at the City Engineer's office, City Hall. Wm. McQueen, City Clerk, City Hall, Vancouver.

Vernon, B.C.—Tenders will be received until April 8th, 1912, for the supply and delivery of 60 cast-iron manhole frames and covers, complete with either cast-iron or galvanized iron mud baskets. D. G. Ttate, City Clerk, Vernon, B.C.

Victoria, B.C.—Tenders for sections of or for the whole work will be received up to noon March 30, 1912, for the construction and completion, ready for use, of a main trunk sewer and outlet, from the inter-municipal boundary on Foul Bay Road, to Bold Point, Shoal Bay. Plans, etc., obtained from Mr. R. Fowler, C.E. Municipal Engineer, 10 Law Chambers, Bastion Street, Victoria, B.C. J. S. Floyd, C.M.C.

Victoria, B.C.—Tenders will be received up to noon of March 30th, 1912, for supplying cast iron water pipe, special castings. Plans, etc., with Mr. R. Fowler, C.E., Municipal Engineer, 10 Law Chambers, Bastion Street, Victoria.

Welland, Ont.—Tenders are wanted for an addition to the Welland County Industrial Home, Welland, tenders to be received until the 3rd of April, 1912. Plans and specifications at the office of T. L. Nichols, Architect, Welland. A. C. Wilson, Esq., Chairman Industrial Home Committee.

Westmount, Que.—Tenders are invited for the following supplies for the year commencing 1st May, 1912:—

(a) Cement.
(b) Sand.
(c) Crushed stone.
(d) Paving blocks.
(e) Sewer pipes.
(f) Bricks.
(g) Farm tile.
(h) Coal.

Specifications, etc., can be obtained at the office of Archibald Currie, City Surveyor, Westmount. Tenders will be received by City Clerk, up to noon of April 3rd, 1912.

Winnipeg, Man.—Tenders will be received until April 18th, 1912, for supply of labor and materials required in the erection of a machine shop at city yards, Ross Avenue and Tecumseh Street. Plans, etc., at office of City Engineer, 223 James Avenue. M. Peterson, Secretary, Board of Control Office, Winnipeg.

CONTRACTS AWARDED.

Fredericton, N.B.—The contract for the construction of the Stone Ridge bridge, in the parish of Douglas, has been awarded to Mr. William R. Fawcett, of Temperance Vale. The contract price was in the vicinity of $2,500. Mr. A. E. Smye, of Alma, Albert county, has secured the contract for the construction of the Titus Bridge at Upham, King's county, at a contract price of $2,400.

Guelph, Ont.—The Water Commissioners have awarded the following contracts for the supply of water works material: Galvanized iron pipe, the Bond Hardware Co.; brass goods, Miller, Limited, London; valves, Kerr Engine Co., Brantford; cast-iron pipe and specials, Gartshore-Thompson, Hamilton; valve boxes, Kerr Engine Co., Walkerville.

London, Ont.—The London & Lake Erie Transportation Company has signed a contract with the Hydro-Electric Commission for five hundred or more horse-power, at $28 per horse-power, $10,000 will be spent on new cars and other equipment.

Northern Ontario.—Messrs. McCafferty and McQuigge, Toronto, have been awarded the contract for the construction of the right-of-way for the Temiskaming Railway Branch into Elk Lake. Their price was about $180,000. The line comprises about 28 miles, from Earlton to Elk Lake, with a maximum gradient of six feet in one thousand. The commission will lay the ties, steel and other incidentals of the permanent way.

Port Arthur, Ont.—Messrs. Barnett & McQueen Company have received a contract to remodel the C.P.R. Elevator "D." The storage capacity will be increased 1,600,000 bushels, making a total capacity of 3,580,000 bushels. Contract price, $400,000.

Port Arthur, Ont.—The Canadian Pacific Railway Company has awarded Messrs. James Whalen and L. H. Wallace the contract for the construction at the local yards of a steel stern wheel steamer for service on Kootenay Lake, British Columbia. Messrs. Whalen and Wallace have also secured a contract for the construction of two large Scotch boilers and complete boiler room outfit for the lake steamer, Turret Crown. These boilers will be 14 feet diameter and 11 feet long.

Barrett Specification Roofs

"Colonade" Apartments, Kansas City, Mo.
Sellers & Marquis, Roofers.
J. W. McKecknie, Architect.

Best for Apartment Houses.

THE "COLONADE" apartments in Kansas City, Mo., illustrated herewith, have Barrett Specification Roofs.

The owners selected this kind of roofing because they wanted first of all the least expensive roof which would give *proper protection.*

As a Barrett Specification Roof will last 20 years and over without care or attention and as its cost is less than that of any other permanent roof covering, they made no mistake on that point.

The owners wanted *low annual charges,* and Barrett Specification Roofs were satisfactory in that respect as they require no painting or care.

The owners also wanted *proper protection against fire* and as these roofs are considered by fire underwriters as slow burning construction, and as such take the base rate of insurance, everything was satisfactory on that point.

It's always the same story—when ultimate costs and satisfactory service are carefully considered, Barrett Specification Roofs are selected.

Further information about Barrett Specification Roofs will be supplied free on request.

Special Note

We advise incorporating in plans the full wording of The Barrett Specification, in order to avoid any misunderstanding.

If any abbreviated form is desired however the following is suggested:

ROOFING—Shall be a Barrett Specification Roof laid as directed in printed Specification, revised August 15th, 1911, using the materials specified, and subject to the inspection requirement

The Paterson Manufacturing Co., Limited

Montreal Toronto Winnipeg Vancouver St. John, N.B. Halifax, N.S.

Saskatoon, Sask.—Mr. W. F. Lee, Winnipeg, has the contract for supplying the city of Saskatoon with approximately 5,000 barrels of Portland cement, Mr. Lee's price being $2.38, net.

Vernon, B.C.—Messrs. Fraser, Williams, Stitt and Mathieson, Pender St., Vancouver, the lowest tenderers for the construction of vitrified pipe sewers, have been awarded the contract, their price being $8,795.

Welland, Ont.—The contract for the construction of approximately 37,000 sq. yds. of street pavement in the town of Welland, has been awarded to Mr. Chas. H. Kaumeir, of Port Huron, Michigan. (For full particulars, prices, etc., see the regular issue of The Canadian Engineer, March 28th).

Winnipeg, Man.—Apartment block on Clarke Street; A. Jameson, building contractor; S. D. Richardson, owner; estimated cost, $75,000.

RAILWAYS—STEAM AND ELECTRIC.

Brantford, Ont.—Plans have been filed by the Grand Trunk Railway for a five-mile cut-off connecting the main line and Tillsonburg branch by a short route through the grounds of the Ontario Institute for the Blind. Work will be commenced this spring. The new line will eliminate 20 level crossings around the city, and will give the company a terminal depot for all branches. A large tract of new industrial land will be opened up. The cost of the cut-off, which includes a new bridge 300 feet long over the Grand River, will be about $200,000.

Calgary, Alta.—The engineer to the Railway Commissioners will prepare a report on the proposed railway lines from Hope to mile 28 and from Coquitlam Summit to Hope. Two companies have surveyed lines over the same ground.

Galt, Ont.—The Galt-Port Dover line has received a bonus from the Federal Government. This line is to be 58 miles in extent and will be known as the Lake Erie and Northern Railway.

Province of Ontario.—The new line of the Canadian Pacific Railway, between Toronto and Montreal, the contract for which has recently been let, will branch off from the present C.P.R. line at Glen Tay, 15 miles west of Smith's Falls, and go thence south-west to Belleville, whence it will parallel the Grand Trunk line along the lake shore, returning to the C.P.R.'s present line at Agincourt for entrance into Toronto. By thus planning the line the C.P.R. will get entrance into every important town between Montreal and Toronto now served exclusively by the Grand Trunk. The C.P.R.'s new line will be laid with 85 pound rails.

Ottawa, Ont.—The Federal Government have inserted an item of $22,927,200.00 to be used in subsiding the following railways:—

For a line from St. John to Grand Falls,—228 miles.

From Milton to Caledonia, N.S.—30 miles.

To the l'Avenir and Melbourne Railway Company, from Melbourne to Drummondville—33 miles.

To the Ha Ha Railway Company in Chicoutimi County—40 miles.

From Ste. Agatne des Monts to Howard, county of Argenteuil—15 miles.

Interprovincial and James Bay Railway Company, from Temiskaming to the De Quinze River—50 miles.

To the Canadian Northern Quebec Railway Company, from Arundel to Preston and Hartwell—30 miles.

To the Quebec and Saguenay Railway Company, from St. Joachim towards Seven Islands—170 miles.

For a line from a point near Montreal to a point near Mile 837 west of Moncton on the National Transcontinental —200 miles.

To the Algoma Central and Hudson Bay Railway Company for three branches—275 miles. One from the Soo to a point on the Canadian Pacific Railway between White River and Dalton; a second from Michipocoten Harbor to the main line of the Canadian Pacific Railway, and the third from a point on the Canadian Pacific Railway towards the National Transcontinental Railway.

To the Algoma Eastern Railway Company, 106 miles from a point between Little Current and Sudbury towards the Algoma Central and Hudson Bay Railway, 76 miles, and from a point near Sudbury northerly, 430 miles.

To the Tillsonburg, Lake Erie and Pacific Railway Company, from Ingersoll to Stratford, 35 miles.

To the Lac Seul, Rat Portage and Keewatin Railway Company, from Kenora to the line of the National Transcontinental Railway, 22 miles.

To the Toronto, Lindsay and Pembroke Railway Company, from Golden Lake to Bancroft, 51 miles.

To the Canadian Pacific Railway from Toulon to a point on the Icelandic River, 35 miles.

To the Vancouver, Westminster and Yukon Railway Company, from Vancouver northerly, 109 miles.

To the Kootenay Central Railway Company, from Golden to a point on the British Columbia Southern near Jukeson, 175 miles, and from Caithness towards the international boundary, 25 miles.

To the Kettle Valley Railway Company, from Grand Forks up the North Fork, 50 miles.

To the Esquimalt and Nanaimo Railway Company, from Wellington to Alberni, 60 miles; from McBride Junction to Sandwich, 45 miles, and from Sandwich to Campbell River, 38 miles, in all 143 miles.

For a line from the Esquimalt and Nanaimo Railway Company near Campbell river toward Fort George, on the Grand Trunk Pacific Railway, 100 miles.

New Subsidies.

To the Fredericton and Grand Lake Coal and Railway Company, for a line from Gibson, on the Intercolonial Railway, to Minto, together with a branch line to Marysville, 35 miles.

To the Great Northern Mining and Railway Company, from Little River through Belle Marche to Eastern Harbor, 3 miles.

To the Southampton Railway Company, from Millville to Pokiok Bridge, on the St. John River, 13 miles.

To the Northern New Brunswick and Seaboard Railway Company, from Drummond Mines, Gloucester county, to the Intercolonial Railway, thence to Alston Point or Carron Point, Bathurst Harbor, 26 miles.

To the North Shore Railway Company, for the following lines: (a) From Adamsville, Kent county, to Snowshoe Lake, connecting with the Grand Trunk Pacific, 20 miles; (b) from Beersville, via Roxton, to Richibucto Head, 20 miles.

For a line of railway from Albert Mines, via Hillsborough to Moncton, 22 miles.

To the Quebec Central Railway Company for the following lines: (a) For an extension from a point (30 miles from St. George) in Dorchester County, to a point in the Parish of St. Sabine, County of Bellechasse, 1.34 miles; (b) for an extension from St. Sabine to Doime, County of L'Islet, 50 miles.

To the Canada and Gulf Terminal Railway Company, from Matane, easterly, to Gaspe Basin, 200 miles.

To the Grand Lake and Belle River Railway Company, from the National Transcontinental Railway at Belle River to 21 Mile Bay, or to Rabbitt Lake on the Ottawa River, in Pontiac County, 45 miles.

To the St. Charles and Hudson River Railway Company, from the main line of the Quebec and Lake St. John Railway at Indian Lorette, to Stoneham, 7½ miles.

For a line of railway from the National Transcontinental Railway at or near mileage 837, west of Moncton, to the mouth of the Nottaway River, on James Bay, 300 miles.

To the Simcoe, Grey and Bruce Railway Company, from Orillia to Kincardine, 50 miles.

To the Algoma Central and Hudson Bay Railway Company, between its junction with the Canadian Pacific Railway and with the National Transcontinental Railway, 65 miles.

To the Rainy River Radial Railway Company, from Fort Frances, on Lake of the Woods, to the mouth of the Little Grassey River, 50 miles.

To the Lake Erie and Northern Railway Company: (a) From Galt to Port Dover, 58 miles; (b) from Paris to Ayr, 10 miles; total, 68 miles.

To the Bruce Mines and Algoma Railway Company, from Rock Lake Mine to the Canadian Pacific Railway, 50 miles.

To the Manitoba and Northwestern Railway Company, from Hamiota to Birtle, 30 miles.

To the Alberta Pacific Railway Company, from Cardston to the Crow's Nest Pass branch of the Canadian Pacific Railway, thence to the Porcupine Hills, towards Calgary, 100 miles.

NORTHERN ELECTRIC INTERPHONES

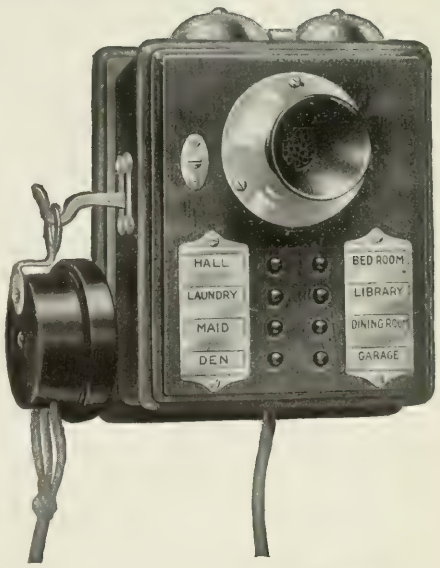
for the FACTORY, OFFICE BUILDING, RESIDENCE or APARTMENT HOUSE.

An Interphone System is the latest, most sanitary and approved method of inter-communication. It replaces the old-fashioned speaking tube which was never anything more than a receptacle for dust and dirt.

Owing to the quickness with which instructions can be given, orders can be transmitted and received almost instantly.

All the advantages of a personal interview are obtained without travelling from one place to another.

The system is available for use at all hours of the day or night independent of an operator, hence no operating expenses.



BETTER WRITE TO-DAY FOR BULLETIN 1061.

THE Northern Electric AND MANUFACTURING CO. LIMITED

Manufacturer and Distributor of Telephone Apparatus, Electrical Supplies and Fire Alarm Apparatus for every possible need.

MONTREAL TORONTO WINNIPEG REGINA CALGARY VANCOUVER

To the Burrard Inlet Tunnel and Bridge Company: (a) From Eburne to Seymour Creek, 10 miles; (b) from Seymour Creek to Deep Cove, 5 miles; (c) from Seymour Creek to Horseshoe Bay, 14 miles; (d) from Pender Street, Vancouver, to North Vancouver, 3 miles.

To the Grand Trunk Railway Company: From Harte to Brandon, 25 miles.

To the Caribou, Barkerville and Willow River Railway Company: From a point on the Grand Trunk Pacific, near Barkerville, 87 miles.

To the Naas and Skeena River Railway Company: From the Nasoga Gulf to Ground Hog Mountain, 100 miles.

To the Kettle Valley Railway Company: From Penticton to a point on the international boundary, 50 miles.

To the Calgary and Fernie Railway Company: From Calgary to Fernie, 100 miles.

Welland, Ont.—The first completed section of the Niagara, Welland and Lake Erie Railway was placed in operation on March 23rd last. The road was constructed by Mr. Hendrick Leitch, C.E.

LIGHT, HEAT AND POWER.

Galt, Ont.—The Hydro-Electric Department will present plans for an ornamental street lighting system to the city council at an early date.

London, Ont.—The management of the London and Lake Erie Railroad have signed a contract for the supply of 500 horsepower from the hydro-electric commissioners. The price quoted is $28 per horsepower. $10,000 will be spent on new cars and equipment.

Winnipeg, Man.—A report from this city states that the Winnipeg Electric Company has been sold and is now under the control of United States capital. The Manitoba Power Company are the purchasers and the report further mentions that the sub-companies are included in the sale. A complete appraisement of the value of the Winnipeg Electric Company is now being made by Messrs. Foster and Richardson of J. G. White & Co., of New York. A further staff is at work on plans of proposed extensions and developments, including that of the Big Bonnet Falls on Winnipeg River which will be carried out after re-organization at an estimated cost of $14,000,000. Rudolph E. F. Flinsch, treasurer of Messrs. White & Co., is in charge of the financial department of the work representing New York bankers whose names will appear later. Joseph R. Choate, Jr., of New York, and W. R. Mulock, of Winnipeg, are attending to the legal details. The price of the purchase is not made public, but is considered to be a large sum above $24,000,000.

GARBAGE, SEWAGE AND WATER.

Calgary, Alta.—The municipal engineering department have prepared plans for a water filtration plant to cost $200,000. The municipal council have not decided to install the plant as yet.

Galt Ont.—A project to erect a dam across the river at a cost of $3,000 is being discussed. There would follow this, if constructed, considerable river improvement work.

Moose Jaw, Sask.—Tenders for the construction of a reservoir have been placed before the Water Commissioners. They include the following:—

Archibald, Winnipeg	$38,175
Archibald, Winnipeg, alternative	44,075
W. Manders, Moose Jaw	50,000
Wilson, Townsend & Saunders, Hurst Engineering and Construction Co., Winnipeg	56,000
Moose Jaw Construction Company	34,352
Atlass Construction Company, Montreal	49,100
Atlass Construction Company, Montreal, alternative	52,000
W. Newman Company, Winnipeg	41,900
Navin Bros., Moose Jaw	36,973
Navin Bros., Moose Jaw, alternative	41,000

Petrolea, Ont.—The Water Commissioners of this town will receive applications for the position of waterworks engineer up to noon on March 27th next. Applicants must hold a stationary engineer's certificate and state salary required. Mr. John McHattie is secretary of the commission.

St. Catharines, Ont.—The board of works will seek authority to issue debentures for the sum of $40,000 to be used in sewer construction work. R. D. Brown, city engineer.

Toronto, Ont.—The municipal council intend to install the following water works material:—

Two 36-inch mains under tracks, main pumping station to Front Street	$44,459 00
42-inch main along Front Street to Bathurst Street	55,048 00
24-inch main along Niagara Street to Queen Street	33,535 00
36-inch main cross town line, Beverley Street to Sumach Street	148,477 00
Two 15,000,000-gallon triple-expansion engines, including buildings and connections	350,000 00

The existing debenture debt of the city (not including the Local Improvement Debt) is as follows:—

General Debenture Debt		$26,415,642 30
Water Works Debt	$9,120,321 22	
Debt for Electric Power Distribution Plant	4,950,000 00	
		$14,070,321 22

BUILDINGS AND INDUSTRIAL WORKS.

Calgary, Alta.—It is reported that the Pioneer Tractor Company will erect a plant in this city. Dr. Wheelock, of Winona, Wisconsin, is interested in the matter.

Calgary, Alta.—The Calgary Herald intend to erect a ten-story building on the corner of Seventh Avenue and First Street West. It will be of concrete and steel construction.

Coquitlam, B.C.—The Canadian United Lumber Company have prepared plans for the erection of a new mill in this town. The Western Canada Power Company will supply the power to operate the machinery.

Edmonton, Alta. — Negotiations have been opened between the municipal authorities and Mr. J. S. Brody as to what location may be secured for the construction of a mattress factory.

Fredericton, N.B.—The municipal council will consider the question of erecting a new fire hall. Ald. Cruickshank is chairman of the fire committee.

London, Ont.—The Hydro-Electric Commissioners will erect a storage building and patrol house in this city. The building will be erected on Horton Street, adjacent to the city's pumping station, and will be large enough to accommodate the water board's workshop. It is to be erected for the board of water commissioners.

Medicine Hat, Alta.—The Ogilvie Milling Company have decided to erect a milling plant in this city. The contract between the company and the municipality calls for the company to spend half a million dollars in the construction of a three thousand barrel flour mill and an oat meal mill and a cereal plant. The city gives free natural gas for ten years and a free site.

Montreal, P.Q.—A report states that a new car construction company are considering the erection of plant in this city. No particulars or names are mentioned in the report.

Province of Ontario.—The Provincial Government have allowed for the following expenditures in their supplementary estimates:—Victoria harbor (additional), $30,000; Acton, public building, $10,000; Barrie, public building (additions and alterations), $15,000; Belleville, public buildings (improvements), $2,500; Bowmanville, public buildings (improvements), $2,000; Brantford, new public buildings, $50,000; Chesley, public buildings, (revote), $15,000; Collingwood, public buildings, $25,000; Dresden, public building, tower clock, $2,000; Dundas, public building, $20,000; Fort William, drill hall, $30,000; Fort William, Customs house and examining warehouse, $50,000; Grimsby, public buildings $10,000; Hamilton, public building (extension and improvements), $22,000; Hespeler, public building, $10,000; Lakefield, public building, $10,000; Lindsay, public building, tower clock, etc., $4,500; Lindsay, drill hall, $25,000; London, postoffice (improvements), $10,000; Markham, public building (additional land), $2,000; Midland, public building (additional amount), $20,000; Milton, public building, $5,000; Mitchell, public building (additional amount), $2,000; Newmarket, public building, $25,000; Orillia, drill hall, $30,000; Oshawa, drill hall, $30,000; Ottawa, new drill hall, $50,000; Palmerston, public building, $10,000; Paris, public building, tower and clock,

THE TRIPLEX BLOCK

A Triplex Block hung from a temporary rigging and used for laying pipe.

What is the Life of a Triplex Block?

WE don't know. Triplex Blocks built by the Yale and Towne Co. at the very beginning—twenty-five years ago—are still in actual use. The Triplex Block of to-day possesses greater lasting powers. With its steel parts—its chain superior to any other—its non-wearing gear movement—and the guarantee of a rigorous test before shipment under a fifty per cent. overload. It will outlast the man who buys it, no matter how young he may be.

Marie, harbor (improvements), $150,000; Telegraph and Nigger Islands; (dredging), $40,000; Thornbury, harbor (improvements), $29,000; Toronto, harbor (improvements—further amount required), $17,000; Whitby, harbor (improvements), $20,000.

Preston, Ont.—B. W. Ziemann is preparing to erect a $10,000 block in this town. A report states that the store portion of the building will be used for retail dry goods purposes.

Saskatoon, Sask.—The Western Foundry and Machine Company are preparing to manufacture sewer pipes. They will erect a new warehouse and have purchased the right for Saskatchewan for the manufacure and sale of the Thomas glazed cement sewer pipe and have engaged an expert sewer pipe maker as foreman of the new department. The company are making the manhole covers used in connection with this city's sewer system. Mr. A. E. Small is general manager of this company.

Saskatoon, Sask.—The municipal council have decided to prepare a by-law to raise the sum of $100,000 for the purposes of erecting a new public library.

Stratford, Ont.—Mr. Ben Williams proposes to erect a knitting factory and has asked the municipal council to grant him a loan of $8,000. It is probable that a by-law will be submitted to the ratepayers at an early date.

Toronto, Ont.—The municipal council intend to erect the following fire halls:—

Greenwood Avenue Fire Hall	$30,000 00
Purchase price of site	7,064 00
Wychwood Fire Hall	30,000 00
Purchase price of site	7,004 00
Roncesvalles Avenue Fire Hall	25,000 00
Purchase price of site	29,469 00
Spare Stable and Supply Store house in rear of the Adelaide Street Fire Hall	8,000 00
Purchase of Site and erection of Fire Hall, Earlscourt	25,000 00

BRIDGES, ROADS AND PAVEMENTS.

Ottawa, Ont.—The Federal Government have inserted an item of $956,000 in the estimates to be used for the purpose of bridge building and calls for aid in the construction of the following works:—

Bridge Subsidies.

To the Vancouver, Westminster and Yukon Railway Company. From a bridge across Burrard Inlet, not exceeding $350,000.

To the Canadian Pacific Railway, for a bridge over the Saskatchewan at Outlook, not exceeding $115,000.

To the Kettle Valley Railway Company, for a bridge over the Fraser River, near Hope, not exceeding $250,000.

To the Caribou, Barkerville and Willow River Railway Company, for twenty bridges over the Willow River, not exceeding $95,000.

To the Grand Trunk Pacific Company, for a bridge over the Assiniboine, at Brandon, not exceeding $20,000.

Saskatoon, Sask. — The Railway Board, which recently held a sitting at this point, were asked to order the construction of a steel span bridge to replace the structure at present used by the Canadian Northern Railway.

St. Catharines, Ont.—The municipal council have given notice of their intention to pave several of the city streets and highways. The materials are bitulithic and vitrified brick and the estimated cost amounts to $43,000.

St. Catharines, Ont.—Two bridges in the vicinity of this city were badly damaged by ice during the recent thaw. They are in Lount Township and cross the Twenty Mils Creek.

Toronto, Ont.—The municipal council are considering the erection of the following bridges:—

Crawford Street, reinforced concrete arch with girder span approaches	$29,450 00
Strachan Avenue, two steel plate girder spans, concrete floor, Class A, exclusive of land damages	58,200 00
Cattle Market, steel lattice girder bridge on steel bench and steel approach ramps	14,900 00
Riverdale Foot Bridges, raising river span and adding two new spans over railway tracks	13,000 00
Gerrard Street Bridge, new bridge and river span—	
If of steel	151,800 00
If of concrete	200,000 00

CITY ENGINEERSHIP VACANCY.

Mr. J. Hutcheon has resigned his position as City Engineer of Guelph. The advertisement calling for applicants for the position will be found in this issue of The Canadian Engineer.

ORDERS OF THE RAILWAY COMMISSIONERS OF CANADA.

Each week on this page may be found summaries of orders passed by the Board of Railway Commissioners, to date. This will facilitate ready reference and easy filing. Copies of these orders may be secured from The Canadian Engineer for small fee.

16115—March 2—Rescinding Order No. 13818 of May 31st, 1911, and authorizing city of Toronto to maintain wires across tracks of C.P.R. and G.T.R. and over wires of G.N.W. Tel. Co., to pumping station at foot of John Street, Toronto, Ont.

16116—March 13—Disallowing Tariff No. 1300 of Boston & Maine Railway re rates on granite from Beebe Jct., Que., to Montreal, Ottawa and Toronto and other points; complaint of the Stanstead Granite Quarries Co., Limited.

16117—March 14—Substituting plan "A" for plans filed for transfer tracks between C.P.R. and C.N.R. at Carberry, Man., and approved by Order No. 16035 of February 27th, 1912.

16118—16119—March 13—Relieving C.P.R. from erecting fences along its right of way on its Kimberly and Crow's Nest subdivision, in Provinces of Manitoba and Alberta, and British Columbia.

16120—March 13—Approving revised location of C.P.R. Moose Jaw southwesterly branch from mileage 0 to mileage 35.59 and location of same branch from mileage 35.59 to 37.85.

16121—March 14—Amending Order 16065 of March 6, 1912, re swing bridge of G.T.R. over Lachine Canal, Montreal, Que.

16122—March 14—Amending Order 16095 of March 7, 1912, by striking out words "County of Simcoe" and inserting "Twp. of Sidney."

16123—March 14—Authorizing C.P.R. to construct three spurs for St. Mary's Portland Cement Co., Ltd., Twp. of Blanchard, Ct. Perth, Ont.

16124—16125—March 14—Approving location of C.N.O. Ry. station grounds at Fallowfield and Merivale, Twp. of Nepean, Ct. Carleton, Ont.

16126—16127—March 14—Approving location of C.P.R. station at Drake, Sask., and plan of station at Dysart, Ont.

16128—March 15—Relieving C.P.R. from erecting fences on its Cranbrook subdivision, B.C. division.

16129—March 15—Authorizing G.T.R. to construct temporary bridge across Beauharnois Canal, at mile post 48.58 on its 13th dist., Ottawa division.

16130—March 14—Relieving G.T.R. from further protection of crossing fourth east of London city limits, Ontario.

16131—March 13—Directing G.N.R. to erect and maintain adequate and suitable fences from mile post 63 to 77; by 1st June, 1912, under penalty of ten dollars per day.

16132—March 15—Authorizing Pere Marquette Ry. to issue transportation to H. G. Shufelt, ice car inspector, of Dept. of Agriculture of Canada.

16133—March 15—Authorizing B.C. Electric Ry. to cross with its tracks of Esquimalt & Nanaimo Ry. near Russell station, B.C. Half interlocking plant to be installed.

16134—March 15—Approving plan of interlocking and derailing apparatus to be installed by C.P.R. at Batiscan River Bridge, on its Quebec subdivision.

WATERPROOFING CONCRETE STRUCTURES*

By C. A. HAGGANDER.

One of the hardest problems presented in connection with the construction of the concrete subway track elevation of the Chicago, Burlington & Quincy in Chicago is the waterproofing. These subways are constructed with concrete slabs or girders 7 ft. wide, built away from the work, resting on concrete abutments at the street lines and on concrete columns and cross girders at the curb lines and centre line of street. There is a joint between the slabs longitudinally across the bridge, also one over each cross girder and one at the bridge seat on top of the abutment. The slabs over the strees are 2 ft. 9 in. thick over the street girder, and 2 ft. 6 in. thick over the curb cross girder. The slabs over the sidewalk are 1 ft. 5½ in. thick over the curb cross girder and 1 ft. 2½ in. thick over the bridge seat.

The first waterproofing was done in 1906. The most natural method seemed to be the closing of the joints. In order to do this the first slabs were built with the sides offset as shown in Fig. 1. The open space between them after they were set was ¼ in. at the lower part and 1¼ in. at the upper part. A board was put under the joint where the bridge seats did not prevent the mortar from leaking through and the ¼-in. space was filled with cement grout to within 1½ in. of the offset. The next 3 in. was calked with oakum soaked with an asphaltic compound. The rest of the opening was filled with cement grout and over the entire joint were placed three layers of felt painted with this compound.

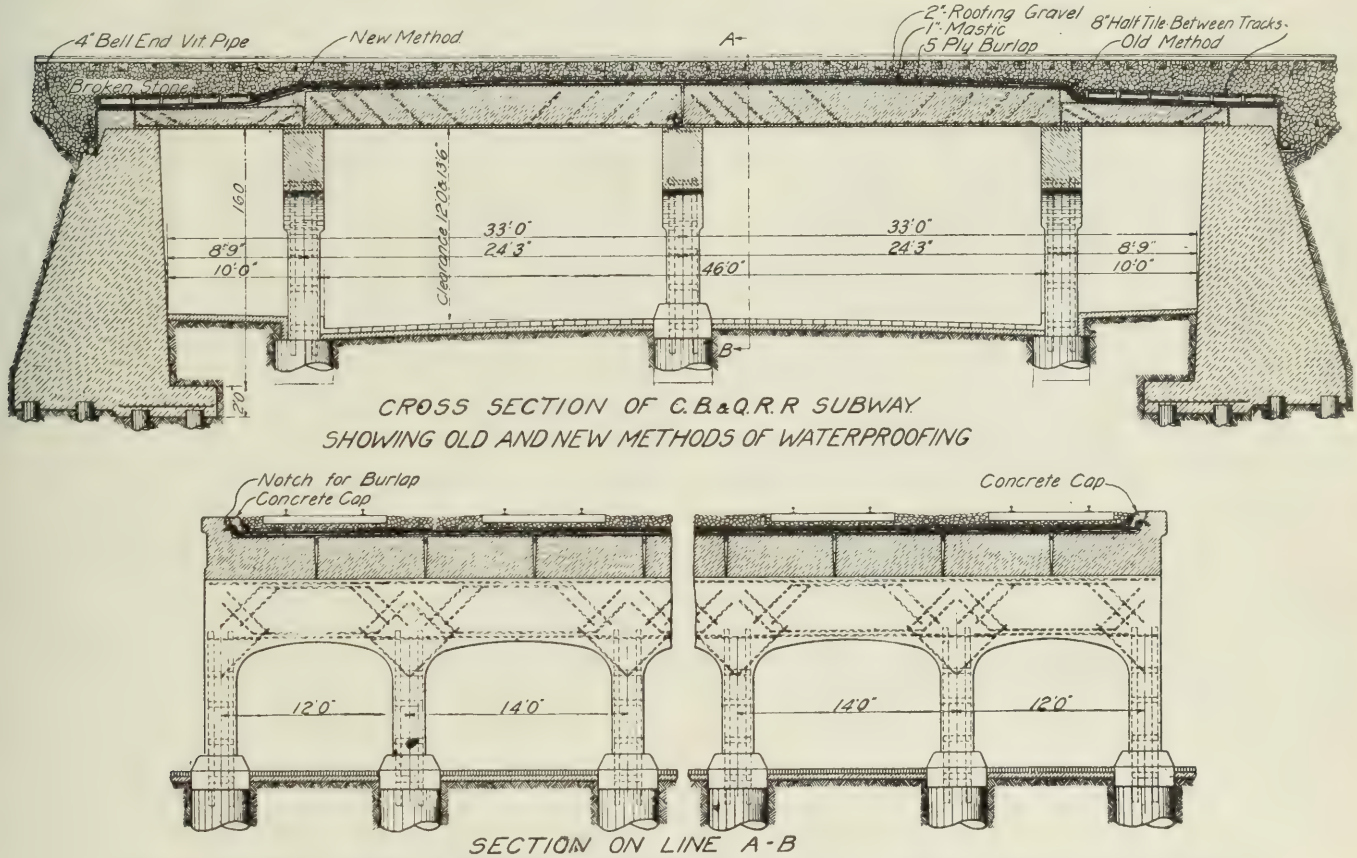

Fig. 8. Standard Method of Waterproofing Subways; C. B. & Q. Track Elevation Work, Chicago.

This method was not effective, the subways leaking very badly. It did not prevent the water behind the abutment from running through the mortar joint down the face, and the joints cracked open, letting the water through. It was thought best to fill the joints with some elastic material and six schemes were tried as shown in Figs. 2 to 7 inclusive. They consist of different arrangements of oakum, cement grout, tar or some asphaltic compound and sand. In every case the bottom of the crack was calked with oakum to prevent having to use boards under the joints. None of the methods were even partly successful until the sixth was tried.

* The Armour Engineer, January, 1912.

This one failed when the tar leaked out through the oakum, but this was prevented to a great extent by the use of sand above the oakum. At first the joints were water tight, but the jar and slight working about of the slabs loosened the oakum, letting the sand and tar escape. The joint at the abutment also leaked very badly. In addition to this the water found its way through two of the slabs themselves.

These methods had been tried during 1906 and 1707, and in 1908 it was thought best to waterproof the whole surface of the bridge and to aid the water in running off by a system of drain pipes.

The method shown on the right-hand side of Fig. 8 was the one adopted. The slabs were built with a ½-in. batter on the sides instead of with an offset so that they could be

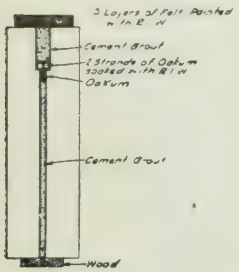

FIG. 1

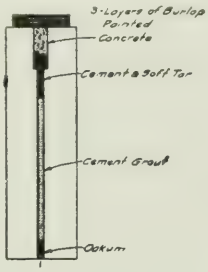

FIG. 2

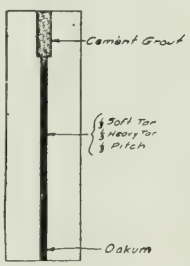

FIG 5

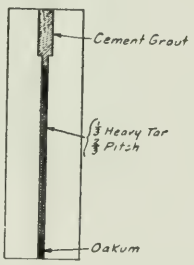

FIG 6

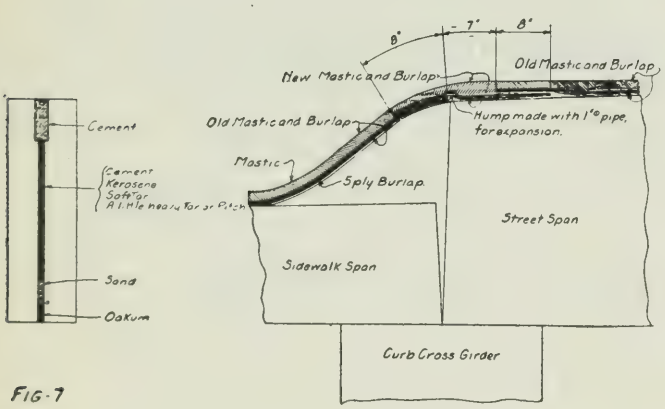

FIG. 7

FIG. 9

calked from above. After calking the cracks with oakum they were filled with cement grout. The vertical offset of 12½ in. over the curb cross girder was rounded off by a fillet of concrete. The abutment back of the bridge seat was built up to the level of the top of the sidewalk slab. The lifting stirrups or hook bolts by means of which the slabs were placed were cut off at the top of the concrete and the surface of the bridge swept clean. As a rule only one track or a width of 14 ft. could be waterproofed at one time because of operating conditions and the fact that the force used was of such size that this was one day's work. A strip about 4 ft. wide was mopped with a coat of asphalt which had been heated to the melting point. Four kinds of asphalt were used at different times, Sarco No. 6 and No. 651, melting point 160 deg., Barber Asphalt Company's positive deal "A," melting points 140 deg. Texaco and Warren Chemical Company's asphalt cement. On this was put a strip of 8-oz. open-mesh, first quality burlap, 42 in. wide. This came in 2,000-yd. bundles and was made into rolls coiled on a 1½-in. gas pipe 7 ft. long. It was applied by starting at one end of the bridge and rolling it across. A man followed the roll and swept out any wrinkles so as to give a smooth surface and bond it to the asphalt below. The top of this burlap and a strip of concrete about 15 in. wide on one side of it was then painted with hot asphalt and another layer of burlap laid, covering two-thirds of the first layer, the rest lapping over on the concrete. This burlap and the adjacent concrete were then painted and another strip laid covering one-third of the first and two-thirds of the second strip. In this way the burlap was made three-ply. Care had been taken that the temperature of the asphalt was not high enough to burn the burlap. A melting point of 160 deg. Fahrenheit gave the best results, as asphalt with a higher melting point burns the burlap and it becomes more brittle at low temperatures. After three-ply of burlap had been laid the whole surface was again mopped with asphalt and a protecting layer of mastic put on. This layer consisted of one part of asphalt and four parts of dry engine sand. The asphalt was heated to the melting point in one kettle and the engine sand heated over an iron plate. They were mixed and stirred in another kettle until of the right consistency, a slow fire under the kettle keeping the mixture plastic. This mastic was dipped into iron wheelbarrows, wheeled on broad runways laid on the burlap, dumped, and finished with wooden trowels to a thickness of 1 in. The top of this mastic was mopped with asphalt. This 1-in. layer was not intended to aid in waterproofing, but was put on to protect the burlap from the ballast and the track tools.

The drainage system consisted of inverted 8-in. half-tiles laid between each track leading from the hump over the curb cross girder to the back of the abutment. Back of the abutment and about 1 ft. below the bridge seat a board was placed on which rested another 8-in. half-tile. The end of the burlap rested in this and another 4-in. tile was laid in it. The tiling was given a slope of about 1 per cent. toward down-pipes. These down-pipes were 50 ft. apart and ran down the back of the abutment to the sidewalk level, then through it and under the sidewalk to the gutter. The mastic was protected by ¾ in. of roofing gravel to keep the sharp edges of the crushed stone ballast from cutting into it. The crushed stone ranged from ½ in. to 2½ in. and was used to allow free movement of the water through it.

It was not long, however, before the boards and tiling crushed down into the newly made fill, giving no means of escape for the water which ran off the bridge, causing it to back up above the level of the bridge seat and find its way down the face of the abutment. This was prevented by building the concrete so as to overhang the back of the abutment about 1 ft. and letting it run down the back about the same distance. The top of the abutment was painted with a heavy coat of tar paint before setting the slabs. This effectually sealed the joint. In all abutments built after this experience a notch was left in the top, as shown on the left-hand side of Fig. 8, in which to place the tile and prevent its crushing down.

After the first year's experience with this waterproofing, it was thought advisable to increase the thickness of burlap to five-ply. Many leaks had developed over the curb cross

girder due to the tearing of the burlap over the hump at the cross girder joint. This seemed to be caused by a slight expansion and contraction of the slabs and tendency of the waterproofing to travel down the slope of the hump due to the load of an engine above it. The crack which opened up was sometimes as wide as ¼ in. Some method of allowing for this had to be used so a 1-in. pipe was laid over the joint, the burlap put on in the regular way, the pipe withdrawn, and the mastic applied. This scheme was used on all work during the year 1909 and thereafter. Another precaution was taken by putting a flatter slope on the hump, the concrete being run out with about 3 ft. 6 in., so that the tendency of the waterproofing to slide down was diminished. The bridges waterproofed during 1909 are almost devoid of leaks.

The bridges which were waterproofed by filling the joints in 1906 and 1907 have since been waterproofed by the latter method. Those which were waterproofed during 1908 developed leaks where the waterproofing cracked and repair work was started during the fall of 1911. In this repair work the mastic was chipped off for a distance of 8 in. each side of the crack. The burlap was cut away from the crack to the edge of the mastic on the street slab. A 1-in. pipe was then laid over the joint and the mastic and the burlap was cut away from the crack to the edge of the mastic on the street slab. A 1-in. pipe was then laid over the joint and the mastic and the burlap on the street slab lifted up so that a new strip of burlap could be inserted under it. It was lapped under about 9 in. and then laid over the old burlap on the slope. Five-ply were laid, each painted with asphalt, the pipe withdrawn (thus allowing for expansion), and new mastic put on.

Records have been kept of the dates when different portions of the bridges were waterproofed. This repair work has shown that during the cold weather the asphalt that is applied to the cold concrete becomes chilled and does not penetrate the burlap which is laid on it. If the weather was very cold even the coat which was mopped on this first layer of burlap did not penetrate it, due to the fact that the cold concrete had chilled it. The second layer of burlap seemed to have been pretty well saturated in all cases, while the third layer was thoroughly saturated. In waterproofing which was laid during warm weather all of the burlap was in a good state of preservation, having been well saturated with the asphalt. The mastic seemed to protect the burlap very well, although in some cases track tools had penetrated it, causing leaks. The smaller sizes of crushed stone of about ½ in. did not penetrate the mastic as much as the larger sizes on account of the more uniform bearing.

The average force used on this work consisted of:

1 foreman	..... at	$.33	per hour.
3 finishers	..... at	.25	per hour.
1 kettleman	..... at	.27½	per hour.
8 laborers	..... at	.20	per hour.

These men waterproofed a bridge 14 ft. wide and 75 ft. long, or 1,050 sq. ft. per ten-hour day. The average cost of the latter waterproofing was a little less than 14 cents per sq. ft. for the burlap and the mastic, not counting the concreting over the hump and bridge seat and the filling of the joints with mortar. This work was done by another gang the day previous to the waterproofing. It added about three cents per sq. ft. to the cost, making a total of 17 cents.

This work was done under the direction of C. H. Cartlidge, bridge engineer, and L. J. Hotchkiss, assistant bridge engineer, and was directly in charge of F. H. Cramer, by whom much of the material in this article was furnished.

SOME METHODS OF PREVENTING DUST ON MACADAM ROADS.*

By John F. Icke, City Engineer, Madison.

A macadam road, as we all know, is made of crushed stone of varying sizes, held in place by filling the interstices with smaller stone, stone dust, or other suitable material as a binder. In the ordinary water bound macadam a cementing action takes place between the crushed stone and the dust used as a binder, the degree of this cementing action depending upon the material used as crushed stone and the material used as a binder.

The harder the rock, the less able it is to absorb moisture, and the more difficult it is to bind. For this reason the granites are more difficult to bind than the limestones when used as a road material.

In order to keep macadam street in good condition it must receive sufficient traffic to furnish more or less dust, and moisture must be provided to aid in keeping the stone cemented. If a sufficient amount of moisture is not present then the road will ravel and will be rapidly destroyed, especially if very much automobile traffic passes over the road:

In order to supply the necessary moisture the method known to all of us of applying water with a sprinkling wagon has been used almost exclusively in the past. The water so applied furnishes the moisture which is absolutely necessary to keep the macadam well bound, and also acts as a dust layer, or dust preventative.

Many objections to the use of water as a dust preventative may, however, be urged. If the water is applied in just the right quantity to lay the dust, but not in quantities enough to make the road surface unnecessarily muddy, then the service may be considered fairly satisfactory. The difficulty lies, however, in the almost impossible task of having the water applied often enough, and in quantities sufficient only to keep the surface moist.

Another objection to the use of water is on account of the injurious effect upon the road material that the frequent application of water has. Any slight depression in the surface of the road will collect and hold water, which will soften up the road surface and hasten the formation of still greater depressions. Still another objection exists in case the supply of water is inadequate. The demand upon the waterworks system is usually already great at that season of the year when the sprinkling of the streets is most urgent and in many cases the heavy demand of the sprinklers seriously interferes with the pressure throughout the system.

For some years past engineers and others interestel in road work have been experimenting with various materials and methods of application, designed as a substitute for water as a dust layer. The use of tar or asphaltic oil applied to the surface of the road, or of tar or asphalt as a binder for the upper two or three inches of th eroad surface is now good practice in many localities.

The application of tar or asphaltic oil on the surface of the road is generally spoken of as surface treatment. The writer's experience with the use of tar in the surface treatment of macadam streets dates back to the year 1908, when the first trial was made. The material used was a prepared tar, known as Tarvia A, made by the Barrett Manufacturing Company.

The street in question was one built of crushed limestone in 1897. The surface was in ideal condition, with very

* Extract paper read at 1912 meeting Engineering Society of Wisconsin.

few depressions or irregularities The preliminary treatment of the road surface before applying the tar consisted in thoroughly sweeping the street surface to remove as much of the dust as possible. The consistency of the tar was such as to make it necessary to heat it before it could be applied. Application was by means of sprinkling cans with broadened nozzles. Approximately one-half gallon of tar was applied per square yard of surface. The surface of the tar was covered with a thin layer of coarse limestone screenings approximately one-quarter inch in diameter, from which practically all the dust had been removed. The street was rolled with a fifteen-ton roller and was thrown open to traffic as soon as possible thereafter. After a short time, and after the excess of screenings had been worn away, the street resembled, in many respects, a sheet asphalt pavement. After the lapse of two years a second treatment was given, similar in all respects to the first, except that the quantity of tar per square yard was about one-third of a gallon. This second treatment was given primarily to cover the individual stones which projected above the general surface of the pavement and were thus not thoroughly covered by the first treatment. Several excavations made in the street since the last treatment show that the tar penetrated the surface of the road from three-quarters of an inch to

Tarviated Road in Madison, Wisconsin.

one inch, and thoroughly bound the surface. How soon it will be necessary to again apply the tar it is impossible to tell; however, it is safe to say it will not be necessary to apply another treatment for at least three years, and possibly not for five or six. The above mentioned treatment has practically eliminated the formation of dust caused by the breaking down of the stone under traffic. The street is, however, not dustless, as more or less dust is brought upon it from traffic and other outside sources, and it has been found advisable to give the street more or less sprinkling with water to keep down the small amount of dust which does accumulate on the street from the sources mentioned above. The street surface is so well bound that any ordinary rain will free the surface from dust as though it were an asphalt pavement. One objection to the above mentioned treatment is that it leaves the street slippery at those times when, due to weather conditions, other pavements like asphalt are also slippery.

The cost of the first treatment was 7 cents per square yard. In this cost is included all the items which should enter, namely, the cost of cleaning the street, the cost of the tar, of heating and applying it, the cost of the screenings and applying them, and the cost of rolling. The second treatment cost 4 cents per square yard, as the quantity of tar applied per square yard was less.

In addition to applying the heavy tar mentioned above a lighter tar (Tarvia B) requiring no heating before applying, has been used with considerable success. This tar is sufficiently fluid, under ordinary temperature, to run freely from the tank cars in which it is shipped. Before applying the tar the road surface must be cleaned of all dirt so as to expose the stone surface. The cleaner the surface of the street the better will the result be in the end. If any cakes of dirt or screenings are allowed to remain on the surface then the tar will not penetrate into the macadam, but will instead be absorbed by the layer of dirt or screenings. The first heavy rain will simply loosen the dirt layer and the street will in consequence become muddy. The street may be swept either with a rotary street sweeper or with push brooms. The former method is the more economical, but is somewhat objectionable on the part of the public on account of the raising of dust while the sweeping is being done. The raising of a dust while sweeping may be lessened somewhat by sprinkling lightly with water previous to sweeping.

The tar is hauled from the tank cars to the street in wagons equipped with a sprinkling attachment attached to the rear of the wagon. Several such attachments are on the market, the general principle of all being the same. Suitable regulating valves are provided on the attachment which makes it possible to gauge the quantity of tar to be applied. In practice about one-third of a gallon of tar is applied per square yard of street surface.

The tar, especially during warm weather, penetrates into the surface of the macadam sufficiently at the end of from six to twelve hours to enable the street to be thrown open to traffic. The efficiency of the tar as a dust preventative lies in the fact that it penetrates the surface of the street from one-fourth to one-half inch and firmly binds the stone in place.

The cost of the cold tar application described above is about 1 9/10 cents per square yard. In order to get the best results a second application of tar should follow the next season after the first application. These two applications will then be sufficient for the two or three following seasons.

AN OUTCOME OF THE GREAT BRITISH COAL STRIKE.

Following the distress of the recent coal strike in Great Britain, serious attention has of late been given to the immense deposits of peat in Ireland and the best method for their economical use.

The methods of preparing peat for fuel are very primitive and would have to be changed completely to make peat fuel a real competitor with coal. An attempt was made some years ago to make turf briquettes, but the scheme, though it promised well, did not turn out as successfully as was expected and the company failed. The moisture was squeezed out of the peat by compression and the briquettes when fresh seemed to be just the thing that was wanted, but whatever defect there was in the preparation of them they were not able to stand the knocking about they got in the railroad wagons and canal boats.

The problem of making peat briquettes that can travel by train without falling to pieces has, however, since been solved in Sweden and in other countries, and this fact has given encouragement to Irishmen to take the matter up again. The coal strike has brought the question within the range of practical things as nothing else could have done.

AIR LIFT PUMP—ITS ADVANTAGES AND DISADVANTAGES.*

The essential structural features of the air lift pump are exceptionally simple and few in number, and this fact constitutes one of its principal advantages. In its simplest form, as shown in Fig. 1a, it consists of a pipe for the discharge of the water and a smaller pipe for conveying compressed air to it at a point near its lower end.

The Eduction Pipe.—The discharge pipe is designated by various writers as the eduction pipe, lift tube, lift pipe, and rising main. It should not touch the bottom of the well or reservoir from which it is to pump, but should be elevated above it, so as freely to admit the water or other liquid through its lower open end. This end of the pipe should, however, be submerged below the liquid surface a distance which, the Wisconsin experiments indicate, should be greater than the height above the water surface to which the liquid is lifted. This latter distance technically is called the lift of the pump. The distance from the water surface down to the point of admission of the air into the eduction pipe is known as the submergence of the pump. Submergence generally is expressed as a percentage of the total length of the pump, measured from the point of air inlet to the point of discharge. The discharge should be free into a reservoir at atmospheric pressure. Submergence and lift should be measured from the elevation of the water as it stands under working conditions rather than under static conditions.

The Foot-Piece.—In most air lift pumps the compressed air from the air pipe enters the eduction pipe through a casting designed to cause the air to enter in a special manner. The casting used for such a purpose technically is called a foot-piece.

Frizell's and Pohle's foot-pieces are cited as examples in design. In the former the foot-piece is an hour-glass-shaped, perforated casting, so designed for the express purpose of admitting the air in small bubbles. In the latter type the exit end of the air pipe is enlarged by bevelling off the inner edge thereof, in order to permit the free delivery of the air in mass or bulk, and thus to avoid the formation of air bubbles.

Quite a large number of different foot-pieces have been devised and patented, and, in most cases, extravagant claims have been made for them as regards their effect in increasing efficiency of the pump.

The Wisconsin experiments indicate that changes in the form of the foot-piece have little if any effect on the efficiency and capacity of the pump, other than the effect due to the amount of obstruction of the water passages; a factor which differs in the various types.

Tail-Piece.—Most forms of foot-piece are arranged for the attachment of a pipe on to their lower ends, thus extending the eduction pipe some distance below the point of air admission, for the purpose of preventing the escape of compressed air from the bottom of the eduction pipe. The pipe used for such an extension is termed a tail-piece. The tail-piece is often made a larger size of pipe than is the remainder of the eduction pipe. The length and size to be used for a tail-piece are problematical.

A number of distinct types of air lift pump have been produced through the various methods that have been devised for piping the wells. The methods in most frequent use are illustrated in Figs. 1 and 2 and are described below.

Side Inlet Pump.—The side inlet pump, in which the air pipe is on the outside of the discharge pipe, is shown at (a) in Fig. 1. The air pipe is connected to the bottom of the eduction pipe by means of standard fittings, special castings, or one of the various patented foot-pieces. This method is used when the well is large enough to admit of the air and water pipes being placed side by side from top to bottom and is probably the most economical of the systems shown.

Annular Air Tube Pump.—Fig 1 (b) shows the annular air tube pump in which the well top is sealed and the air passes down through the annular space between the discharge pipe and the air pipe or well casing.

Many annular tube pumps have been built with no foot-piece or opening in the side of the pipe. In such pumps the air forces the water level in the well down until the bottom of the discharge pipe is uncovered. Air then enters the discharge pipe and the pressure in the annular space is lowered. This causes the fluid to rise again in the air space and discharge pipe until the pressures balance and then the operation is repeated. This causes the water in the well approaching the bottom of the eduction pipe to surge more violently than it would if it were allowed to rise in the well around the eduction pipe to its normal height, as it does in the side inlet system. It is claimed for pumps built in this way that this surging promotes the entrance of the water and air into the eduction pipe in a manner conducive of high efficiency.

Central Air Tube Pump.—Fig. 1 (c) shows the central air tube pump which uses the well casing as the discharge pipe, and introduces the air through a small pipe usually fitted with some special device or foot-piece attached at the bottom through which the air escapes. Usually a number of small holes are drilled, or a number of slits are cut into the lower joint of the pipe and the end plugged. An objection to this method is that when the well is cased for only a portion of the distance, the air and water may escape out of the well into fissures in the rock. The hydraulic radius of the water passage in the discharge pipe is reduced by the air pipe, which increases the fractional losses and so diminishes the efficiency, but in this method of piping the entire cross-section of the well, less the area of the pipe, is available for use as a discharging pipe; so a well piped in this way will have a greater theoretical capacity than wells of the same size piped by the other methods; notwithstanding the obstruction caused by the central air pipe. This fact is shown by the following comparison of the three methods. Assuming in each case that the wells are 6 ins. in diameter, the largest eduction pipe which can be got into the well with a 1-in. air pipe beside it, is 3⅛ ins. in diameter, while the annular tube method of piping a 4½-in. eduction pipe can be accommodated. In the central tube system it is assumed that a 1½-in. air pipe is used with the 6-in. casing serving as the eduction pipe. It may be noted from Table I. that the hydraulic radius of the central air tube pump is less than that of the annular tube pump, but the net area of the former is nearly twice as large as that of the latter. The discharge through a pipe under a given head is proportional to the product of the area and the square root of the hydraulic radius of the pipe. This product has been calculated and tabulated in the last column and shows the relative capacities of the wells piped according to the three different methods, assuming the value of the co-efficient of pipe friction and slip to be the same in all three cases.

*Abstract of Bulletin No. 450, University of Wisconsin, by G. J. Davis and C. R. Weidner of the Department of Hydraulic Engineering

Table I.—Hydraulic Properties of Three Types of Air Lift Pump.

Annular tube pump..	6	4½	6	15.96	14.62	1.13	16.9
Central air tube pump	6	6	1½	26.05	25.02	1.04	26.5

* Area of eduction pipe in square feet multiplied by the square root of the hydraulic radius.

Combination Pump.—Fig. 1 (d) shows a combination of the annular air tube and central air tube methods of piping. It is evident that the hydrostatic head in the well cannot be greater than that due to the ground water to permit of continuous operation. Therefore, no special advantage is to be gained in introducing compressed air above the water surface in the well, unless the increased surging, due to the less depth of water on the outside of the eduction pipe, might affect the size of bubbles of air admitted. The results of

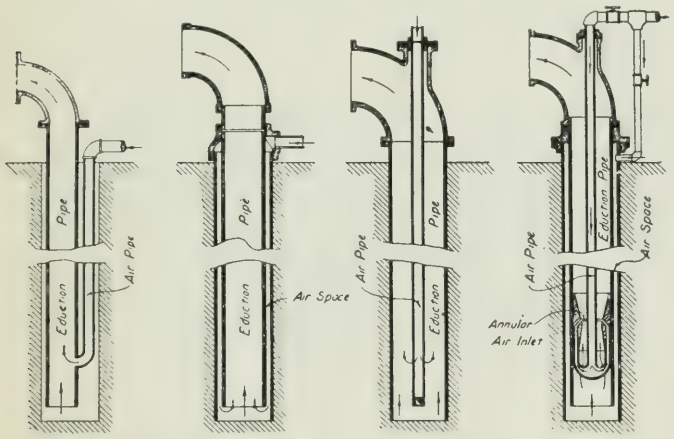

Fig. 1.—Different Methods of Piping Wells for Air Lift Pumping.

the Wisconsin experiments show that with the well piped according to the side inlet method, using a Harris Air Pump Company's foot-piece, there was no appreciable difference when compressed air was introduced above the water surface in the well and when the well was open to atmospheric pressure, the percentage of submergence and lift being the same in both cases.

Multiple Air Lift Pump.—When the lift is very high and the proper submergence difficult to obtain, the arrangement shown by Fig. 2 may be used where the cross-section of the well permits of its use. This arrangement employs a series of successive lifts and it is claimed that it works more economically than when the water is raised in a single lift. The cross-sectional area of the ordinary deep well will not permit of such an arrangement, but it may be used to advantage in a mine shaft.

Return Air Pump.—In rising through the eduction pipe there is a transfer of heat between the air and the water; the temperature of the two being practically equal at the point of discharge. Therefore, where the air lift is being used to pump from underground supplies, the temperature of the air issuing from the discharge pipe will be cooler than the atmosphere during the warm months of the year. For each five degrees fall in temperature of the free air entering the compressor, a saving of about 1 per cent. in the expenditure of energy used in doing the work of compression may be effected. Hence, where the wells are situated in close proximity to the power house, considerable economy may be effected by connecting the air inlet of the air cylinder of the compressor with the top of the well casing head. An air separator used for this purpose consists of a cylindrical drum about 18 ins. in diameter and 8 or 10 ft. long, attached to the casing head from the side of which the discharge from the well passes out. From the top of the cylindrical drum the air is piped to the compressor, as shown in Fig. 3. The return-air method may be used with any of the types illustrated. The air separator described above is useful also where it is desired to pump to points situated some distance from the well.

Diverging Outlet Pump.—When the eduction pipe is of uniform diameter throughout, the velocity of discharge is comparatively high, and there is considerable energy lost. To conserve this kinetic energy of the water an eduction pipe which increased in diameter towards the top has been used. In this form of eduction pipe as the compressed air expands in rising the velocity is not greatly increased. This device could be used with any type of foot-piece and any method of piping. A few experiments by the authors of the bulletin indicate that a considerable saving may be effected by the use of a diverging outlet of proper design.

The Plant.—An air lift pumping plant comprises the motive power, an air compressor, an air receiver, and an air pipe leading to one or more pumps such as have been described in the preceding paragraphs.

Fig. 4 serves to illustrate, in a general way, the machinery and other essential apparatus.

The compressor and receiver should be located where the expense of installing and operating the plant will be the least. They often are situated a considerable distance from the wells. The power used to drive the compressor may be either steam, electric, water or internal combustion engines.

The Compressor.—The type of compressor installed will depend on the pressure required to pump the wells, the nature and amount of power available for compressing the air, and the number and size of the wells. Where the pressure required is small and the quantity to be compressed not very large, the ordinary straight line or duplex compressor may be used. Where high air pressures are necessary economy demands the cross compound type fitted with an intercooler.

The Receiver.—The receiver is used to store and equalize the air pressure. It acts in much the same way as the air chamber on a force main and reduces the effects of the pulsations of the compressor. It also acts as a separator to catch the water and oil which are carried by the air. It is quite necessary to provide some kind of separator for this purpose to prevent the air pipes becoming clogged, and where a foot-piece with small air openings is used it is especially desirable to have the air free from any clogging material. The air receiver is usually built of boiler iron and designed so as to permit a steady flow of air to the well. The air from the compressor passes down from the top of the receiver through a pipe and discharges beneath the surface of some water which is usually kept in it. The outlet pipe for the air is located near the top of the receiver, and a drain is provided at the bottom to carry away the oil and water.

The Air Line.—From the receiver the main line runs to the wheels. The piping to the wells should be arranged to avoid unnecessary valves, elbows and bends, as these reduce the efficiency of the plant. The same precaution should also be taken in the design of the water pipes. A valve

should be placed on the air main in the power house so that the wells may be controlled from a central point. It is desirable to place a regulating and a stop valve at each well so that after the proper amount of air has been adjusted to the conditions of lift, submergence, etc., at the well, it will not be necessary to disturb the adjustment in order to shut down the well.

In the bulletin the discussion is confined to the air lift pump alone, leaving out of consideration the efficiency of the air transmission pipes, compressors and other appurtenances, which have an important bearing on the desirability of installing air lift pumping plants, but the consideration of which is beyond the scope of the bulletin.

Disadvantages of the Air Lift Pump.—The air lift pump, in common with every other device, has a number of disadvantages, the principal ones being its low efficiency, the great depth of submergence required and its poor adaptability to conditions requiring the discharge to be conveyed great horizontal distances.

Low Efficiency.—The most serious of the above-mentioned disadvantages is the low hydraulic efficiency of the pump. The pump is generally credited with efficiencies of only 25 to 33 per cent., but notwithstanding the low efficiency of the pump itself, the entire air lift pumping plant in some cases develops a duty which compares favorably with other systems of pumping.

Great Depth of Submergence.—A single air lift pump cannot be used in a shallow well or reservoir except to raise the liquid a very small distance, owing to the high percentage of the total length of the pump which must be submerged to give good efficiencies. This fact limits the field of the air lift pump principally to deep well pumping. The multiple stage previously described overcomes the difficulty, but probably at the cost of reduced efficiency.

Limited Horizontal Pumping.—Several plants have been installed where the air lift was used to pump the water a considerable horizontal distance after it had been raised to the surface of the ground, but such plants are not considered efficient. The air in passing through the horizontal or even an inclined pipe, is not likely to be evenly distributed throughout the cross-section of the pipe, but is likely to pass along under the upper side, allowing a large space in the lower portion of the pipe for the water to slip back past the bubble. In a horizontal pipe the air cannot exert any buoyant effort to aid in discharging the water, and its expansive force, which might be used in overcoming pipe friction is not likely to be effective on account of the serious amount of slip which occurs under these conditions. Where it is desired to convey the water to a point distant horizontally from the well, the eduction pipe should be carried vertically above the well a height equal to the friction head of the water in the horizontal conductor, and at its top it should be fitted with an air separator, such as the one previously described. From the separator the water would flow by gravity to the desired point.

Aeration.—The thorough aeration of the water pumped is generally regarded as an advantage, but under some circumstances it is a disadvantage. It doubtless promotes the rusting and consequent destruction of the eduction pipe and in some cases causes a deposit of salts which clogs the water passages, especially in the foot-piece. The opinion has also been expressed that compressed air causes an excessive growth of algae. The bacterial content of water is somewhat increased by the air lift unless the air supply is filtered.

Advantages of the Air Lift Pump.—The air lift pump possesses many features which give it decided advantages over other types of pumps, when applied to certain conditions.

Large Capacity.—Its principal claim to superiority lies in its large capacity. When the conditions are suitable for its installation, an air lift pump will discharge more liquid from a well of small bore than will any other type of pump. This is due to the fact that almost the entire cross-sectional area of the well is available for the flow of liquid and the action is nearly continuous. The quantity that can be discharged by an air lift pump is only limited by the capacity of the well and the expense of pumping at unreasonably high rates; while deep well pumps, the majority of which are single acting, limit the discharge by the allowable piston speed, which usually does not exceed 100 ft. per minute. The air lift affords a ready means for testing the capacity of a well even if it is not to be permanently installed.

Low Maintenance Cost.—Owing to the simplicity of the pump the expense of maintenance of the plant is very low, and is due principally to the expenses in connection with the compressor. The operation of the air lift is exceedingly simple and the life of the pump is almost indefinite. Sometimes the air pipes and foot-pieces become clogged with the oil carried over from the compressor cylinders and in that case have to be removed and cleaned, but this rarely occurs, and when it does the cost is small compared with the cost of replacing a mechanical pump. The fact that there are absolutely no moving parts in the well makes the pump especially fitted for handling dirty or gritty water, sewage, mine water and acid or alkaline solutions in chemical or metallurgical works, or other corrosive liquids. Mechanical pumps suffer from fine sand in the water, which cuts the packing, plungers and valves in a short time and makes frequent repairs necessary. To repair such pumps they have to be stopped for a period of several days, resulting in a consequent waste of time and increase in expenses. Liquids that attack metals such as brine, sulphuric acid, etc., may be pumped by the air lift pump, because the pump and appurtenances may be replaced at a small expense and loss of time. The application of the air lift as a dredge pump has been tried and found successful, but it has not been extensively used for this purpose.

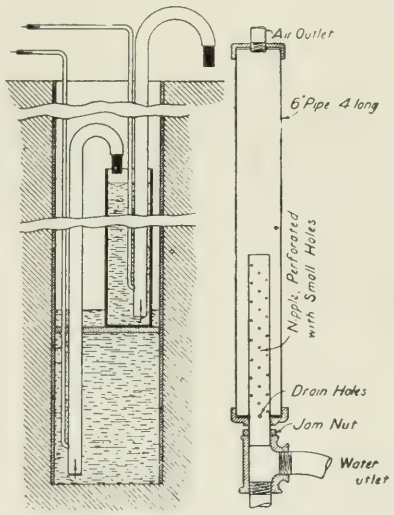

Fig. 2—Multiple Air Lift.
Fig. 3—Air Separator.

Low Operating Cost.—In places where the wells are scattered over a considerable area, or are remote from the power house, the air lift pump has an advantage over the steam-driven pump. In a deep well pump driven by steam each well must be equipped with a separate and working barrel, which entails heavy condensation losses through long steam supply pipes. The expense of attendance of a plant of this sort with its scattered pumping units is great. In

the air lift pump the transmission loss is much smaller and as no attendance at the well is required, they may be put in operation or controlled by a valve in the power house.

Not Affected by High Temperatures.—Fluids of different densities and temperatures may be handled to advantage by the air lift in cases where the use of other types of pumps would be prohibited. In the case of a hot liquid the air absorbs part of the heat of the liquid and hence is increased in volume, so that the discharge of liquid for the same expenditure of free air is greater with hot than with cold liquids. This results in a considerable gain in efficiency for the pump.

Aeration.—Where the water is to be used for a domestic supply and there are impurities in it such as iron, it has been noticed that the iron is oxidizd by the aeration of the water and the supply is thereby improved Aeration is especially advantageous in the pumping of sewage on account of the aid it gives in the oxidation of the impurities.

Reliability.—Air lift pumps are not liable to sudden stoppages or breakdowns.

The Wisconsin eyperiments were not made on actual wells, but the apparatus was designed to reproduce as nearly as possible the practical working conditions of the air lift pump.

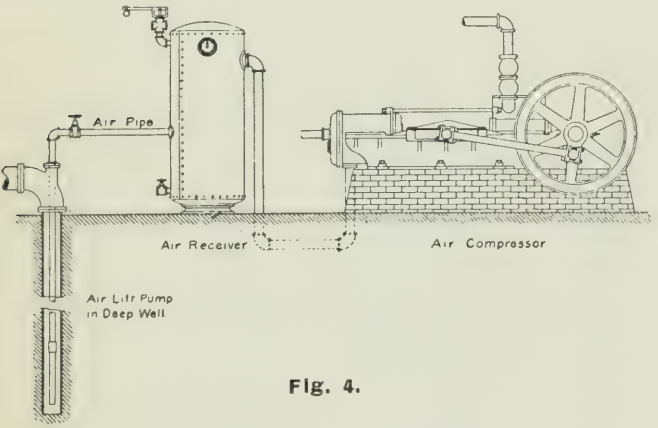

Fig. 4.

The experiments made by the writers were planned to determine, first, the effect on the discharge and efficiency of variations in the working conditions of the air lift pump, such as variations in submergence, lift and quantity of air used, and second, the effect on the discharge and efficiency of changes in the structural features of the pump. The bulletin contains the complete log of the experiments, arranged in tables and diagrams. The coefficients which were evaluated and applied to Lorenz's theory of the air lift are given. The conclusions reached by Messrs. Davis and Weidner are as follows:

Conclusions.—A comparison of the advantages and disadvantages of the air lift pump shows that there is a field of usefulness of sufficient magnitude to make it an important apparatus deserving of further theoretical and experimental study. From a study of the discussion and accompanying data given in the bulletin, ideas in regard to improvement in the design will no doubt be suggested to the designer or experimenter. However, a full realization of the complexity of the action must be appreciated, as also the number of variables which enter into the problem. In order to facilitate the study of results, the variables which may affect a particular type and size of pump are again given at this place. They are (1) percentage of submergence, (2) lift, (3) discharge, (4) volume of air, (5) pressure of air. The conclusions which may justifiably be deduced from the Wisconsin experiments are given below, and hold only for the particular type, size and length of pump on which the experiments were performed. The inference, however, may be drawn that these conclusions would hold for other types and sizes.

(1) The central air tube pump has the greatest theoretical capacity for a given size of well.

(2) The coefficient of pipe friction and slip decreases as the discharge increases, and decreases as the ratio of volume of air to volume of water increases.

(3 The coefficient of pipe friction and slip varies with the length of pump, but seems to be independent of the percentage of submergence and of the lift.

(4) The length of pump, the percentage of submergence, and therefore, the lift remaining constant, there is a definite quantity of air causing the maximum discharge. This quantity of air for maximum discharge, as also the ratio of volume of air to volume of water, differs for different percentages of submergence and lift, the length of the pump remaining constant.

(5) The length of pump remaining constant, the maximum output (e.g., foot gallons) occurs at about the same percentage of submergence for all rates of air consumption, being at from 61 to 65 per cent. for the pump used in the Wisconsin experiments. At other submergences the output varies as the ordinates of a parabola having vertical axis. Under these conditions the lift does not remain constant as the percentage of submergence varies.

(6) The length of pump and percentage of submergence remaining constant, and therefore constant lift, the efficiency increases as the input decreases; that is, the highest efficiencies are obtained at the lowest rates of pumping.

(7) By varying the percentage of submergence, and therefore the lift, the length of pump remaining constant, the maximum efficiency is obtained at approximately 63 per cent. submergence for all rates of input or discharge.

(8) The lift remaining constant, the efficiency increases as the percentage of submergence increases, for all rates of input and all practical percentage of submergence.

(9) With the same size and type of pump the percentage of submergence remaining constant, the efficiency increased as the lift increased for the small lifts experimented on; that is, up to about 24 ft. From a theoretical study, however, the indications are that a point will be reached from which the efficiency will decrease as the lift increases.

(10) Other conditions remaining constant, there is no advantage to be gained by introducing compressed air above the surface of the water in the well.

(11) The type of the foot-piece has very little effect on the efficiency of the pump, so long as the air is introduced in an efficient manner and the full cross sectional area of the education pipe is realized for the passage of the liquid. Anything in the shape of a nozzle to increase the kinetic energy of the air is detrimental.

(12) A diverging outlet which will conserve the kinetic energy of the velocity head increases the efficiency.

THE TRANS-AUSTRALIAN RAILWAY.

Full plans and complete specifications for the construction of the railway between Port Augusta in South Australia and Kalgoorlie in Western Australia have been prepared by the engineers of the Commonwealth government. The delay in making the plans available is said to be caused by important questions of policy—such as the gauge to be decided upon and the wages to be paid to laborers. It is understood that the construction will be carried on by day labor, but parts of the work may be done by contractors.

COST OF GIRDER AND SLAB CONCRETE HIGHWAY BRIDGES.*

By B. H. Piepmeier.

The purpose of this paper is not to discuss the practice of the Illinois Highway Commission in the design of through girder and slab types of concrete highway bridges, but to develop a ready means of ascertaining the approximate number of cubic yards of concrete in a completed structure of a known span, height of abutments and length of wings, as well as to develop a means of making preliminary estimates of the cost of completed structures without calculating the quantities in detail.

The bridge work of the commission requires a personal inspection of the bridge site with the local officials, and at this meeting the necessary data are obtained for the design of the bridge. Almost invariably the officials expect that an estimate of the cost of the proposed work be given them at this time. Consequently, it is desirable to be prepared to give an estimate of the proposed bridge that will closely approximate the one that is made from the detailed drawings. This is usually a somewhat difficult matter unless the time is taken to compute the number of cubic yards that will be in the bridge.

With the increased interest in concrete bridge work the past four or five years, it is needless to say that the commission has been called upon for engineering assistance more frequently each year, until to-day it is almost impossible to meet all the requests. For this reason a system of standards was devised and all computations tabulated. This greatly improved the office efficiency and made it possible to answer a large number of requests.

Again, in our office, it has been necessary to do considerable figuring to determine the best make up for a bridge. Frequently a series of small slabs on piers would sum up much cheaper than the larger spans, and vice versa. It is sometimes advisable to compare a steel bridge for the same site. With curves worked out by Mr. H. E. Bilger on the cost and the number of cubic yards in substructures for steel bridges, we are able to get a very accurate estimate of the cost of a steel bridge complete. It, therefore, became desirable that some ready means be devised for determining the approximate number of cubic yards in concrete slab and girder bridges, for both office and field use.

From the large number of computations we have made of various concrete bridges, it was thought possible that a complete tabulation of quantities or a system of curves could be worked out that would enable one to determine readily the contents of either the slab or the girder type of bridges. It is proposed, therefore, to correlate all computations and data on the flat top type of bridge, and to arrange it in a convenient form for both office and field use in determining the number of cubic yards in ordinary bridges, besides obtaining an approximate estimate of the cost. Before proceeding, however, it may be well first merely to outline in a general way the slab and the girder bridges as designed by the Illinois Highway Commission, and give a few dimensions that you may better understand the types of bridges under consideration.

Slab Bridges.—For reinforced abutments for slab bridges the main wall is made 12 inches thick from top to bottom, the steel reinforcing being placed on the stream side, and the percentage of steel increased as the height increases. The abutments rest on an 18-in. reinforced footing, which is made of sufficient size to allow but 3,000 lb. per square foot bearing on the foundation. When a soft foundation is encountered, this same size footing is usually sufficient to permit the proper spacing of the required number of piles.

The reinforced wings for slab bridges are of the standard cantilever type, the base being 33 per cent. of the total height. The wing wall proper is 12 in. thick for heights up to 16 ft. For greater heights the base of the wall increases in proportion to the height. Nearly all wings for this type of bridge have a drop of 18 in. to 5 ft. at the end to conform to the 2 to 1 slope on the sides of the road. I may say here that the cantilever type of wing for extreme heights has been found much more satisfactory than the buttress type, as the increased thickness at the base and the large percentage of steel does not equal the extra cost of forming necessary for the buttress type.

Reinforced concrete slab bridges are designed with various roadways, ranging from 16-ft. upward. The side rails usually average 8 in. thick and 3½ ft. high. On this type of bridge the slab and the side rails come flush with the back of the abutment walls. The top of the wings comes up along the outside of the rails to catch the side slope on the road. In determining the thickness of the slab, its entire dead load is considered, the load of the cushion wearing surface, and a 24-ton engine live load. Excluding temperature stress, the steel is figured at 12,000 lb. per square inch; the compressoin in the concrete is assumed at 800 lb. per square inch.

Girder Bridges.—For the reinforced abutments for girder bridges, the general type is the same as that for the slab bridges, with the exception that all abutment walls proper are 18 in. thick, and the width of base for the wings is 40 per cent. of the total height. The extra thickness in the abutments is for bearing of the girders. The extra width of base under the wings is for stability, as the wing walls are cut away from the abutment walls proper by a 1-in. partition to allow for expansion of the superstructure. They can, therefore, receive no support from the abutments, as is the case with wings on slab bridges. The wings on this type of bridge also come up on the sides of the girders and drop several feet at the ends to follow the general side slopes on the road.

The reinforced concrete girder superstructures are designed with roadways from 16 to 30 ft. The roadway usually required is 16 to 20 ft. The side girders average from 4 to 16 ft. in height, and 16 to 30 in. wide on the top. On the side girders there are heavy depressed panels to lighten the web and to give the proper appearance to the finished bridge. The floor slab and side girders on this type of bridge also extend to the back side of the abutment wall. The floor slab is designed to carry its own dead load, the cushion wearing surface and a 24-ton engine live load. The side girders are designed to carry the entire dead load of the superstructure, plus a live load of 125 lb. per square foot on the roadway, or a 24-ton engine, whichever gives the greater moment.

Abutment Diagram.—For the purpose of determining offhand the approximate yardage in a pair of reinforced concrete abutments for either slab or girder bridges, Fig. 1 has been prepared, and is applicable within the specific cases used. For abutments of slab bridges, 40 different designs were taken from the files of the commission, and the number of cubic yards in the two abutments of each design was plotted against H (R + 2W), where H is the distance from the finished roadway to the bottom of the footings, R is the clear roadway of the slab bridge, and W is the length of one wing measured on the stream side. R was taken as the clear roadway of the bridge, as this figure is always secured at the preliminary inspection of the bridge site. W, the length of the wing, can always be assumed in the field or

* A paper read before the Illinois Society of Engineers and Surveyors.

computed in the office, knowing first the general conditions of the bridge site.

It will be noticed that the number of cubic yards in the two abutments varies approximately as the height of the abutments; also, that the maximum deviation from the curve does not exceed 2 cu. yd., and more often it is less than 1 cu. yd. In fact, for heights of abutments up to about 16 ft., or where H (R + 2W) does not exceed 900, the quantities so plotted follow practically a straight line, and might be represented by the straight line formula, cubic yards = 0.09 [H (R + 2W)] — 1.37, which often is convenient when the curve sheet is not at hand.

For a particular bridge, suppose the distance from the crown of finished roadway to bed of stream is 10 ft., and the footing should be carried 4 ft. below bed of stream. Then H = 14 ft. Now assume the wings are each to be 13½ ft. long, and that the finished bridge will have a 16-ft. clear roadway. We have now H (R + 2W) = 600, the value to be read at the bottom of Fig. 1.

It will be seen by locating the point on the curve and going across to the left-hand side that there are about 53 cu. yd. in the two abutments. Where the quantity at the bottom of the figure exceeds 900, we readily see that the curve begins to rise above the straight line. This is expected, as abutments exceeding 16 ft. in height have the base of the wings spread to allow for the proper percentage of steel. This extra width of base is added to the back of the wing wall by a batter, the batter extending up from the footing 4 to 8 ft., according to the height of the wall. This batter does not extend to the top of the wall, as the drop at the end of the wing would increase its thickness at the end, and this does not give the best appearance to the finished bridge. The abutment walls remain 12 in. thick up to 21 ft. high, and from there on the thickness increases as the height. The slight variation from the curve in solving specific cases may be attributed to the difference in the angle of the wing with respect to the abutment, and the difference in width of footing for bearing. The more nearly the direction of the wing approaches a parallel with the centre line of the road, the higher will be the wing at the end, thereby increasing the number of cubic yards, but as the corner formed by the intersection of the abutment wall and wing is measured twice, these two quantities tend to compensate one another.

For the reinforced abutments on girder superstructures 25 designs were taken from the files of the commission, and the number of cubic yards in the two abutments plotted against H (R + 2W), the notation being the same as before.

It is to be noted here that the number of cubic yards is somewhat greater than the number of yards in the abutment for slab bridges. This is due to the extra thickness of the abutment walls proper, to give the desired bearing and the extra width of footings under the wings. It will be noted on this curve that some of the specific cases used had a wide variation from the mean. This can be attributed to the fact that some of the abutments had extremely long wings that were level on top and also the different length of spans requires a little different width of footing under abutments to take the required bearing. A curve of this kind could not take into account all of these conditions, and while several points fall several yards off the curve, the mean is close enough for the purpose that it is to meet.

For a particular case, take the same dimensions that were considered before; clear roadway, 16 ft.; height, 14 ft., and length of wings, 13½ ft. We now have 600 to read off at the bottom of Fig. 1. Getting the intersection with the curve for girder spans, we find that the two abutments contain 67 cu. yd. instead of 53 cu. yd. in case of the slab span, a difference of 14 cu. yd. in favor of the slab bridge. Fig. 1 then is a ready means of comparing the substructures of the two types of concrete bridges and to determine the approximate number of cubic yards in each.

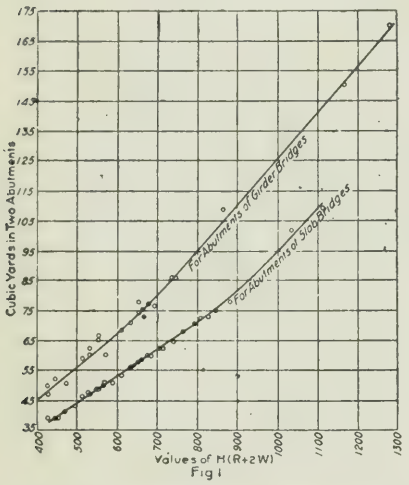

Fig 1

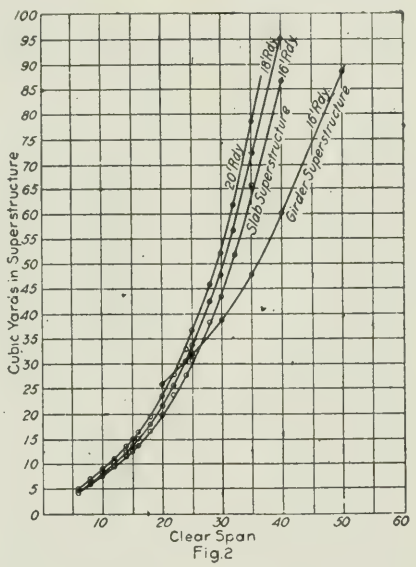

Fig.2

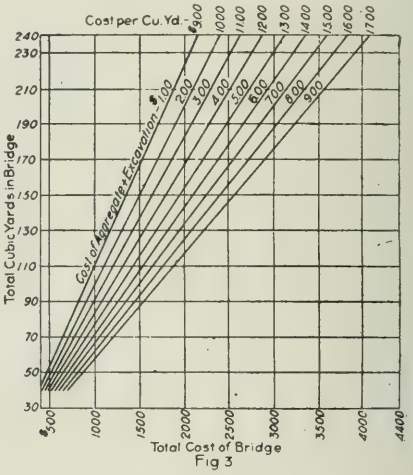

Fig 3

Diagrams for Determining the Approximate Cost of Through Girder and Slab Bridges.

Superstructure Diagram.—The next thing of importance is to determine the number of cubic yards in the superstructures of the two types of bridges. For this, Fig. 2 has been prepared, and is applicable for the flat top type of bridges up to 50 ft. in span. For slab superstructures 48 designs of different roadways and spans were taken from the files of the commission, and the total number of cubic yards in the superstructure was plotted against the clear span length, the curves drawn through the points having 16, 18 and 20 ft. roadway. The three curves will meet the requirements of the majority of highway bridges. Occasionally a special case arises, such as a skew or extra wide roadway, and then it is necessary to make special computations to determine the number of cubic yards.

For a special case, assume a bridge to have a 30-ft. clear span and 16-ft. roadway. We readily see the number of cubic yards to be about 43.2.

We may wish to consider for the same site the 30-ft. girder type with 16-ft. roadway. Here we see that the number of cubic yards is about 38.6, or a difference of 4.6 cu. yd. in favor of the girder superstructure. But you will notice for the same height substructure the difference in all cases is in favor of slab bridges. If it should happen that

for a single span the girder bridge and the slab bridge should have the same yardage, an advantage still rests with the slab type, as it has been found that contractors usually bid more favorable on this type. There is also another very important point in favor of the slab type. If for any reason there should be any defective material placed in the rail, or poor alignment in its construction. it may be torn down and replaced without disturbing the floor, even after the falsework has been taken down.

Cost Diagram.—Having found the expression that is the measure of the number of cubic yards in the abutments and superstructures of concrete slab and girder bridges, the next step is to combine the quantities with a unit price that we may determine the approximate cost of each type. For this purpose Fig. 3 has been prepared.

It has been found from the cost data of a large number of slab and girder type concrete bridges built under the supervision of the Illinois Highway Commission, that it is possible to get a very close figure on each individual item that goes to make up the cost of the bridge; first, the cost at the bridge site of sufficient cement to make 1 cu. yd. of 1:2½:4 concrete; second, the cost of the necessary lumber for forming 1 cu. yd.; third, the cost of reinforcing steel per cubic yard of concrete; fourth, the labor cost in mixing and placing 1 cu. yd. of concrete; fifth, the cost of sufficient aggregate to make 1 cu. yd. of concrete; sixth, the cost per cubic yard of concrete to make the necessary excavation to start the concrete of the footings. The two items that largely control the cost of a structure of this kind are the excavation and the necessary aggregate for the concrete. We find that the cost per cubic yard of concrete for cement, forms, reinforcing steel, and the mixing and placing, have narrow limits in their variation.

It therefore appears possible that some definite quantities may be fixed to the first four items and a curve plotted for the last two, combining them in such a way that the total cost may be readily determined after we have learned the number of cubic yards in the bridge.

The cost at the bridge site of sufficient cement to make 1 cu. yd. of concrete for a 1:2½:4 mixture may vary from $1.75 to $2.10. While the price of cement, the distance it has to be hauled, and the amount required for some aggregates, vary slightly, the extreme variation would not be over 20 cents per cubic yard from the average. From a general average of all cost data on this item, it would seem that we are probably safe in choosing for cement about $1.90 per cubic yard of concrete.

The cost of forms includes all the necessary falsework, bracing and form lumber for completing the bridge. While this item varies somewhat for different localities, and will vary again where the contractor can use some of his old lumber, it will fall between the limits of 75 cents and $2.50. Experience has shown that about $1.50 for the ordinary type of bridge is usually sufficient and might well be chosen for this cost curve.

The reinforcing steel varies from 50 lb. per cubic yard for substructures to 170 lb. per cubic yard for superstructures, or an average of about 110 lb. for the two combined. This steel delivered at the bridge site under ordinary conditions and bent ready for placing in the structure will cost about $2.10.

The item for mixing and placing concrete might vary from $1.50 per cubic yard for crushed rock concrete mixed by hand to possibly as low as 40 cents for gravel concrete mixed by machinery. This item should also provide for the necessary work in spading the concrete next to the form and securing the desired finish. In spite of the possible wide variation, we find the cost of this item varies but little from the fixed amount of $1.25. While all these quantities given above may seem somewhat in doubt as to their reliability, yet experience has determined that they are not far from the correct figures for normal conditions on the average bridge.

The item of excavation, which includes also cribbing, sheet piling, pumping, and all necessary work to start the concreting of the footings, has been found from the cost data on file to vary from 50 cents to $5 per cubic yard of total concrete in the bridge. The 50 cents per cubic yard is found only in some very favorable cases and on the smaller spans, where there is practically no cribbing, sheeting or pumping necessary. On the other hand, the cost of $5 per cubic yard of concrete is caused by a soft, seepy soil where cribbing, sheet piling and excessive pumping are necessary. Quite often the wide variation in the item for excavation is due to poor management on the part of the foreman in charge. This item, therefore, may vary considerably, but with experience with the excavation that is to be handled and with the type of bridge that is to be built, one is able to estimate this item sufficiently close for all practical purposes.

It will be seen that the cost of the aggregate delivered to the bridge site is the second item determining the price per cubic yard of concrete. Under the most favorable conditions with respect to location of a satisfactory aggregate supply, it would likely cost at least 50 cents per cubic yard to haul it to the mixing plant. On the other hand, the cost of aggregate at the bridge site might exceed $4 per cubic yard, as the structure may be isolated from a railroad station, and it may be necessary to ship in either gravel or crushed rock and sand, besides hauling it several miles into the country.

In the light of the wide range on these two items, Fig. 3 has been prepared to give the total cost of the bridge complete, including profit to the contractor under conditions where the cost of excavation, plus the cost of aggregate at the bridge site, might vary from $1 to $9.

For a specific case, we will assume that a concrete bridge has 120 cu. yd. of concrete. We will next investigate the condition of the foundation, and assume the cost for completing this part of the work, and express it as so much per cubic yard of concrete. We then approximate the cost of delivering at the bridge site the necessary aggregate to make 1 cu. yd. of concrete. For convenience let us say that these two quantities amount to $3 per cubic yard of concrete. Entering Fig. 3 with 120 cu. yd. at the left-hand side, and following this across to the $3 curve, or the $11 per cubic yard, which is the same thing, and then to the bottom of the figure, we find the cost of the bridge complete to be $1,300. The total cost per cubic yard of concrete is shown at the top for aid in determining the unit price.

From the figures heretofore given, we are able to determine approximately the number of cubic yards in either the slab or the through girder type of bridges, besides having a ready means of determining the probable cost. While the curves here developed apply only to the slab and through girder types of bridges, similar curves might readily be developed for the deck girder, the through girder floor beam type, or the arch, and would prove of equal service to the highway engineer, but their development is beyond the scope of this paper.

The foregoing is not intended to supply a substitute for engineering ability, but rather to furnish aid that will safely direct the engineer who will interpret with judgment and experience.

BRITISH COLUMBIA'S FOREST WEALTH.

The lumber industry and the lumber trade both showed very satisfactory returns for the year 1911, stated Hon. Price Ellison in the British Columbia Legislature when introducing his budget. "I ventured to predict in my last budget speech that 1911 would prove a prosperous year in the lumber trade. My forecast was correct. The steadiness of the lumber market enabled the mills to operate during the entire year though some of those in the interior curtailed their output during November and December, on account of the American mills dumping their surplus out on the markets of the northwest at less than cost price.

"According to the returns made to the chief timber inspector the lumber cut for 1911 was as follows:

"Logs officially scaled west of Coast range 619,000,000 feet; cut from Esquimalt & Nanaimo Railway lands, 144,000,000 feet; logs officially scaled east of Coast range 297,000,000 feet; total, 1,060,000,000 feet.

"Of this amount the total manufactured into lumber was 113,000,000 feet, and the total exported 47,000,000 feet.

"The royalty collections for 1911 exceeded those of 1910 by no less than $50,734.

"The causes of this better return may be summed up as follows:

"1. The crops in the prairie provinces compared favorably with those of 1910.

"2. The record number of incoming settlers increased the demand for dwelling and other houses.

"3. The checks on the dumping from the United States effected by the enforcement of the customs regulations by the new government at Ottawa will prevent the importation of other than real rough lumber.

"4. The lesson taught by the prolonged shutting down of mills in the United States has produced a lasting effect.

"I look forward, therefore, to a still greater stimulus in the lumber trade in 1912—especially as there will be a larger amount demanded provincially owing to our development.

"The supply of pulpwood in the eastern United States has been hopelessly insufficient for the present needs of their people, and they already import one-quarter of the whole of the raw material for their paper mills from Canada. We are also exporting to them $4,000,000 worth of manufactured pulp for the paper mills of the eastern states.

"I look forward to a rapid growth in that industry. I may add that the completion of the Panama canal in 18 months time cannot but have enormous influence in the development of our lumber trade. It can hardly fail in fact to become by far the most profitable of our staple industries. The cheaper freight rates, which will necessarily accompany the opening of the canal, must give an unprecedented stimulus, and will at the same time prevent a recurrence of periods of depression. With an easy means of communication secured to us by water as well as by land the depletion of the world's timber in other regions cannot fail to make the timber output of our forest lands a most permanent source of revenue for generations to come.

"This province more than two years ago outstripped Quebec in the production of lumber, while in 1910 her output was on a par with that of Ontario. It does not require the eye of a prophet to see that, with a vast proportion of her virgin forests still untouched she will, in proportion to her size take prominent place within a year or two among the great timber producing countries in the world.

"In order to bring about this end and to encourage the establishment of the paper making industry in the province the government granted in 1901, 21 year leases of pulp forests to companies on liberal terms. In 1903 the law granting pulp leases was repealed. The annual rental now paid under these leases, is two cents per acre and a royalty of 25 cents per cord of pulp wood cut. Four companies are now either erecting or operating plants, the British Canadian Wood Pulp Paper Company, the Swanson Bay Forests Wood Pulp & Lumber Mills, the Ocean Falls Company, Bella Coola and the Powell River Paper Company. As proof of the prosperity of the industry the last named company is filled up with orders for all the paper and pulp it can produce.

"I believe that the mills of Powell River, Swanson Bay, Howe Sound and those of the British Columbia Wood Pulp and Paper Company, vast as they are, are but the pioneers of an enterprise which will fling its tentacles all over the world.

"Looking forward into the centuries, one can imagine a time when the great forests of this province will be denuded of most of their timber; but even then, if all the wealth were gone, British Columbia would remain the greatest producing region in the world. No country shares with us our climate or our soil. It is the most congenial for the cottonwood, spruce, balsam, hemlock, and Lombard poplar, which produce the best paper. Already our ships are conveying the output of our forests in pulp and paper to Australia, New Zealand and the Orient, and no far sighted man can doubt that in the near future half of the whole world will be the market place of the pulp and paper produce of British Columbia.

"We have in this province a combination of the three factors which together insure the prosperity of the pulp and paper trade—factors without which the industry can nowhere be successfully maintained. These three factors are (1) cheap water power; (2) cheap timber; (3) cheap transportation in close juxtaposition. Washington, Oregon and California have the last two but they lack that most essential factor—cheap water power. My conviction is, therefore, that we can always compete successfully against other producing countries in capturing the pulp trade."

IRON ORE IN QUEBEC.

The iron ore industry of the Province of Quebec has, in the last few years, shown a serious decline. The bog iron ore deposits of the St. Maurice district and of Drummond county seem to be passing away, and, so far, no other iron ore deposits have been brought into prominence to replace them. In 1911, only 931 tons of local ore were charged into the Drummondville furnace, of the Canada Iron Corporation, the main supply of ore having had to be imported from Ontario. The Radnor furnace of the same company went out of blast in the summer of 1910 and was not blown in during 1911.

INDUSTRIAL ACCIDENTS.

According to the record of industrial accidents kept by the Department of Labor, 61 persons were killed and 178 injured during February, 1912. This record compares very favorably with that of January, when 86 workmen were killed and 214 injured. Compared with February, 1911, the record is still more favorable, as 93 were killed and 197 injured in that month. The worst disaster of the past month was the premature explosion of dynamite on construction work near Fort Frances, Ont., on the line of the Canadian Northern Railway, by which 13 construction hands were killed and six others seriously injured.

The Canadian Engineer

ESTABLISHED 1893.

ISSUED WEEKLY in the interests of the CIVIL, MECHANICAL, STRUCTURAL, ELECTRICAL, MARINE AND MINING ENGINEER, THE SURVEYOR, THE MANUFACTURER, AND THE CONTRACTOR.

Managing Director: JAMES J. SALMOND.
Managing Editor: T. H. HOGG, B.A.Sc.
Advertising Manager: A. E. JENNINGS.

Present Terms of Subscription, payable in advance

IMPROVEMENT IN HOME CONDITIONS.

It is a familiar phrase among Canadians that the western portion of the country is "land mad," and the statement is strengthened to some extent by the many sheets in the newspapers given up to the description and offerings of western real estate.

It is particularly noticeable that these land booms follow, almost invariably, the extension of the railways, and that the erection of railway yards or other property is always an incentive to the realty men to increase their prices for late comers and industrial concerns.

In the City of Calgary, Alta., the scene of considerable real estate activity, the Canadian Pacific Railway have recently erected a large railway yard, and in order to protect their employees from the high prices of the agents have decided to open a tract of land adjoining the shops for the purpose of giving their employees a chance to erect and build homes and dwellings for their own use.

The lots will be sold at very reasonable prices, and when the employees have been given enough land for this purpose the balance will be offered to the public.

It is not a common thing for the management of our large industrial enterprises, in this country, to take an interest in the home life of their working men. In Great Britain it is much more prevalent, and the results in almost every instance have been satisfactory in the highest degree. The village of Port Sunlight, in England, is almost entirely under the control of the Lever Brothers and their employees, and the result is that laboring classes, speaking generally, have better home conditions than the average mechanic in this country. In the first place the worry of rent payment is entirely eliminated, and the fear of higher prices being asked from time to time is done away with, and the sanitary conditions are kept up to a certain standard.

It is just possible that should more capital industries follow the course of the railway in this matter, the high cost of living would decline.

MUNICIPAL EXPENSES.

Ratepayers and supporters of municipal finances are only too well acquainted with the reckless and thoughtless expenditure of civic moneys by municipal controllers and council men. We have recently had an example of a direct waste of several thousand dollars in waterworks material in one of our larger cities, and the following increase in the tax rate that must result from this expenditure that will never return dividends monetary or otherwise. Recently in and during the council meeting in a Canadian city, a controller questioned a small item for ornaments for the mantel shelf of the Mayor's office. The articles in question may be procured for a few cents, and as they were for decorative purposes only the council man requested that the item be referred back for an explanation.

In due course the item returned with the amount lessened by the sum that had been questioned when the bill was presented for payment. Accompanying the bill a written explanation was offered, and from the composition a reader would be at once impressed with the friction that must exist between certain departments in the civic organization.

As stated above, the item was small but the principle of the thing was apparent from the start. The council man was already aware of the large deficit carried for-

ward from last season and here saw an opportunity to reduce the civic expense. He did not object to the articles of decoration, but expressed his opinion that a lower price could have been paid for the same value and appearance. If the article had been some municipal requirement where utility was the all important point, sarcasm given in answer to a suggestion for expense reduction could not be overlooked; but surely the council member deserves the approval of the citizens in his attempt, however small, to reduce needless civic expenditure.

A GOOD CHANGE IN TENDER WORDING.

In a recent advertisement for the supply of road machinery for one of the smaller municipalities of this country a clause was inserted in the composition to the effect that "Any firm or dealers who personally or through their agents canvass members of the County Council or officials of the council will be disqualified from having their tenders accepted."

This is an unusual clause to notice in a municipal tender but surely it is a criterion of the fair minded intentions of the council members to see that the ratepayers are supplied with the worth of the staple dollar for dollar as well as giving the smaller manufacturer an equal chance in the competition.

PUBLIC HEALTH.

The recent announcement from the Federal Government regarding the new methods to assist the public in the matter of health is the outcome of several suggestions and ideas on the part of municipalities and communities who have tried to combat disease and found themselves handicapped owing to the limited extent of their powers.

The Federal Government are the proper body to direct this campaign for many reasons, chief of which is the unlimited powers enjoyed by that party owing to no restriction being made by boundary lines or municipal borders.

But the federal powers may be greatly strengthened by co-operation of the municipal authorities, and in return the municipal health officers may feel increased powers with the knowledge that suggestions, if practical, will be adopted and enforced with powers that they as individuals do not enjoy.

It is to be hoped that the new office will prove of equal value to the Canadian public with the benefits of the Government inspection of live stock.

Honorable Frank Cochrane has given notice of a resolution providing for a subsidy not exceeding $6,400 a mile for the Temiskaming and Northern Ontario lines, described as follows: From North Bay to Cochrane, not exceeding 252.8 miles. From Englehart to Charlton, not exceeding 7.8 miles From Cobalt to Kerr Lake, not exceeding 3.9 miles. From Iroquois Falls to Timmins, not exceeding 33.6 miles. From Nipissing Junction to North Bay, not exceeding 2.18 miles. Provision is made for the payment of the subsidy upon the certificate of the chief engineer of the Department of Railways and Canals as to the mileage constructed in such manner and in such amounts, and subject to such conditions, if any, as the Governor-in-Council may deem expedient.

THE FIRST COLD WEATHER REINFORCED CONCRETE JOB.

It is interesting to note that the first reinforced concrete factory ever built, the Pacific Coast Borax Refinery at Bayonne, N.J., was constructed partly during the winter of 1897-1898. Reinforced concrete buildings are now so general that it is hard to appreciate the boldness of the conception to construct a building to carry actual working loads of 400 lbs. per sq. ft. out of a material which had been previously used almost exclusively in foundations and at a time when the placing of concrete in the winter was considered absolutely erroneous. The contractors for this building were the Ransome & Smith Company, while Ernest L. Ransome was the designer. That the work was well done and the design well made is evidenced by the way the building stood the severe fire which visited it in the spring of 1902.

The construction was begun late in the fall of 1897 when the ground was frozen. In placing the foundations salamanders with long legs were placed in the excavations to keep the concrete from freezing. Most of the broken stone was brought down in scows from the Palisades of the Hudson River and was piled near the cement shed. The size of the stone was limited to particles passing a 2-inch ring, while for much of the work a 1-inch size was employed. There was so much fine material left in the rock that only a small quantity of sand averaging not more than 10 per cent. was needed. This stone pile was heated by steam pipes from a central plant to a temperature of about 80 deg.

The cement and stone were measured in barrows, dumped into a hopper which discharged into a car. This car was hauled by a cable through a subway and then up an incline to about 30 ft. above the hopper and about 400 ft. distant, where it was automatically tipped into a chute leading to the mixer. Salt was added to the water used in the proportion of 8 lbs. of salt to each barrel of water. The mixer was one of the early Ransome mixers, and it discharged into a trough containing a screw conveyor which delivered the concrete to a vertical bucket elevator and this hoisted the material to the storey where it was required and dumped upon a platform which held about one cu. yd. A steam engine operated the car, mixer and elevator, besides operating a number of machine tools.

One of the most interesting points of this building is the double walls. The total thickness of all of the walls is 16 ins. for the entire height of the building, the hollow space varying from 10 ins. to 12¼ ins. These walls were constructed in three feet sections and the concrete was kept from freezing by placing salamanders in the hollow walls. The work was enclosed by canvas, floor by floor, and salamanders were also used here. This method of concreting in cold weather proved very satisfactory, and the cost of this building per cu. ft. of contents was less than 5 cents, which is a remarkable showing when everything is considered.

PANAMA CANAL REPORT.

The recent report of the volcano under the Panama canal has proved, upon investigation, to be false; the steam and other manifestations of heat are said to arise solely from the oxidation of pyrites and that the trouble is disposed of after the portion is uncovered for a few days.

THE PRINCIPLES OF SPECIFICATION AND AGREEMENT WRITING.

By C. R. YOUNG, A.M. Can. Soc. C.E.

(Registered in Accordance with the Copyright Act.)

Final Article.

THE AGREEMENT.

In the agreement is recorded the formal promise of the Contractor to perform certain labor and supply certain materials in return for a specified consideration promised by the Owner. The general business and legal relationships involved in the whole arrangement between these two parties thus properly require statement here, rather than in the "General Clauses" of the specifications.

While it is impracticable to here attempt an outline of all the stipulations which might find place in engineering agreements, the following matters are of essential importance to such instruments and have mention, in one form or another, in most of them. The items set down do not necessarily represent the titles of corresponding clauses, but merely ideas which should be embodied in some form or other in the agreement:—

(1) A title clause.
(2) Description of subject-matter.
(3) Inclusion of specified documents.
(4) Satisfaction of the Engineer.
(5) Contractor's Risk and Obligations.
(6) Commencement and Completion.
(7) Liquidated damages.
(8) Disputes and Arbitration.
(9) Dismissal of Contractor.
(10) Liens.
(11) Assignment of Contract.
(12) Consideration.
(13) Binding of Successors and Assigns.
(14) Dating.
(15) Signatures.
(16) Witnessing.

(1) **A Title Clause.**—This clause, which is naturally the first one of the agreement, records the making of an agreement on a certain day between parties who are named, numbered and described. The following is a simple illustration:—

> "ARTICLES OF AGREEMENT, made this twentieth day of March in the year One Thousand Nine Hundred and Twelve between the Jones Construction Company, hereinafter called the "Contractor," of the First Part, and the Municipal Corporation of the Town of Blankville, hereinafter called the "Corporation," of the Second Part."

The order in which the parties are named is immaterial, but usually the Contractor's name is placed first.

(2) **Description of Subject-Matter.**—Only a very concise description of the work which the Contractor binds himself to do in return for the consideration mentioned should be placed in the agreement. A description by title and location merely, affording some aid to the identification of the plans and specifications, is sufficient. For the general and detailed descriptions of the work, reference is made in this clause to the plans and specifications which are declared to be a part of the agreement. An example of a clause embodying the above-mentioned features, and which would form the second clause of the agreement, is the following:—

> "WITNESSETH, that in consideration of the payments and covenants hereinafter mentioned to be made and performed by the Corporation, the Contractor hereby agrees to furnish all materials, tools and appliances and perform all labor necessary for the construction of a Reinforced Concrete Arch Bridge over the White River on Robert Street in the Town of Blankville, and in the Province of Ontario, in accordance with the plans and specifications prepared by John James Smith, Civil Engineer, which are hereby incorporated with and declared to be a part of this contract."

(3) **Inclusion of Specified Documents.**—It is necessary, in order that plans and specifications may be included as a part of the contract, that such incorporation be declared, either in the clause setting forth the subject-matter, as above, or in a separate clause. The inclusion of detail or explanatory plans may be covered by this separate clause or, as has already been pointed out, by the specific clause of the specifications referring to plans.

(4) **Satisfaction of the Engineer.**—Although it may have been provided in the specifications that the work is to be done under the general supervision of the engineer and to his satisfaction, it is desirable to include this statement in the agreement as well. The status of the engineer and the important relation which he is to bear to the contracting parties is thus acknowledged and declared in the agreement—the very soul of the contract.

(5) **Contractor's Risk and Obligations.**—The conditions under which the Contractor accepts the contract, in so far as legal responsibilities of a general character are concerned, should be stated here. It must be made plain that the Contractor cannot secure immunity from the pledges of the contract on the ground of unforeseen obstacles or accidents. One of the reasons for the Owner letting the work by contract at all is to relieve himself of the risks and responsibilities incidental to the project, and when a Contractor agrees to do the work for a certain sum it is assumed that he has taken full account of all eventualities in his tender. He, therefore, cannot secure a release on the grounds of undue difficulties if the work be capable of performance by human agencies. Responsibility for accidents due to his own operations should be made to include the defence of all suits for damages arising from this source. A customary and satisfactory phrasing adopted in this clause is that "the Contractor shall indemnify and save harmless the Owner with respect to actions and damages, etc." Conformity to existing building and sanitary laws is to be required of the Contractor, and the responsibility for their violation placed upon him.

(6) **Commencement and Completion.**—If the times of commencement and completion and the required rate of progress have been defined in the specifications, as has been recommended in the present discussion, it is sufficient for the agreement to state that in these respects the work shall be done in accordance with the provisions of the specifications.

(7) **Liquidated Damages.**—Failure of the Contractor to complete the work on time, should entitle the Owner to collect such damages as may have been actually sustained by the default. The legality of fixing beforehand, or "liquidating," the damages has been confirmed

many times by the courts, and there are on record numerous cases where damages have actually been collected from a delinquent Contractor.

But while this principle is well established, it is a matter of common observation that the cases where damages have been recovered from the Contractor are very few compared with those which have been decided in his favor. The reasons are to be found both in the defective preparation of contracts and in the failure of the Owner to comply with the conditions upon which the Contractor's promise was based.

Perhaps the most frequent evidence of weakness in contract stipulations respecting non-completion on time is the fixing of liquidated damages far in excess of the actual damages. In such a case only the actual damages can be recovered from the Contractor, since the contract legally provides for the exaction of a penalty. The disguising of a penalty under the term "liquidated damages" cannot affect the character of the clause, for its exact nature is judged from the contract as a whole and not by the particular term employed. If, however, the actual damages cannot be determined, any amount which does not appear grossly disproportionate to the value of the work done may be collected provided all other conditions have been complied with.

The circumstance which most frequently deprives the Owner of the right to collect damages from the Contractor for failure to complete on time is the contributory delay of the Owner himself. This may result from the Owner failing to deliver up the site to the Contractor at the time specified in the contract for commencement or from delays or suspension of work during progress. It is possible that this contingency might be met in a legal manner by providing in the contract that delays caused by the Owner up to a certain maximum number of days should automatically extend the time of completion by an equal number of days, and that liquidated damages should be calculated from this altered time of completion.

Contrary to the popular impression, it is not essential that a clause conferring on the Owner the right to collect liquidated damages must, in order to be legal, be accompanied by a corresponding bonus clause. There are many cases on record where damages have been recovered without a bonus clause in the contract at all. This much may be said, however, that its inclusion imparts to the contract an increased degree of mutuality and removes to some extent the stigma of one-sidedness. In addition, the reasonableness of the amount fixed as liquidated damages is enhanced by the declared willingness of the Owner to pay a similar amount per day for every day by which his possession of the work is hastened.

(8) **Disputes and Arbitration.**—Most disputes arising under the contract are preferably subject to final settlement by the engineer, as has already been pointed out in discussing the General Clauses of the specifications. These decisions will be upheld by the courts unless the existence of prejudice, partiality or fraud is proven. There are nevertheless many questions upon which an appeal from the decision of the engineer to a specified board of arbitration should be allowed. In this category would come disputes relating to payments, alterations, extras, Contractor's delay and similar business or non-technical matters, upon which a mixed board might properly pass. To safeguard findings by arbitration, its conduct should be such as is sanctioned by law. The character of the tribunal should be definitely fixed in the contract, the scope or subject-matter of arbitration fixed, and the procedure of the board should be proper and without partiality. While the common practice is to specify a board of three arbitrators, much may be gained in despatch at least by the reference of disputes to one man of large experience and of undisputed ability and integrity.

However much the contracting parties may have endeavored to prevent litigation by carefully-framed provisions for arbitration, either party may refuse to be bound by the award of the arbitrators and appeal to the courts. The law will not allow any one to barter away his right of being heard in a court of justice. On the other hand, if the arbitration has been properly conducted and the award made in good faith, the courts will generally confirm the decision, so that it rarely pays a dissatisfied party to attempt to upset the findings of the arbitrators.

(9) **Dismissal of Contractor.**—The interests of the Owner demand that he should have the power to terminate the contract for any one of several causes. Sufficient ground for such an act should be afforded by the abandonment of the work by the Contractor or its suspension for over a certain number of days; undue delay in the prosecution of the work; failure to complete the work as a whole or in part by the times mentioned in the contract; violation by the Contractor of any of the covenants or conditions of the contract; or his refusal to comply with the instructions or orders of the engineer. The right of the Owner to take possession of the entire work, including unused materials and the Contractor's plant and camps must be retained, for otherwise great delay and inconvenience might result from the dismissal of the Contractor and the resumption of operations under new auspices. The Owner should also stipulate in the contract that the work may be completed by day labor, by contract or by any means which may seem desirable to him under the circumstances. In case the entire work should under these conditions cost more than the tender of the original Contractor, the means of recovery of the difference should be stipulated.

(10) **Liens.**—The Owner should reserve to himself in the contract the right to discharge all liens or formal claims filed against the Contractor and to deduct the amounts thus paid from any moneys due the latter under the contract.

(11) **Assignment of Contract.**—Assigning or subletting a contract should not be permitted without the consent of the engineer. Otherwise, the Contractor might delegate work to irresponsible and incompetent persons whose incapacity or tardiness might bring great loss to the Owner and chagrin to the engineer.

(12) **Consideration.**—The consideration passing from the Owner to the Contractor may take the form of a lump sum or certain prices per unit of measurement for each of the different classes of work covered by the contract. The prices for extras and the basis of remuneration for Force and Material Account work should also appear in this portion of the agreement.

(13) **Binding of Successors and Assigns.**—Each of the contracting parties, should in his own interests, require the contract to extend to and bind the heirs, executors, administrators and assigns of the other, if an individual, or the successors and assigns of an incorporated company or municipal corporation.

(14) **Dating.**—It is not desirable to date an agreement twice, because of the liability of disagreement and consequent invalidating of the contract. For this reason it is a common practice to record the signatures as being

made the "day and year first above written." Where a contract is drawn in one Province, State or country to be enforced in another, it is desirable to establish the place of its closing, since the question of the laws under which the contract is to be interpreted should not be clouded by uncertainty as to the place of making.

(15) **Signatures.** — Signatures should obviously correspond precisely to the names of the parties in the body of the contract. If an incorporated company, commission or governmental corporation is entering into a contract, the signatures of its proper officers should be required and in case of a governmental corporation the Corporate seal should also be affixed.

(16) **Witnessing.** — The various signatures to the contract should, for purposes of identification, be witnessed. It is preferable to have the execution of the instrument acknowledged before a notary public or other public officer authorized to act in such a capacity. The courts will in this case accept the instrument as identified and admit it at once as evidence.

PRACTICAL SUGGESTIONS.

Language, Spelling, Punctuation, etc. — Since the guiding principle in the interpretation of contracts is the intention expressed by the parties, it is evident that the best kind of language to use in the preparation of such instruments is that which most clearly expresses this intention. There is no special virtue in legal phraseology and the engineer has no need to employ it except, perhaps, in special cases where definiteness of statement may be furthered by its use. The safest practice for one without special legal training is to employ only simple, plain langauage involving words and terms the meaning of which is well understood in the locality where the work is to be done. Clearness requires the employment of short rather than long sentences and it is frequently desirable, rhetorical principles notwithstanding, to repeat words and phrases where other expressions would not convey precisely the same meaning. Brevity, although commendable, should not be secured by the omission of words as understood, since the avoidance of ambiguity should be one of the first cares of the contract-writer. In this connection it is well to remember that the intention of the contract is judged by the meaning of the words and not by what the engineer may allege he intended to express. While specifications and agreements are not a proper field for the rhetorician, the inelegances of the imperative mood and of such barbarisms as "the same" should be avoided. Mistakes in grammar, spelling or punctuation will not be allowed to invalidate the contract, but their occurrence may precipitate disputes and ultimately lead to litigation. Anything which distorts a sentence or obscures the meaning of the instrument in any particular should therefore be avoided. Even if accuracy in this respect does not serve to keep the case out of the courts, the task of interpreting the contract will be much facilitated thereby.

Balanced Treament.—Each of the various matters covered in a contract should be given that consideration which its importance demands. It frequently happens that an engineer through lack of familiarity with certain phases of the work covered in his specifications dismisses them with the statement that they shall be "to the satisfaction of the engineer," while pages of space are given over to the description of relatively unimportant matters with which he was well acquainted. The incorporation of characteristically brief manufacturers' specifications for certain materials and apparatus in the specifications of the engineer is likely to result in this curious lack of due proportion. From the placing of undue emphasis on certain matters the Contractor may be led to slight things of equal, or perhaps greater, importance in his endeavor to live up to the letter of the contract.

Arrangement.—The clauses of a contract should not be thrown together in a haphazard manner but should be arranged in some logical order. It is most convenient to divide the specifications up into divisions corresponding to the various contracting interests affected, or sometimes even to issue a separate specification for each. Within these divisions an orderly arrangement should, of course, be followed. This may be in chronological order or in the order of importance, but neither can be followed rigidly. The best order is a combination of these and one in which one clause or subject suggests another. Each item should be contained in an individual numbered clause, a unit in itself and not dependent upon any other clause. It should be remembered also that the ease with which a specification may be used is greatly enhanced by the use of marginal references.

Checking.—All specifications and draft agreements should be carefully checked before being issued from the office of the engineer, and in case of important contracts this should be done by a lawyer as well as by the engineer. Checking of his own work by the writer of the contract should not be done immediately after its preparation but preferably a few days later. In no case should the work of a typist be allowed to go out unchecked.

Changes and Corrections.—Changes in the text of the contract should not be made by erasure but by lining out the words or portions altered. In this way it is established that most, and perhaps all, of the changes were made while the document was being transcribed and before it was finally signed. As a safeguard, it is well also to have each signer of the contract initial such changes. Care should be taken to see that the requisite changes in the plans are made at the same time.

WATERWORKS OF ST. THOMAS, ONT.

This department of the city's utilities showed a net profit of $18,500 during the past year, according to a report recently issued by the water commissioners of that city. The population of this city is placed at 15,240, and the water is conveyed to the citizens by means of 29 miles of street mains; the hydrants number 168, and the reservoir capacity is 25,000,000 gallons.

The source of supply is Kettle Creek and from artesian wells, and this water is filtered before reaching the taps by means of six coagulating filters using alum, ⅔ grain to the gallon, as a coagulant.

Under the present system the water is pumped directly from the suction well through the filters into the mains. The coagulant is applied in the well, so that its opportunity for performing its work before entering the mains is very limited.

Under the new system, now in course of construction, the water will be taken from the present suction well by an electrically driven centrifugal pump. The pump is manufactured and supplied by the Canadian Boving Company, and has a capacity of 2,100 imperial gallons per minute. It pumps against a head of 58 ft.; speed 720 r.p.m. It is driven by a 3 phase Lancashire motor capable of developing 60 b.h.p. when running at 720 r.p.m. A reserve steam driven centrifugal pump will also be installed, which is

also manufactured and supplied by the Canadian Boving Co. This pump has a capacity of 3,500 imperial gallons per minute. It pumps against a head of 58 ft.; speed 550 r.p.m. It is driven by an Alley and MacLellan high speed engine capable of developing 94 h.p. at 550 r.p.m., when steam is at 100 lbs. per square inch.

The above mentioned pump will raise the water through an 18-inch cast iron pipe to the aerator and coagulating basin, located on the high ground to the north-east of the works. At the aerator it will be broken into a spray so that every particle will come into contact with the air. From the aerator, it will pass into the coagulating basin which has a volume of about 400,000 gallons. Here, the water will remain four hours or more, giving the coagulant time to have its full effect, and settle the matter held in suspension, before passing through the 20-inch pipe line and through the filters by gravity. From the filters it goes to the clear water basin, where one million gallons of filtered water will be held in reserve. From there it will be pumped directly into the mains by the pumps which are at present in use.

In addition to the 12-inch vitrified pipe from the dam directly to the suction well, an 18-inch cast iron pipe line has been laid. A man-hole and sluice gate is placed in the pipe line. This will furnish ample supply from the dam when the reservoir is emptied.

The following table shows the amount of water pumped for the year, tabulated monthly, and the amount of fuel and alum used:—

	Coal		Wood	Alum	Gallons of
	Tons.	Lbs.	cords.	lbs.	water pumped.
January	83	500	½	3,100	45,322,560
February	76	1,000	½	3,400	41,342,570
March	80	900	1	5,100	44,207,695
April	76	1,600	1	4,800	40,853,250

COAL IN WESTERN CANADA.

It is estimated by the Geological Department of Canada that the total coal content of the three Provinces of Manitoba, Saskatchewan and Alberta, together with Eastern British Columbia, is 143,490,000,000 tons, covering an approximate area of 22,506 square miles. In the above total it is estimated that the various classes of coal occur in the following proportions:—

	Tons.
Anthracite	400,000,000
Anthracite and semi-anthracite	860,000,000
Bituminous and semi-anthracite ..	43,070,000,000
Coal and Lignite Coal	99,160,000,000
	143,490,000,000

The total coal production of the Province of British Columbia for the year 1910 was 2,800,046 tons; Alberta [illegible],000 tons, and Saskatchewan 224,500 tons.

THE PRACTICAL DESIGN OF REINFORCED CONCRETE FLAT SLABS.

By Sanford E. Thompson.

(Continued from last issue.)

Moment at Centre of Slab.—It is possible to adopt the Eddy theory to the design of the centre of the slab as well as to the supports. In practical design, however, as has been indicated, the thickness of the slab is determined by the thickness at the support, which is always the greater. But, in order to avoid too wide spacing of the bars and to adapt the centre reinforcement to that over the supports, more steel is generally run through the slab than the results of tests would show to be necessary. Consequently, instead of considering this from a theoretical standpoint alone, safe values for the bending moments may be selected, based on general principles of mechanics and qualified by actual tests.

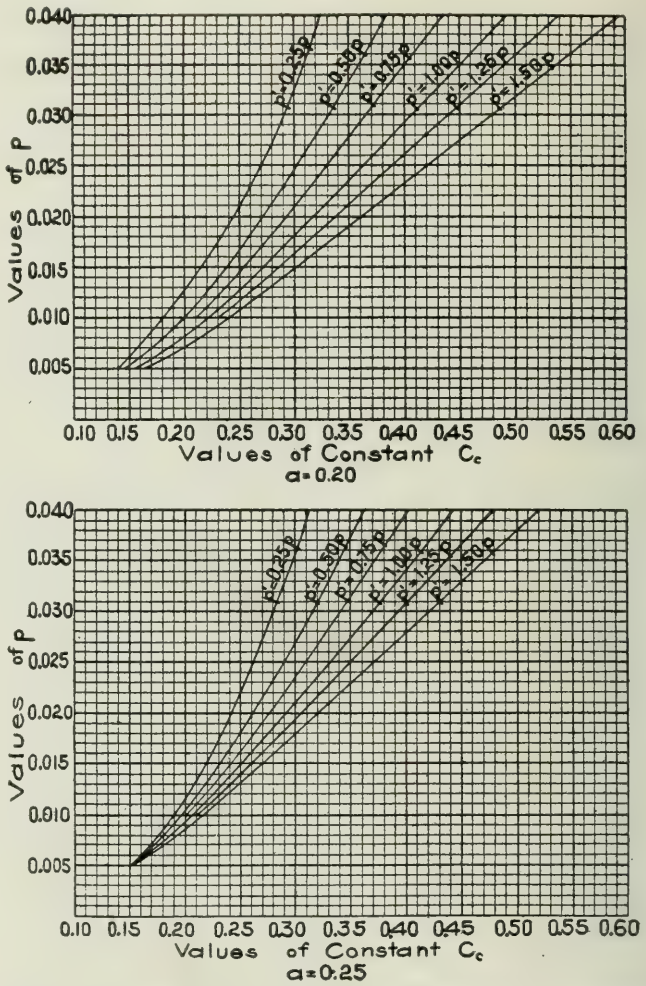

Fig. 6.—Diagram Giving Values of Constants in Formula.

$$fc = \frac{M}{Ccbd^2} \quad \text{for } a = 0.20 \text{ and } a = 0.25$$

$$a = \frac{\text{Depth of Steel in Compression.}}{\text{Depth of Steel in Tension.}}$$

$$p = \frac{\text{Area of Steel in Tension.}}{\text{Area of Concrete above Steel.}}$$

Let l_1 = distance between lines of inflection. This distance will be about 3/5 of the net span between column heads

For the rectangular reinforcement, if the slabs between the points of inflection were simply supported, we should have a moment of $wl_1^2/8$. However, the bending moment in the Minneapolis tests, based on the maximum stresses under uniform working load is about $wl_1^2/33$. It would appear amply safe, therefore, to adopt a value of $M = wl_1^2/12$.

For the diagonal reinforcement, the steel runs in two directions, and considering both theory and test, a value of $M = wl_1^2/24$ is conservative to use for the steel in each direction.

Cross Steel Between Columns.—In flat slab floors, cracks are apt to occur between columns on rectangular lines, because, since the span is shorter, the deflection is less than in the centre of the slab. To prevent these cracks, it is advisable to place cross reinforcement of small bars in the top of the slab.

Tables for Design of Slabs.—The accompanying tables give thicknesses of slab, reinforcement, and size of column head, for various column spacings and loads.

Three arrangements for steel over the column head are chosen: The first where the area of steel in the top is twice the area of steel in the bottom; the second where the two are equal; and the third where the area of steel in the bottom is one and a half times that in the top. This gives the designer a variety of thicknesses of slab. The percentages of steel selected are those which produce, with the given conditions, a compressive stress of 800 lb. per sq. in. in the concrete and 16,000 lb. in the steel. In order to allow 800 lb. in the concrete, it should be mixed in proportions as rich as 1 part cement to 2 parts fine aggregate to 4 parts coarse aggregate. Poisson's ratio is assumed as 0.1, which from recent tests appears to be a fair value.

$$fc = \frac{}{Ccbd^2} \text{ for } \alpha = 0.30$$

$$\alpha = \frac{\text{Depth of Steel in Compression.}}{\text{Depth of Steel in Tension.}}$$

$$p = \frac{\text{Area of Steel in Tension.}}{\text{Area of Concrete above Steel.}}$$

Table 1.—Design of Flat Slabs.

* Area of steel over column head = circumference of column head in inches × d × p or p′ depending upon whether the steel is in tension or compression. This steel is assumed as distributed over the entire widths of the bands. Thus if a band of steel has 2 sq. in. steel in section, the area, effective, for two bands will be 8 sq. in. (See example.)

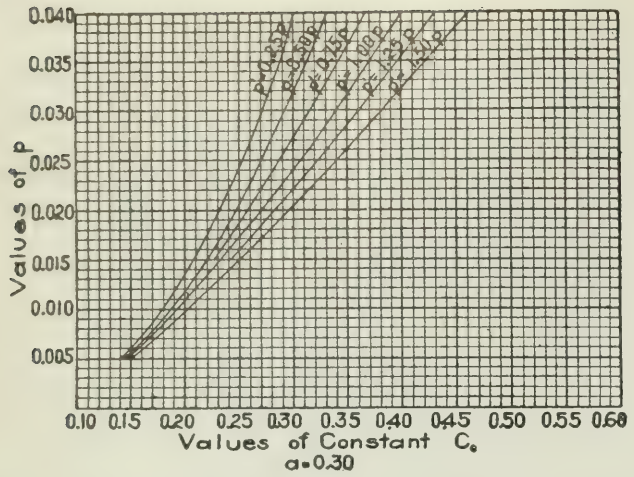

Fig. 7.—Diagram Giving Values of Constants in Formula

The size of column head has been figured for a shear of 60 lb. per sq. in. on a circle a distance, t, (the thickness of slab) outside of the column head. This shear is used simply as measure of the diagonal tension. The value is somewhat larger than is permitted in beam design but appears to be warranted in the case of flat slabs.

The steel in the centre of the slabs has been figured for a stress of 16,000 lb.

Diagrams for Designing Slabs.—To provide for cases not covered by the table, curves for values of C_s and Ce are given so that the moment under various conditions can be readily figured from the formula for the bending moment given in a preceding paragraph.

Diagrams for Determining Steel in Top and Bottom of Beams or Slabs.—In Figs. 5 to 8, curves are plotted for finding the values of the constants Cc and Cs in the formulas for the steel and concrete stresses in beams or slabs with steel in top and bottom. The curves are drawn for different values of a, the ratio of distance of steel in com-

The values printed in black type are figured for a column head 7 ft. in diameter and the thickness of the slab is increased to withstand the shear. (See example.)

* Area of steel over column head = circumference of column head in inches × d × p or p′ depending upon whether the steel is in tension or compression. This steel is assumed as distributed over the entire widths of the bands. Thus if a band of steel has 2 sq. in. steel in section, the area, effective, for two bands will be 8 sq. in.

If the reinforcing rods are so bent that more than 60 pounds in shear can be allowed on the concrete the thickness of the slab may be decreased, provided the steel areas are increased sufficiently to give the desired strength.

pression from compression sufrace to distance of steel in tension from compression surface, and for different values of p'/p, where p = ratio of cross-section of steel in tension to concrete above it,* and p' = ratio of cross-section of steel in compression to this same area of concrete.

Example.—For a warehouse floor with a live load of 150 lb. per. sq.ft. and a column spacing of 20 ft. each way, what is the necessary thickness of slab, size of column head, and amount of steel?

Solution.—From Table 2 the thickness of slab is given as 8½ in., the size of column head 5.5 ft., and the area of steel as 24.7 sq. in. at top of slab and same amount at bottom of slab over column, using ratio of area of steel in tension to area of concrete below steel as 0.017. Dividing

$$fs = \frac{M}{Csbd^2}$$

$$a = \frac{\text{Depth of Steel in Compression.}}{\text{Depth of Steel in Tension.}}$$

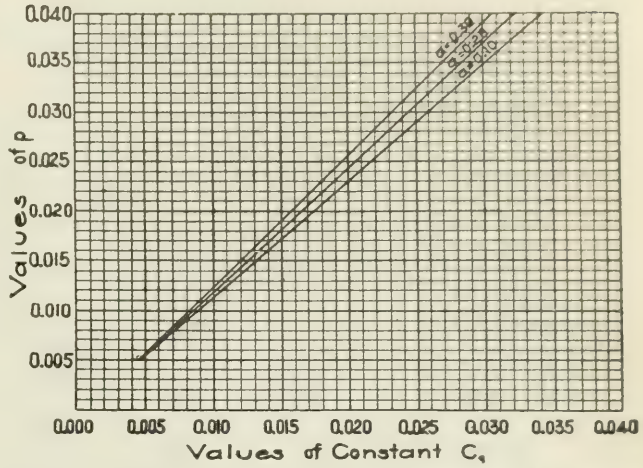

Fig. 8.—Diagram Giving Values of Constants in Formula

* Where the tension steel is at the top, as over the support of a flat slab or beam, the concrete area is taken below the tension steel.

22	**0.016**	**0.012**	**8¼**	**10**	**7.00**	**34.90**	**26.15**	**0.42**	**0.19**
24	**0.014**	**0.006**	**10¼**	**12**	**7.00**	**37.90**	**16.24**	**0.46**	**0.22**

The values printed in black type are figured for a column head 7 ft. in diameter and the thickness of the slab is increased to withstand the shear. (See example.)

* Area of steel over column head = circumference of column head in inches × d × p or p′ depending upon whether the steel is in tension or compression. This steel is assumed as distributed over the entire widths of the bands. Thus if a band of steel has 2 sq. in. steel in section, the area, effective, for two bands will be 8 sq. in.

If the reinforcing rods are so bent that more than 60 pounds in shear can be allowed on the concrete the thickness of the slab may be decreased, provided the steel areas are increased sufficiently to give the desired strength.

$$p = \frac{\text{Area of Steel in Tension.}}{\text{Area of Concrete above Steel.}}$$

these values by 4, as each end of the bands is effective, we have 24.7/4 = 6.2 sq. in. as the area of steel in each band. For this may be used twenty ⅝-in. round bars spaced 5 in. centre to centre for both tension and compression steel.

The amount of steel required at centre of rectangular band is 0.17 sq. in. per ft. of width. Placing a ⅝-in. round bar every 10 in. gives more than the necessary area, but ease in placing the steel makes up for the extra amount. The amount of steel required at centre of diagonal band is 0.35 sq. in. per ft. of width. ⅝-in. round bars every 10 in. will thus give necessary amount of steel.

The values printed in black type are figured for a column head 7 ft. in diameter and the thickness of the slab is increased to withstand the shear. (See example.)

* Area of steel over column head = circumference of column head in inches × d × p or p′ depending upon whether the steel is in tension or compression. This steel is assumed as distributed over the entire widths of the bands. Thus if a band of steel has 2 sq. in. steel in section, the area, effective, for two bands will be 8 sq. in.

If the reinforcing rods are so bent that more than 60 pounds in shear can be allowed on the concrete the thickness of the slab may be decreased, provided the steel areas are increased sufficiently to give the desired strength.

PUBLIC EXPENDITURE IN MONTREAL.

The plans of City Engineer Janin, which have been submitted to the Board of Control, and which it would seem are likely to be acceptable to the Board and to the City Council, involve the expenditure of upwards of $1,000,000 on street paving in the city of Montreal, this amount being $50,000 to $75,000 greater than last year. Residential streets will be macadamized at an average cost of $12.00 per square foot, the granite rate ruling about the same price. Altogether there are some fifty streets or sections of streets to be paved with approximately 65,000 square yards of macadam and granite, the latter being used on streets where there is heavy traffic. It is understood that well on to $9,000,000 will be spent by the government on buildings in Montreal and on improvements to the Montreal harbor and rivers St. Lawrence and Ottawa. The supplementary estimates include upwards of half a million dollars for expenditure on government buildings in Montreal and other works in the city or in suburbs of the city. In addition to this $6,000,000 has already been passed by statute to the Montreal Harbor Board and $1,658,000 for the deepening of the St. Lawrence, and there is $310,000 to provide for dredging plant for the river from Montreal to Father Point. Improvements to the Lachine Canal amount to $200,000, and a considerable sum will also be expended on the portion of the Ottawa River, known as Back River, which flows past the north side of the Island of Montreal.

PURIFICATION OF WATER BY FILTRATION.*

By R. Winthrop Pratt, M. Am. Soc. C.E.

The filtration of public water supplies for the purpose of removing sediment and other impurities has been practised in Europe, especially in England, for the last 60 or 70 years, or more.

The method used was what is now called the slow sand system, and consisted in passing the water through sand beds at relatively slow rates; and without first using chemicals to produce a coagulation of the impurities. European methods of filtration were proposed for use in this country as early as 1866, and during the few years following were installed in several of our smaller cities. In some cases, where the character of the water supply was similar to that of the English supplies, the filters were successful; but in other cases, where turbid waters were treated, success was not attained.

In 1890, the Massachusetts State Board of Health, at its Lawrence Experiment station began an extended investigation of the principles underlying the purification of water by filtration, and of the nature of the processes involved. Merrimac river water was used in these studies.

Three years later, in 1893, based on the results of the work at the Experiment station, and also following European precedent, a filter was built to purify the entire water supply of the city of Lawrence. This was the first filter in the United States, installed expressly for the purpose of reducing the typhoid fever death rate. Its success is well known —the typhoid death rate having been reduced some 80 per cent. This did much to stimulate interest in filtration in other American cities; and during the next few years the installation of filters of the slow sand type was begun by Albany, Washington, Philadelphia and Pittsburg.

About 1884, there was invented the American or mechanical system of water filtration. The essential features of this method were, and still are, first, the addition of a coagulant to the water before it is applied to the filtering material; second, the passage of the water through the sand layer at a rapid rate; third, provision for cleaning the sand layer in place, by means of a reverse current of water instead of removing the dirty sand, as with the slow sand system.

Mechanical filters were first used principally by paper manufacturers, who required a clear water. Their use as a means of hygienically purifying the water was not generally begun until within the last ten or twelve years. The efficiency of the principles of mechanical filtration for municipal supplies was perhaps first proven during experimental tests at Louisville and Cincinnati, in 1897 and 1898. These cities are representative of a large class in the middle west, which has to use a clay-bearing water, and one that cannot be purified bacterially, or even clarified by the slow sand system. The development of mechanical filtration to its present state of efficiency has been necessary to meet the demands of such cities.

The cost of installing filter plants may range from $10,000 to $40,000 or even $50,000 per 1,000,000 gallons capacity. This unit cost varies with the size of the plant, the character of the water to be treated, the expense necessary to connect with the existing water system, and other local conditions. For example, the cost of installing the raw water pumps would be much less in places along the Great Lakes than it would be on the Ohio river, where the water level fluctuates 50 or 60 feet.

Studies by the Ohio State Board of Health, of 11 filter plants in Ohio, namely, those at

	Cost per 1,000,000 Gals.
Cincinnati	$49,830
Dennison	26,000
Elyria	10,000
Geneva	13,000
Lorain	12,000
Marietta	10,000
Rocky River	14,000
Upper Sandusky	15,000
Vermillion	8,000
Warren	13,000
Youngstown	13,000

have shown the average cost per 1,000,000 gallons capacity to be about $17,000. Excluding the Cincinnati plant, however, which cost $49,830 per 1,000,000 gallons capacity, the average cost of the remaining ten is only $13,000 per 1,000,000 gallons capacity. The average cost per capita (based on ultimate capacity of plant), excluding Cincinnati, was found to be about $1.50.

Slow sand filters are in general more costly to build, but cheaper to operate than mechanical filters. This statement is made with the assumption, of course, that the slow sand filters are installed only where the water is sufficiently clear to enable them to be operated with reasonable periods of service between cleanings.

Operating costs vary greatly with the quality of the raw water and the character of the treatment. Lake waters drawn from points removed from shore, are cheapest to treat; while muddy river waters are most expensive.

Special treatment to remove color or odor add to the cost; and water softening may increase it two or three times. Under ordinary conditions filtered water may be obtained at a cost of $10 per 1,000,000 gallons, including interest and depreciation charges. This figure will vary from $5 to $20.

With slow sand filters the principal operating cost is the labor and maintenance of equipment used for washing the sand. With mechanical filtration, the cost of chemicals and of labor, which are about equal, constitute the largest items.

In Ohio, it was found that the operating costs, excluding interest charges, ranged from $2.55 per 1,000,000 gallons at Elyria to $12.10 at Warren, with Youngstown second highest at $10.67. This great difference in cost is largely due to the superior quality of Lake Erie water taken from a point fairly remote from pollution, over that of the turbid and polluted Mahoning river.

In considering the cost of maintaining a filter plant, attention should be directed to the comparatively small increase in the cost of supplying filtered water over that of supplying unfiltered water. This increase is rarely more than 25 or 30 per cent., and frequently only 10 or 15 per cent. In any case, the increase should not amount to more than 50 cents to $2 per person per year—a small price to pay for enjoying pure water and all of its benefits.

*Paper read before Cleveland Engineering Society.

DISINFECTION OF WATER BY CHEMICALS.*

By Dr. R. C. Perkins.

This term is to be translated more or less literally, as it means merely getting rid of all forms of animal or plant life, which may set up disease or give rise to unpleasant conditions of the water.

Removal of the non-pathogenic varieties was the first of the uses to which chemical disinfection was put, and while at first great things were claimed for the various processes, certain difficulties were found to be present which have modified our actions to a large extent. Of the various chemicals used, the only one which has at present a practical use is copper sulphate, which is used for clearing reservoirs from the fresh water algae which develop in them, especially in the warm weather. In most cases, a strength of about one part of copper sulphate to the million parts of water is sufficient to destroy all the algae, and to leave the water clear after the dead forms have disappeared. It must be considered, however, that it has been found in many cases that the algae return in increased numbers after a short interval, and in others that there are resistant forms which cannot be killed by a dilution which will not be injurious to higher forms of life. The earlier claims that this method would kill pathogenic bacteria in the above dilutions have not been substantiated.

We are at present more interested in the disinfection of water from the standpoint of removal of the pathogenic forms, especially those of the type of typhoid, Asiatic cholera, dysentery, etc. The essential of a successful disinfection would obviously be the total and constant destruction of all of these organisms by the use of quantities of the chemical which would be so small as to cause no danger per se, or interfere with domestic or commercial uses of the water. There are then certain definite indications for the use of a disinfectant, and even for the period of use and the strength of the chemical. There are in general three sets of circumstances leading to disinfection:

1. Impure water with no immediate prospect of permanent improvement. Here the use should be continued until the establishent of a permanent safe supply.

2. Where there is a water supply which has been made safe by filtration or other means, there should be an emergency apparatus at hand for temporary treatment in case of accident to the plant.

3. Where there is a properly constructed filtration plant treating polluted water, it is now considered best to use a small amount of disinfectant **after** the filtration to protect against any possible errors.

With these points as the essential indications for disinfection, one may consider the choice of an agent. Ozone and chlorine are the chief chemical agents to be considered, since the ultra-violet ray is rather physical than chemical. One may say in passing that the latter is entirely unsuitable for our purposes in Cleveland since it will work only in a clear water, necessitating preliminary filtration.

Ozone and chlorine then are left, and they act by the setting free of mo'ecules of so-called nascent oxygen, which has an oxidizing power of extraordinary strength. When water is treated by these agents, the nascent oxygen attacks all organic matter with great vigor, and inasmuch as the effect is in direct proportion to the exposed surface, it is clear that bacteria, being very finely divided organic matter, will be among the first to be oxidized. There is thus no specific action, but the pathogenic germs share the fate of the inert organic matter. The germs, however, are more or less well equipped to meet harmful influence and it thus happens that a very definite amount is necessary, and that some varieties are more resistant than others. Fortunately the varieties which cause the water-borne diseases are among the least resistant.

Both these methods have been extensively tried, and both have their good and bad points. From the enormous increase of the use of chlorine as against the very slow spread of the use of ozone it is clear that the apparent advantages are on the side of the former. Ozone is procured by the passage of an arc through dry air and then passing this air through the water to be treated. The difficulties are: First—the need of an expensive and more or less complex apparatus; Second—the necessity of dry air, requiring a special drying apparatus in addition to the other; Third—the need of a storage reservoir, as there is no other possibility of reserve; Fourth—that the method is not at all standardized.

The main advantage is that the public is so pleased at the idea of the use of life-giving oxygen that it offers no objection to the use of the chemical, though this in greater strengths is a definite poison.

The objections to the use of chlorine, leaving out for the present those without foundation, are: First—the introduction of a chemical with a disagreeable odor, taste and associations; Second—the use of a chemical which is known to have corrosive and bleaching powers.

The advantages of chlorine are the cheapness and simplicity of the process which are not approached by any other method, the standardization, the fact that even where a power mixing plant is used, hand mixing could be readily resorted to, so that there is no danger of an interruption of the dosing.

Neither process affects the turbidity, the hardness or the general appearance of the water.

It is the opinion of most sanitariums that ozone is still in the experimental stage and that chlorine is a disinfectant which has practically revolutionized the water problem. In the United States alone there are over two hundred places which are using the method, and there is a very large and increasing number abroad.

One may use chlorine in the form of gas under pressure and there are special apparatuses on the market for the dosage. One may make the gas by electrolysis of salt water, or may use the commercial chloride of lime, also known as bleaching powder, which is made by the saturation of lime with the chlorine formed in the process of manufacture of caustic soda by the aforesaid electrolytic method. For practical purposes the chloride of lime has been found most useful, though there are certain definite advantages in the electrolytic chlorine.

Whatever the method by which the active agent is obtained, it is always the same, and is spoken of as available chlorine. Moreover, the active strength is also the same, as established by a large amount of experimental work, and as a result of this work one may say that a proportion of one part of available chlorine to one million parts of water will destroy all the germs of water-borne diseases. As the result depends on the action on organic matter as such it is clear that the amount of organic matter normally present in the water will have a bearing on the proper dosage, and that waters with a great variation in the organic content, as is true of our water here, will require a greater factor of safety than others.

*Paper read before Cleveland Engineering Society.

The fact of perhaps greatest importance is that there is apparently a critical point in dosage, at which satisfactory results will be obtained, but below which it is not safe to go. With the Cleveland water it was found experimentally, for instance, that 0.6 to 1,000,000 was adequate but that 0.5 was not. Moreover it is also true that a marked excess over this point is of no value as the total efficiency has already been obtained. Continuance of the experiments indicated that 0.7 allowed the necessary factor of safety, except under extraordinary conditions, when it will be advisable to make a temporary increase.

When the chlorine is put into the water where there is chance for aeration, as at the entrance to a reservoir, there is a very rapid action, and a very rapid disappearance of smell and taste, but where the circumstances are as in Cleveland, with the actual place of intake inaccessible during a large part of the year, this ideal method cannot be used. Accordingly it is necessary to put the chemical into the pump well, where there is an interval of less than five minutes before it goes under pressure. The killing effect has been satisfactory at this time, but the taste persists for a time dependent mainly on the temperature of the water, lasting longer in cold water, ordinarily from 30 minutes to an hour, while the odor persists practically until the water is released from pressure at the tap. The amount of odor will decrease with the increase of time from the intake and at distant points will be only appreciable by keen senses, while at nearer points it may be readily smelt, for instance, at the time of the morning bath. The actual disappearance is rapid, tests showing that when samples are taken at once and after five minutes there is already a decrease of nearly 50 per cent., and when the water reaches the consumer there is present less than one part in ten million, so high a dilution that to scientific men it is hardly necessary to point out the absence of danger.

Wherever the method has been tried, it has proved successful in reducing the water-borne diseases, and this has been notably the case in Cleveland, where at the time of introduction of the process, there were all the weather and water conditions suitable for the development of a serious epidemic, which, however, failed to appear. The typhoid rate in December has been the lowest for many years, though the general water conditions have been very unfavorable. In fine, the results of chemical treatment with chlorine have been found here and elsewhere to reduce typhoid to a very large extent and to reduce the pollution of the water as indicated by the daily tests at the city laboratory, which have been carried on since 1904, while there has been absolutely no positive evidence of the slightest ill results to persons who drink the water. The objections are in the main sentimental, and at times hysterical, but all the proof lies on one side of the case.

Note.—Cost of process. Apparatus for small communities pumping 200,000 to 500,000 gallons a day may be established for less than $25. Where there is a reservoir, very large quantities may be treated at a very low cost, and the only real expense lies in the establishment of the large tanks and the power mixer advisable for large communities. The cost of the Cleveland plant was $4,143.68.

The cost of the bleach is usually from $20 to $25 a ton, and roughly one-third of this represents the available chlorine. With the weight of a gallon as eight and one-third pounds one may calculate twenty-five pounds of the powder as able to disinfect one million gallons at a strength of one part in a million. From this the daily cost may be readily computed. Tests of the bleach should be frequent to check irregularities. The dosing outfit should be so arranged as to prevent the ingress of any of the sediment and should allow of flexibility in flow in case of changes in pumpage or in the quality of the water.

PURIFICATION BY OZONE.*

By R. M. Leggett.

One of the most convincing arguments in favor of our advanced civiliation lies in the fact that governments, both national and municipal, have taken to themselves the task of guarding the public health.

A sick or dead citizen ceases to be an asset to any community, and in a great many instances becomes a liability. The trend of modern medicine is to prevent disease, to teach people how to keep well, more than to make them well when stricken.

Thus, modern conditions place responsibilities upon cities that did not exist a decade ago. The city governments to-day are responsible, to a great extent, for the health and safety of every citizen. They supply an adequate police force to protect the public in so far as it is possible to do so, they provide asylums for the insane and hospitals for the sick, but so far as public health is concerned, a great many cities lock the stable door after the horse has been stolen. This they do by compelling the citizens to drink water containing sewage pollution and disease producing bacteria. To quote Ellice Hopkins, "It is better to fence the precipice at the top, than to wait with an ambulance at the bottom."

The majority of American citizens have learned by very bitter experience that it is costly to provide for their inhabitants a polluted drinking water.

Very rapid strides have been made by sanitary engineers in the last ten years, and their labors have resulted in placing at the disposal of cities various devices having as their object the purification of water.

Water purification embraces two principal acts, first, the removal of matter in suspension; second, the destruction of matter in solution.

Suspended matter comprises:

First—The grosses particles, such as clay, sand, leaves and parts of dead fish, sewage, etc.

Second—Micro-organisms.

Third—Bacteria.

The soluble content is composed of the organic compounds due to animal and vegetable decomposition, and mineral contamination from factories, and natural conditions of soil and rock.

In all problems of water purification, we have first to deal with that which causes disease, and after that, with those contents that cause unpleasant but harmless odors, colors and tastes.

The water to be treated by ozone must usually first be passed through a rapid roughing filter. This simply acts as a strainer, removing the grosser matter in suspension. Particles of sewage, dead leaves and organic matter absorb so much ozone, that if present in the water to be treated, reduce the efficiency of the system, unless first removed in this way.

(To be continued.)

---

Metallurgical Comment

T. R. LOUDON, B.A.Sc.

Correspondence and Discussion Invited

DROSS MELTING BY ELECTRICITY.

A new form of electric furnace for the melting of drosses, scrap metal and cyanide precipitates is described in the Brass World, January, 1912. This furnace is the invention of Raymond S. Wile, of the Pittsburg Electric Furnace Company, and is a combination of the arc and resistance furnaces. Four carbon electrodes are used, two passing up through the bottom of the furnace and the other two down through the top. When melting is to be begun, the furnace is partly filled with broken glass and the carbon electrodes arranged so that they touch. After the current is turned on they are drawn apart and an arc is formed, which soon melts the glass in its neighborhood. As the glass melts it becomes a conductor of the electric current, where before melting it was a non-conducor. The electrodes are now drawn farther apart so that the current passes through the molten glass and finally the whole charge becomes fluid, the glass being kept liquid by the resistance offered by it to the passage of the current.

When all of the glass is in a molten condition, the metal or dross to be melted is charged directly on top of it. The initial heat of the glass melts the metal, and then, on account of its great specific gravity and the fluid condition of the glass, it sinks to the bottom of the furnace where it is completely protected from oxidation. After several months the glass becomes more or less impure and must be tapped off and replaced, but broken bottles form a cheap mixture for refilling it. The furnace is lined with chrome brick, as that is found to be the best resisting material for such work. A furnace with a capacity of 1,000 lb. of brass will pour about one ton of metal per hour and, if run continuously, consumes about 68 kw. in doing so. If the current is not run continuously, and electric current costs 2c. per kilowatt-hour, it has been found that the current cost for melting 1,000 lb. of brass is about $1.36. This is somewhat higher than the cost of melting with oil or coke, but the waste in melting is less and is said to more than compensate for the extra power cost.

STRENGTH OF ROLLED ZINC.

When it was proposed recently that zinc be used for the hangers of electric cables the fact was brought out that data on the strength of American zinc were lacking, and tests were made by the Materials Testing Laboratory of the University of Illinois on this subject. Thin zinc plates were found to have an ultimate tensile strength of about 24,000 lb. per sq. in. The modulus of elasticity was found to average 11,500,000 lbs. per sq. in. Under the action of punches and shearing tools, zinc plates developed about 40 per cent. of the shearing resistance of mild steel and required the expenditure of about 30 per cent. of the energy required for plates of mild steel of the same thickness. No clearly defined elastic limit of yield point was found for cast or for rolled zinc. Zinc plates was found to break under pull with much less stretching than steel, but a zinc cylinder could be flattened without cracking. The result of tests of American zinc showed that its strength does not differ from that shown by European laboratories for foreign spelter. The results of these tests are published in Bull. 62 of the Engineering Experiment Station of the University of Illinois.

NEW COPPER ALLOY.

A copper alloy with the hardness of steel and great tensile strength is claimed by a French metallurgist. It is made by melting together one pound each of chromium and aluminum and adding 22 pounds of copper, 5 of nickel and 4 of zinc, with intervals of half an hour or an hour between the successive additions to the fused mixture. By varying the proportions of chromium and copper the alloy can be given a considerable range of properties, with adaptation to many uses.

WATER POWERS IN UNITED STATES.

On March 14th Herbert Knox Smith, United States commissioner of corporations, submitted to President Taft a report on the concentration of control over water power by large interests in important localities. The report recommends that the government should preserve title to the remaining power sites and develop them to prevent their possible monopolization by public utility companies. They should be developed at once, not only to conserve the fuel supply of the country, but also because they are rapidly passing into private control. The public can either develop and operate these sites, selling the energy at market rates, or lease the sites at a rental. Mr. Smith says that the water power developed and practically capable of development of this kind probably does not exceed 25,000,000 h.p. The total developed water power to-day is about 6,000,000 h.p. The total stationary power used in the United States, steam, water and gas, is probably more than 30,000,000 h.p. The enquiry showed that there was concentration of water powers in three distinct phases: first, there was concentration of control in each important locality; second, large interests influenced some of these local concerns, and finally, there was a growing relationship among large interests.

In California six corporations, of which the most important is the Pacific Gas & Electric Company, with 118,343 h.p., together control 375,000 h.p., which is over 80 per cent. of all developed water power in the State. In Washington two companies control 210,000 h.p., or about 70 per cent. of all developed water power. In South Carolina the Southern Power Company owns about 101,000 h.p., or 75 per cent. of the total development, with 73,000 h.p. undeveloped. In the southern peninsula of Michigan the Commonwealth Power & Light Company controls 52,000 h.p., or 73 per cent. of the whole commercial development, together with probably 71,000 h.p. more undeveloped. Practically similar conditions are reported to exist in Montana, Colorado and Georgia and at Niagara Falls.

More important than this local concentration are the operations of ten large groups of interests which possess control or influence over 1,821,000 h.p., about 60 per cent. of the water power already developed, together with 1,449,000 h.p. undeveloped. The General Electric interests are said to control or influence 939,000 h.p. of developed water power in eighteen States and 640,000 h.p. of undeveloped resources, a total of over 1,500,000 h.p. Next are the Stone & Webster interests with 278,000 h.p,. chiefly in connection with public service concerns. They exercise control over fifty-

five to sixty companies, largely through management rather than through ownership. Eight of these companies have water power.

The other groups are the Hydraulic Power Company of Niagara Falls, 144,000 h.p.; the Pacific Gas & Electric Company, with over 118,000 h.p. developed and the dominating factor in a large portion of California; the group known as the Clark-Foote-Hodenpyl-Hardy interests, 104,000 h.p., largely dominating the water-power situation in Michigan and also active in Maine and Oregon; the Southern Power Company, 101,000 h.p. in South Carolina, as previously noted; the S. Morgan Smith interests (Georgia), 76,000 h.p.; the Brady interests (Tennessee), 70,000 h.p.; the United Missouri River Power Company, 65.000 h.p., which, with the Butte Electric Power Company (General Electric group), practically dominates the power situation in Montana, and the Telluride Power Company (Colorado, Idaho and Utah), 56,000 h.p. The last-named nine interests also include under their influence 887,000 h.p. of energy as yet undeveloped.

The two greatest of the General Electric and the Stone & Webster groups have directors in a number of the same corporations. They and the S. Morgan Smith, Westinghouse and Brady interests are similarly connected.

OIL-DRIVEN TRAMS.

The Financial Times of February 23rd last gives an account of the recent developments in the use of oil fuel, and devotes particular attention to the recent trials of a petrol electric coach on the Great Western Railway of England.

The car, which was built for experimental purposes, weighs only 14 tons. The power is supplied by a 40 h.p. Maudslay petrol engine, which drives a dynamo, which in turn, transmits power to two electric motors on the axles of the rail car.

Notwithstanding the light weight of the vehicle, it accommodates 44 passengers, and this in itself is one great advantage of the petrol electric system, the weight of the car, engine, dynamo, etc., per passenger working out to only 700 pounds, as compared with about 1,500 pounds for the steam rail cars in use on the Great Western Railway.

A further advantage is that the fuel is contained in a very small area, the petrol tank, which is carried underneath the experimental car, holding sufficient petrol for between 200 and 250 miles running.

The car is divided into three compartments:—

(1) Containing petrol engine, dynamo and controller.

(2) Passenger compartment.

(3) Conductor's compartment, also containing electrical controller and brake control, the car being driven from either end, according to requirements.

Only one man is required at the driving end, the conductor riding at the opposite end and attending to the engine if required, he also being in a position to stop the car in case of emergency.

It is believed that the new system should prove, for the above reasons alone, in the case of small cars, considerably more economical than steam power, and with these advantages the further development of certain sections of the line which have hitherto not presented the likelihood of paying loads should be possible.

If the series of tests is satisfactory the Great Western Railway Company can hardly fail to reap the reward of their enterprise, as they are the largest users of rail motor cars in the United Kingdom.

ENGINEERING NOTES.

Montreal, P.Q.—The municipal engineer has taken objections to the plans of the Canadian Northern Railway for the construction of an underground tunnel on the grounds that he fears the excavations will damage the city reservoir.

Ottawa, Ont.—Engineers of the Public Works Department of the Federal Government are preparing to make a test in order to ascertain just how much the tower of the Victoria Museum has settled since the erection of the building. An effort is also to be made to ascertain the real cause of the sinking of the middle portion of the structure, if possible, and what means can be taken to prevent it in the future. During the past few months there has been no noticeable settlement, although it is feared that with the approach of spring matters may be different.

Vancouver, B.C.—The Vancouver Shipmaster's Association have disapproved of the plans for the Second Narrows bridge. They claim that with a strong tide running a slight delay in the opening of the draw would mean disaster for the marine interests and possibly for the bridge structure. The bridge has been designed in such a manner that the draw may be opened in three minutes. A design carrying the floor level higher than the one planned would please the shipping men.

PERSONAL.

Mr. R. C. St. John has been appointed to the position of engineer of maintenance of way for the Canadian Pacific Railway for Western Canada.

Mr. J. C. Holden has been appointed to the position of division engineer of the Canadian Pacific Railway for the Province of Manitoba.

Mr. C. H. Fox has been appointed to the position of assistant division engineer of the Canadian Pacific Railway for the Province of Manitoba.

MEETINGS.

Mr. G. R. Conway, chief engineer of the British Columbia Electric Railway, gave an illustrated lecture before the company section of the National Electric Light Association in Vancouver. He took as his subject "Famous Tunnels Under Rivers."

FAMOUS TUNNELS UNDER RIVERS.

During the course of an address given before the members of the company section of the National Electric Light Association in Vancouver recently, Mr. G. R. Conway, chief engineer of the British Columbia Electric Railway, stated that the teredo, a worm-like animal which perforates submerged woodwork, suggested the plan on which all subaqueous tunnel work is carried out. Marc Brunel in 1818 had his attention drawn to an old ship timber which had been bored by the teredo, and this led to an examination of the animal by the engineer. He found that the animal was armed with a pair of strong shelly valves, to which, with the foot used as a fulcrum, a rotary motion was given by powerful muscles, the wood being penetrated as by an auger. Brunel then invented his tunnel shield, which was a machine of iron forming auger-like cells for the workers, which was pressed forward with a rotary motion by hydraulic force, displacing the material for the tunnel. In this space.

as the shield moved onward, was placed a steel tube, which was later lined with brickwork. This method, based on the teredo action, the lecturer said, formed the foundation of all subaqueous tunnel work, even to the present day.

The tunnel under the Thames was started by Brunel in 1825, but not completed until 1842. During the progress of this work Lord Dundonald outlined an improvement in the methods involving the use of compressed air and air locks. Lord Dundonald's system was first used in the sinking of shafts at Chalons, France, in 1839 and in 1851 was employed in England on the sinking of the foundations for a bridge over the Medway at Rochester.

Views and explanations were then given of various great tunnel works, showing the advance of methods as the use of compressed air was improved, mechanical excavators employed, etc. These descriptions included the Blackwall tunnel, 27 feet in diameter, on which a shield weighing 200 tons was advanced 25 feet per week; the Baker Street and Waterloo tunnels under the Thames, each of 12 feet diameter, on which 29½-ton shields were used; the great River Dee tunnel, where a 400-ton shield was employed, and the tunnels of the Pennsylvania Railway at New York, where the North and East rivers are being conquered to provide adequate access to the city. This latter work was said to involve the construction of over six miles of tunnel of a diameter of 23 feet, on which four shields, each weighing 200 tons, were employed.

COMING MEETINGS.

CANADIAN INSTITUTE.—198 College Street, Toronto. Saturday Evening Lectures, 8 p.m. April 13th.—"Lantern Experiments on Reaction in Non-homogeneous Systems," by Prof. Kenrick, Toronto University. April 20th—"Chemical Interpretations of Vital Phenomena," illustrated. Prof. Leathes, Toronto University.

ONTARIO MUNICIPAL ASSOCIATION.—Annual convention will be held in the City Hall, Toronto, on June 18th and 19th, 1912. Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ont.

THE CLEVELAND ENGINEERING SOCIETY.—Regular Meeting, Tuesday, April 9th, 1912. Chamber of Commerce Bldg., Cleveland, Ohio. Symposium on the Elimination of Grade Crossings. F. W. Ballard, Secretary.

ENGINEERING SOCIETIES.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—413 Dorchester Street West, Montreal. President, W. F. TYE: Secretary, Professor C. H. McLeod.

VICTORIA BRANCH—Chairman, F. C. Gamble; Secretary-Treasurer, R. W. Macintyre

QUEBEC BRANCH—Chairman, P. E. Parent; Secretary, S. S. Oliver. Meetings held twice a month at room 40, City Hall.

TORONTO BRANCH—96 King Street West, Toronto. Chairman, T. C. Irving; Acting Secretary, T. R. Loudon, University of Toronto. Meets last Thursday of the month at Engineers' Club.

MANITOBA BRANCH—Secretary E. Brydone Jack. Meets every first and third Friday of each month, October to April, in University of Manitoba, Winnipeg.

VANCOUVER BRANCH—Chairman, Geo. H. Webster: Secretary, H. K. Dutcher, 319 Pender Street West, Vancouver. Meets in Engineering Department, University.

OTTAWA BRANCH—
177 Sparks St. Ottawa. Chairman, S. J. Chapleau, Ottawa; Secretary, H. Victor Brayley, N.T. Ry., Cory Bldg. Meetings at which papers are read, 1st and 3rd Wednesdays of fall and winter months; on other Wednesday nights in month there are informal or business meetings.

MUNICIPAL ASSOCIATIONS

ONTARIO MUNICIPAL ASSOCIATION.—President, Chas. Hopewell, Mayor, Ottawa; Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ontario.

UNION OF ALBERTA MUNICIPALITIES.—President, H. H. Gaetz, Red Deer, Alta.; Secretary-Treasurer, John T. Hall, Medicine Hat, Alta.

THE UNION OF CANADIAN MUNICIPALTIES.—President, W. Sanford Evans, Mayor of Winnipeg; Hon. Secretary-Treasurer, W. D. Lighthall, K.C., Ex-Mayor of Westmount.

THE UNION OF NEW BRUNSWICK MUNICIPALITIES.—President, Councillor Siddall, Port Elgin; Hon. Secretary-Treasurer J. W. McCready, City Clerk, Fredericton.

UNION OF NOVA SCOTIA MUNICIPALITIES.—President, Mr. A. S. MacMillan, Warden, Antigonish, N.S.; Secretary, A. Roberts, Bridgewater, N.S.

UNION OF SASKATCHEWAN MUNICIPALITIES.—President, Mayor Bec, Lemberg; Secretary, Mr. Heal, Moose Jaw.

UNION OF BRITISH COLUMBIA MUNICIPALITIES.—President, Mayor Planta, Nanaimo, B.C.; Hon. Secretary-Treasurer, Mr. H. Bose, Surrey Centre, B.C.

CANADIAN TECHNICAL SOCIETIES

ALBERTA ASSOCIATION OF ARCHITECTS.—President, G. M. Lang Secretary, L. M. Gotch, Calgary, Alta.

ASSOCIATION OF SASKATCHEWAN LAND SURVEYORS.—President, J. L. R. Parsons, Regina; Secretary-Treasurer, M. B. Weeks, Regina.

ASTRONOMICAL SOCIETY OF SASKATCHEWAN.—President, N. McMurchy; Secretary, Mr. McClung, Regina.

BRITISH COLUMBIA LAND SURVEYORS' ASSOCIATION.—President, W. S. Drewry, Nelson, B.C.; Secretary-Treasurer, S. A. Roberts, Victoria, B.C.

BUILDERS' CANADIAN NATIONAL ASSOCIATION.—President, E. T. Nesbitt; Secretary-Treasurer, J. H. Lauer, Montreal, Que.

CANADIAN ASSOCIATION OF STATIONARY ENGINEERS.—President, Wm. Norris, Chatham, Ont.; Secretary, W. A. Crockett, Mount Hamilton, Ont.

CANADIAN CEMENT AND CONCRETE ASSOCIATION.—President, Peter Gillespie, Toronto, Ont.; Secretary-Treasurer, Wm. Snaith, 57 Adelaide Street, Toronto, Ont.

CANADIAN CLAY PRODUCTS' MANUFACTURERS' ASSOCIATION.—President, W. McCredie; Secretary-Treasurer, D. O. McKinnon, Toronto

CANADIAN ELECTRICAL ASSOCIATION.—President, N. W. Ryerson, Niagara Falls; Secretary, T. S. Young, Canadian Electrical News, Toronto.

CANADIAN FORESTRY ASSOCIATION.—President, John Hendry, Vancouver. Secretary, James Lawler, Canadian Building, Ottawa.

CANADIAN GAS ASSOCIATION.—President, Arthur Hewit, General Manager Consumers' Gas Company, Toronto; J. Keillor, Secretary-Treasurer, Hamilton, Ont.

CANADIAN INDEPENDENT TELEPHONE ASSOCIATION.—President, W. Doan, M.D., Harrietsville, Ont.; Secretary-Treasurer, Francis Dagger, 21 Richmond Street West, Toronto.

CANADIAN MINING INSTITUTE.—Windsor Hotel, Montreal. President, Dr. A. E. Barlow, Montreal; Secretary, H. Mortimer Lamb, Windsor Hotel, Montreal.

CANADIAN PEAT SOCIETY.—President, J. McWilliam, M.D., London, Ont.; Secretary-Treasurer, Arthur J. Forward, B.A., 22 Castle Building, Ottawa, Ont.

THE CANADIAN PUBLIC HEALTH ASSOCIATION.—President, Dr. Charles A. Hodgetts, Ottawa; General Secretary, Major Lorne Drum, Ottawa.

CANADIAN RAILWAY CLUB.—President, A. A. Goodchild; Secretary, James Powell, P.O. Box 7, St. Lambert, near Montreal, P.Q.

CANADIAN STREET RAILWAY ASSOCIATION.—President, D. McDonald, Manager, Montreal Street Railway; Secretary, Acton Burrows, 70 Bond Street, Toronto.

CANADIAN SOCIETY OF FOREST ENGINEERS.—President, Dr. Fernow, Toronto.; Secretary, F. W. H. Jacombe, Department of the Interior, Ottawa.

CENTRAL RAILWAY AND ENGINEERING CLUB.—Toronto. President G. Baldwin; Secretary, C. L. Worth, 409 Union Station. Meets third Tuesday each month except June, July and August.

DOMINION LAND SURVEYORS.—President, Mr. R. A. Belanger, Ottawa; Secretary-Treasurer, E. M. Dennis, Dept. of the Interior, Ottawa.

EDMONTON ENGINEERING SOCIETY.—President, J. Chalmers; Secretary, B. F. Mitchell, City Engineer's Office, Edmonton, Alberta.

ENGINEERING SOCIETY, TORONTO UNIVERSITY.—President, J. E. Ritchie; Corresponding Secretary, C. V. Ross.

ENGINEERS' CLUB OF MONTREAL.—Secretary, C. M. Strange, 9 Beaver Hall Square, Montreal.

ENGINEERS' CLUB OF TORONTO.—96 King Street West. President, Willis Chipman; Secretary, R. B. Wolsey. Meeting every Thursday evening during the fall and winter months.

INSTITUTION OF ELECTRICAL ENGINEERS.—President, Dr. G. Kapp; Secretary, P. F. Rowell, Victoria Embankment, London, W.C.; Hon. Secretary-Treasurer for Canada, Lawford Grant, Power Building, Montreal, Que.

INSTITUTION OF MINING AND METALLURGY.—President, Edgar Taylor; Secretary, C. McDermid, London, England. Canadian members of Council:—Prof. F. D. Adams, J. B. Porter, H. E. T. Haultain and W. H. Miller and Messrs W. H. Trewartha-James and J. B. Tyrrell.

INTERNATIONAL ASSOCIATION FOR THE PREVENTION OF SMOKE.—Secretary R. C. Harris, City Hall, Toronto.

MANITOBA LAND SURVEYORS.—President, George McPhillips; Secretary-Treasurer, C. G. Chataway, Winnipeg, Man.

NOVA SCOTIA MINING SOCIETY.—President, T. J. Brown, Sydney Mines, C. B.; Secretary, A. A. Hayward.

NOVA SCOTIA SOCIETY OF ENGINEERS, HALIFAX.—President, J. N. MacKenzie; Secretary, A. R. McCleave, Assistant Road Commissioner's Office, Halifax, N.S.

ONTARIO PROVINCIAL GOOD ROADS ASSOCIATION.—President, Major. T. L. Kennedy; Hon. Secretary-Treasurer, J. E. Farewell, Whitby; Secretary-Treasurer, G. S. Henry, Oriole.

ONTARIO LAND SURVEYORS' ASSOCIATION.—President, T. B. Speight, Toronto; Secretary, Killaly Gamble, 703 Temple Building, Toronto.

THE PEAT ASSOCIATION OF CANADA.—Secretary, Wm. J. W. Booth, New Drawer, 2263, Main P.O., Montreal.

PROVINCE OF QUEBEC ASSOCIATION OF ARCHITECTS.—Secretary, J. E. Ganier, No. 5. Beaver Hall Square, Montreal.

ROYAL ARCHITECTURAL INSTITUTE OF CANADA.—President, F. S. Baker, F.R.I.B.A., Toronto, Ont.; Hon. Secretary, Alcide Chausse, No. 5. Beaver Hall Square, Montreal, Que.

ROYAL ASTRONOMICAL SOCIETY.—President, Prof. Louis B. Stewart, Toronto; Secretary, J. R. Collins, Toronto.

SOCIETY OF CHEMICAL INDUSTRY.—Dr. A. McGill, Ottawa, President; Alfred Burton, Toronto, Secretary.

UNDERGRADUATE SOCIETY OF APPLIED SCIENCE, McGILL UNIVERSITY.—President, J. P. McRae; Secretary, H. F. Cole.

WESTERN CANADA IRRIGATION ASSOCIATION.—President, Wm Pierce, Calgary; Secretary-Treasurer, John T. Hall, Brandon, Man.

WESTERN CANADA RAILWAY CLUB.—President, R. R. Nield; Secretary, W. H. Rosevear, 115 Phœnix Block, Winnipeg, Man. Second Monday, except June, July and August, at Winnipeg.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand and projected, contracts awarded, changes in staffs, etc. Printed forms for the purpose will be furnished upon application.

PLANS AND SPECIFICATIONS ON FILE.

The following Plans (P.) and Specifications (S.) are on file for reference only unless otherwise noted at the office of The Canadian Engineer, 62 Church Street, Toronto:—

Bids close		Noted in issue of
4-8	Paving, Port Arthur, Ont. .....(S.)	3-21
4-11	Grading, sanitary sewers, cement walks, etc., Lethbridge, Alta.....(P. & S.)	3-14
4-15	Cement sidewalks, Battleford, Sask. ..(P. & S.)	4-4
4-30	Tunnel sewer, Edmonton, Alta. .....(S.)	4-4

(Battleford and Lethbridge plans and specifications are on file at The Canadian Engineer Office, 820 Union Bank Building, Winnipeg.)

TENDERS PENDING.

In Addition to Those in this Issue.

Further information may be had from the issues of The Canadian Engineer referred to.

TENDERS.

Battleford, Sask.—Tenders for the construction of a building for the Battleford High School Board, will be accepted up to April 6th, 1912. Plans and specifications at the office of Robert S. Byers, Architect, Saskatoon, or W. C. Soole, Secretary-Treasurer, Battleford.

Battleford, Sask.—Tenders for laying approximately 150,000 sq. ft. of cement sidewalk, with crossings and curbing, will be received by H. C. Adams, secretary-treasurer of the town of Battleford, up to noon of April 15th, 1912. Wm. Kitson, Town Engineer. (See advt. in Canadian Engineer).

North Battleford, Sask.—Tenders will be received by the Secretary-Treasurer as follows:—

(1) Until Monday, April 22nd, 1912, for constructing 180,000 sq. ft. of concrete walks.

(2) Until Tuesday, April 30th, 1912, for labor laying water mains and sewers. Also construction of power house.

(3) Monday, April 15th, 1912, for furnishing and erecting boiler; furnishing and erecting 750 h.p. steam engine and accessories; furnishing and erecting 500 k.w. generator and equipment. Plans and specifications may be seen at the office of the engineers, Toronto and Winnipeg, and at the Town Hall, North Battleford, on and after the following dates:—(1) April 3rd, 1912; (2) April 10th, 1912; (3) April 17th, 1912. J. Griese, Esq., Mayor; H. W. Dixon, Esq., secretary-treasurer; Messrs. Chipman & Power, engineers.

Carleton Place, Ont.—Tenders will be called for shortly for water supply, sewerage and sewage disposal works. Albert E. Crain, Mayor.

Edmonton, Alta.—Tenders will be received by the City Commissioners until April 30th, 1912, for the construction of a reinforced concrete tunnel sewer. Specifications and forms of tender may be obtained at the office of the City Engineer, Edmonton; also at the office of The Canadian Engineer. (See advt. in Canadian Engineer). A. J. Latornell, City Engineer.

Kentville, N.S.—Tenders will be received until April 15, 1912, for the erection of a brick and reinforced cement academy building for the town of Kentville, N.S. Plans and specifications at the town office, Kentville, or at the office of the Architect. J. Carroll, Town Clerk, Kentville. Leslie R. Fairn, Architect, Aylesford, N.S.

London, Ont.—Tenders will be received until May 1st, 1912, at the office of the City Clerk, for a modern 75-foot aerial hook and ladder truck, the apparatus to be delivered f.o.b., Central Fire Station, London, Ont., on or before August 1st, 1912. Tenders will also be received for bids on the old aerial truck, now in service, at the same time and date. W .D. I. Wright, Chairman No. 3 Committee. John Aitken, Chief, Fire Department.

Moose Jaw, Sask.—Tenders will be received up to noon of April 15th, 1912, for the delivery of sewer pipe and specials f.o.b. cars, Moose Jaw. City Commissioners. (See advt. in Canadian Engineer).

Moose Jaw, Sask.—Tenders for cast-iron pipe and specials will be received by the City Commissioners up to noon of Monday April 15th, 1912. (See Advt. in Canadian Engineer).

Moose Jaw, Sask.—Tenders for the supply and delivery of about 700 barrels of Portland cement, will be received by the City Commissioners, Moose Jaw, up to noon of April 9th, 1912.

Ottawa, Ont.—Tenders will be received until April 18th, 1912, for the construction of a reinforced concrete sewer at St. Boniface, Man. (See advt. in Canadian Engineer).

Ottawa, Ont.—Tenders will be received until noon of April 20th, 1912, for supplying and delivering the steam coal required for the fog alarm stations in the New Brunswick Agency during a period of one, two or three years at the option of the Department. Specifications, etc., can be obtained from the Marine Department at Ottawa, and from the agent of this Department at St. John, N.B. Alex. Johnston, Deputy-Minister of Marine and Fisheries, Department of Marine and Fisheries, Ottawa.

Ottawa, Ont.—Tenders will be received until May 1st, 1912, for the erection of additions and for certain alterations at the Mount Elgin Industrial School, Muncey, Ont. Plans and specifications may be seen at the office of the Principal, Muncey, and at the office of the Indian Agent, Dekaware, at the post offices, London, St. Thomas, and Hamilton, and at the office of J. T. Sing, C.E., Confederation Life Building, Toronto. J. D. McLean, Assistant Deputy and Secretary, Department of Indian Affairs, Ottawa.

Ottawa, Ont.—Tenders for the erection of a teacher's residence and a school-house on the Little Pines Reserve, Sask., will be received by J. D. McLean, Assistant-Deputy and Secretary, Department of Indian Affairs, Ottawa, up to noon of May 6th, 1912. Plans and specifications at the offices of the Indian Agent, Battleford; the Indian Agent, Duck Lake, and W. J. Chisholm, Inspector of Indian Agencies, Prince Albert; and the Indian Office, Winnipeg.

Penticton, B.C.—Tenders will be received until April 18th, 1912, for the erection of a concrete and steel power station, including all materials except as specified. Plans and specifications may be seen at the office of F. H. Latimer, Consulting Engineer, Engineer for the Municipality, Pentic ton, B.C., to whom all tenders may be addressed, and at the office of Mather, Yuill & Co., Consulting Electrical Engineers, 429 Pender Street, Vancouver, B.C.

Port Arthur, Ont.—Tenders will be received up to noon of April 15th, 1912, for the supplying and installation of a 50 box fire alarm system, with the necessary central station equipment. J. J. Hackney, Commissioner Utilities. (See Advertisement in Canadian Engineer.)

Prince Albert, Sask.—The time for opening tenders for Contract 12G for 2,400 lin. ft. of concrete outfall sewer disposal works, has been extended to noon, Monday, April 15th, 1912. C. O. Davidson, Secretary-Treasurer, Prince Albert. (See advt. in Canadian Engineer).

Regina, Sask.—Tenders will be received until noon of Friday April 12th, 1912, for the excavation of about three miles of trenching for and the laying therein of 6-inch to 15-inch vitrified pipes, construction of manholes, etc., for water collecting lines at the source of supply in the Boggy Creek Watershed near Regina. Plans, etc., may be had from R. O. Wynne Roberts, Consulting Engineer, P. O. Box 65, Regina. (See Advt. in Canadian Engineer).

Saskatoon, Sask.—Tenders will be received until noon, April 6th, 1912, for supplying cast-iron sidewalk gratings. All information may be obtained on application to Geo. T. Clark, City Engineer, Saskatoon.

Toronto, Ont.—Tenders will be received up to noon of Wednesday, April 10th, 1912, for the erection of the new entrance at Dufferin Street to the Exhibition Grounds, and also the erection of a combined fire hall and police station on the Exhibition Grounds. Specifications and plans may be seen and full information obtained at the office of George W. Gouinlock, Architect, Temple Building, Toronto. G. R. Geary, Mayor, Chairman Board of Control, City Hall, Toronto.

Toronto, Ont.—Tenders will be received until noon April 9th, 1912, for one 36-inch check valve for the waterworks department. Specifications may be seen and forms of tender obtained at the office of the City Engineer, Toronto. G. R. Geary (Mayor), Chairman of the Board of Control, City Hall, Toronto. (See Advt. in Canadian Engineer.)

Toronto, Ont.—Tenders will be received at the office of Symons & Rae, until noon, April 22nd, 1912, for all trades required in the erection of St. Alban's Cathedral, Toronto. Drawings, etc., may be obtained at the office of Symons & Rae, Superintending Architects, 15 Toronto Street. Cram, Goodhue & Ferguson, Architects, Boston and New York.

Winnipeg, Man.—Tenders will be received until April 9th, 1912, for the supply of a 50-h.p. gasoline traction engine, to be delivered f.o.b., city yards, on or before May 15th, 1912. Specifications, etc., at the office of the City Engineer, 223 James Avenue. M. Peterson, Secretary, Board of Control Office, Winnipeg.

Winnipeg, Man.—Tenders are wanted for evaporating and bottling plant, at Little Lake, Manitou. Must be built before the first of May. Morrel's Manitou Mineral, Limited, Winnipeg.

CONTRACTS AWARDED.

Brampton, Ont.—Concrete reservoir; Mr. John Patterson; $3,600, and 30c. cubic yard for excavation. Tenders for pumps and meters have not yet been awarded.

Calgary, Alta.—A contract has been let at Edmonton for the construction of a sandstone brick plant to cost $100,000.

Chesley, Ont.—Public building; Messrs. Gilpin Bros., Wiarton, Ont.

Grand Falls, N.B.—Post Office and Customs interior fittings; the J. T. Schell Co., Alexandria, Ont.

Lockport, Man.—Approaches to bridge, Red River; the Brown Construction Co., Ltd., Winnipeg, Man.

Municipality of Surrey, B.C.—Erection of dams and excavation work; Messrs. M. P. Cotton & Co., Vancouver, B.C., $85,924, without gates.

New Liskeard, Ont.—Wharf; Mr. C. L. McCool, Fort William, Que.

Ottawa, Ont.—The contracts awarded for the Kent Street school alterations are as follows:—Carpenter and brick work, Taylor and Lackey, $9,113; galvanized iron work, Architectural Sheet Metal Company, $1,056; heating and plumbing, McKinley and Northwood, $3,373; painting and glazing, W. J. Carson, $925; fans, etc., Canadian Sirocco Company, Limited, $595; plastering, T. Brethour and Company, $400.

Port Arthur, Ont.—Office building for Alberta Land Co.; Mr. J. L. McRae; brick, two stories, 90-ft. x 110-ft.; cost, $62,000; Messrs. Hood & Scotte, architects.

Prince Albert, Sask.—Mr. Wm. Osemun, of Kinistino, has closed a contract with the C.N.R. for the grading of fifty miles of railway from Prince Albert towards Hudson Bay.

Stewart, B.C.—Extension to wharf, Portland Canal; W. G. Gillett, 429 Pender St. W., Vancouver, B.C.

Toronto, Ont.—Tenders on the construction of the Connaught Public School, amounting to $96,798, have been awarded as follows:—Masonry, Bayliss & Sons, $53,200; terra-cotta, Robert Bennett, $6,608; carpentry, William Williamson, $22,545; plastering, George White, $5,294; painting, J. R. Robinson, $2,630; roofing and tinsmithing, W. E. Dillon & Company, $2,021; iron stairs, Canadian Ornamental & Iron Company, $4,500. The total estimated cost of the Connaught School is $115,000, and work on which tenders are yet to be received are plumbing, heating, ventilation and wiring. The tender of the cabinet work in the manual training department of Brown School was awarded to the Beverley Wood and Specialty Company for $488.

Vancouver, B.C.—Messrs. Robertson, Godson & Co., Ltd., of Vancouver, have received the contract for the supply of water pipe for the proposed extensions to the water works distribution system, during the current year, at a contract price of $66,054. Other bidders and their prices are as follows:—Messrs. Crane Company, $68,643.50; Messrs. Evans, Coleman & Evans, Ltd., $68,443; Messrs. Balfour, Guthrie Co., Ltd., $68,837.50.

Victoria, B.C.—Messrs. Parfitt Bros. have secured the contract for the erection of an important addition to the emergency plant of the British Columbia Electric Company. They will erect a new cement roof and other fire-proof parts.

Welland, Ont.—Mr. Marcus Vanderburg, of Welland, has secured the contract for the extensive factory buildings at Port Robinson for the British-Canadian Canners, Ltd. The company will also build factories at Bowmanville, Cobourg, Merlin and Highgate.

Tarvia

Preserves Roads
Prevents Dust

Charles Street, Stratford, Ontario, showing "Tarvia Modern Pavement."

Adding to the Life of Macadam

Ordinary macadam belongs to the past. It is not adequate to meet the demands of modern automobile traffic.

It must be discarded or "tarviated."

A tarviated road costs a little more than ordinary macadam but lasts so much longer that the addition of the Tarvia is more than paid for in the reduction of maintenance.

Tarvia makes a firm elastic matrix around the stone, filling all voids, excluding water, and resisting pulverization of the surface.

For an old road that cannot be rebuilt or resurfaced, the "sprinkling" or "surface" treatment known as "Tarvia B" treatment is highly effective. One treatment will give excellent results for a season, or even longer, depending upon the amount of traffic. This treatment is quite inexpensive.

Tarvia gets at the original causes of road waste and disintegration. Oils and other devices simply make the dust too heavy to rise. They have little or no bonding or preservative properties.

Tarvia is made in three grades:—

Tarvia X, for road construction.

Tarvia A, for use in surfacing old roads and keeping them dustless.

Tarvia B, for dust suppression on old roads.

Road Engineers, road authorities, automobile owners and residents along macadam roads are invited to send for our booklet.

Address nearest office.

The Paterson Manufacturing Co., Limited
Montreal Toronto Winnipeg Vancouver

The Carritte-Paterson Manufacturing Co., Limited
St. John, N.B. Halifax, N.S.

West Toronto, Ont.—The contract for the construction of tar macadam pavement from Humber bridge to Mimico at $10,000 per mile, has been awarded to the McKnight Construction Company.

Weyburn, Sask.—J. H. Simmons, of Winnipeg, has secured the contract for building a freight shed for Canadian Pacific Railway, to cost $25,000. T. Martin, Moose Jaw, Divisional Engineer.

Winnipeg, Man.—Messrs. C. W. Sharpe & Son have signed the contract for the new C.P.R. building at Edmonton to cost $350,000.

RAILWAYS STEAM AND ELECTRIC.

British Columbia.—Mr. William McNeill, chairman of the directors of the projected Burrard, Westminster, Boundary Railway and Navigation Company, has returned from Ottawa and is reported to have stated that ample capital for the commencement of the project has been secured and that the work will proceed at once if the provincial government show that they are in accordance with the scheme.

Calgary, Alta.—It is reported that the Chicago, Milwaukee and St. Paul Railway Company will construct a line from Butte, Montana, into Canada, and that part of the proposed route has been surveyed, and that it will pass through the Flathead Valley and into Alberta.

London, Ont.—The Water Commissioners have engaged the services of an expert to place a value on the plant and belongings of the London Street Railway with a view to purchase the same at a future date.

LIGHT, HEAT AND POWER.

Catineau Point, P.Q.—This municipality will construct a new system of electric lighting to cost $25,000. Mr. Lafortune is the mayor of this town.

Hull, P.Q.—The municipal council have stated that the funds available for the present will not permit the erection of a "white way" and if the same is constructed the citizens will have to pay for it themselves. Some members of the city council desire a movement made for aid from the provincial government of Quebec.

Sudbury, Ont.—Considerable damage was done to the plant of the Wahnapitae Power Company by the bursting of a turbine case.

Victoria, B.C.—The emergency power plant of the British Columbia Electric Company will be increased by the addition of about $25,000 worth of new apparatus, and extensions to the building. A new cement and fire-proof roof and other structural alterations will be made.

Victoria, B.C.—The city council have authorized the calling of tenders for the supply of cluster light materials.

GARBAGE, SEWAGE AND WATER.

Brighton, Ont.—The Reeve and Council of Brighton have instructed Mr. T. Aird Murray, of Toronto, to prepare plans for a gravity water supply for the town. The water will be taken from springs located north of the town.

Carleton Place, Ont.—The Board of Water and Sewerage Commissioners have completed an agreement with Mr. T. Aird Murray, of Toronto, to act as consulting and supervising engineer for works of water supply, sewerage and sewage disposal. The town recently passed a by-law for a sum of $150,000 for the above purposes. Tenders will be called for in the course of a month and the work proceeded with this year with as little delay as possible.

Cobourg, Ont.—The Town of Cobourg contemplates extensive additions to its sewerage system. Mr. T. Aird Murray has been engaged by the corporation to prepare plans for a system including sewage disposal for the western section of the town. The Northumberland and Durham Counties have also instructed Mr. Murray to at once prepare plans and specifications for a complete sewage disposal system for the House of Refuge. The work will be let by contract at an early date.

Edmonton, Alta.—The superintendent of the municipal waterworks has expressed his opinion in favor of the purchase of a duplicate of the large steam pump recently installed.

Lethbridge, Alta.—During the construction of the sewage plant it has been found that the estimated cost of $76,500 voted by the ratepayers will not complete the work, and that an additional $17,000 will be required. The total for the plant is made up as follows:—

Hotson, Leader & Goode's contract	$65,000
Roof for filters	7,000
For lifting sewage from No. 2 outlet to sewage plant.	2,000
Hauling 7,000 yards of cinders by city	10,000
Engineering, approximately	9,000
Total.	$93,000

Saskatoon, Sask.—The employees of the city have completed the task of constructing a new intake for the municipal water supply.

Saskatoon, Sask.—The date for opening of tenders for the outfall sewer and disposal work has been postponed until noon of Monday, April 15th. Geo. T. Clark, City Engineer.

Toronto, Ont.—The recommendations of Judge Winchester, who has been preparing a report on the water supply system of this city, include the purchase of Venturi meters to ascertain the loss between reservoir and main pumping station, a steel pipe to replace the cement one now in use, and that the pumping station be enlarged and electrical equipment be installed throughout.

BUILDINGS AND INDUSTRIAL WORKS.

Calgary, Alta.—Work is to be resumed immediately on the new million dollar store building for the Hudson Bay Company and an effort will be made by the contractors to have the building ready for occupation November 1.

Langdon, Alta.—The Canadian Pacific Railway will erect a dam at this point. The project is for the purpose of storing water for the irrigation system throughout the country around this town.

Lethbridge, Alta.—Mr. A. Southard announces that he intends to erect a six story hotel structure in this city. The cost of the undertaking will be about $300,000. The building will contain 200 rooms and be constructed of brick and terra cotta.

Ottawa, Ont.—A new company which will be known as the Gatineau Spa Milling Company, composed of prominent business men of Ottawa and Hull, is in process of formation. The company which is capitalized at $125,000, has acquired quarries situated in the Gatineau Valley. Messrs. Belcourt and Ritchie are engaged in organizing the new industry.

Port Arthur, Ont.—The ratepayers of this city will erect a new municipal hall to cost $100,000. The Central School site has been chosen for the structure.

Regina, Alta.—The Security Lumber Company plan to erect lumber yards and sheds in this city. The head office of this concern is in Winnipeg, Man.

Saskatoon, Sask.—An addition to the programme of large buildings for the coming season has been made owing to the announcement of Messrs. S. R. and W. Ross of their intention to erect a seven story structure for office purposes in this city. The building will contain one hundred and forty offices and will be fitted with all modern conveniences for mercantile pursuits.

Saskatoon, Sask.—There is serious talk of the municipal controllers taking definite steps toward the construction of a civic abattoir. Ald. Maclean and Blackstock are the committee that will report on the project.

Saskatoon, Sask.—Messrs. Harrison and Jones, brick manufacturers, England, are about to consider the erection of a brick plant in this city. Mr. Charles R. Hill, Saskatoon, is interested in the matter.

Welland, Ont.—Mr. J. L. Weller, superintending engineer of the Welland Canal, reports that it is the intention to sink large steel tubes underneath the canal at the north end of the aqueduct, from the river above, where the present lock is, to the river below the aqueduct and change, for that distance, the bed of the river, carrying it through these tubes instead of underneath the aqueduct as at present.

BRIDGES, ROADS AND PAVEMENTS.

Brantford, Ont.—The Grand Trunk Railway officials are considering the rebuilding of the bridge over the Grand River at a cost of $50,000. The proposal is to move the easterly abutment eighteen feet farther east and add a span at the west end of 68 feet 6 inches. Also to rebuild the centre part with two trusses and another girder. The old bridge consists of three spans of 100 feet each, having a clear water way of 285 feet. The clear water way of the proposed bridge will be 366 feet. To get this will mean the building of two new abutments, and three piers, the westerly abutment being turned into a pier.

Gatineau Point, P.Q.—The Provincial Government of Quebec Province have sanctioned the expenditure of $20,000 for the construction of macadamized roads around and in this locality. Mr. Lafortune is the mayor of this town.

Galt, Ont.—A proposal has been made that the present bridge doing service on Main Street of this town be moved below the waterworks and provide an entrance to the industrial section.

Halton County, Ont.—The Halton County Council propose to spend $300,000 on road improvements in their county. This includes the grant recently made by the government. n ent.

Kildonan, Man.—The council of this municipality are considering the erection of a bridge to cost $165,000.

Province of Manitoba.—Premier Roblin, during a discussion on the estimates in connection with grants to the various municipalities of the province in aid of roads and bridges, stated that at the present time the government was considering a policy of having a standard road for the province, and also of bringing in a bill at this session defining the position to be taken by the government on the important question of good roads.

Nelson, B.C.—Chief Provincial Engineer Griffiths will advocate that the proposed bridge across the Kootenay River at Nelson be a quarter of a million dollar steel and concrete structure instead of the pile bridge originally planned. A permanent bridge is necessary to meet the rapidly growing requirements of this district.

Saskatoon, Sask.—This municipality will purchase six new road sprinklers during the coming spring. Geo. T. Clark, city engineer.

South Vancouver, B.C.—The municipal council will consider a new by-law dealing with the collection and handling of the civic garbage. It is proposed to fill certain ravines and gullies around the city with the refuse.

St. John, N.B.—The Provincial Government has announced that an agreement has been reached with the St. John Railway Company with regard to the erection of a bridge, to cost $335,000.

FIRES.

Lindsay, Ont.—Fire destroyed the plant and premises of the Hood Knitting Company.

Oshawa, Ont.—The car barns of the Oshawa Railway Co. were destroyed by fire on the morning of March 29th last. The loss is placed at $20,000.

Ottawa, Ont.—The plant of the Ottawa Paint Works was destroyed by fire on March 28th, last. Loss estimated at $8,000.

Orillia, Ont.—The sash and door factory of J. R. Eaton and Sons was destroyed by fire on March 27th last.

CURRENT NEWS.

Lethbridge, Alta.—Tenders will be called at an early date for the work of laying and constructing the municipal sanitary sewers, street grading and cement sidewalks.

Calgary, Alta.—The Canada Western Natural Gas, Heat, Light and Power Company will lay their underground mains by means of a mechanical trencher with a capacity of one mile, six feet deep and twenty-two inches wide, per twenty-four hours. The digging pieces or buckets are caused to pass along in rotation, each grasping its capacity of earth or gravel and in turn depositing it on a wooden slide that passes it out to one side. The digging part of the machine, which gets its power from a 24 horsepower gasoline motor, is similar to that of many river dredges.

Frank, Alta.—The Canadian Pacific Railway will confer with the federal authorities for the making of an expert's report on the advisability of blowing up Turtle Mountain at Frank.

Moncton, N.B.—The natural gas piping is now completed in this city the first users of the commodity being Messrs. John Abram and Sons. This firm will use the gas for boiler operations as soon as the necessary appliances are installed.

Montreal, P.Q.—The Shipping Federation and the Montreal Board of Trade have petitioned the federal government that the wrecking plant of the Messrs. George T. Davis and Sons, of Levis, P.Q., be granted an increased subsidy and the plant retained in its present position on the St. Lawrence River for an emergency. There has been some talk of a sale being concluded with the owners and another shipping firm. The proposition will be considered by the cabinet.

Moose Jaw, Sask. — Money by-laws totalling $741,000 have been passed by the ratepayers. They include $95,000 for 11th avenue subway; $225,000 for electric plant extensions; $70,000 for public library; $170,000 for sewer and water extensions; $6,000 for exhibition ground improvements; $16,000 for the paving programme. An option was also given of $15,000 or $10,000 grant for the board of trade campaign, and the former carried. All the by-laws had sweeping majorities.

Quebec, P.Q.—The federal government are preparing plans for an increased wireless telegraph equipment at this point. The present station in the Citadel is only a half-kilowatt one, and it is impossible to get communication with Father Point, or Montreal, without relaying at the stations at Grosse Isle or Three Rivers. The new station will be one of five kilowats, or perhaps ten, so that direct communication will be established with places hundreds of miles distant.

Regina, Sask.—The municipal council are about to appoint a Health Officer for the city.

Vancouver, B.C.—This municipality recently witnessed the working of a new system of fire alarm methods. Representatives of the manufacturers fitted up a working model and invited fire insurance inspectors, electricians and business men to the demonstration. The great point of difference with the systems now in use is that the ordinary civic telephone wires are the main part of the new apparatus. A small signal box is connected with the house instrument in such a method as to not interfere with the workings of the telephone. At the fire station end of the system the usual signal boards are used and should a fire occur in a building a contact button is pressed on the cover of the box, a buzzing sound in the central exchange warns the operator that the attention of the fire station is requested and she connects the telephone in the burning building with the fire station and saves the time of an ordinary call.

Vancouver, B.C.—A report states that a number of British and French financiers have decided to promote a scheme for building a floating dry-dock for Vancouver. The capital for the scheme has already been subscribed, and joint boards have been formed in London and Paris in connection with the project.

Vancouver, B.C.—The mayor of this municipality has decided to make a tour of the city and fix the blame for the condition of the dirty streets and lanes that exist in some portions of the city. As there appears to be some difference as to the share of responsibility held by the health authorities, the police and the fire warden, as well as the Board of Works, the mayor considers that a joint tour will do a great deal to clear the matter up and effect more co-operation.

West Vancouver, B.C.—There has been a movement made to appoint a city engineer for this municipality. Applicants may address the clerk of North Vancouver.

The smelting of metallic ores in Canada during 1911 did not produce the profit that was enjoyed from the same industry in the year 1910. The following list has been com-

THE TRIPLEX BLOCK

A Triplex Block hung from a temporary rigging and used for laying pipe.

What is the Life of a Triplex Block?

WE don't know. Triplex Blocks built by the Yale and Towne Co. at the very beginning—twenty-five years ago—are still in actual use. The Triplex Block of to-day possesses greater lasting powers. With its steel parts—its chain superior to any other—its non-wearing gear movement—and the guarantee of a rigorous test before shipment under a fifty per cent. overload. It will outlast the man who buys it, no matter how young he may be.

The Canadian Fairbanks-Morse Company

LIMITED

Fairbanks Standard Scales — Fairbanks-Morse Gas Engines
Safes and Vaults

CALGARY SASKATOON VANCOUVER VICTORIA

piled from the mines branch of the Dominion Government at Ottawa. The ores treated may be classified as follows:

	1910, tons.	1911, tons.
Nickel-copper ores	628,947	610,834
Silver cobalt-nickel-arsenic ores	9,466	8,504
Lead and other ores in lead furnaces	57,549	55,408
Copper-gold-silver ores	1,987,752	1,517,981
Total	2,683,714	2,192,727

The closing down of the Granby smelter in British Columbia, due to the coke shortage, was the principal cause of the falling off in copper-gold ores treated.

The products obtained in Canada from the treatment of these ores include: Refined lead produced at Trail, B.C., and fine gold, fine silver, copper sulphate and antimony produced from the residues of the lead refinery; silver bullion, white arsenic, nickel oxide and cobalt oxide produced in Ontario from the Cobalt district ores.

TRADE ENQUIRIES.

The following were among the enquiries relating to Canadian trade received at the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W., during the week ending March 11th, 1912:—

An English firm of fancy leather dressers are desirous of getting into touch with Canadian importers and users of bookbinding and fancy leathers.

A London firm manufacturing electrotyping machinery and appliances, elevating laying machines, box board printing machines, branding machines, box trimming and nailing machines, stereotyping machinery and appliances, desire to get into touch with Canadian importers.

An East Anglian firm specializing in the manufacture of cement-making plant desire to enter into Canadian business connections.

The following were among the enquiries relating to Canadian trade received at the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W., during the week ending March 18th:—

A Bristol correspondent makes enquiry for the means of Canadian furniture manufacturers open to establish themselves in his city.

A Yorkshire firm manufacturing elevators and conveyers for grain, coal, and all classes of material, as well as complete equipments for colliery surface plants, and specialties connected with automatic stoking and transport appliances, desire to get into touch with users of such machinery, and to appoint suitable representatives in Canada.

A London firm desire to appoint agents in Canada for the sale of their high-class decorative enamels and iron enamels.

A London firm manufacturing annealed tungsten wire lamps for steamships, piers, quays, cotton mills, etc., desire to get into touch with Canadian importers.

A correspondent now in London is proposing to establish in South Africa a general agency for Canadian goods of all descriptions, for which a large market exists, and would like to hear from Canadian manufacturers and produce exporters open to consider propositions.

An Indian firm of manufacturers and general agents desire to get into touch with Canadian manufacturers and produce exporters open to do business in India; also with importers of Indian products.

From the branch for City Trade Enquiries, 73 Basinghall Street, E.C.:

A South of England company manufacturing bungalows and all kinds of portable buildings would like to arrange for their sale in Canada.

A Lancashire manufacturer of belting (leather, cotton, balata, etc.,) would like to be placed in communication with Canadian importers.

A manufacturers' agent in Toronto asks to be placed in touch with United Kingdom manufacturers of bifurcated, tubular and other rivets of all kinds, and also self-feeding automatic machines for attaching same; leather measuring machines and manufacturers of belting, and garter elastic.

ORDERS OF THE RAILWAY COMMISSIONERS OF CANADA.

Each week on this page may be found summaries of orders passed by the Board of Railway Commissioners, to date. This will facilitate ready reference and easy filing. Copies of these orders may be secured from The Canadian Engineer for small fee.

16135—March 14—Approving changes and alterations in C.P.R. station at Dufferin Bridge, Ottawa, Ont.

16136—March 15—Relieving C.P.R. from erecting and maintaining fences on its Sirdar subdivision, B.C.

16137—March 15—Authorizing C.P.R. (G.B. & S. Ry.) to cross two highways at mileage 82.89 and 82.02.

16138—March 18—Authorizing C.P.R. to reconstruct bridge No. 66.6 on Souris subdivision.

16139—March 18—Authorizing C.P.R. to construct spur track across Montcalm Street, in the city of St. Boniface, Man.

16140—March 18—Authorizing C.P.R. to construct industrial spur for city of Medicine Hat, Alta.

16141—March 18—Permitting C.P.R. to file a new location plan for its Molson St. Boniface branch, said plan to show a width of land that will coincide with arbitration notice filed by the railway company; application of E. B. Chambers and W. G. Phair, Winnipeg, Man.

16142—March 16—Approving revised location of C.N.R. (Swift Current Branch) mileage 78.29 to 124.56, Saskatchewan.

16143—March 16—Relieving G.T.R. from further protection of 2nd highway north of Huntsville, dist. of Muskoka, Ont.

16144—March 19—Further extending until April 1st, 1912, time for installation of interlocker at Nipissing Jct. by G.T.R. crossing C.P.R. and connecting with T. & N.O.

16145—March 20—Directing that Twp. of York shall at all times maintain bridge over Toronto Belt Line Ry. (G.T.R.) east of Yonge St., Toronto, as well as construct same.

16146—March 19—Authorizing C.P.R. to construct bridge 85.2 on its Portal subdivision, Sask.

16147—March 18—Naming express delivery and collection limits for city of Ottawa, Ont.

16148—March 20—Substituting Plan "A" for plan filed showing diversion C.N.O. Ry. approved by Order 13052, June 14, 1911.

16149—16150—March 20—Authorizing G.T.R. to construct siding for J. Goodwillie & Sons, Welland, Ont., and for J. T. Watson, in the Township of York, on Toronto Belt Line Railway.

16151—March 20—Authorizing town of Claresholm to extend Fourth Ave. across C. & E. Branch of C.P.R.

16152—March 21—Authorizing C.P.R. to reconstruct bridge No. 176.9 over Bow River on Calgary Sub-division.

16153—March 18—Rescinding Order No. 12783 on Jan. 18th, 1911, in complaint Dawson Board of Trade vs. White Pass & Yukon Route.

16154—March 22—Authorizing C.P.R. to construct its Lacombe Easterly Branch across highways from mile 140.31 to 143.61.

16155—March 22—Relieving C.P.R. from further protection at public highway near Griswold, Manitoba.

16156—March 21—Authorizing C.P.R. to construct spur for Vancouver Lumber Co., Ltd., in Townsite of Merritt, B.C.

16157—March 22—Authorizing C.N.O. Ry. to construct spur for Alexander Bruce and Company. Tie Preserving Plant, on Indian Reserve No. 18B in Twp. of McIrvine, Ontario.

16158—March 20—Approving rules of T.H. and B. Ry. for operation of automatic block signals.

16159—March 22—Approving location of Campbellford, Lake Ont. and Western Ry. Co., through town of Oshawa and revised location as previously approved by Order 11947 through Township of East Whitby mileage 29.1 to 34.2.

16160—March 22—Authorizing Montreal and Southern Counties Ry. to construct track from G.T.R. property east of Front St., St. Lambert, P.Q., to connection with Central Vermont Ry., crossing Victoria Ave. by overhead bridge.

16161—March 21—Directing G.T.R. to file special tariff or supplement to existing tariff C.R.C. No. 1686 to take effect not later than 8th April, 1912, establishing a rate of $3.00 per car for switching lumber from docks of F. McGibbon and Sons, of Sarnia, Ont., to storage yard and mill, for storage, sorting or dressing and re-shipment via. G.T.R.

16162—March 21—Authorizing G.T.R. to construct siding to premises of William Laking at Haliburton Sta., County Haliburton, Ont.

16163—March 22—Directing G.T.R. to at once remove shrubs, etc., at crossing of 1st highway east of Waterdown Station, Ontario. Cars of trains not to be left standing within 75 feet of crossing.

16164—March 20—Approving standard plan of Portable Depot of Great Northern Railway Company.

16165—March 25—Naming express delivery and collection limits for city of Hull, Que.

10166—March 22—Authorizing G.T.R. to construct spur into premises of Steel and Radiation, Ltd., St. Catharines, Ont.

16167—March 23—Authorizing Highway Board of Parish of Grand Falls, N.B., to construct highway across C.P.R.

16168—March 23—Approving location of C.P.R. Suffield to Kipp, Alta. Branch from main line near Suffield to mileage 21.

16169—March 13—Authorizing C.P.R. (G.B.&S.Ry.) to construct across Jackson Street, in village of Bethany, Ont.

16170—March 5—Approving location of G.T.P.Ry. station to be erected at Henry House, Alberta.

16171—March 25—Approving Supplement No. 8 to Express Classification for Canada No. 2.

16172—March 25—Granting certificate of correction to G.T.R. B.L. Co. correcting errors in revised plan at Cutknife Branch.

16173—March 25—Slightly amending Order No. 16076 March 5th, 1912, re Boissevain to Lauder Branch of the C.P.R.

16174—March 23—Authorizing city of Saskatoon to carry 20th Street across C.P.R. at Rail Level.

16175—March 25—Amending Order 16064 of March 1st, 1912, re Bridgeburg Bridge by adding clause that Municipality shall at all times and at its own expense maintain bridge, etc.

16176—March 26—Authorizing G.T.R. to construct bridge No. 165 at mileage 32.22 over Clubiness Creek and Bridge No. 166 at mileage 33.91 over Holland River, 11 District Northern Division.

The Canadian Engineer

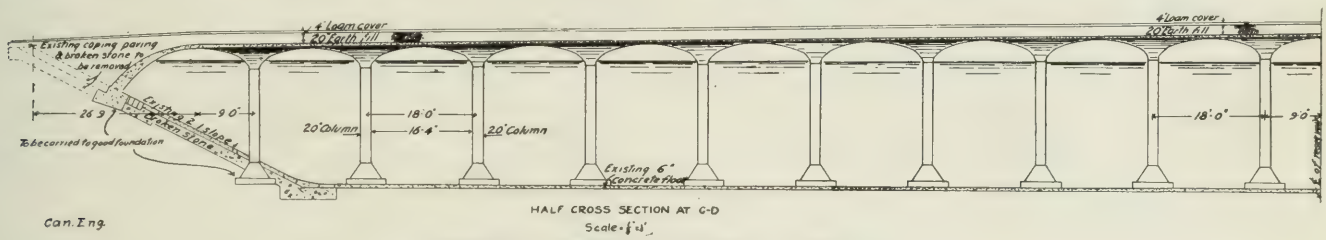
An Engineering Weekly

MINNEAPOLIS MECHANICAL WATER FILTRATION SCHEME.

By A. W. ELLSON FAWKES, C.E.

The Minneapolis mechanical water filtration scheme is now nearing completion, which will fill a long-felt want as regards the city's water supply. In the early stages Minneapolis had under discussion two projects, i.e., mechanical water filtration, and piping of the water from Mille Lacs, a distance of eighty-one miles. The vital points were: pure water, quantity, description of project, and cost.

The present average consumption of water in Minneapolis is twenty million gallons with a population of 316,000, with a per capita consumption of sixty gallons per day, quite a low figure at a glance, but a study of the analyses of the Mississippi water is explanatory. On account of the evaporation, run-off, and shrinkage of the water on Lake Mille Lacs, also the estimated cost of $3,913,414, approximately $48,915 per mile, the Mille Lacs scheme was abandoned in favor of the mechanical filtration scheme, by this means utilizing the existing pumping stations with an increased pumping capacity of 80,000,000 gallons per day.



Section Through Clear Water Reservoir.

The mechanical filtration system having been decided upon, various analyses of the water were taken to determine the extent of the mechanical scheme. Briefly the water of the Mississippi River contains:

Chemical analysis (sanitary)—Free ammonia, alb. ammonia, chlorine, alkalinity, hardness.

Physical analysis—Suspended matter, (a) mineral, (b) organic; rate of sedimentation, color, suspended and dissolved matter, (a) organic, (b) inorganic.

Biological analysis—Bacteria, plankton.

Mud analysis—Mineral, clay, silica, organic (dead and living.)

Chemical Analysis.—Free albumnoid and ammonia varies from .430 in May to as low as .059 in October.

Alkalinity and permanent hardness: The average total hardness reached a maximum of 173 and a minimum of 139. The maximum is during the months of December, January, February. The minimum during April.

Chlorides: These vary greatly with the heights of the water, and follow directly the alkalinity and total hardness. During the past ten months the chlorides have varied in about the same relative amount as the permanent hardness.

Color: The Mississippi River varies greatly in color at different points along its course. These changes in color are caused by the confluence of contributary streams. Along some of the highly-colored tributaries are large swamps, the water of which shows a color as high as 700 to 800. This color is derived from macerated vegetable matter, and persists as a considerable factor in the total color of the Mississippi at Minneapolis. The greatest reduction of color occurs during the months of August and September, and very little in the winter. This is coincident with the greatest and least amount of plankton. When copper-sulphate was used to destroy plankton, the bleaching process at the reservoirs was interfered with.

Suspended and dissolved matter: The organic residues are greatest in summer months. The inorganic residues follow the alkalinity and chlorides. The mineral residue varies from 113 to 162. The organic from 62 to 75.

Turbidity: The turbidity of the Mississippi River water at Minneapolis is usually low—so low, in fact, that it has been regarded as a negligable quantity in the earlier analysis. In occasional instances it has for a short time risen to 25 or 30, but quickly subsides. It is safe to assume that in 350 days of the year it is in the neighborhood of 10.

The Mississippi water deposits on an average .13 cubic yards of sediment per million gallons of water during a period of four days of sedimentation. In the process of sedimentation, the algae and diatoms are the first to be deposited; at the end of 24 hours, only fine clay remains suspended in water, and at the end of 96 hours but 36% of the original turbidity remains.

The following is an analysis of deposited matter taken from the city reservoir recently:

Organic matter	19.3%
Alumina	13.6%
Silica	50.3%
Iron (ferric-oxide)	6.5%

The most objectionable feature of the Mississippi River water at Minneapolis is the bacterial content. Colon bacilli are constantly found in the water. This indicates the presence of animal contamination. The high rate of typhoid

fever in Minneapolis among the users of the river water of the Mississippi goes to prove this. The fact that typhoid bacillus has been isolated from the waters of the Mississippi at Minneapolis, and the fact that above Minneapolis are situated several large towns contributing sewage directly into the river indicates the dangerous character of the raw Mississippi River water. It has been stated by engineers that typhoid fever germs will live in the same water for ten days. The Mississippi water passes several towns, such as Grand Rapids, Anoka, St. Cloud, Little Falls and Brainerd. The water that passes these towns reaches Minneapolis in less than eight days. The contamination of the Mississippi at Brainerd is sufficient to give colon bacilli in every cubic centimetre of the water throughout the course of the stream. The absolute numbers of bacteria in the

Reinforcement of Groin Arches North Filter Basin, and forms to South Series of Filter Built in Alternate Sections.

water at Minneapolis vary according to the season; the greatest in July and August was 3.000 per c.c., and lowest in January 150 per c.c.

The greatest percentage of reaction occurs in the reservoir also during July and August. These are the months of the maximum of plankton, when the range is from 400 to 1,200; in January 75 is an average.

Softening the Water.—The alkilinity of the Mississippi River water is due to the bi-carbonates of calcium and magnesium. This means the presence of carbon dioxide gas (Co 2). To reduce the alkilinity of the Mississippi water to about normal (66) after a treatment of 24 hours will be possible with lime treatment in about the quantities of 7.26% grains per gallon of raw water during November and December.

Color.—The color is due to vegetable substance which is slightly lessened by the lime treatment, and is further treated by alum as a bleaching medium. The slight precipitation soon settles with two grains per gallon, assisted with four grains of sulphate of aluminum. The Mississippi water will continue to bleach with longer storage.

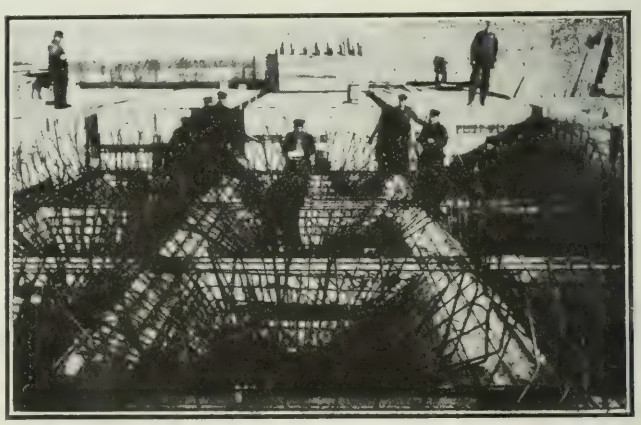
Sterilization.—The water in the reservoirs: 90 million gallons was treated with copper sulphate (50 lbs. to the 90 million gallons three times a week, and as a result the plankton was decreased 80% in 30 days. Bacteria was reduced 40%, turbidity 20%. Also the color was slightly reduced. These experiments were conducted during July and August, the usual time for these organisms to be on the increase.

The purification of the Mississippi River water having been solved, and the amounts and kind of purifying mediums to be administered, the constructional part of the work was started late in the fall of 1910, and has progressed very rapidly. The work was done on the day labor plan, the city of Minneapolis being the contractors.

The layout of the plant is as follows: The raw water or settling reservoir is of concrete and has a capacity of 75 million gallons. The water passes from this reservoir after sedimentation into a 60-inch intake pipe through a venturi meter into the chemical controlling chamber. There it receives the chemical treatment, measured by automatic devices according to the flow of the water. The water then passes into the mixing chamber, and is thoroughly mixed by flowing around a large number of wooden baffles. It then passes through controlling chamber No. 2 into a centre passage and is distributed into the two coagulating basins, again flowing against baffles, then passes over a skimming weir into the upper portion of the centre passage through a 60-inch influent pipe passing through the south side of the head house into the pipe gallery. The water is then passed into the filters ranging along each side of the pipe gallery through 24-inch branches off the influent pipe. The water passes through the filters into a network of pipes below, through a controlling meter into the clear water basins below, there to be turned into the large covered reservoir with a capacity of 47 million gallons, or into the city's distributing mains.

Head House.—The head house is of concrete and brick construction with several floors, and contains the mechanical devices for the operation of the plant. At grade 300 are located the two boilers for heating purposes, having a heating capacity of 15,000 square feet.

Alum Tanks.—These tanks are of concrete, reinforced with ¾-inch rods, both vertical and longitudinal. They are 13 ft. by 12 ft. by 12 ft. high. The concrete in these tanks was a 1:2:4 mix, and was put in for $7.00 per cubic yard. Above these tanks are located three 3-h.p. motors to drive the agitating devices. There are two pumps in connection with these alum tanks of the single section type, with a two-inch discharge having a pumping capacity of 40 gallons per minute against a 45-foot head including friction. They



Reinforcement of Concrete Storage Bins.

are operated by two single 2-h.p. motors. These pumps have bronze shells, runners, and diffusion vanes, and monal-metal shafts with especially designed packing to resist the action of the acid solutions. Switches for controlling these pumps are connected with the operating room at a point convenient to the pumps.

Hypo Tanks.—These tanks are similar to the alum tanks in construction, except that they have a concrete cover over them. The motive power, pumps and controlling devices are the same as in the alum arrangement.

Lime Tanks.—These tanks are of steel plate construction, three in number, 12 ft. 6 ins. in diameter and 13 ft. high. They have an agitating device driven by three 5-h.p. motors. There are two lime solution pumps in connection with these tanks of the single suction type with a 3-inch discharge especially designed for a 7% solution and pumping a thick, gritty liquid. They have a pumping capacity of 40 gallons per minute against a 45-ft. head. These pumps are also operated and controlled at the operating room as well as at the tanks, and are driven by two 2-h.p. motors.

Mixers.—There are two concrete mixers with a mixing capacity of 40 cu. ft. each for mixing the lime solution which is dumped into a trough in front of the tanks and flows through a screen of a ¼-in. mesh into the lime tanks. These mixers are driven by two 20-h.p. motors. The floor at grade 300 is sloped to a grade of 1 in 20 to drain the floor to a sump. In this sump is placed a vertical submerged pump with a pumping capacity of 200 gallons per minute against a 15-ft. head, and a suction of six feet. It is slow speed and automatic in operation. The pump and motor have a combined efficiency of 35% driven by a 3-h.p. motor.

Wash Water Pumps.—There are two of these pumps of the single stage centrifugal type with an eight-inch discharge, having a capacity of 1,600 gallons each per minute against a 50-foot head. These pumps are for the purpose of feeding the wash water tank with water to wash the filters. The water is taken from the clear water basins as it is necessary to wash with filtered water. Upward wash is used, the wash water flowing into the drain provided. These pumps are intermittent in action and are each controlled with an electrical controlling apparatus which will automatically stop when the water reaches a certain elevation in the wash water tank. These pumps are driven by two 40-h.p. motors.

Flushing Pumps.—These pumps are of the two-stage, 50-h.p. centrifugal type, with a pumping capacity of 500 gallons per minute when flushing, and operated against a pressure of 100 lbs. per sq. in. They are driven by a 50-h.p. motor.

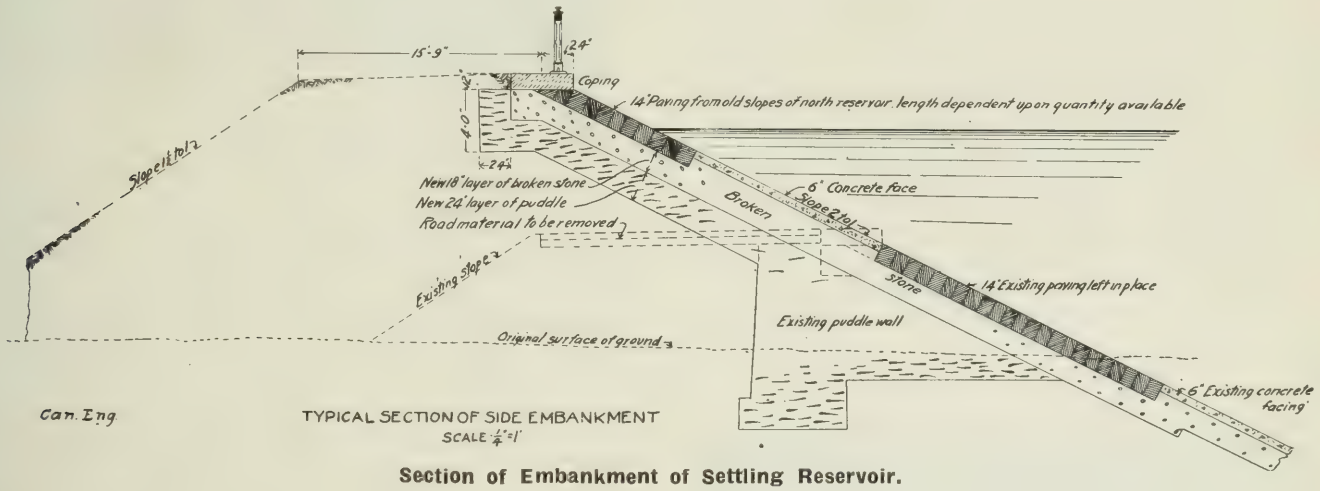
Pressure Tank Pumps.—These pumps also take water from the clear water basins and deliver water to a small steel tank in the tower of the head house. They are of the single suction type, discharging 30 gallons per minute against a head of 80 feet. They are operated by two 3-h.p. motors. These pumps are intermittent in service and are started and stopped by means of floats placed in the tank. Each float operates a Cutler Hamar series relay self-starter. It starts and stops the corresponding pump with a positive and certain maximum difference of not over six inches in the rise and fall of the water in the tank.

Sample Pumps.—There are twelve of these pumps of ¼ h.p. each with a pumping capacity of two gallons per minute against a 20-ft. head. These pumps are situated on brackets secured to the walls of the operating gallery, one under each of the 12 operating tables. They take their suction from the corresponding influent pipes near the filter gallery wall, and are controlled by switches on the corresponding table.

Lime Crusher.—The lime crusher has a capacity of 15 tons per hour, the crushed lime to pass through an iron ring of one inch in diameter.

Concrete Storage Bins.—These bins, twelve in number, are for the purpose of storing the alum, lime and hypochlorite. The various chemicals are conveyed from these bins by a bucket with a recording gauge to register the weight. The bucket travels along a suspended track to the lime, alum and hypochlorite tanks. The concrete to the storage bins is heavily reinforced with steel work. The concrete was of the 1:2:4 mix and cost $9.00 per cubic yard. The forms to this work came rather high, averaging 9 cents per square foot.

Chemical Feed Tanks.—These tanks are situated on floor grade 328, and consist of the lime, hypo. and alum



Section of Embankment of Settling Reservoir.

water, and are controlled by a set of lime, alum and hypo. controllers.

The offices, laboratories, preparation rooms, lockers, lavatories and bath rooms are on this floor grade 328.

Ash Storage.—The ash storage is located on floor grade 340.

Controlling Chamber.—This chamber is 28 ft. by 7 ft., in which is situated a venturi meter to gauge the flow of the water from the raw water basin. The chemical supply is admitted at this stage, controlled and governed by a device in connection with the venturi meter. The controlling chamber and venturi meter is of concrete.

Mixing Chamber.—This chamber is 141 ft. by 47 ft., is connected to Nos. 1 and 2 controlling chambers, and is divided into 47 spaces by wooden baffles for the water to flow around; these baffles being fixed with an alternate space at the ends. This chamber is of concrete at 1:2:4 mix, and cost $6.00 per cubic yard.

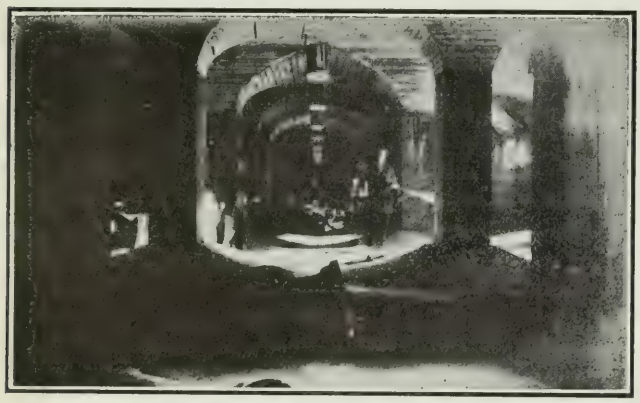
Centre Passage.—This passage is 7 ft. wide, 192 ft. long, and separates the mixing and controlling chambers from the coagulating basins, and has an upper and lower compartment. The water passes into the lower portion to the coagulation basins, and returns over a skimming weir into the upper portion of the centre passage to the filters.

Coagulating Basins.—There are two of these basins, each 120 ft. by 96 ft., with three sets of concrete baffles and two skimming weirs. These basins have a flat concrete roof supported by 126 concrete columns.

Gate House.—The location of this building is over the entire length and width of the centre passage. Here are located the controllers in connection with the valves that control the flow of water in the mixing chamber, coagulating basins and centre passage. This building is of brick construction with a cinder concrete roof covered with slate.

Filters.—The filters are twelve in number, each 28 ft. by 53 ft., situated six on either side of a pipe gallery. These filters and gutters are of concrete reinforced with ⅝ steel. The mixture is a 1:2:4, and cost $10 per cubic yard. The filters are divided into two sections with a 2-ft. 6-in. centre gutter running north and south with lateral gutters running east and west supported on the 6-inch centre gutter walls. The water flows into the centre gutter. At elevation 310.50 it passes into the lateral gutters and sprays on to the filter beds below. Each filter has a filtering capacity of three and a quarter million gallons per day. The water, after passing through the filtering medium, passes into the pipe arrangement below, through a rate controller into the clear water basins or to the clear water reservoir.

Filtering Mediums.—The filtering mediums consist of three grades of gravel and one grade of sand. The gravel is of four grades, as follows: The bottom layer is three inches thick, composed of pebbles. These pebbles pass through a screen of one inch mesh, and are retained on a screen of ⅝ inch mesh. The second layer is two inches thick; the grains pass through a screen of ⅝ inch mesh and are retained upon a screen of ⅜ inch mesh. The third layer is 1¾ inches thick, pass through a screen of ⅜ in., and are retained upon a screen of 5/16 mesh. The top layer is 1¼ inches thick, pass through a screen of 5/16 in. mesh, and are retained upon a screen having 10 meshes per lineal inch No. 20 wire. This gravel is of hard and durable rounded particles, with a high specific gravity, free from thin or flat pieces, washed and screened, and free from



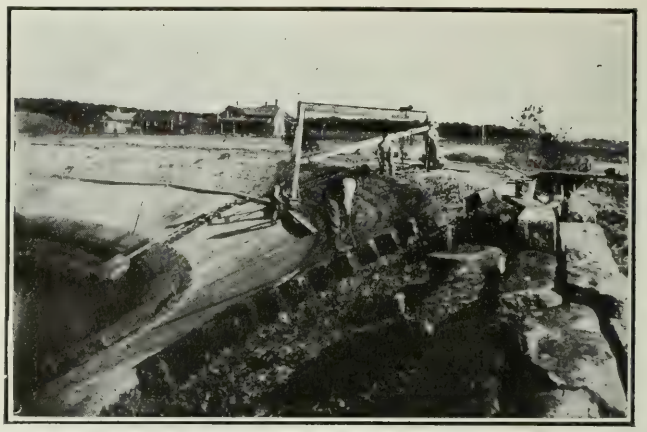
View of Groin Arches, After Removal of Forms.

sand, loam, dirt and organic impurities. This gravel, without being ground or crushed, is digested for 24 hours in cold, strong hydrochloric acid, and 95% must remain insoluble.

The filter sand is placed above the gravel, separated by a wire screen, to a depth of thirty inches, and is of a hard and durable kind, free from clay, loam, organic matter and flat particles, and stands up to a similar test as the gravel above. This sand has an effective size of not less than .35 or more than .44 of a millimeter, and a uniform coefficient of not more than 1.65. Not more than 1% is finer than .25 of a millimeter, and 90% is finer than .8 of a millimeter. The diameter of the sand grains is computed on the spheres of equal volumes, and all percentages are calculated by weight.

Clear Water Basins.—These are two in number, situated below the filters, and are 151 ft. 6 in. by 53 ft., with a concrete groin roof that supports the filters. This groin roof is supported by 26-inch concrete columns at 14-foot centres.

Pipe Gallery.—This pipe gallery is situated between the clear water basins and the filters, in which are situated the hydraulic valves, influent pipe, wash water pipe and wash water drain.



The Concrete and Stone Addition to Settling Basin to Increase Storage Capacity from 45,000,000 to 75,000,000 Gallons.

Operating Gallery.—The operating gallery is situated above the pipe gallery and extends out over part of the filters. This is of brick construction with a cinder concrete transept arch roof, covered with slate. Here are situated all the operating tables and devices for controlling the hydraulic valves, motors and all mechanical devices in connecnection with the chemicals, filters and pumps.

Pipes.—The total weight of piping in connection with the filters is 150 tons; influent, wash water and drain pipes, 365 tons; 48-inch pipe line from reservoir to Central Avenue, one and a quarter miles, 2,550 tons. Lead used, 80 tons; bolts, 6,500, assorted, for flange joints.

Clear Water Reservoir.—This is an immense covered concrete tank with a concrete groin roof supported by 960 20-in. concrete columns at 18-ft. centres. The length of the clear water reservoir is 877 ft. 6 in. by 413 ft. 6 in. by 24 ft. deep, with a capacity of storage of 47 million gallons. The total amount of concrete in this roof and columns was 15,000 cubic yards, put in at the following cost:—

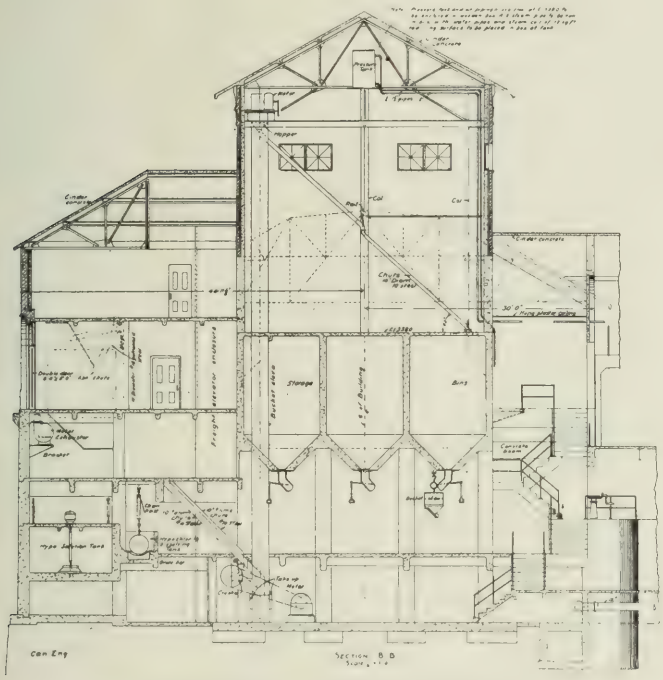
Cement	$2.00
Crushed stone	1.35
Sand	.28
Mixing, transporting, placing	.82
Form building, 2c. per sq. ft.	.10
Wrecking and placing	1.40
Total per cubic yard	$5.95

Wash Water Tower.—This wash water tower is circular in construction, 46 ft. in diameter, built of concrete from grade 296 to grade 369. Elevation 296 to 340 is used for storage rooms, and elevation 340 to 353 is for water storage. The outside facing above the grade of fill is of brickwork. This wash water tower is for the purpose of water storage with sufficient pressure for an upward wash to the filters.

Brickwork.—The brickwork facing of concrete and solid walls above the grade fill to the head house, filter building, gate house and wash water tower is laid in cement mortar. The panels are laid with dark headers and light stretchers, which give the buildings an effective appearance. All interior walls are coated with ½ inch of plaster. The cost of the labor for the brickwork was $4.00 per 1,000. All copings and window sills are of terra cotta of such a shade to blend with the brickwork.

Carpentry.—All interior doors and frames are of red oak, exterior door and frames of clear white pine; the floors to offices and rooms at grade 328 are ⅞-in. by 3-in. tongued and grooved, close grained, long leaf, yellow pine fixed to bevelled strips embedded in the concrete floor. These bevelled strips stand above the concrete 1½ inches, the intervening space being filled with cinders. A ⅞-in. by 7-in. moulded base goes around all the rooms that have lumber floors.

Laboratory and Chemical Benches.—These benches are of hard maple, made up of 1½-in. by 3-in. strips, with the thin edge up, bolted together and secured with waterproof glue. A gas machine of 150 cubic-foot capacity per hour is installed to furnish gas for laboratory purposes. The water pipe lines stand up to a pressure of 150 lbs. per sq. inch. All other pipes 50 lbs. hydrostatic pressure.



Cross Section Through Head House.

Steam Heating.—Steam heating is furniished by two boilers situated at grade 300 with a heating capacity of 1,500 square feet, capable of supplying steam for 8,000 square feet of radiation surface with a steam pressure of 25 lbs. per square inch. The radiators are of the peerless two-column type.

Vacuum Cleaner.—The vacuum cleaning system is of the rotary pump type, having a displacement of 85 cubic feet per minute when operated at a speed of 220 revolutions per minute.

Earth Fill and Embankments.—A fill is placed around the head house, filters, wash water tower and coagulation basins, from grade 301 to 323, with a 12-foot crown and a 1 in 1 slope. This embankment is to keep the water in the coagulation, filters and tower from freezing. The roof to the clear water reservoir is covered with 3 feet of earth, which will be planted and laid out in an artistic manner. The embankment to the raw water of settling reservoir has been carried up another ten feet to overcome the loss of head in the filtration plant, and to give the same pressure to the city's distribution system.

Total quantities:—35,000 cubic yards of concrete, 500,000 cubic yards of excavation, 260,000 cubic yards of fill and embankments, 900,000 pounds of reinforcement to concrete, 600,000 bricks.

Embankment and fill, watered and rolled, cost 85 cents per cubic yard. Excavations, 65 cents per cubic yard.

The accompanying illustrations show the work during construction, which was carried out under the supervision of Mr. A. W. Ellson Fawkes, C.E., chief assistant engineer on the works for the city of Minneapolis. Messrs. Hering and Fuller, consulting engineers, New York, designed the system.

PURIFICATION BY OZONE.

By R. M. Leggett.

(Continued from last issue.)

If the pre-filter removes the gross matter, the ozone will remove the bacteria and the organic matter in solution, the effluent being clear, pure and free from odor, color or taste.

Ozonization is but another name for oxidation and it is by rapid and more or less complete oxidation that the desired results are accomplished.

Ozone is allotropic oxygen expressed by the symbol O_3, as distinguished from oxygen, O_2. It is an unstable form that tends to give up its extra atom.

Bacteria are composed of about 86 per cent. water and 18 per cent. of organic matter, 6 to 8 per cent. of which is carbon. The contact of these bacteria with ozone spells their instant destruction, as the carbon is reduced by oxidation to carbonic acid, the water is freed from the organic matter and we have as a result, water, carbonic acid and nitrous and nitric oxides.

In water highly contaminated with mineral salts, these gases may very slightly increase the nitrates and carbonates, but on such a minute scale as to be hardly detectable by analysis.

It has been estimated that one million bacteria represent one-sixteenth of a milligram total weight, of which, as stated, 80 to 86 per cent. is water and the rest carbon.

The average untreated natural water contains from 1,000 to 10,000 bacteria per cubic centimeter, which represents so small an amount of carbon as to make its products of oxidation negligible.

Various devices are in use for the production of ozone, but in all, the object is to bring a current of air in contact with the silent discharge of a high-tension current of electricity.

The ozonizers in use in the Ann Arbor plant are of the tubular type, and consist of 109 tubes. They are 35 inches long and 24 inches in diameter. There are three of these ozonizers, two of which are in operation all of the time, and one is kept ready in case of emergency. The ozonizers are simply steel shells, containing 2-inch aluminum tubes, about 30 inches long, rolled in, and have the appearance of small fire tube boilers. Inside these tubes are mica tubes for the dielectrics and inside the mica tubes are other aluminum tubes. The discharge takes place between the two aluminum

tubes and the dielectric. The space in each case is about 1/16 inch, through which the air is passed.

The ozonizers are enclosed in steel tanks which have a circular dam in the middle, which forms two compartments. One compartment is the receiving end, where air under pressure from an air compressor is taken in and passed through the ozonizer. Part of its oxygen is converted into ozone and the air then passes along, as required, to the sterilizing towers.

After the air is compressed, it is passed through a cooler, thus preventing any heating of the ozonizer due to the discharge. It must be explained that only a small percentage of the energy applied to the ozonizer is utilized in the production of ozone. The greater part is lost.

Just as ozonizers are various in their form, so are, to no less extent, the means for applying the ozonized air to the water. The problem is evidently to produce a thorough mixture and in the methods in successful use there are two fundamentally different ways of doing this. In one the water is finely subdivided and passed through the ozonized air and in the other, on the contrary, the air is subdivided and passes through the water. The Ann Arbor plant belongs to the second class.

The ozonized air is conveyed to the sterilizing towers, which are built in batteries of a size to meet the capacity demanded. These towers are built on steps, with a fall of 3½ feet between each step. The water is taken in at the top of No. 1 tower, at the bottom of which are arranged suitable spray nozzles for the introduction of the ozonized air. Each tower contains four baffle plates that compel the water to travel 57 feet in each 13 feet of tower. This prolongs the contract of the water and ozone and enhances the efficiency of the system. The water leaves the bottom of No. 1 tower and enters the top of No. 2 tower, 3½ feet lower, where the same operation is repeated, and so on to No. 3 and No. 4 tower.

The chief advantages of the ozone system over any other known system of water purification lie in economy of operation, constancy of action, and freedom from costly repairs and renewals.

Nothing is added to the water to cause it to have an unpleasant taste.

No deleterious by-products are formed and odors and tastes due to organic matter are destroyed. Filtration by any means is only a greater or less reduction in the bacteria contained in the raw water. This percentage may be as high as 99 per cent. when everything is working right, but the remaining 1 per cent. in a highly polluted water may represent a grave danger. Filtration exerts no selective action. It removes the same percentage of pathogenic organism as it does of the harmless ones.

Ozone, on the contrary, has a selective action, killing all the pathogenic germs and practically all of the others. This is due to the low power of resistance to oxidation of the pathogenic germs and is confirmed by the statistics of various places where ozonization has been introduced. Paderborn, Germany, had a typhoid rate of about 1,500 per 1,000,000 population. Filtration reduced this rate to 290, and ozonization still further reduced it to zero. This plant was built in 1897 and has been in continuous operation since that time. Similar results have also been recorded in Paris, Dinard, Chartres, Nice, Weisbaden and other European cities.

In conclusion, it may be stated that any municipality using surface water may render this water safe by ozonization properly applied as outlined above.

THE ELECTRIC PURIFICATION OF WATER.*

By D. D. Vincent.

The pollution of the sources from which our great cities draw their water, and the sickness and loss resulting from the use of impure water, has drawn the attention of scientists and engineers to the various methods proposed for the purification of such water as is available.

Your attention is invited to the electrical purification of water, as practised by the Electra Pure Water Co., of this city, with which I am associated, as this method produces an ideal table water, free from organic matter, but not devoid of the necessary mineral salts.

Water purified by this process is taken from the city mains under pressure and passed between aluminum plates which are connected to a suitable source of electrical supply. It is then filtered through crushed quartz while still under pressure. We do not know to-day all of the changes which take place in the presence of the current. We do know, however, that a small percentage of the water is decomposed and that the organic matter in the water is oxidized and coagulated by the oxygen which is released and that the hydrogen combines with minerals in solution forming flakes of solid matter which can be removed with the organic matter by filtration. Repeated tests have shown that colon bacilli will not survive in this water any longer than in distilled water.

Exact work is being undertaken to establish the best practice in using this method of purification, both as to the form of apparatus used and the most economical current density and we are convinced that the cost of purification can be reduced to such a low figure as to give this method of purification a very wide application.

*Paper read before Cleveland Engineering Society.

DISCUSSION ON FOREGOING PAPERS.

Langdon Pearse*:—

The previous speakers have given a general review of the field of water purification. Mr. Pratt has shown you what the processes of filtration are, and the cost.

Mr. Leggett's paper covers the ozone plant as erected at Ann Arbor. The ozone process, as a means of sterilization, is not yet on a commercial basis in this country, in that a plant cannot be operated continuously to give uniform results, nor is it economical. This was conclusively shown by careful independent tests, made at Jerome Park reservoir, for the city of New York several years ago. Sterilization by hypochlorite of lime is much cheaper and more dependable. Ozone treatment was considered for the city of Montreal, but Messrs. Hering and Fuller in their report distinctly state that it is not yet on a basis to mertit recommendation.

The paper by Mr. Vincent describes a process for the purification of water, based on making electrolytically aluminum hydrate. Instead of adding sulphate of aluminum the hydrate is made by passing an electric current between two plates. This simply coagulates the water, and a filter is essential both to remove the turbidity and the bacteria. There is no virtue in the electric current. It is cheaper to buy the sulphate of aluminum and apply it in the usual way. In the Louisville report, in 1896, Mr. George W. Fuller ex-

* Division Engineer, The Sanitary District of Chicago. In charge of Sewage Disposal Investigations.

amined this general process very carefully, with extended tests, and concluded that it was impracticable, and extremely uneconomical.

Sanitary engineers to-day recognize that the only tried and effective means of treating a water supply to remove bacteria and turbidity, are sedimentation followed by slow sand or rapid filtration. A coagulant may be used at times with a slow sand filter, and is always required for the rapid filter. As a finishing process, chloride of lime is available to sterilize. Alone it serves as an emergency process. It does not affect the turbidity.

The situation in Cleveland is of great interest to me, as I represented Mr. Whipple for two months, in 1903. I have followed the situation since. At that time we felt that filtration would undoubtedly be required. How soon, we could not say, as the four-mile crib had only been in operation two or three months, and the sewage had not been intercepted, as originally planned. With the data available, Mr. Whipple reported that filtration would probably be required in a few years. Even if the sewage was removed from the Cuyahoga and the water front and discharged at a point some nine miles to the east of the crib, the crib would still be exposed to occasional pollution. Sewage is still flowing into the Cuyohoga in amount some 40 per cent. of the entire discharge.

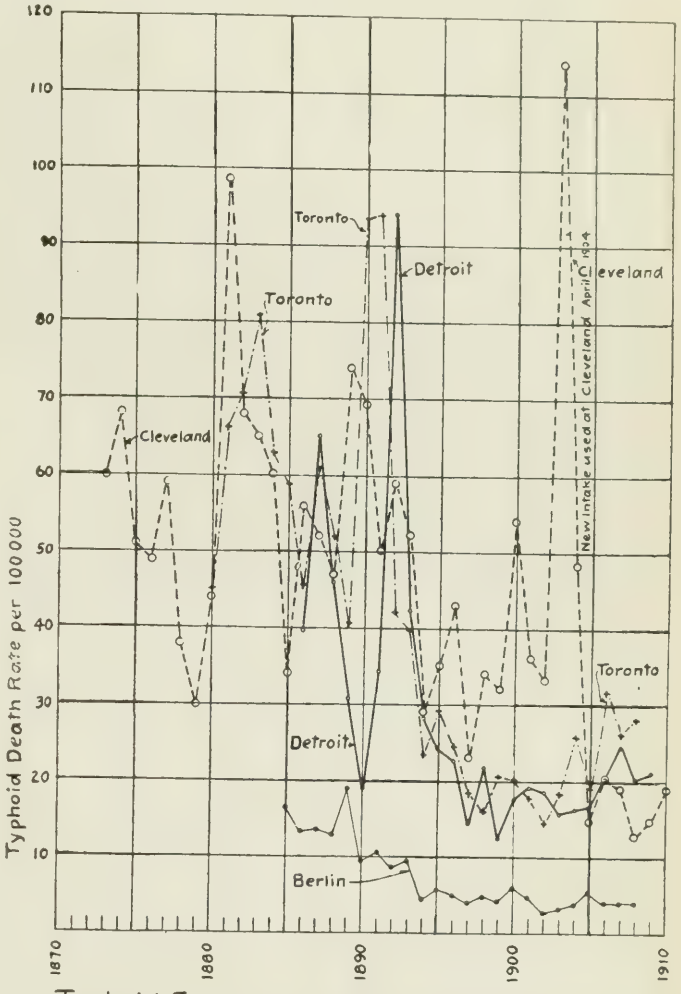
Personally, I have never understood why the four-mile crib in Cleveland was located directly in front of the Cuyahoga, even though four miles off shore. Recent tests for the Lake Michigan Water Commission have shown that under favorable conditions a sewage stream may work out even ten miles from shore before finally dispersing. The Cleveland water supply is turbid at times, and is undoubtedly open to suspicion on the ground of bacterial pollution. I have not had a chance to examine the data at hand. I do feel, however, that if there is conflicting data, all hands should get together at once and urge the appointment of a disinterested expert, a sanitary engineer of high standing, to examine into the case in the light of developments since 1903, and report whether or not filtration is not immediately advisable, particularly as the sewage has not been diverted from the Cuyahoga, and may not be for some years to come.

In the meantime, systematic data should be collected daily, particularly on the turbidity of the lake water, as taken from the tunnel at Kirtland street pumping station, its temperature, alkalinity, and bacterial content, in order to have data on hand to help in determining the filter problem. Possibly Mr. Pratt proposes to do this. It would also be very easy for him, in connection with a sewage experiment station, to build two or three small experimental water filters, and try out slow sand and mechanical filters at Kirtland street, in order to have a line on their adaptation to Cleveland conditions.

About eight months ago, in a talk at Detroit, and later before the Illinois Water Supply Association I showed a diagram on which was plotted the typhoid fever death rate of Detroit, Toronto, Cleveland and Berlin. Toronto and Cleveland both have an uneven rate. Berlin has a rate extremely low and consistently so. (See diagram.) At that time I pointed out that the Cleveland supply was open to suspicion. From what I have heard during the last two days I am convinced that immediate steps should be taken to determine whether filtration is required, at once, and to make the proper moves to finance the project, if it is required. Chloride of lime is an excellent emergency expedient to sterilize the water, and is now in use at the temporary plant.

With the modern standards of sanitation it is essential that a city have a clear water supply, always free from turbidity, and above suspicion of bacterial pollution. This is not only a valuable asset, an advertisement of progressiveness, which appeals alike to commercial men and homeseekers, as well as to residents, but is also a distinct gain to the public health, since abundant statistics point to a marked reduction in the general death rate with the accompanying reduction of the typhoid rate, when a pure water supply is introduced. The yearly saving in lives, if estimated at $5,000 each, would easily pay the interest on the cost of a filtration plant in many cases. If 40 lives can be saved yearly, this would amount to $200,000, which capitalized at 5 per cent., is $4,000,000.

The situation in Cleveland is not unique, but is a common one around the Great Lakes to-day, where a city has to



Typhoid Fever Death Rate per 100 000 at Cleveland Detroit Toronto and Berlin

discharge its sewage into the source of water supply. Chicago is the only city which can successfully divert the sewage. That is the scheme we are following to-day, as laid down by Mr. Hering in 1885. Recent investigations have shown that, with the unexpected increase in industrial wastes as well as human pollution, the rate of 3.3 cubic feet per second per 1,000 population is not sufficient. We feel, however, that the work was excellently planned, and has fulfilled its purpose. A recent report by Mr. Wisner, our chief engineer, has outlined the means open to us to increase the dilution capacity by settling the sewage in Emscher tanks. Some work must be done at once on the industrial wastes and the city sewage, since the capacity, in accordance with our legal ratio of dilution, will be exhausted in 1922. We have been operating a testing station

for over two years, and carrying along preliminary studies in the various schemes.

Milwaukee is now facing the problem. There the entire sewage of the city is flushed out into the lake, two and a half miles from the water intake. Filtration of the water has been recommended, with the removal of the sewage from the river and its diversion to a point about nine miles from the intake, where, later, settling basins, and finally, sprinkling filters will be required.

In Toronto the water supply is to be filtered, with slow sand filters, recommended, by the way, by Messrs. Hazen and Whipple, and the sewage is to be diverted to a point some three and a half miles to the east, where it is to be settled and perhaps disinfected before discharge into the lake. Dr. Amyot can tell you more of the details.

In conclusion, I may sum up by saying that it is recognized to-day that filtration of a water supply, either by slow sand or rapid filters, according to conditions, will remove impartially 95 per cent. or more of the bacteria, and the turbidity. A small amount of hypochlorite of calcium will remove practically all the remaining bacteria. The situation in Cleveland demands a most careful, unbiased investigation, at once, in order to fix whether the available data warrant the immediate expenditure of the sum required for filtration. Conditions have changed since 1903. In matters appertaining to the public health, delay is dangerous. Sterilization with chloride of lime will, however, furnish temporary protection until the decision is rendered.

VENTILATION.

By Dr. Leonard Hill and Dr. Martin Flack.*

The authors remarked that the good effects which resulted from efficient ventilation and open-air treatment, though generally supposed to be due to the chemical purity of the air, were due really to the movement, coolness, relative humidity of the air, and the ceaseless variation of these qualities. The ventilating engineer had hitherto followed a great illusion in thinking that the main object to be attained was chemical purity of air. The heating engineer had sought after an equally great illusion in striving to obtain a uniform summer temperature. The ventilating and heating engineers should aim primarily at giving air which was cool and of proper relative humidity, and which moved so as to vary the cutaneous state of the body. Comfort and discomfort in crowded rooms and shut-up places depended, not on the chemical purity of the air, but to a minor degree on the influence of the smell of the air on the olfactory sense, and, to a vast degree, on the influence of the temperature and relative humidity, and the variations of these qualities of the air, which acted on the great field of cutaneous sensibility.

The chemical purity of the air might be considered from three points of view—the concentration of carbon dioxide, the concentration of oxygen, and the supposed presence of organic poison exhaled by the breath.

Owing to the fact that a percentage of carbon dioxide exceeding a very few parts per 1,000 was not legally permissible in factories, it was commonly supposed that any greater excess acted as a poison. The truth of the matter was quite otherwise, for whatever the percentage of carbon dioxide in the atmosphere might be, that in the pulmonary air was kept constant at about 5 per cent. of an atmosphere by the action of the respiratory centre. It was impossible any excess of the gas should enter the body even in breathing the air of the worst-ventilated room, in which the percentage of carbon dioxide assuredly did not rise above 0.5 or at the outside 1 per cent.

The oxygen in the worst-ventilated theatre, school-room, or chapel was never lessened by more than 1 per cent. of an atmosphere, but all the evidence went to show that only when oxygen was lowered below a pressure of 14 to 15 per cent. of an atmosphere did signs of oxygen want arise. A diminution of 1 per cent. of an atmosphere had not the slightest effect on health or comfort.

There was no positive evidence which demonstrated the poisonous nature of the condensation water obtained from the breath, as suggested by Brown-Sequard and d'Arsonval; further, there was at present no trustworthy evidence of the existence of any such poison in exhaled air.

As to the general principles which ought to control the practice of the heating and ventilating engineer, the old English methods of open fire and open window had very much to recommend them. By the open fire air was kept moving and cool air was brought in; the heating was by radiation, and uniformity of the conditions of temperature in the room was prevented. On the other hand, the impulsion of hot air into a room was the most objectionable of all the systems employed. A cool air and radiant heat were the ideal; the hot air system gave neither. In cold weather the heated air became excessively dry; the vigor and health of children in America had been seriously undermined by the impulsion of hot "desert air" into the schools.

Uses of Ozone.—In the concluding part of their paper the authors discussed the uses of ozone in ventilation, basing their remarks on experiments carried out with an ozonizing apparatus put at their disposal by the Ozonair Company. They stated that by the smell concentrations of ozone of far less than one part in a million could be detected, and the gas should be present in the air for continuous breathing in concentrations not greater than that scarcely perceptible to the smell. Concentrations of even one part in a million were too irritative. Very weak concentrations, barely perceptible to the smell, had no ill effects, but destroyed the effect of unpleasant smells and gave a certain tang or quality to stuffy air which relieved its uniformity. It was in this respect that ozone had its use. There existed in modern conditions of life so many trade shops, tube railways, cold meat stores, etc., where the employes were exposed to a persistent, uniform, and depressing smell. The air in many buildings was made to smell by the heating appliance used. The addition of ozone took away the smell and relieved the monotony of such air, and as the Ozonair apparatus could, by the turning of a switch, be put in or out of use, the uniformity of the atmospheric conditions could thus be frequently changed. The ozone, no doubt, exerted its effect both on the cutaneous and respiratory nerves. They thought that the addition of ozonized air to the Central London Railway had improved the conditions, the unpleasant characteristic smell of the tube being diminished, and the monotonous quality of the air improved.

The Harbor Commission, Los Angeles, Cal., have decided that the harbor improvements, consisting of a 2,600-foot fireproof wharf and wharf structures are to be constructed of reinforced concrete.

* Abstract from a paper read before the Society of Arts, London, Eng., on "Influence of Ozone in Ventilation."

ECONOMIC LIMITATIONS UPON THE DEVELOPMENT OF TRANSPORTATION BY ELECTRIC RAILWAYS.*

By Guy E. Tripp.

The evolution of electric railways from the horse cars, cable cars and steam dummies of the late 80's has produced many changes in our social and industrial life. The man who formerly had to locate his home near a steam railroad line that he might go to the city each day with certainty and comfort while his family enjoyed the benefits of suburban life can now locate almost anywhere within a reasonable distance and be served safely, cheaply and expeditiously by the electric street railway. This has produced a complete change in the distribution of the suburban population of our cities and has added greatly to the value of land which was hitherto comparatively inaccessible, and the electric transportation system has become so indispensable to every large city that the loss of its service would be a public calamity which would paralyze a large part of the city's industries. Electric transportation has, in fact, become so closely interwoven in our social and economic fabric that any attempt to adjust its financial or administrative problems is far reaching in its effects and provokes vigorous opposition. It is as when one touches a spider's web; the spider is sure to rush from a dark corner to devour the disturber.

It has been generally realized for a number of years that, while some favorably located street railway properties have made a satisfactory return on the capital invested in them, many are on the border line, so to speak, while others again would show an actual deficit if their accounts were carefully analyzed and all reserves provided; yet so fearful are we of public opinion, so willing to let sleeping dogs lie, that little active and concerted effort has been made to adjust such cases and to put the properties upon a firm financial footing.

The electrical traction business was an unknown field when the horse railroads were electrified, and it has grown so rapidly during the past twenty years that its promoters and operators did not realize that in the enormous extensions of track and mileage and improvement of service they were giving the public quite another commodity than that which had been furnished by horse car lines. Settlements were made beyond the ends of lines, which soon required further extension, and the process was repeated; so, step by step our city systems have extended out into the country until, in some cases, they reach to a distance of 10 miles from the centre.

At the beginning most of the patrons of these lines lived near the city, but as the territory gradually built up the centre of density kept moving toward the outer end, constantly increasing the average haul. Further than this, the people were not satisfied with being carried to the centre of the city; they demanded that they be carried to any portion of it that they might elect; that is, that they be given transportation from any part of the system to any other part. In many cases, however, this service was traded for something else or was a wholly voluntary concession on the part of the street railway. This demand was met by the free transfer, which introduced a condition which did not exist to any considerable extent in the old horse car days and which has contributed more than almost any other single factor to the increasing cost of operating our city roads. With all these changes there has been no change in the rate of fare.

The Increase of Haul and the Transfer.—The pushing out of the centres of population and consequent increase of average haul at a fixed rate of fare and the universal transfer are the most subtle and most difficult factors to isolate and to which assign a value—much more so than mere over-extension of trackage.

It is evident that all these changes must have increased relatively the expenses of operation, but this increase has been somewhat obscured by improvements which have been made in engines, generators, motors and, in fact, in all street railway apparatus, which have tended to reduce the cost of operation and maintenance. While the operating ratio of individual companies may have shown considerable variation over a period of years, there has been no marked change in the average ratio of all companies.

This evolution in the service has also, of course, necessitated corresponding increase in the equipment, so that the investment has grown rapidly, more rapidly, in fact, than have the earnings.

The attitude of the public toward the transportation companies has changed as their service has become irrevocably established. In the beginning the agency which furnished transportation so much more rapid and for so much greater distance than had previously been possible was courted and favored. Every inducement was offered to attract anyone who was ready to electrify an existing system or to build into new territory. Small communities vied with each other in their efforts to attract extensions which would put them within easier reach of the larger sections. Almost any sort of construction and almost any sort of service was accepted gratefully and under this stimulus lines were built long before they should have been from a sound business standpoint; and the deficits that have thus accumulated must be met either by the public or by the investor who fails to receive a fair return from the beginning. The public, however, has withdrawn from the old partnership, leaving its partner to pay the debts of the concern while it retains considerable jurisdiction over the assets, upon which it proposes to base a new deal.

The efforts of the public service commissions and of the legislatures have been to secure more and more for the public, which means less and less for the transportation company. Such an attitude is but natural in light of their conception of their duty to protect the public and to advance its interest solely, while the railroad is left mainly to defend itself and its investors. It is unfortunate that many people seem to think that a public service corporation is subject to economic laws which are different from other lines of business. Now, an electric railway property is not an eleemosynary institution; it is a business enterprise. In the last analysis it is a manufacturing concern. Its product is transportation and its customers are the people who ride upon its cars. It is governed by the same economic laws as any other line of manufacture. In order that any growing business may prove a commercial success its earnings must be sufficient to pay the operating expenses and maintain the property in good condition, to meet taxes and similar charges, to replace worn-out or discarded equipment and to yield a return on its capital which is of sufficient amount and sufficiently stable to attract such additional investment as is required by the growth of the business. If all these conditions are met over a period of years, the business will prosper. If one or more of them cannot be met, the success of the whole enterprise is in danger.

*Abstract of paper delivered to American Electric Railway Association, January 26th, 1912.

The street railway business requires larger amounts of capital than it is possible to supply from its earnings, and we must turn to the investing public to secure the funds necessary; and there is nothing which attracts the public to an investment in street railway enterprises in preference to other lines of business. If the profits of the business are decreasing beyond that point, what is to be done about it?

Economies in Operation.—It is evident that the returns will be increased if we can reduce the expenses without changing the earnings or the investments, so during the last decade the efforts of every street railway manager have been directed toward securing economies in his operation. Power stations, transmission lines, car equipment, carhouses —every part of the system has been considered with a view to reducing the cost of operation and of maintenance, and the savings effected in these directions have been very satisfactory; but, as I have pointed out before, the average length of haul at the same time has been increasing steadily with a consequent increase in the cost of operation. Further than this, the cost of living has been increasing, so the final result has been that the gain by economy has been practically offset by the increase in the expenses which were beyond the control of the management. The forty-third annual report just issued by the Board of Railroad Commissioners of Massachusetts shows an average percentage of expenses to earnings in 1902 of 67.75 per cent., while that of 1911 was 65.35 per cent. I think you will agree with me that an improvement of a little les than 2½ per cent. in nine years is not, by itself, of great economic significance.

It is evident, too, that the return on the investment will be increased whenever we increase the earnings of the property without a corresponding increase in the expenses and investment. This, however, would have to come from an increase in the rate of fare, or by reducing the amount of transportation which is given for a single fare; that is, we might adopt some form of zone system or we might charge a passenger for a transfer. These sources of relief have been tried to only a very limited extent in this country.

The third factor entering into the return on the investment, and one which is not generally understood, is the ratio which the investment bears to the gross earnings of the business. Many know, in a general way, that in a street railway the investment may profitably be four or five times the gross earnings, but it appears not to be so generally understood that this ratio varies with the operating ratio of the business, and will increase or decrease as the operating ratio goes up or down, moving always in the opposite direction.

I believe there has been a decided increase in the ratio of investment to gross earnings (and please note that I say investment and not par value of capitalization) in our street railway enterprises. I base this idea largely upon the returns which are made to the Massachusetts Railroad commissioners, for these returns are unusually complete: they cover companies doing a railway business only and the capitalization is carefully supervised by the Railroal Commissioners and is based on the investment in the property.

Ratio of Investment and Earnings in Massachusetts.—I find that in 1891 the net investment in the traction system of the State was approximately $27,500,000, while the gross earnings for that year were $8,900,000, so that the investment was 3.1 times the annual gross earnings. Ten years later, in 1901, the investment was approximately $99,500,000 and the earnings $23,000,000, so the investment was 4.3 times the gross. In 1911 the investment was $172,100,000, and the gross earnings approximately $37,000,000, a ratio of 4.65 to 1. This increase in the investment ratio without a marked reduction in the ratio of operating expenses has, of course, produced a reduction in the amount available for interest, depreciation and similar charges and, since the property must be maintained, it must mean that the return on the investment has been reduced.

For example, a company earning $100,000 in 1891 represented an investment of 3.1 times the gross, or $310,000. If we assume the operating expenses at that time were 70 per cent., $30,000 was left to take care of taxes, interest, depreciation, etc., this being 9.65 per cent. on the investment. In 1911, however, a company earning $100,000 gross would have an investment of $465,000 and, if operated for 65 per cent., there would be $35,000 to apply against the above charges, which is at the rate of 7.55 per cent. of the investment.

The profit may be improved by proceeding along one or all of three general lines. We may reduce the ratio of the investment to the earnings, or reduce the operating expenses, or increase the earnings, and if we can do the last without an increase in the investment, we will have accomplished the first automatically; that is, the ratio of investment to earnings will be reduced. You will agree with me that we cannot reduce the investment which we have already made and I am slow to believe that our effort to reduce expenses will be more successful in the future than in the past. Trackless trolleys, pay-as-you-enter cars, campaigns against accidents have promised good results, but the effect of their adoption has not been marked. I believe that our city lines cannot secure additional business at a rate of investment less than the present average. It would seem, therefore, that the only solution of this vexing situation, and the one which will put the street railway business upon a firm and equitable basis, is a readjustment of our system of fares. Just what this readjustment should be I am not prepared to say, but I believe that the situation should be well understood, and an educational campaign should be carried on. The problems which confront us are not new. The horse railroads had the same difficulty and their fares were made 6 cents or 7 cents or 8 cents or 9 cents, as circumstances justified, and the people paid these fares, not without grumbling, it is true, but nevertheless they paid.

Effect on Electric Railway Development.—I have seen it stated that there has been a decided letting up in the development of electric railway enterprises during the last ten years, and tables showing the total mileage of electric lines in this country have been quoted to show that this is the case. Statistics of this sort are extremely difficult to obtain and still more difficult to check with accuracy, but I am inclined to believe that the figures quoted do not fairly represent the conditions; for instance, this table shows an increase of only 1,200 miles in the total trackage from 1907 to the end of 1910, yet the statistics published each year in the Electric Railway Journal show that during this same period almost 3,400 miles of new track were constructed. To bring this up to date we must add approximately 1,000 miles constructed during the year 1911, so it would appear that during the last four years over 10 per cent. has been added to the total existing track.

I have tried to analyze these figures somewhat; and, while the results are probably somewhat inaccurate, I think they show fairly well the conditions which exist. In 1907 the interurban mileage was rouhhly one-fifth of that in the cities, and during the four years I have mentioned the addition to the city track was 2,048 miles, or approximately 7 per cent., while the addition to the interurban was 2,419 miles, or approximately 43 per cent. As I said before, these

figures may not be strictly accurate, yet I believe they show fairly the conditions which exist.

One of the essential differences between the ordinary interurban and the city lines is that the former bases its fare upon the number of miles the passenger is carried, and is thus able to proportion its charge to the service it gives, while the city line operates upon a fixed fare and hence is often forced to take business upon a losing basis. Furthermore, our city governments and our railroad commissions have as yet failed to give the interurbans the same strict supervision that they have to the city properties, and this has tended to make the interurbans more attractive. I believe we are justified in saying that we have probably reached the limit of economic development of our city lines on the present fixed rate of fare, and not only that but further, if existing taxes, prices and service are not to be reduced, there must be a readjustment of the fixed 5-cent fare and universal transfer in order to insure a fair return even on the present investment.

SOME REFRACTORY SUBSTITUTES FOR WOOD.

At the meeting of the American Society of Mechanical Engineers held in Boston, November 16, 1911, the Boston Society of Civil Engineers and the Boston section of the American Institute of Electrical Engineers coöperating, a paper was presented by Prof. Charles L. Norton, Mem. Am. Soc. M.E., of the Massachusetts Institute of Technology, on Some Refractory Substitutes for Wood. An abstract of the paper follows:

The common use of wood in and around our buildings is responsible for a considerable part of the annual fire loss, and the discovery or invention of a satisfactory substitute which would possess the desirable properties of wood and yet be non-combustible has been long hoped for. It is clear that in order to be accepted as a substitute for wood in building construction, a new material must approximate in lightness, strength, elasticity and ease of working, the natural woods, and further, since the variation in natural woods fits them for special details of construction, the substitute must be had in different grades of hardness, toughness, fineness of texture, etc. Moreover, the ease of working, sawing, boring, nailing and so on, leads to a wide use of natural wood, and a substitute to be acceptable must approximate the ordinary natural woods in these respects.

Many of the earlier attempts were made in the direction of altering the natural wood by some chemical treatment, so as to make it ignite with greater difficulty and burn more slowly and without much flame. These processes afforded a number of so-called fireproof woods. The principle underlying the chemical treatment was usually one of two. First, the wood was saturated with a solution which, on drying, left in the pores a salt capable of giving off a gas when heated, this gas being of such a nature as to be incapable of supporting combustion. Phosphate of ammonia and tungstate of soda were extensively used for this purpose. With thorough saturation the protection afforded the wood and adjoining portions of the structure was by no means insignificant; specimens of wood treated with phosphate of soda have been in the possession of the author for more than ten years, and after ten yearly tests show no signs of deterioration. Similarly some specimens of wood and cloth treated with tungstate of soda in 1903 have shown little or no loss in fire resistance. The main value of such chemical protection lies in its diminishing the volume of the resulting flames. When once thoroughly ignited, the fireproof wood burns more briskly than the natural untreated wood.

The second method of chemical treatment was one in which such substances as alum were used in order to supply a considerable quantity of steam from the water of crystallization and also to encase the pores of cells with a solid refractory substance.

A still earlier procedure was that of protecting wood from contact with a combustion-supporting atmosphere by coating it with thin sheet metal, usually tinned iron or copper. For doors and shutters this was found very effective. More recently hollow metallic members for doors and trim and for furniture have been extensively used, with a considerable degree of success. They are, of course, non-combustible, and under ordinary exposure keep their shape fairly well.

The wooden lath is without doubt responsible for the rapid spread of fire in many buildings of the older types of construction, and the attempts to develop a substitute have resulted in the metal lath and in the so-called plaster boards. The former are eminently satisfactory as substitutes for wooden lath, their greatest defect being their liability to become weakened by corrosion in damp places when used with certain kinds of plaster. The plaster boards are made of plaster of paris and some fibrous binding material, often wool, hair, or jute. Some are made of superposed layers of wool, felt and plaster. All, however, contain so large a percentage of plaster or other non-combustible material that combustion proceeds very slowly.

There have been from time to time, in the last 30 years, attempts to make use of boards composed only of refractory, inorganic substances. In general, such boards have been composed of some fibre and a cementing medium. The most popular fibres for this sort of experimentation have been asbestos and mineral wool, the cements used including about all the common cements of both the air drying and the hydraulic types. Oxychloride of magnesium, the value of which as a cement was discovered some 50 years ago by Sorel, has been the favorite cement for experimenters because of its simple preparation, its quick hardening and great strength. For some reason, however, a large percentage of the oxychloride cement is variable in its properties and often defective. When mixed with sand or similar dense bodies the oxychloride is often satisfactory for long periods, but the experience of the author with mixtures of this cement with fibres, both organic and inorganic, leads to the conclusion that it is unstable and unsatisfactory. This is more probably the case when the boards are used in damp places or out of doors.

There next appeared a number of wood substitutes in which a fibre was bonded by silicate of soda, commonly known as water-glass. Some were made in this country, but the most serious attempts were made in England and Russia, where the Imshenetzky process was used to make a board called uralite. It was the most satisfactory substitute for wood which had appeared up to that time. Uralite was composed of a sheet of asbestos millboard saturated with a solution of silicate of soda, which was subsequently precipitated as colloidal silica by a solution of bicarbonate of soda. For some reason not connected with the physical or chemical properties of the material, uralite has practically disappeared from the market. There have appeared from time to time a number of patents for boards composed mainly of fibres and lime, but no great use seems to have been made of them.

After much study two conclusions seemed inevitable to the author: First, no homogeneous inorganic substance was likely to prove satisfactory, but that a mixture of a fibre

and a cementing substance was necessary to give wood characteristics to the material; and secondly, a mixture of asbestos fibre with one or two cements (first oxide of magnesium or calcined magnesia, and second calcium silicate and aluminate mixture) seemed more suitable than any other combination.

The author proceeds to describe what he calls asbestos wood made under his patents and developed from the application to mixtures of certain processes of mixing, pressing and curing. It is stated to be practically incombustible, harder than natural woods, to have a transverse strength about two-thirds that of white pine with the grain, and, without being brittle, an elasticity less than that of natural woods; the coefficient of thermal conductivity has been found in English units to be between 50 and 30 B.t.u. per sq. ft. per 24 hours, per 1 deg. Fahr.

The weight of the several grades of asbestos wood 1 in. thick varies from 8 lb. to 13 lb. per sq. ft. White pine 1 in. thick when dry weighs approximately 3 lb. per sq. ft., and oak about twice as much. The transverse strength of boards and the maximum fibre stress is between the limits of 5,000 lb. and 10,000 lb. Test specimens 12 in. wide, 12 in. long and ¼ in. thick, broken by centre load when supported on two edges with 11 in. span, broke on an average at 200 lb. load. Under the same conditions clear white pine broke under a load of 300 lb. with grain and 20 lb. across it. In some cases the equality of strength in both directions is of great advantage.

The tendency of the material to absorb water varies between the limits of 4 per cent. and 20 per cent. This absorption is not of such a nature or amount as to cause disintegration from freezing and the material is not injured by prolonged soaking in fresh water. Sea water tends to disintegrate it after a time, the magnesium salts in the water replacing the calcium of the cement.

The coefficient of expansion varies with the temperature and also with the age of the specimen. It is small, being about 0.000004 at ordinary temperatures, diminishing rapidly at 700 deg. Fahr. and becoming negative at 950 deg. Fahr. where shrinkage occurs.

The operations of boring, sawing and finishing are all somewhat more difficult with asbestos wood than with the natural woods. It withstands scraping and rubbing much better. Floors and stair treads made of the material wear well, but are liable to be slippery when wet.

Many of the common wooden details of modern buildings have been successfully duplicated in asbestos wood, doors usually being hollow to save weight. Wherever there is danger of ignition of wooden framework a lining of the material has been found effective, notably in the vicinity of electric apparatus. It has been found best to mold the sheets while still in a plastic condition so as to form large pipes or ducts, and many locomotive round-houses have been equipped with smoke jackets or ventilating hoods. Shingles which have been in the weather for years have proved durable and this quality seems certain to equal that of fire resistance.

The ability to stand heat makes it available for blocks on friction brakes where a flexible material is not needed. The coefficient of friction of iron is approximately 0.3 to 0.4.

It has also been used as a mold for glass utensils during the process of manufacture, its non-conducting properties making it preferable to iron in some instances.

It is, of course, the fire resistance of the asbestos wood which gives it its greatest interest. There is nothing combustible in it, and on exposure to fire nothing can occur except a gradual dehydration of both fibre and cement. Under prolonged red heat the boards become weakened, but for such exposures as occurs in fires in buildings the resistance is ample. For instance, a sheet of ¼-in. asbestos wood may be placed over the top of an open furnace at 1700 deg. Fahr., the flame impinging directly on the lower surface of the sheet, and at the end of half an hour the sheet may be taken off and while its lower side is still white hot be plunged into cold water and then returned to the furnace for 10 minutes. It may be slightly warped and its strength will probably be diminished 25 per cent. or more, but it will still be sound and whole and free from cracks or serious weakness. Fire tests have shown the ability of the material to withstand much longer exposure, but it is not suitable for linings for furnaces or kilns which are kept constantly at red heat. In some fire tests the paint on the outside of an asbestos wood door 1¼ in. thick was not scorched after the fire inside had been burning at a temperature of 1700 deg. Fahr. for more than an hour.

BRITISH COLUMBIA'S MINERAL PRODUCTION.

An estimate of British Columbia's mineral production has been prepared by Mr. W. F. Robertson, provincial mineralogist, which is really a prelminary review of the progress made in 1911, with an approximate estimate of the quantities and value of the province's several mineral products.

The estimated mineral production is $23,211,816. If the revised statement which is made up after the receipt of all mining returns shows this amount to be approximately correct, it will then be seen the amount was smaller than that of 1910 by $3,165,250, and less by various amounts than that of any year since 1905.

The curtailment of ouput is attributable for the most part, if not entirely, to the effects of the strike of coal mine employees in the Crow's Nest district of South-east Kootenay. The suspension of work at the mines and coke-ovens lasted for practically two-thirds of the year, and prevented the production of coal and coke during that period to an extent that involved a decrease in value from East Kootenay alone of nearly $3,000,000. If to this be added the decrease in value of the production of metals of one copper producing company alone—as compared with 1910, of $1,600,000—which was the direct result of the cutting off of the supply of coke for its blast furnaces, there will be obtained a total decrease of more than $4,500,000, which was an immediate consequence of the labor difficulties at the Crow's Nest collieries.

There were other temporary obstacles to production being maintained at the ordinary rate which also in a lesser degree accounted for a decrease in the output, these either have been overcome or are likely soon to be removed. Meanwhile a settlement has been made of matters that were in dispute between the coal-mine operators and their employees, thus by the end of the year the normal output of coal and coke was being gradually restored.

British Columbia's proportion of the mineral production of Canada is comparatively large. The whole value of the production of this province to the end of 1911 is approximately $397,000,000, since the published official records of the whole Dominion do not include production prior to 1886, the present comparison must be confined to the period of twenty-six years—1886-1911. Placing the aggregate for the whole of Canada at $1,245,000,000 (which allows for 1911 a Dominion total of $115,000,000, an amount $10,000,000 greater than that of 1910), and British Columbia's proportion for the same period at $333,000,000, it follows that this Province has to be credited with nearly 27 per cent. of the value of the mineral production of the whole of Canada in the twenty-six year period under notice.

The Canadian Engineer

ESTABLISHED 1893.

ISSUED WEEKLY in the interests of the CIVIL, MECHANICAL, STRUCTURAL, ELECTRICAL, MARINE AND MINING ENGINEER, THE SURVEYOR, THE MANUFACTURER, AND THE CONTRACTOR.

Managing Director: JAMES J. SALMOND.
Managing Editor: T. H. HOGG, B.A.Sc.
Advertising Manager: A. E. JENNINGS.

Present Terms of Subscription, payable in advance

Postpaid to any address in the Postal Union:

HYDRAULIC TURBINE DESIGN.

The recent failures of water-wheel casings, as a result of which great damage was done to the power houses and electrical equipment, bring to mind the fact that water-wheel design is as yet in an elementary condition as regards the handling of certain features by the hydraulic engineer. The failures in question and the attendant results were caused by the breaking of the wheel casings. There is little excuse for failures of this nature with the present state of hydraulic theory and structural design.

A few years ago failures of this nature rarely occurred. Now, however, they are becoming increasingly frequent in number. The reason for this increase is hard to see, for the theory of turbine design has advanced very rapidly, until now we have reached a state of near perfection with regard to efficiencies, etc. Likewise, our knowledge of the strength of materials and the stresses induced has developed. Too little account, however, is paid by the manufacturer of hydraulic turbines and the hydraulic engineer to the new conditions which have arisen in connection with water-power development. Many plants are being installed having long penstocks, and these inevitably cause trouble unless handled properly. The difficulties of regulation caused by long feeder penstocks are hard to deal with, and as a result the manufacturer and the engineer have left the question to solve itself. Many plants are now struggling along with practically no regulation on account of the above. Difficulties other than regulation are liable to develop as in the above noted failures. The vibrations and oscillations set up in the penstocks as a result of change of load, or load thrown off, induce excessive pressures in the penstocks and wheel casings. When no account of such excessive pressures is taken, or means furnished to relieve the condition by the installation of relief valves, bursting plates or standpipes, trouble will certainly develop.

In a design which came to the writer's attention recently a small bursting plate was placed at the lower end of a penstock 1,500 feet long, and this was the only provision made for safeguarding the penstock and wheel casing. The specifications for the water-wheel governors did not state the minimum time allowed for full closure of the gates. On investigation it was found that the governors would have to be set for minimum time closure of eight seconds to ensure safety to the penstock. With conditions such as these, is it any wonder that the failures of wheel casings are increasing?

In order to prevent serious criticism, hydraulic engineers must pay more attention to this feature of power plant design. It is often cheaper and easier to neglect the regulation side of the design, but it will be usually found that such neglect is very costly in the end to the power plant owner as well as to the reputation of the engineer.

WATERPROOFING OF CONCRETE.

The waterproofing of concrete has become very important on account of its widespread use in building and engineering construction. For some time the opinion of engineers who have paid some attention to this phase of Portland cement and concrete has been that little benefit is gained by using the waterproofing mediums now sold on the market. It has been stated by the manufacturers that the use of these so-called integral waterproofing compounds would procure an impermeable con-

crete or mortar, and a few years ago results seemed to justify their use. However, many intelligent and comprehensive tests on the absorbtive and permeable qualities of Portland cement and concrete have been made, and these experiments almost universally show the same results.

Tests on the waterproofness of concrete are difficult to execute, for the constituents vary in absorptive qualities, porosity and percentage of voids. The Bureau of Standards of the United States has just finished a series of tests of the absorptive and permeable properties of Portland cement mortars and concrete, together with tests of damp-proofing and waterproofing compounds and materials. An endeavor was made to conduct these tests in such a manner as to make the results of practical value as a determination of the comparative values of these mediums. Forty different compounds were purchased in the open market and several void-filling materials were obtained for testing. A complete record of each compound is reported as to its character, chemical analysis, method of application, the result of physical tests, and noted peculiar characteristics.

The compounds are of two general classes, the waterproofing compounds for preventing the flow of water through masonry where subjected to a hydrostatic head, as in reservoirs, cisterns, tunnels, cellars, and the like; and damp-proofing compounds for overcoming dampness resulting from the capillary attraction and absorptive qualities of masonry, preventing dampness in habitations, and the disfigurement of exterior and interior surfaces of brick, stone, and concrete walls and interior plastering and decorations due to staining and efflorescence.

Two series of tests were made in the investigation, one of the waterproofing or water-resisting qualities of the compounds recommended for such use, and another of the damp-proofing qualities of other compounds so recommended to be used.

A summary of the results of the tests shows that Portland cement mortar and concrete can be made practically water-tight or impermeable to any hydrostatic head up to 40 feet without the use of any of the so-called "integral" waterproofing materials; but in order to obtain such impermeable mortar or concrete considerable care should be exercised in selecting good materials as aggregate and proportioning them in such a manner as to obtain a dense mixture. The consistency of the mixture should be wet enough so that it can be puddled, the particles flowing into position without tamping. The mixture should be well spaded against the forms when placed, so as to avoid the formation of pockets on the surface.

The addition of so-called "integral" waterproofing compounds will not compensate for lean mixtures, nor for poor materials, nor for poor workmanship in the fabrication of the concrete. Since in practice the inert integral compounds (acting simply as void-filling material) are added in such small quantities, they have very little or no effect on the permeability of the concrete. If the same care be taken in making the concrete impermeable without the addition of waterproofing materials as is ordinarily taken when waterproofing materials are added, an impermeable concrete can be obtained.

The damp-proofing tests as conducted would indicate that Portland cement mortars can be made not only impermeable, but damp-proof as well without the use of any damp-proofing or waterproofing compound. However, these tests should be interpreted with caution, as the evaporation may have been sufficient to care for the slight amount of moisture coming through the test pieces without indicating on the filter paper. Thus it cannot be stated that if a material were used which was damp-proof according to this test, if used as a basement wall, one surface being constantly exposed to moisture and the other surface in an enclosed room where there would be little or no circulation of air, that the interior surface would not appear damp and the atmosphere become saturated with moisture. The tests of coating materials as damp-proofing mediums can be considered as only preliminary, but the results, considered along with the chemical discussion, throw some light on their comparative merits. The mortar used in these tests was, perhaps, too coarse and too absorptive for a fair test. The purpose of the rough surface was to test the flowing qualities of the coating, and it would seem that many of the failures may be due to the poor or imperfect spreading and adhesive quality. Several of the compounds deteriorated and proved their unfitness for the purpose intended.

Well-graded sands containing considerable graded fine material are preferable for making impermeable concrete, but if such is not to be had, fine material in the form of hydrated lime, finely ground clay, or an additional quantity of cement will be found of value.

Where Portland cement mortar is used as a plaster coat, if sufficient cement be used and the sand contains sufficient fine material (or a fine material be added) and the mortar be placed without joints and well troweled (care being taken not to over-trowel, which may cause crazing), the coating will be effective as an impermeable medium without the use of any waterproofing compound.

As a precaution, under certain conditions, it is undoubtedly desirable to use bituminous or similar coatings, even on new work, as protection where cracks may occur due to settling of foundation or expansion and contraction caused by temperature changes. In large or exposed work it is practically impossible to prevent some cracks, but where cracks can be prevented no coating whatever is required to make the structure impermeable.

The permeability of Portland cement mortars and concretes rapidly decreases with age.

EDITORIAL COMMENT.

The Commission of Conservation have begun the publication of a monthly paper called "Conservation." The March issue, which has just come to hand, states that it will be published during eight months of the year. This bulletin will be invaluable to the press, containing as it does authoritative information on conservation matters.

* * * *

Commercial peat seems to be very nearly a realization now. The method of treatment heretofore has not been economically successful. That difficulty, however, has been overcome, and a thoroughly successful method of treating peat has been practically demonstrated at the Government laboratories near Ottawa during the last two years. All that remains now to make the immense peat bogs of the Province of Ontario available for fuel is a reasonable amount of commercial enterprise devoted to the work of development.

* * * *

Toronto has decided to build a sewage purification experimental station. The results to be obtained from the operations of such a station are very valuable, and

no doubt the local sewage disposal problem will be greatly cleared by the proposed experiment. The sewage disposal problem of the cities bordering on the Great Lakes has come to be a serious one, and it is only by experimental work that the degree of clarification necessary for preserving the water supply will be discovered. It is sincerely hoped that the experimental work will be prosecuted energetically in order that the resulting data may be of immediate service before the building of sewage treatment works.

GENERAL NOTES.

Precipitation during March exceeded the average very locally in Ontario, and in Eastern Quebec, Northern New Brunswick, and Eastern Districts of Nova Scotia. Elsewhere in Canada it was deficient, and in British Columbia and the Western Provinces, to a marked extent. Practically no reports regarding the amount of snow on the ground in British Columbia have been received, but it is apparent that there is a considerable amount on the mountains, although it is probably less than at the end of February. In the Western Provinces there is comparatively little snow on the ground, the depth in Eastern Saskatchewan and Manitoba being from two to four inches, while in other districts the ground is practically bare. A large amount of snow, between thirty and forty inches, lies on the ground in Northern Ontario and over the greater part of Quebec, but this depth decreases southward to a trace near the shores of Lake Ontario and near the Bay of Fundy.

The table shows for fifteen stations, included in the report of the Meteorological Office, Toronto, the total precipitation of these stations for March, 1912:

	Depth in inches.	Departure from the average of twenty years.
Calgary, Alta.	0.3	— 0.44
Edmonton, Alta.	0.4	— 0.37
Swift Current, Sask.	0.1	— 0.76
Winnipeg, Man.	0.3	— 0.95
Port Stanley, Ont.	2.6	— 0.26
Toronto, Ont.	1.97	— 0.23
Parry Sound, Ont.	1.7	— 1.31
Ottawa, Ont.	1.5	— 1.03
Kingston, Ont.	1.6	— 0.70
Montreal, Que.	2.0	— 1.90
Quebec, Que.	2.2	+ 0.61
Chatham, N.B.,	3.7	+ 0.57
Halifax, N.S.	6.7	+ 1.36
Victoria, B.C.	1.4	— 1.40
Kamloops, B.C.	0.0	— 0.42

FREE ASSISTANCE IN DRAINAGE.

During the exceptionally dry season of 1911 land that was underdrained produced on an average about $16.50 more per acre than land that was not drained, according to data collected by the Department of Physics at the Ontario Agricultural College.

Reports were received from a large number of farmers, of whom twenty-five were able to give definite figures on yields on drained and undrained land. Three of the number said they saw no difference, but all the others reported increases. Eleven counties were represented in the reports, from Durham in the east to Essex in the west. The value of increases, including straw, was figured at October, 1911, prices, and March, 1912, prices. The former showed an average of $15.97 per acre and the latter $17.04, and both together an average of $16.50. The three who reported no increase were counted in obtaining the averages.

In wet seasons the results are even more marked, but even at $16.50 per acre, drains more than pay for themselves in two years.

The O.A.C. is again renewing its offer of assistance to farmers in laying out their drainage systems. The Department of Physics has a special staff of drainage advisers for this work. There is no charge for the services of these men, the only outlay to the farmer being the travelling expenses, which are low. As the railway fare is only one cent a mile for this work, and as several surveys are always made on one trip the expenses are divided among the several parties concerned. Anyone wishing to have a drainage survey made should drop a card to the Department of Physics, O.A.C., Guelph, whereupon regular application form will be sent, and later on one of the department's drainage advisers will make the survey.

PROFESSIONAL DEGREES IN ENGINEERING.

In the year 1895 the University of Toronto passed a statute establishing professional degrees in civil, mining, mechanical and electrical engineering.

Candidates for any of the said degrees were required, in addition to three years' professional experience, to hold the diploma of the School of Practical Science, and also the degree of B.A.Sc. The latter requirement being imposed upon those only who graduated from the school subsequent to June, 1895. Since the passing of the above act a large number of men have graduated who, through their professional activities, have found it impossible to meet the latter requirement of the statute. Some of those of this number have turned their attention to other activities, and many have already made good in their profession, and it has been felt that at least a measure of relief should be given to the situation. The University, therefore, recently amended the statute by changing the date up to which the B.A.Sc. degree would not be required from June, 1895, to June, 1905. By this amendment statuary difficulties at least in the way of proceeding to a professional degree have been removed from about 190 graduates.

OIL-BURNING LOCOMOTIVES.

The Canadian Pacific Railway has decided to use oil in its locomotives on Vancouver Island. The reason for this is because of the stringency of the forestry regulations, which makes a railway responsible for fires originating on its right-of-way. Recently in the supreme court at Nelson, the finding of the jury was that the Canadian Pacific Railway was responsible for the damage done to timber limits of the King Lumber Company, and awarded $140,000, the amount sued for. In that case, the fire started on the right-of-way, smouldered for some days, then was swept by a wind across the Moyie River and later carried by another wind into the timber. It is fairly convenient to burn oil on the coast lines, since transportation from the oil fields is by water, but the question of using oil in the interior has not yet been taken up for definite settlement. With many waterpowers available throughout the whole of the interior, electrical power will probably be utilized when a change is made from the use of coal in locomotives.

SURFACE TREATMENT OF PARK ROADS.*

By Col. Spencer Cosby, U.S.A.

The greatest friend of the American road builder of today, the much maligned and loudly abused automobile, has undoubtedly been the chief single factor in the wonderful advance that has taken place during the last decade, both in the art and in the extent of our road making. Through the instrumentality of the motor car many thousands of our most influential citizens have had carried home to them the conviction that the necessity for good roads is not merely a local issue but is a question of nation-wide importance, and never before in our history has the interest in it been so great nor have such large sums been spent in the making and upkeep of our roads.

But while other factors than the automobile have contributed an important share towards achieving this result in the general case of country and suburban roads, the improvement that has taken place in our park roads during the last few years can be attributed almost solely to the automobile. Until its advent the traffic on these roads was in most cases confined exclusively to light vehicles, so that ordinary macadam, or even well compacted gravel roadbeds, met all requirements.

Here in Washington our roads were thoroughly gone over and all defects repaired once each spring, and this, with frequent watering, sufficed to keep them in good condition for many years—in fact, they never seemed to wear out. The yearly repairs cost comparatively little, the chief item of expense of maintenance being the watering. This averaged about 3.2 cents per sq. yd. of road surface per annum. No watering was done during the three winter months, while in the early spring and late fall the roads were watered once a day in dry weather; during the remaining six months of the year the watering carts went over each road twice a day during dry weather, and three times a day in periods of drought. As long as the roads were kept fairly smooth and reasonably free from dust, everyone was satisfied. No attempt was made to clean the roads, though the gutters were swept from time to time.

But this happy state of affairs ended with the coming of the automobile. The number and average weight and speed of the vehicles using the parks rapidly incrased, the combination of horses' hoofs and driving wheels with wide soft tires quickly raveled the road surfaces, and at the same time their users became more particular—they wanted not only dustless but mudless roads and could not see why a hole which developed in the fall had to wait for the annual spring cleaning to be repaired. They even complained when a road became occasionally dusty during the winter months. In other words, they wanted the park roads to be good at all seasons and in all weathers, and that is what we are now trying to give them.

On the new roads that have been built and on the old roads that have been resurfaced in the last few years a heavy oil or tar binder has been used with most satisfactory results, the penetration method being employed in applying the binder. But most of our work has consisted of the surface treatment of existing macadam roads. We have never attempted to apply any treatment to the old gravel roads but are resurfacing all of these as fast as possible with broken stone. For our surface treatment we have experimented with emulsions, with waste sulphate liquor, with coal gas and water gas tars and with asphaltic oils, and have come to the conclusion that, under present conditions, the latter give the best results.

Our experience with emulsions has not been very extensive. We found that the effect of each application lasted only two or three weeks, the time depending largely on the amount of rain, and we soon reached the conclusion that the cost of labor and material for the repeated applications that were necessary made the cost of this method greater in the end than that of the others. It has the advantage that the road never has to be closed to travel even while the material is being applied, though there is some objectionable tracking for about a day afterwards.

We have also used sulphite liquor, but to only a limited extent, owing to the fact that the first cost of the material is much greater than that of either oil or tar, while its effect is not so lasting. It possesses the advantages of allowing the road to be used immediately after application, of not permanently darkening the color of the road surface and of not staining.

In this market water gas and coal gas tar cost about the same, but the former has given better results in use on roads, as the coal gas tar does not retain its elasticity and so does not have as good binding power. We have used the same method in applying water gas tar and light asphaltic oil, and have found the effect to be about as lasting in each case, one application a year being sufficient to keep the road in good condition. The oil has, however been slightly cheaper than the tar in this market, and it requires a smaller quantity to be used per square yard on the second application; it is also more absorbent of the triturated material that forms on the surface of the road under traffic, and so makes a more nearly dustless road. For these reasons we now prefer it ta tar, though I confess to some misgivings as to the ultimate effect of the crust formed upon the road surface by the commingled oil and dust. Even now, where the traffic is heavy the crust is picked up in places, forming occasional ruts and waves.

Our method of applying oil to macadam roads is as follows:—

All ruts and holes in the surface of the road are first repaired by cleaning out the cavity, filling it with coarse stone, which is covered with a coating of hot, heavy, asphaltic oil, then sprinkling a light coat of screenings over the oil, and finally compacting the mass by ramming. When all holes have been repaired, the surface of the road is thoroughly cleaned with rattan brooms, care being taken to remove all loose materials and caked dirt or dust so that the stone forming the wearing surface of the road shall be exposed and clean.

When the road is entirely free from moisture, and during warm, dry weather if possible, a light asphaltic oil is spread, without being heated, over its surface by means of special sprinkling wagons. One-third to one-half gallon of oil to the square yard usuall yforms this first application. To allow it to penetrate into the surface, the road is closed to traffic for at least forty-eight hours after the first application. At the end of this time the surface of the road is covered with a thin coating of clean, coarse, sharp sand or broken stone screenings, free from dust; it is then rolled and traffic allowed to go over it. A cubic yard of sand or screenings usually covers from 75 to 125 sq. yds. of road surface.

In this climate and under the conditions of traffic obtaining on our park roads, the oiling treatment described above keeps the surface in excellent condition for a year. It is never dusty and is only muddy when, for a few hours after a heavy thaw, the skid chains of automobiles tear up the surface. The subsequent passage of automobiles with-

* Paper presented before Section D of the American Association for the Advancement of Science.

out chains soon irons out the roadway. At the end of the year the surface of the road is again thoroughly cleaned, from ¼ to ⅓ gal. of oil per sq. yd., under normal conditions, is spread over it and the road closed for forty-eight hours and covered with sand or screenings as before. This treatment is continued from year to year.

Instead of handling the oil in barrels, we have found it much cheaper to buy it delivered in tank cars, from which it is unloaded into the sprinkling wagons. A pressure tank wagon was used to advantage for the first application of oil to the road surface, but ordinary sprinkler wagons with an oil distributing attachment and a squeegee fixed behind the distributor were found more economical and equally efficient in spreading the oil the second year. To insure coating all parts of the road with an oil layer of uniform thickness, men with stiff brooms followed the sprinkler.

The following are the specifications under which we have been purchasing asphaltic oil for the surface treatment of park roads:—

(1) The oil shall be a viscous fluid product, free from water and showing some degree of adhesiveness when rubbed between the fingers.

(2) It shall have a specific gravity of not less than 0.940 at 25° C.

(3) It shall be soluble in carbon bisulphide, at air temperature, to at least 99 per cent. and shall show not over 0.2 per cent. of inorganic matter insoluble.

(4) It shall contain not less than 3 per cent., nor more than 10 per cent., of bitumen insoluble in 86° paraffin naphtha at air temperature.

(5) When 240 c.c. of the oil is heated in an Engler viscosimeterto 50° C. and maintained at this temperature for at least 3 minutes, the first 50 c.c. shall flow through the aperture in not less than 10 minutes, nor more than 20 minutes.

(6) When 20 grams of the material is heated for 5 hours in a cylindrical tin dish aproximately 2½ ins. in diameter by 1 in. high, at a constant temperature of 163° C., the loss in weight by volatilization shall not exceed 20 per cent. The residue should be decidedly sticky.

(7) Its fixed carbon shall be not less than 3.5 per cent.

The following table, taken from the year's report of the Office of Public Buildings and Grounds, shows the cost of surface treatment of the macadam roads in the Washington parks under that office from July 1, 1910, to June 30, 1911, oil or tar being the material used:

No. of road.	Material used.	Quantity. Gallons.	Area of road. Sq. yds.	Length of road. Feet.	Sq. yds treated per gal.	Cost of oil and applying per sq. yd. Cents.
1	Oil	2,300	7,500	1,300	3.26	‡2.8
2	"	4,000	19,000	3,500	4.75	†2.2
3	"	1,000	3,400	650	3.40	†2.7
4	"	700	8,600	2,300	12.23	†1.2
5	"	5,000	25,000	5,000	5.00	†2.1
6	"	10,600	43,560	9,000	4.11	†2.2
7	"	3,400	19,450	3,800	5.72	†1.9
8	"	350	4,000	1,200	11.43	†1.3
9	"	1,000	1,680	700	1.68	*4.6
10	Tar	6,000	11,400	3,500	1.90	*4.4
11	"	650	1,500	1,600	2.30	*3.8
12	"	1,600	3,560	1,600	2.23	*3.8
13	"	2,580	7,740	2,800	3.00	*3.1
14	"	2,400	8,100	2,100	3.39	*2.8
15	"	875	2,000	700	2.38	*3.8
Totals		43,455	166,490	38,650	Av. 3.83	Av. 2.5

*1st application. †2d application. ‡2d and 3d applications.

	Cents.
Cost of labor per square yard	0.8
Cost of oil per gallon	6.5
Cost of tar per gallon	6.8
Average cost in past years of watering roads, per square yard	3.2

In the above table the cost of the sand or of the stone screenings used after the application of the oil has not been taken into account, as it is considered part of the cost of repair of the road.

Road No. 1 in the table had been worn down so that the crown had practically disappeared, leaving the road so flat that the water did not readily drain off. This did no special harm in warm weather but the alternate freezing and thawing that occurred during the winter months allowed the heavy traffic to churn up the surface so that it became necessary to give it a second application of oil in the early spring. The small amount of oil applied to road No. 4 was due to the light traffic on this section, while on road No. 8 an unusually heavy application of oil, 1½ gals. per sq. yd., had been made the year before, a few months after the construction of the road. The large amount of oil absorbed by the new road on the first application made only a light second application necessary.

It is only fair to add that one reason why our park roads have been in so much better condition since we started the use of the surface treatment I have described is that we have abandoned the old method of repairing them once a year and now have a system of regular and frequent inspection and repair. Supplies of broken stone, screenings, oil and tar are kept constantly on hand in the vicinity of the roads, and holes and ruts are repaired as rapidly as they develop, usually before they have become large enough to be noticeable to traffic. We have practically no hills on our roads, so the greatest amount of repair work has to be done on the few sharp curves. The roads are also kept clean, being swept by hand sweepers at fairly frequent intervals.

I have confined myself to giving a brief description of the methods we have tried and the results we have obtained in the surface treatment of the roads in the parks within the city limits of Washington. It is almost needless to say that the conclusions we have now reached should not be considered as final or of general application; they represent simply the result of a limited number of experiments carried on for a limited time under the conditions existing in the Washington parks. The value we have provisionally found for "x" in the solution of our road problem may be quite a different one from that arrived at in another locality where the quantities entering the equation are not the same. The whole matter of road construction is in the development stage, and it is only by feeling our way carefully and comparing the results of many and varied experiments that we can hope to approach a final decision.

SELF-PROPELLED CARS.

On Friday evening, January 19th, W. B. Potter, chief engineer railway department, General Electric Company, read a paper on self-propelled cars before the New York Railroad Club. He described his company's gas-electric cars, which weigh 40 tons to 50 tons and are capable of a maximum speed of 60 m.p.h. Electric control and transmission were used to utilize the inherent characteristics of the gas engine to the best advantage and to relieve the engine from mechanical strain and shock. Series-parallel motor control and regulation of the generator voltage gave a wide range of speeds. The tractive effort at the slower speeds was 12,000 lb. or more. As there was no mechanical connection between the engine and driving wheels, the engine could be slowed or shut down without regard to the control system. With the car standing still or moving the power of the engine could be safely applied in either the forward or reverse direction.

Mr. Potter stated that the engine used on these cars had eight 8-in. x 10-in. cylinders and at the normal speed of 550 r.p.m. would deliver 100 kw. to the motors with some margin to spare. The gasoline most used was "painters' naphtha," which could be purchased for about 6 cents per gallon.

The motors, which were standard 600-volt railway machines, were mounted on the forward truck under the engine, thus placing about 65 per cent. of the total weight of the car on the driving wheels. As the traction voltage varied from 200 volts to 800 volts, the current for lighting the car was supplied by a separate gas-electric generating set. The two-cylinder engine of this set also had an air compressor cylinder for supplying compressed air to start the large engine. The cars had both straight and automatic air brakes, the latter for handling trailers. The engine compartment is in the forward end and is about 12 ft. long.

Performance curves of a 70-ft. car, as submitted by Mr. Potter, showed that with stops two miles apart the schedule speed would be about 25 m.p.h. and the maximum speed on level track about 60 m.p.h. He also presented the following table, showing the comparative cost of operating a train of two coaches and a steam locomotive and of a gas-electric car on a daily run of 150 miles, except Sundays, amounting to 3,900 miles a month:

Two-Trailer Steam Train vs. One Gas-Electric Car.

	Steam Train per Mile.	Motor Car per Mile.
Wages of crew*		
Engineer or motorman	$0.0400	$0.0400
Fireman	0.0240	.....
Conductor	0.0280	0.0280
Baggagemaster	0.0183	0.0183
Total wages of crew	$0.1103	$0.0863
*Based on no overtime allowance.		
Fuel, water and engine lubrication:		
Coal for locomotive, 67 lbs. at $2.25 per ton	$0.0750	.....
Water for locomotive	0.0050	.....
Painters' naphtha, 6 gal., at $0.06 per gal.	.....	$0.0360
Engine lubrication	0.0025	0.0050
Other expenses:		
Locomotive, repairs	$0.0850	.....
Locomotive, engine house expenses	0.0050	.....
Coaches (2), repairs and expenses	0.0250	.....
Gas-electric motor car, general overhaul	.....	$0.0215
Gas-electric motor car, running repairs and expenses	.....	0.0210
Other supplies	0.0025	0.0050
Superintendence	.....*	0.0065
Total cost per train mile	$0.3303	$0.1813

*For steam locomotive this is assumed to be included in items of locomotive repairs and engine house expenses.

Saving per train mile	$0.1490
Saving per diem (except Sunday), 150 miles a day	22.35
Saving for twenty-six-day month	581.00
Gross yearly saving	6,970.00

Note.—When no baggage and express is handled and when operating conditions will permit, the gas-electric motor car can be operated without the third man.

Mr. Potter also gave the following table for three months' operation on the Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Company ("Dan Patch" line), which operates five of these cars. The stations on this line are 1.4 miles apart. The figures cover operation over 37.5 miles between Minneapolis and Northfield for July, August and September, 1911.

Three Months' Operation of Gas-Electric Cars.

Number of days actual service	92
Total mileage, five motor cars	39,352
Number of trailers hauled occasionally	1 or 2
Total mileage trailer cars	7,879

	Total.	Per Train Mile.
Total wages of crew	$2,249.40	$0.0573
Fuel and lubrication, engine:		
24,944 gal. of gasoline at $0.062 per gal.	1,534.20	0.0391
755 gal. of gas engine oil at $0.25 per gal.	189.76	0.0048
Running repairs and expenses:		
Total running repairs, material and labor	410.36	0.0104
Car cleaning, materials and labor	135.70	0.0035
Other supplies	81.83	0.0021
Total expenses	$4,601.25	$0.1172

Mr. Potter further suggested certain forms for keeping an accurate record of the cost of operating such motor cars with or without trailers.

In conclusion Mr. Potter said that a special study has been made to secure a light-weight car for this service. The body weighed 28 tons, the trucks 6 tons and the motive power equipment 15 tons, a total of 49 tons for a 70-ft. car. This was equivalent to 1,000 lb. per seated passenger. The gas-electric car had proved very reliable in the coldest weather. The "Dan Patch" line had operated during very heavy snow with the temperature 15 deg. to 30 deg. below zero when steam trains in the same territory were helpless. This line was using painters' naphtha at 5½ cents per gallon.

PUBLIC UTILITIES IN LONDON, ONT.

There is in Canada at the present time a growing movement tending toward the municipal control and ownership of all utilities dependent upon the public for their revenue and existence. In many municipalities the public have acquired the management of these, and in the majority of cases the results have justified the wisdom of municipal ownership. This has been exemplified in a pointed degree in London, Ont., according to a report just issued by the municipal commissioners of that city on the operation of the water works. The report shows an item of $48,398.23 to the credit of revenue account for the year ending November 30th, 1911. The revenue derived from the sale of water totalled $112,588.93, and the receipts from other sources brought the income to the sum of $173,733.88.

The commissioners have been active in new main laying and general improvement to the plant; the sum of $44,000 being spent on mains and new pumping equipment.

During the past year the motive power of the pumping plant was changed in order that the service offered by the hydro-electric commissioners could be used. By this means the expense of operation, although two plants were in use, was reduced to a considerable extent. By the sinking of artesian wells the water pressure was improved to such an extent that the fire underwriters reduced rates on many buildings. The general superintendent states in the outset of the report that the success of the past year is due in a large measure to the system adopted in regard to the submanagement. The department heads have been given a free hand in the selection of their assistants, etc., making each and every departmental head responsible for results, and at the same time allowing no interference on account of political or personal reasons. The superintendent points out that the result of this is to increase a feeling of responsibility and makes the more valuable men take a pride in their work.

It is pointed out during the course of the report that the future will witness important expansions of the system in the direction of Springbank.

INDUSTRIAL WORKS IN INDIA.

The India office has awarded the contract for the steel work required in connection with a state railway bridge near Allahabad, India, to the Phœnix Bridge Company, of Phœnixville, Penn. There was a difference of 26½ per cent. in its bid and the lowest British tender. This company received the contract for the ill-fated Quebec bridge.

THE MATERIAL-LIST METHOD OF STORE-KEEPING.

By R. W. Heafield.

In putting before your readers the main features of this system of storekeeping, I do so with a firm belief that it is one of the simplest, one of the most effective, and, certainly, one of the least expensive systems that can be adopted. Moreover, it is one that is especially adapted to the engineering trade, both electrical and otherwise, though not necessarily confined to that trade.

One of the most commonly used systems of to-day is that known as the Card Index System, and, although successful to a great extent, as its popularity proves, it, nevertheless, has its drawbacks, one of the greatest of which is, that though the Stores Dept., and the Purchasing Dept. (or Order Section), are the two departments most concerned, they work quite independently and each one is ignorant, to a great extent, of the actions of the other. For example: In many instances the storesman (the man who has the actual handling of the material and giving out of same) if appealed to by anyone to say whether a certain article is on order or not, cannot tell you, and the foreman of a shop, or whoever it is who requires that information, has to either go or send to the Order Section to find out particulars. In many instances it happens that the Order Section is quite a distance from the shop, and the time lost by running about is very often an item of considerable importance to the firm. Another thing worthy of consideration is that this system entails the continuous employment of two, and often more clerks, in the Stores Dept., who do nothing but mark off issued material from the shop tickets on to the stock cards, a very tedious operation and one that is carried on day after day, week after week, all the year round, and, more often than not, results in a man leaving the place just as he has become thoroughly used to the work. Now, this Card Index System is supposed to give a correct statement of the amount of all material in hand or on order. This is the case theoretically, but, in practice, it is found to be faulty and, from time to time, it is found that there is a shortage of stock when the card shows a considerable amount to be in stock, so that the system becomes unreliable.

Now, it is not claimed that the Material List System is infallible, but it is claimed that it does away in large part with the above disadvantages, and, moreover, it gives a greater interest in their work to the storesmen who handle the actual stock.

Upon the securing of an order (or contract) the Engineering Dept., through its Material List Section, shall issue a material sheet or sheets, setting out in detail the quantities of material required. As a rule, no material is ordered or work started until the material list is issued. The material list is first sent direct to the general storekeeper, who shall be responsible for the marking thereon what is in stock and what is not. He shall then forward the material sheet to the Order Section, who shall issue orders for all material not carried as stock. The marking of these sheets may be left to the second man when the storekeeper is too busy to attend to same personally.

The following illustration shows a sample material list.

S. signifies stock.

M.O.S. signifies material on order for stock.

S.P.A. signifies stock part altered.

Z. does not concern stores. Order Section order this to the contract No.

This system gives the storekeeper an opportunity of using up old and perhaps otherwise worthless material, as in the case of the item marked S.P.A. He may have bolts of say 1¼ in. diameter by 14 in. long, which could be cut down and screwed at less cost than the making or purchasing of new bolts. It also enables the shop foreman to see at once what material is on order with the probable time of its arrival and enables him to plan his work accordingly.

When the material list is passed on to the Order Section they shall order all items marked X, marking on the material list the number of the requisition and the date of ordering. The material list was then passed on to the blue print room, for copies to be taken for distribution to the shops building the apparatus, the general storekeeper and all subsidiary storekeepers interested. It should be borne in mind that the shops draw their material from stores in the exact quantities specified on the material list.

CONTRACT APPARATUS — D.L. No. — C.L. No. — Sg'd — Ch'd — Mat. List No. — Date — Sheet

Item	Name of Part	Drg. No.	Pt. No.	Description	Material	No. Reqd.	Remarks	Change

Assuming that we are dealing with a firm which employs from 4,000 to 5,000 men, there will be required considerable sized general stores, besides a number of subsidiary stores, all under the supervision of the general storekeeper. In the general stores there will be employed probable six (6) or more men; and for the sake of illustration, we will divide the general stores into two sections: 1st, bright goods; 2nd, black goods; with an equal division of all raw material, such as fibre, vulcanite, brass, copper, etc., etc. The two most capable men should be selected as the heads of these two sections. Each should be made responsible for any shortage of material in his section, and the watchword in stores work should be thoroughness and efficiency.

Each bin should be provided with a card suspended on a hook. These cards take the place of those used in the Card Index System. On these cards is kept a faithful

record of all material received, the date of receipt, and the requisition number it was ordered on. So strict a record need not be kept of issues, however, especially as regards bolts, nuts, washers and things of little value, as the date of receipt of the last consignment gives an idea of the quantity used in a given time, but in the case of instruments and anything of exceptional value, such as gold, silver, platinum, iridium, quartz, etc., it is necessary that a correct record be kept of all issues together with the contract number issued on. All invoices, whether for stock or contracts should be passed by stores, and all cards marked accordingly. This will be found to be a very considerable advantage in stocktaking, and is necessary to the successful carrying out of the system of debit and credit between the several shops stores and costs department. Debit and credit, however, do not concern us in this article.

A specimen card is given below:

A. B.				E. Co.			
RECEIPTS				ISSUES			
Date	No. Rcd.	Req. No.		Date	No.	Contract	

A red card hung on the hook over the white card indicates that material is in order, and prevents reports of "material wanted" being duplicated.

When the storesman considers it necessary to replenish any article of stock he should requisition more on a form similar to the following, keeping a carbon copy of same.

10-1-12.

STOCK REQUISITION.

Quantity	Article	Delivery	Last Req.	Remarks
200	Bolts ½ x 3 in. Bright Hex.	7 days	42681	
144	L'gts Br'ss Rod ¾ dia. x 10 ft. long	21 days	49763	
10 lbs.	Eureka Wire .0625 dia.	14 days	21364	

He then enters these items in a day-book after the style shown at head of next column.

When the delivery of any particular item is completed he shall draw a line in red ink through that item, but when only part delivery is made, the number or weight of such material shall be recorded in the remarks column.

The storesman can thus tell at a glance, when requested for information, as to whether a certain article on order has come in and whether or not the order is completed. If not in, he can tell when delivery is expected. He is, also, able to obtain his last requisition number from this book, which

Date	Article	Recd. No.	Date Recd.	Req. No.	
10-1-12	200 Bolts ½ x 3in. Bright Hex	200	18-1-12	50264	
"	144 len's Brass Rod ¾ dia x 10 ft. long	100	30-1-12	50265	44 shrt.
"	10 lbs. Eureka Wire .0625 dia.	10	26-1-12	50270	

is really a double check on the stock cards on the bins. This last requisition number is always given in ordering new material, as it is of invaluable assistance to the order section.

The subsidiary stores shall follow a similar course and each responsible storesman shall come to the head storekeeper every morning with requisitions made out. The general storekeeper shall initial all requisitions passed. If he considers any item thereon unnecessary, or in excess of what should be ordered, he shall withhold his signature until he has made personal investigation. All requisitions passed shall be sent without delay to the Order Section.

In addition to the stock material handled as above, the general stores has to receive and distribute, as wanted, all the special material ordered for apparatus being built on sales order and contracts.

A certain section should be allotted for such material in each stores, and a contract book should be kept for the purpose of recording this material in as it arrives and its location in the stores.

This can be indexed in the usual way, keeping the contract numbers in numerical order. Although generally one page suffices for each contract, in the case of a large order two or more may sometimes be found necessary. Outside of steam turbine or locomotive work, however, this is seldom the case.

The above outline covers the procedure of stock-keeping in its chief details; the minor details and changes will have to be worked out to meet the peculiar needs of the work involved.

If properly followed and manned, no embarrassment should arise from the dismissal or enforced absence of any particular individual connected with the department, as each member is more or less familiar with all the routine work.

Like all other systems, this requires alertness and unremitting attention on the part of the head storekeeper and his staff. Great emphasis must be placed upon the proper and reliable marking of the material list sheets; also to the proper checking and recording of goods received.

The writer has worked this system in two large firms with great success. In one firm it was adopted during his employment by them, consequently he worked it from its very inception.

A NEW SOURCE OF CANADIAN GRAPHITE.

Recent exploration has unearthed a large deposit of graphite in the Queen Charlotte Islands, off the coast of British Columbia. The main load appears on the Juskatia Inlet.

A STEAM WAGON FOR HAULING AND CONSTRUCTION WORK.

The wonderful sales and uses found for the gasoline trucks will shortly be competed with by a new steam truck being introduced into this country by Messrs. Jones and Glassco, of Montreal, who have kindly supplied us with this information.

The manufacturers of these trucks are Fodens, Limited, of Sandback, England, who have brought the steam propelled vehicle to a high state of perfection and utility.

Figure 1 is a side representation of one of these machines, and gives a general idea of the appearance and mechanical make-up.

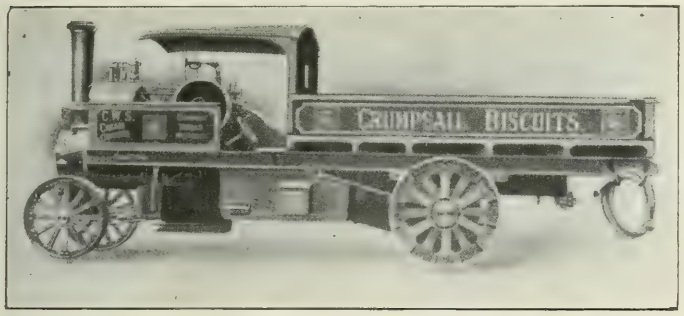

Fig. 1.—Steam Wagon.

Use has been found for these wagons in many diverse occupations in England and there is no reason why they should not compete with trucks driven by other means in this country.

The general design of this wagon is of a novel and original character. The boiler, which is of the horizontal multitubular type, forms the front part of the frame work. The sides of the frame are constructed of strong channel steel tied and braced together in such a manner as to secure great strength in the complete lorry. The platform of the vehicle is 14 ft. long by 6 ft. 6 in. wide. The boiler is fired with coke, hard coal or wood, and is without doubt the easiest steam maker of any boiler or any motor wagon. The wagon is driven by a compound steam engine fixed on the top of the boiler, so as to be readily accessible, and to work with "dry" steam. The cylinders are 4⅜ in. and 6¾ in. diameter, and are fitted with a patented high-pressure gear, by means of which both cylinders can, in case of emergency, receive live steam from the boiler, and each cylinder exhausts independently into the chimney. The reversing motion is of the ordinary link type, and the whole construction of engine and steering arrangement is so similar to the "Foden" traction engines, that any ordinary traction engine driver can easily handle the wagon. The power is transmitted by a pair of spur wheels acting on a compensating gear by an extra strong Renold roller chain. The gearing is arranged for two speeds—9 to 1 and 24 to 1. The car is mounted on laminated springs, and is capable of taking a load of 6 tons on itself and 3 tons on a trailer at an average speed of 6 miles per hour, and can travel 20 miles without taking up water. The fuel carrying capacity allows the apparatus to travel 40 miles on one loading. It can climb a hill (with slow speed) of 1 in 6 with full load. The traveling wheels are extra large, front wheels 2 ft. 9 in. by 6 in. on face, back wheels 3 ft. 6 in. diameter by 10 in. on the face, and so constructed that frost pins and paddles can be used. The tires are constructed of steel, thus doing away with the expense attached to rubber tires. The body is so constructed that the back portions may be tipped for rapid unloading; this can be accomplished by hand or from a belt driven from a flywheel. The back wheels can be made up to 14 in. on face for soft roads.

There are many points of advantage for this machine claimed by the agents and manufacturers over the gasoline trucks; among these the first to be noticed is the cost of operation; an important item to contractors and other large haulers of merchandise.

A large brewery reported a test and statement of a trial of this wagon as follows:—

Goods carried.....763 tons (2,000 lb.)
Total mileage.....2,255
Coal consumption .....2 tons 1,236 lb.
Coal consumption per mile..18.28 lb.

The management of a large leather mill report:—

154 miles per week average distance covered.
Average load .....7.75 tons
Cost per week $24.30
Cost of same haulage by horse $149.64

The management of a brick yard report that a truck of this description has transported 5,000 ton of brick over very rough country with a coal consumption of 40 tons, 640 pounds. The distance of this haulage was 6,000 miles and repairs to the machine during the year of operation totalled $115.38

This company state that they could not have attempted to do the work with horses that the steam wagon did, as the cost would have been far and away too great, and it would have taken eight good horses to do it, the greater portion of the work being beyond horse work altogether. The brick hauling accomplished by these trucks is one of the heaviest and roughest jobs an engine can be put to, owing to the unfinished condition of the approaches to the building, where the materials are to be delivered.

It will be noticed from the second illustration that these wagons differ in many points from steam tractors now in use in this counry inasmuch that the design has been

Fig. 2.—Steam Wagon.

carried out so as to give as much space as possible for the placing of merchandise and other goods, and that the space occupied by the boiler is much less than that of an ordinary tractor

The British War Office have recently turned their attention to the use of these machines for the betterment of their department, and following we give the summary of trials carried out by the officials of that department in order that the most economical means of heavy haulage could be ascertained.

The wagon entered by the Foden manufacturers went through the road trial of 257 miles without a mishap or stoppage for repairs, and was, on the conclusion of the trial, awarded the prize of £250.

The trials at Aldershot have shown that these steam lorries are good and serviceable machines, suitable for present supply, and likely to be of great advantage to the transport service in countries where fuel and water in sufficient quantity is available.

Compared with horse draught, these trials have shown that self-propelled lorries can transport five tons of stores at about six miles an hour over very considerable distances on hilly average English roads under winter conditions. The load transported by each single lorry (five tons), if carried in horse wagons of service pattern would overload three general service wagons, requiring twelve draught horses, besides riding horses, whose pace would not ordinarily exceed three miles an hour. Moreover, the marching of 197 miles in six consecutive days over hilly roads would not have been accomplished by horses even at that speed without the assistance of spare horses.

There are a number of these wagons in use in Canada, and of these twelve are in Montreal, three are on order for Toronto concerns, and there are several more in the West.

The London County Council have purchased a number of these Foden trucks and the corporation of Denbigh have had one constructed for street watering with complete success.

IRON AND STEEL INDUSTRY.

The total shipments of iron ore in 1911 are reported as 210,344 tons, valued at $522,319. These may be classified as magnetite 72,945 tons, and hematite 137,399 tons. In 1910 the total shipments were 259,418 tons comprising magnetite 127,768 tons; hematite 130,380 tons and bog ore 1,270 tons. Exports of iron ore from Canada during 1911 are recorded by the Customs Department as 37,686 tons, valued at $133,411. The exports were chiefly from Bathurst, New Brunswick.

The shipments from the Wabana mines, Newfoundland, in 1911 by the two Canadian companies operating there were 1,181,463 short tons, of which 765,184 tons were shipped to Sydney and 416,279 tons to the United States and Europe.

The total production of pig iron in Canadian blast furnaces in 1911 was 917,535 tons of 2,000 pounds, valued at approximately $12,306,860 as compared with 800,797 tons, valued at $11,245,622 in 1910. Of the total output in 1911, 20,758 tons were made with charcoal as fuel and 896,777 tons with coke. The classification of the production according to the purpose for which it was intended was as follows:—Bessemer 208,626 tons; basic 464,220 tons; foundry and miscellaneous 244,686 tons.

The amount of Canadian ore used during 1911 was 67,434 tons; imported ore 1,628,368 tons; mill cinder, etc., 30,298 tons. The amount of coke used during the year was 1,121,321 tons comprising 543,933 tons from Canadian coal and 577,388 tons imported coke or coke made from imported coal. There were also used 1,190,459 bushels of charcoal. Limestone flux was used to the extent of 625,216 tons. In connection with blast furnace operations there were employed 1,778 men and $1,097,355 were paid in wages.

The total daily capacity of 18 completed furnaces was according to returns received 3,630 tons and the number of furnaces in blast December 31, 1911, was 12.

The production of pig iron by provinces in 1911 was as follows:—

Provinces	1911 Tons	Value	Value per ton
Nova Scotia	390,242	$4,682,904	12.00
Quebec	658	17,282	26.34
Ontario	526,635	7,606,674	14.44
Total	917,535	$12,306,860	$13.41

The exports of pig iron during the year are reported as 5,870 tons, valued at $271,968, an average of $46.33 per ton. Probably the greater part of this is ferro-silicon and ferro-phosphorus, produced at Welland and Buckingham respectively.

There were imported during the year 208,487 tons of pig iron, valued at $2,610,989 and 17,226 tons of ferro-manganese, etc., valued at $429,465.

The production of steel ingots and castings in 1910 is reported as 876,215 tons of 2,000 pounds of which 861,493 tons were ingots and 14,722 tons castings. The production in 1910 was 822,284 tons, including 803,600 tons of ingots and 18,684 tons of castings.

The production of open hearth and Bessemer steel has been for three years as follows:—

	1909 Tons	1910 Tons	1911 Tons
Ingots—Open-hearth (basic)	535,988	580,923	651,676
Bessemer (acid)	203,715	222,668	209,817
Castings—Open-hearth	14,013	18,085	13,982
Other steels	1,003	599	740
Total	754,719	822,284	876,215

THE PANAMA CANAL.

Mr. William McNab, principal assistant engineer of the Grand Trunk Railway system, recently returned to Montreal from the Panama Canal, where he went for the purpose of inspecting the engineering plant used, as well as other features connected with the undertaking.

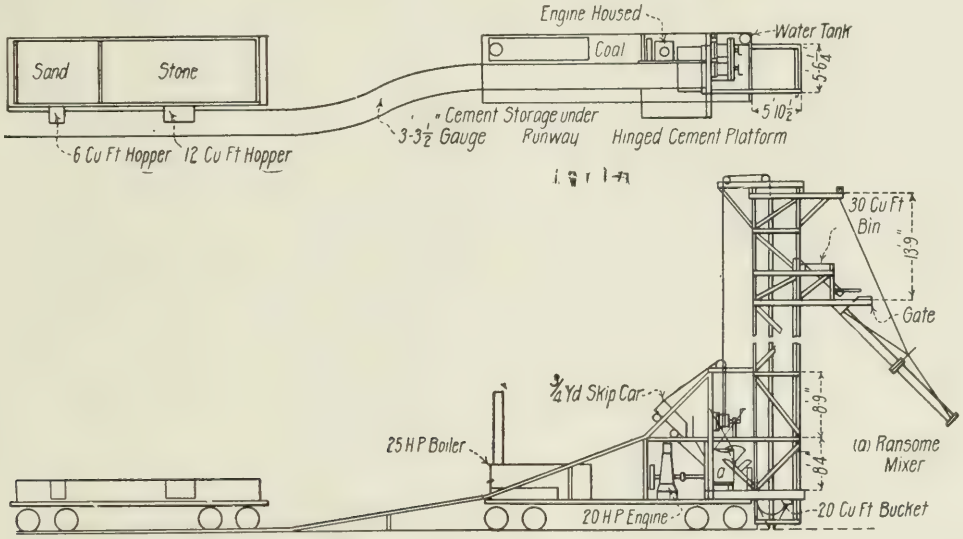
"In regard to the economics of commerce," said Mr. McNab, "there can be little doubt but that the canal will in general create an entirely new situation. Its operation will not only form new geographical features and substantially modify the complexity of the world's commerce but it will be an element of such importance that its influence will be universally felt in a more or less degree in every branch of trade. The North will be nearer and in closer relationship to the South and the South will be closer to the North. The Central American republics, too, which hitherto have been an uncertain feature in modern business and social life, will be found to fall in line with and share in such development. The fruit districts of Central America and the West Indies will also undergo rapid expansion in meeting the new order of things.

"It is unnecessary at present to quote saving in distance in certain existing sailing routes which will be effected after the canal is in use. It is obvious, among other things, that rapid growth of Pacific ports may be looked for.

"In regard to how the several transcontinental railways will be affected by the existence of the canal and the traffic it will carry, it is obvious that the most northerly ones will specially derive a direct benefit from it. The wheat fields of Western Canada are practically only beginning business, and at no far distant date will be a main source of supply of breadstuffs for not only Europe, but for the Southern States and West Indies as well. The problem of handling the fall crops in one direction within a reasonable time will then be felt. The Grand Trunk Pacific with its low gradients will be in a position to distribute its business to advantage, and take westward from Saskatchewan and Alberta a fair share of the agricultural output of these provinces for shipment via Prince Rupert and the canal."

AN EFFICIENT CONCRETE PLANT FOR RAILROAD WORK.

The accompanying line drawing shows a concrete plant which has been used with much success by a southern railway company for constructing abutments, retaining walls, culverts, etc., along its right-of-way. With a ¾-yard Ransome mixer driven by a 20 h.p. engine, 288 cu. yds. of concrete have been mixed in nine hours. The additional h.p. of the mixer engine is required to operate the hoist and the ¾-cu. yd. skip car. Steam is furnished by a 20 h.p. boiler.



An Efficient Concrete Plant for Railroad Work.

In order that the work of unloading may go on without the necessity of keeping the skip car from taking its load of material to the mixer, quick unloading chutes are attached to the flat cars in which the sand and stone are received. The skip car runs on an industrial track that is laid up an incline to the mixer. The section of the track between the end of the mixer car and the ground is hinged so that it can be quickly swung up when it is necessary to move the plant and two or three sections of the track can be readily picked up and thrown on the flat car. The skip car discharges into the fixed batch hopper of the Ransome mixer which in turn discharges the finished concrete into a 20-cu. ft. bucket, located in a wooden hoisting tower. The concrete is raised in the tower to a 30-cu. ft. concrete hopper with a Ransome gate. From here the concrete enters the swinging chute and runs to the point desired.

It will be noted that the entire plant is portable, the flat car having mounted on it the boiler, engine, mixer, and tower, while space for coal and water tank is provided. The entire plant was designed by the Ransome Concrete Machinery Company.

Metallurgical Comment

T. R. LOUDON, B.A. Sc.

Correspondence and Discussion Invited

SOME ENGINEERING FEATURES OF ELECTRIC FURNACES.*

By Carl Hering.

As it is such a simple matter to convert electric energy into heat, electric furnaces have to a large extent been designed and constructed by metallurgists and chemists rather than by engineers,† almost any crude electric contrivance will produce heat, and hence was good enough; the main question was: Will it perform the necessary metallurgical, physical or chemical reactions? Now that the latter has been demonstrated beyond question for a large variety of processes, the inevitable question naturally arises, will it pay to use electric heat? To determine this it becomes necessary to design and construct the furnaces so that they will have the highest possible heat efficiency; that is, to reduce the inevitable heat losses to the least possible. This is of far greater importance for electric furnaces than for those using the combustion of fuel, as the cost of a unit of heat is generally considerably greater when produced electrically than when generated directly by combustion. Fuel furnaces are, as a rule, so very wasteful that their design is of little or no aid in designing electric furnaces. The important problem of to-day, therefore, in connection with electric furnaces, is that of their design and construction so as to make them as perfect an engineering structure as possible; hence it falls into the province of the engineer as distinguished from the chemist or metallurgist.

The study of the flow of heat through bodies does not seem to have been given the attention which it deserves. A postage stamp pasted on the fireside of a steam-boiler tube will not even be charred by the flames, showing the existence of an enormous resistance to heat flow on the outside of the tube; a study of the phenomenon of the flow of heat showed how the resistance can be diminished, resulting in a much greater flow, hence increased steaming capacity. An excessive heat insulation of a gas-engine cylinder would result in its destruction. The over-insulation of steam pipes, which is said to be quite common practice, results in the waste of more money for the covering than the saving in steam warrants. All such engineering problems would be simplified by giving this subject of the flow of heat more attention. The lack of proper units and physical constants for such calculations is doubtless responsible in part for the neglect of due consideration of this branch of engineering.

In general, there are two classes—resistance and arc furnaces. In the former the heat is generated in the interior of a conductor, due to the resistance offered by the material to the passage of a current through it. The ordinary incandescent electric lamp is a simple illustration of the generation of heat in this way. In the arc furnaces the heat is generated by the passage of a current through a gap formed between the ends of two conductors; the bridging of this gap by the current is called the electric arc. The ordinary arc lamp used in streets and halls is a simple illustration of the generation of heat in this way.

In the resistance furnace the current may be passed through the material itself which is to be treated, or it may be passed through a permanent near-by conductor, and transmitted to the material to be treated by radiation, conduction, and convection.

When the heat is generated in the material itself, the heating becomes very efficient, practically 100 per cent. as all the heat is generated in the body itself, where it is wanted. This is therefore the most efficient method; it is also generally the most rapid, as no time is lost for the heat to penetrate by the slow process of conduction, from the outside to the inside; it is all in the inside when it is generated, and it can be generated very fast by simply increasing the current. Hence in some respects it is the ideal method. As long as the material remains solid, there is apparently no limit to the temperature which may be reached, for by continuing the passage of the current, heat continues to be generated, and if it cannot escape, it accumulates, thereby continually raising the temperature until the losses equal the input. This is the case in the graphite and carborundum furnaces, in which exceedingly high temperatures are obtained, estimated to be from 2,300 deg. C. to 4,000 deg. C. (4,000 deg. F. to 7,500 deg. F.)

If, however the material through which the current passes becomes liquid, generally in an open channel, there is a very decided and sometimes very serious limit to the temperature which can be produced, for when the current reaches a certain value, dependent on the cross-section and the density of the material, a formerly unrecognized force comes into play, which contracts the column of liquid until it is severed completely, and this, of course, interrupts the current. This peculiar phenomenon was encountered, studied, and described by the writer some years ago, and termed by him the "pinch phenomenon," by which name it is now generally known here and abroad. By submerging these channels of liquid deeply below the surface, the writer found that this pinching force may not only be prevented from interrupting the circuit, but may even be used to cause the liquid in the confined channel to flow out of it as quickly as it is heated, whereby it also produces much desired circulation. Such a furnace, then, has the desirable qualities of one with solid registers, besides some new qualities due to the rapid circulation of the heated liquid.

The characteristics of the arc furnaces are briefly as follows: The temperature of the arc is always that of the volatilization of the material of the electrodes between which the arc plays, and as these are generally carbon or graphite which have extremely high vaporization temperatures, it follows that the temperature developed in such arc furnaces are exceedingly high—generally far above what is required. This heat is, however, all generated in the arc itself, and at the surfaces between which the arc plays; hence it can reach the main body of the material to be treated only by radiation, conduction, and convection, and this necessarily takes time; the exceedingly high arc temperature aids this. In heating liquids with an arc, much of the enregy must necessarily radiate upward, hence is not utilizied, and even tends to destroy the roof of the furnace. Moreover, heating a liquid from the top surface is not the most rational way, as the heat travels downward with difficulty and quite slowly, hence taking time for the heat to penetrate; this is also the case in open-hearth furnaces. The electrodes in arc furnaces are consumed, and

* From a Paper read before the Engineers' Club of Philadelphia.

† The significance of this statement should be recognized. Metallurgists are more and more being called upon to display constructive ability.—Ed.

therefore require continuous feeding, or else the arc goes out. Some, and perhaps a considerable amount, of the electric energy, for such furnaces is necessarily consumed in volatilizing the electrode material, although part of this may be again recovered.

Heat is generated by the current in the electrode; this, generally being at a lower temperature than the interior of the furnace, flows out at the cold end. As long as the end of the electrode which is in the interior of the furnace is cooler than the heated product under treatment, heat must necessarily be abstracted from this product, and will flow out through the electrode, thereby chilling the product. This latter loss of heat could be stopped entirely if the hot end of the electrode were at the same temperature as the heated product, for heat will flow only when there is a difference of temperature. If, therefore, the electrode is given such a cross-section and length that the heat generated in it by the current raises the inside end to the furnace temperature, then this desired result of stopping this abstraction of heat from the furnace product will be accomplished.

Former practice had led to making the electrodes larger and larger, to keep them cool; this made them more and more costly and more difficult to handle. They should have been made smaller instead, so as to stop the loss of heat from the furnace product where it is wanted; the heat generated in the electrode costs less than in the furnace, as it has to be transmitted (as electric energy) over a shorter distance. Such reductions in the size of electrodes result in large annual savings, not only of power, but of electrode materials also. And it increases the valuable available space in the furnace by not chilling a more or less large part of the product.

Formerly it was claimed very positively by certain parties that graphite was a worse material to use than carbon, on account of its much higher heat conductivity; it was claimed to "chill the product too much," and therefore very wasteful of energy. The above analysis showed that this too was an error, as this chilling may be entirely prevented by proper proportioning; and when thus proportioned graphite is even less wasteful than carbon.

The explanation of this is that the minimum losses and the best proportions do not depend on either the electric or the thermal conductivities alone, but on certain relations between them. Neither property alone is a criterion. This brought out the surprising fact that the best electrode materials, from the standpoint of the least possible electrode losses and the smallest amount of electrode material were the metals; and of these, copper, the best of all heat conductors was decidedly the most economical. Hence, electrodes should be made of metals whenever possible, if economy of power and material is an object. This gives the resistance furnace an important advantage over those using the arc.

Although, as a rule, electric heat is more expensive than fuel heat, yet in electric furnaces it is generally possible to apply the heat much more economically, and greatly to reduce the thermal losses, by proper and careful design, so that the total cost of the thermal operation in many cases becomes less, and that is after all the deciding factor in most cases. When a furnace is properly designed to reduce the thermal losses to the least possible, it is believed by the writer that it will soon be economical to replace some of the present fuel furnaces by electric furnaces for commercial work, even when the electric power has to be purchased from the supply in cities. There are, of course, other factors involved also, such as the reduction of labor, the better quality of the materials produced, the rapidity of heating, etc., all of which should be taken into consideration.

COMPETITIVE CONDITIONS BETWEEN THE OPEN-HEARTH FURNACE AND THE BESSEMER CONVERTER.*

The progress of the open-hearth process may be explained from different points of view. As far as raw materials are concerned, the converter requires a pig-iron the composition of which must only vary within relatively slight limits, and the economical production of which thus depends on the natural conditions of deposits which are not met with in all iron and steel districts. On the other hand, the open-hearth process accommodates itself to very diverse working formulæ, and the proportion of pig-iron in the charge being capable of variation within the widest limits—from 100 per cent. in the ore process, where the charge does not permit of scrap, but only of pig-iron with the corresponding quantity of ore down to 30 per cent. and even 25 per cent. in the scrap process.

In the case of districts with ore moderately phosphoric, giving a "bastard pig," containing, for instance, 0.8 to 1 per cent. of phosphorus, it does not appear a priori impracticable to make basic pig by embodying in the charge a calculated percentage of phosphoric additions. Once the process was permanently established for the whole of the works (blast furnaces and steel works), such phosphoric additions could naturally be furnished by the scoria of dephosphorization itself. The basic process is, therefore, not necessarily limited to districts supplying ore of the basic class, such as the minettes in Lorraine; whilst, on the other hand, the Bessemer process is only possible when hematite ores are available. The progressive diminution of the reserves of hematite ores in the world consequently tends to restrict more and more the possibilities of the Bessemer, and, at the same time, those of the acid open-hearth processes.

With due acknowledgments of the qualities of basic Bessemer steel when properly manufactured, it must be recognized that open-hearth steel presents, cœteris paribus, a greater regularity of quality, and appears best suited for certain manufacturers, such as boiler-plates, tyres, axles, forgings, tubes etc., as well as for all pure and semi-pure steels in general and special steels. The great elasticity of the open-hearth process may also be pointed out. On the other hand, the process is disadvantageous owing to the relative slowness of furnace refining, and the price of open-hearth steel is generally higher than that of converter steel. In this connection, the price of producer coal forms an essential element in the cost of refining in the open-hearth furnace.

The United States.—The contest in the United States is limited to the Bessemer and open-hearth processes, the latter gaining on the former year by year. Two principal facts dominate the situation. On the one hand there are the growing demands on the part of consumers (particularly by the railways) from the standpoint of the purity of the metal, and on the other the content of phosphorus in the red hematites from Lake Superior. These great deposits—which have already yielded over 300,000,000 tons, and the reserves of which are still estimated by the United States Geological Survey at 3,500,000,000 tons, furnish about three-fourths of the American production of iron ore. The deposits, moreover, constitute the most important reserves, in the country, as the resources at present available are only estimated (the Stockholm Congress of Applied Geology) at 4,250,000,000 tons for the whole of the United States, of which the Lake Superior district is credited with 82 per

* Bulletin of the Société de l'Industrie Minerale.

cent. But these deposits furnish an increasing proportion of non-Bessemer ore; that is to say, too phosphoric for the manufacture of pig-iron for the acid Bessemer process. It is known that the maximum phosphorus content allowed in the ore in America for Bessemer treatment has been 0.044 per cent. for a long time past, which, with a yield of 50 per cent. of iron corresponds to about 0.09 per cent. in the pig-iron and 0.1 per cent. in the steel. The tonnage of Bessemer steel rails supplied in 1910 was only 1,949,000 tons, as compared with 3,434,000 tons in 1907, whereas the quantity of basic open-hearth rails, which was only 257,000 tons in 1907, rose to 1,743,000 tons in 1910.

Thus, through the natural conditions of the ore deposits and the greater exigencies of consumers there is a progressive diminution of the possibilities of the converter to the advantage of the basic open-hearth furnace, which has for several years furnished more than one-half of the production of steel. As for the acid open-hearth process, which depends on the scrap market, its prospects are most restricted. It is usually reserved for the manufacture of pure and semi-pure steels, with pig-iron having a very small content of phosphorus—much purer than those readily used with the Bessemer process. Thus its percentage seems likely to decrease.

Whether the basic converter will ever be established in the United States seems more than doubtful. The principal ore deposits do not yield basic ore, and the non-Bessemer hematites from Lake Superior, which are too impure for the acid converter, are much too poor in phosphorus for the manufacture of pig-iron for basic conversion. Suitable ores could only be found in some secondary deposits of relatively low production and limited reserves. Moreover, none of them appears to possess hitherto the regularity of phosphorus content which characterizes the oolitic deposits in Lorraine, and which constitutes a condition which is so essential for the economical manufacture of basic pig-iron. It therefore does not seem in the present condition of the deposits that the basic process is destined to play an important part in the American iron and steel industry.

Germany and Luxemburg.—The situation in Germany and Luxemburg is very different. The perdominance of the basic process is explained when it is considered that four-fifths of the iron ore produced in the Customs Union, the total of which amounted to 28,700,000 tons in 1910, are yielded by Alsace-Lorraine and Luxemburg; that is to say, by the minette region which exclusively supplies basic ores. Excluding the annexed portion of Lorraine and the Grand Duchy of Luxemburg, Germany proper scarcely furnishes from 5,000,000 to 6,000,000 tons, and one of her most productive deposits—that of Ilsede—yields basic ore. The output of ore in Germany, including Luxemburg, is considerably less than the consumption, and the difference between the two figures tends to increase in the direction of growing imports. In 1910 the production reached 28,710,000 tons, the imports 9,817,000 tons, the exports 2,953,000 tons, and the total consumption 35,574,000 tons.

The excess of imports over the exports of iron ore represent at present about one-fifth of the consumption as compared with one-seventh three years ago. Sweden remains the principal country from which ore is imported into Germany, and is followed rather closely by Spain, but the progress made by imports from France has been rapid; they now form 18 per cent. of the total imports as contrasted with 9 per cent. three years ago, and it is possible that they will occupy the first position in the course of a few years. But these imports originate almost entirely from the Briey basic, or minette district. As far as the Swedish ores are concerned, they are mostly phosphoric magnetites, which are largely used by the Westphalian works for the enrichment of their basic charges. The most important deposits in Sweden, both from the point of view of present production and that of the known reserves, are, moreover, those of phosphoric ores. But their importance is secondary as compared with the minette district, the output of which was 36,182,000 tons in 1910, and the recognized resources of which are estimated at over 5,000,000,000 tons. These deposits, which constitute the largest reserves of ore in the world, assure a brilliant future for the basic process both in France and Germany, including Luxemburg.

The production of ore in Luxemburg rather tends to decrease, and that of Lorraine progresses slowly, but that of Meurthe and Moselle is growing with enormous rapidity owing to the development in the Briey basin. However, if the increase in the output in the minette district should be considerable in the near future, the percentage of basic Bessemer steel can hardly increase very much at the expense of that of open-hearth steel. It seems, indeed, that for Germany and Luxemburg the state of equilibrum may be substantially reached between the basic Bessemer and the open-hearth processes, which divide nearly the whole of the production of raw steel. The importance of the acid processes is at present practically nil, being 1.1 per cent. for acid open-hearth and 1.3 per cent. for acid Bessemer, as compared with 37.3 per cent. of basic open-hearth and 60.3 per cent. of basic Bessemer. On the one hand the development of the basic process involves a co-relative development of the open-hearth (scrap) process for the utilization of rolling-mill waste. On the other hand, the open-hearth furnace, working with a high percentage pig-iron, is gaining increased ground even in Germany, owing to the improvements recently introduced in the methods of working, and the advantages offered by the process in districts which only yield bastard ores.

STEEL CASTINGS.

A lecture on "Steel Castings" was delivered before the London branch of the British Foundrymen's Association by Mr. H. Brearly, of the Brown-Firth Research Laboratory, Sheffield.

The lecturer pointed out that the coarse crystalline appearance which the fracture of a steel casting was supposed to have was not now a sufficient distinction between castings and forgings. Examples of the coarse crystalline fractures of steel cast in sand moulds and slowly cooled were exhibited, and also illustrated by lantern slides, side by side with portions of the same casting after heat-treatment. The exposed fractures of the latter were in all respects indistinguishable from well-wrought forgings. The lecture was mainly devoted to the processes involved and the structural changes taking place between these two extremes.

The lecturer emphasized the workshop value of careful observation of fractured and prepared surfaces with a hand lens or any other available magnifying outfit; and then showed by a series of low-power photographs the wonderfuly perfect structure of the interior of separate crystalline grains of mild steel. By the same means the defects arising in and about the crystalline grains were demonstarted, and a clear impression conveyed of the objects to be attained by annealing.

The portion of the lecture which dealt with the fragility of unannealed steel castings was well illustrated and conveyed a clear reason for their erratic behavior. The lecturer thought it highly undesirable that unannealed castings

should be brought into any kind of service where trustworthiness was called for; and showed, quite apart from the question of cooling stresses, how they might be expected to fail and how the important question as to whether or not a casting had been successfully annealed could be determined by simple means. The main object to be accomplished by annealing was said to be the elimination of the coarse crystalline structure, due to cooling from the liquid state, and the substitution of a much finer structure by methods which varied with the composition of the steel. Some very clear slides illustrated the hindrances, which occurred in uncontrollable ways, and prevented the attainment of this object, and led also to that kind of rupture between the crystals known to the foundrymen as pulling.

The pulling of metal as it passed from the fluid to the solid state was only briefly referred to, and illustrated by a few instances occurring in simple shapes usually cast in chill moulds; but more attention was paid to the manner in which castings of varying cross-section might bring themselves to an untimely end during cooling from a red heat to atmospheric temperatures. Alloy steels appeared to be very tricky in this respect, which accounted to some extent for the unwillingness of many manufacturers to utilize them for sand castings. It would appear, however, that the difficulties were of such a kind as could be overcome by intelligent care and close observation.

IRON AND STEEL INDUSTRY IN BRAZIL.

A decree has been passed in Brazil which grants power to Mr. A. Thun, or to a company which he may form, to establish in the municipal district of Ouro Preto, Minas Geraes, blast furnaces capable of producing 50,000 tons of pig-iron annually, this amount to be increased by 10,000 tons until a yearly capacity of 100,000 tons is reached. The plant is also to be suitable for the manufacture of rolled iron and steel. The contract provides for the granting of certain State privileges for the encouragement of the iron and steel industry in Brazil.

QUEBEC'S LANDS AND FORESTS REPORT.

The total revenue of lands and forests amounted to $1,229,928, states the Minister of Lands and Forests of the Province of Quebec, Honorable Jules Allard, in his introduction to a recently published report, for twelve months ending June 30th, 1911. The ground rents due on timber licenses brought in $221,215; the dues on timber cut under such licenses, $821,719; penalties for infringements $44,730; accrued interest $7,798, and bonuses on transfer $31,444, making a total of $1,126,907. On account of greater production the stumpage dues brought in nearly $85,000 more than in the previous year, although the new tariff was not yet applicable. Through the increase in stumpage dues and ground rents and also by reason of the rapid settlement of the public lands, the Minister of Lands and Forests reports that the department is sure of a yearly revenue of nearly $1,500,000. The expenditure of the department includes $85,000 for surveys, $16,523 for protection against fire, and $4,000 for the Forestry School. The salaries and disbursements of forest rangers amounted to $23,546. Woods and forests general expenses amounted to $36,199.

The area under license during the year amounted to 70,138 square miles. The amount of square timber cut was 109,406 cubic feet. The cut of spruce, hemlock, balsam, cypress, cedar, white birch and poplar, saw logs and boom timber totalled 498,624,000 feet b.m. The cut of white pine and other varieties of saw logs and boom timber amounted to 154,429,708 feet b.m. The cut of red pine, saw logs and boom timber, amounted to 21,623,970 feet b.m. The cut of white pine 11 inches and under for saw logs amounted to 62,112,914 feet b.m. The quantity of poles cut was 203,586 lineal feet. The cut of pulpwood amounted to 345,206 cords of 128 cubic feet. Of this quantity 180,803 cords were shipped out of Canada. The cut of firewood was 3,808 cords. Railway ties were manufactured to the number of 608,429, and pickets to the number of 109,734. The cut of shingles amounted to 8,373,000. Spool wood was cut to the extent of 8,981 cords. Of posts and rails, the output was 44,372 pieces, and 755 cords of lathwood were manufactured.

ENGINEERING NOTES.

St. Lambert, P.Q.—The Montreal Harbor Board did not encourage the proposal of this municipality regarding the extension of the sewer from St. Lambert.

Saskatoon, Sask.—The municipal filtration plant is now ready for the placing of the sand on the filter beds. It is expected that the plant will be in operation by May 1st next.

North Vancouver, B.C.—This municipality have commenced construction work on a new reservoir. Rice Lake is being converted for water storage in connection with this project.

British Columbia.—A start has been made on the scheme to reclaim 14,000 acres of fine land in the lower Fraser Valley, south of New Westminster. The cost will be $135,000.

Saskatoon, Sask.—There is serious talk of a forestry station being established near this city. The Dominion Government have allowed $20,000 in the supplementary estimates for this purpose.

Toronto, Ont.—The municipal council have taken the first steps toward the consideration of a new source of water supply for this city. Certain members of the municipal department have prepared a scheme that is expected to do away with the intake, as used at present, and the filtration plant. The plan is to dig a well on the lake shore and allow it to fill with water. The water having filtered through several hundred feet of sand before it reached the well, would be as pure as the most elaborate plan of filter beds could make it. From the well the water would flow to the pumping station at the foot of John Street by gravitation, as it does now from the intake in the lake. It is proposed to have the well from 70 to 100 feet deep, according to the distance required to reach rock-bottom. It will be 50 feet in diameter and will be covered. The well will be simply a big iron pipe faced with concrete. The water will filter into the tank from the bottom. It is estimated the cost of such a well would be $100,000, and that it will supply 18,000,000 gallons of pure water per day. Petrolea and London have tried the plan with great success.

PERSONAL.

Mr. T. H. Bryson, of Pembroke, Ont., has been appointed municipal engineer of Brockville, Ont.

Mr. Albert S. Goodeve, M.P., has been appointed to the Board of Railway Commissioners for the Dominion of Canada.

Mr. Lea, waterworks engineer for the city of Vancouver, B.C., has been granted a leave of absence and will seek a return of his health in the eastern portions of Canada.

Mr. Frederick L. Riggs has been appointed to the position of secretary of the Civic Guild. Mr. Riggs is the manager of the Imperial Construction Company, Quebec Bank Chambers, Toronto.

Mr. George E. Herrmann has been appointed to the management of the Vancouver branch of the engineering firm of Robert W. Hunt and Company, Ltd. The address of the new offices is 415 Bank of Ottawa Building.

Mr. Arthur Scott has been appointed manager of the Dominion Steel Company. Mr. Scott is a graduate of McGill University and has had considerable experience with the chemistry of iron and steel and substances used in their manufacture.

Mr. John A. Bensel, M. Am. Soc. C.E., state engineer of New York, on March 25th delivered an illustrated lecture on "The Construction and Maintenance of the State Roads of New York" before the graduate students in highway engineering at Columbia University.

Messrs. A. W. McConnell, B.A., Sr., and Stanley Makepeace, B.S., have formed a partnership and will enter the practice of architecture with their offices in the Kent Building, Toronto. Mr. McConnell was lecturer in architecture at the University of Toronto, and Mr. Makepeace was a member of the late firm of Makepeace and Makepeace, Syracuse, N.Y.

COMING MEETINGS.

CANADIAN INSTITUTE.—198 College Street, Toronto. Saturday Evening Lectures, 8 p.m. April 13th,—"Lantern Experiments on Reaction in Non-homogeneous Systems," by Prof. Kenrick, Toronto University. April 20th—"Chemical Interpretations of Vital Phenomena," illustrated. Prof. Leathes, Toronto University.

THE CLEVELAND ENGINEERING SOCIETY.—Special Meeting, Tuesday, April 23rd, 1912, Chamber of Commerce Bldg., Cleveland, O. "Steel and its Heat Treatment" (Illustrated), by Robt. R. Abbott, Metallurgical Engineer, The Peerless Motor Car Co. F. W. Ballard, Secretary.

ONTARIO MUNICIPAL ASSOCIATION.—Annual convention will be held in the City Hall, Toronto, on June 18th and 19th, 1912. Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ont.

ENGINEERING SOCIETIES.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—413 Dorchester Street West, Montreal. President, W. F. TYE: Secretary. Professor C. H. McLeod.

VICTORIA BRANCH—Chairman, F. C. Gamble; Secretary-Treasurer, R. W. Macintyre

QUEBEC BRANCH—Chairman, P. E. Parent; Secretary, S. S. Oliver. Meetings held twice a month at room 40, City Hall.

TORONTO BRANCH—96 King Street West, Toronto. Chairman, T. C. Irving; Acting Secretary, T. R. Loudon, University of Toronto. Meets last Thursday of the month at Engineers' Club.

MANITOBA BRANCH—Secretary E. Brydone Jack. Meets every first and third Friday of each month, October to April, in University of Manitoba, Winnipeg.

VANCOUVER BRANCH—Chairman, Geo. H. Webster: Secretary, H. K. Dutcher, 319 Pender Street West, Vancouver. Meets in Engineering Department. University.

OTTAWA BRANCH—
177 Sparks St. Ottawa. Chairman, S. J. Chapleau, Ottawa; Secretary, H. Victor Brayley, N.T. Ry., Cory Bldg. Meetings at which papers are read, 1st and 3rd Wednesdays of fall and winter months; on other Wednesday nights in month there are informal or business meetings,

MUNICIPAL ASSOCIATIONS

ONTARIO MUNICIPAL ASSOCIATION.—President, Chas. Hopewell, Mayor, Ottawa; Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ontario.

UNION OF ALBERTA MUNICIPALITIES.—President, H. H. Gaetz, Red Deer, Alta.; Secretary-Treasurer, John T. Hall, Medicine Hat, Alta.

THE UNION OF CANADIAN MUNICIPALTIES.—President, W. Sanford Evans, Mayor of Winnipeg; Hon. Secretary-Treasurer, W. D. Lighthall, K.C., Ex-Mayor of Westmount.

THE UNION OF NEW BRUNSWICK MUNICIPALITIES.—President, Councillor Siddall, Port Elgin; Hon. Secretary-Treasurer J. W. McCready, City Clerk, Fredericton.

UNION OF NOVA SCOTIA MUNICIPALITIES.—President, Mr. A. S. MacMillan, Warden, Antigonish, N.S.; Secretary, A. Roberts, Bridgewater, N.S.

UNION OF SASKATCHEWAN MUNICIPALITIES.—President, Mayor Bec, Lemberg; Secretary, Mr. Heal, Moose Jaw.

UNION OF BRITISH COLUMBIA MUNICIPALITIES.—President, Mayor Planta, Nanaimo, B.C.; Hon. Secretary-Treasurer, Mr. H. Bose, Surrey Centre, B.C.

CANADIAN TECHNICAL SOCIETIES

ALBERTA ASSOCIATION OF ARCHITECTS.—President, G. M. Lang Secretary, L. M. Gotch, Calgary, Alta.

ASSOCIATION OF SASKATCHEWAN LAND SURVEYORS.—President, J. L. R. Parsons, Regina; Secretary-Treasurer, M. B. Weeks, Regina.

ASTRONOMICAL SOCIETY OF SASKATCHEWAN.—President, N. McMurchy; Secretary, Mr. McClung, Regina.

BRITISH COLUMBIA LAND SURVEYORS' ASSOCIATION.—President, W. S. Drewry, Nelson, B.C.; Secretary-Treasurer, S. A. Roberts, Victoria, B.C.

BUILDERS' CANADIAN NATIONAL ASSOCIATION.—President, E. T. Nesbitt; Secretary-Treasurer, J. H. Lauer, Montreal, Que.

CANADIAN ASSOCIATION OF STATIONARY ENGINEERS.—President, Wm. Norris, Chatham, Ont.; Secretary, W. A. Crockett, Mount Hamilton, Ont.

CANADIAN CEMENT AND CONCRETE ASSOCIATION.—President, Peter Gillespie, Toronto, Ont.; Secretary-Treasurer, Wm. Snaith, 57 Adelaide Street, Toronto, Ont.

CANADIAN CLAY PRODUCTS' MANUFACTURERS' ASSOCIATION.—President, W. McCredie; Secretary-Treasurer, D. O. McKinnon, Toronto

CANADIAN ELECTRICAL ASSOCIATION.—President, N. W. Ryerson, Niagara Falls; Secretary, T. S. Young, Canadian Electrical News, Toronto.

CANADIAN FORESTRY ASSOCIATION—President, John Hendry, Vancouver. Secretary, James Lawler, Canadian Building, Ottawa.

CANADIAN GAS ASSOCIATION.—President, Arthur Hewit, General Manager Consumers' Gas Company, Toronto; J. Keillor, Secretary-Treasurer, Hamilton, Ont.

CANADIAN INDEPENDENT TELEPHONE ASSOCIATION.—President, W. Doan, M.D., Harrietsville, Ont.; Secretary-Treasurer, Francis Dagger, 21 Richmond Street West, Toronto.

CANADIAN MINING INSTITUTE.—Windsor Hotel, Montreal. President, Dr. A. E. Barlow, Montreal; Secretary, H. Mortimer Lamb, Windsor Hotel, Montreal.

CANADIAN PEAT SOCIETY.—President, J. McWilliam, M.D., London, Ont.; Secretary-Treasurer, Arthur J. Forward, B.A., 22 Castle Building, Ottawa, Ont.

THE CANADIAN PUBLIC HEALTH ASSOCIATION.—President, Dr. Charles A. Hodgetts, Ottawa; General Secretary, Major Lorne Drum, Ottawa.

CANADIAN RAILWAY CLUB.—President, A. A. Goodchild; Secretary, James Powell, P.O. Box 7, St. Lambert, near Montreal, P.Q.

CANADIAN STREET RAILWAY ASSOCIATION.—President, D. McDonald, Manager, Montreal Street Railway; Secretary, Acton Burrows, 70 Bond Street, Toronto.

CANADIAN SOCIETY OF FOREST ENGINEERS.—President, Dr. Fernow, Toronto.; Secretary, F. W. H. Jacombe, Department of the Interior, Ottawa.

CENTRAL RAILWAY AND ENGINEERING CLUB.—Toronto. President G. Baldwin; Secretary, C. L. Worth, 409 Union Station. Meets third Tuesday each month except June, July and August.

DOMINION LAND SURVEYORS.—President, Mr. R. A. Belanger, Ottawa; Secretary-Treasurer, E. M. Dennis, Dept. of the Interior, Ottawa.

EDMONTON ENGINEERING SOCIETY.—President, J. Chalmers; Secretary, B. F. Mitchell, City Engineer's Office, Edmonton, Alberta.

ENGINEERING SOCIETY, TORONTO UNIVERSITY.—President, J. E. Ritchie; Corresponding Secretary, C. V. Ross.

ENGINEERS' CLUB OF MONTREAL.—Secretary, C. M. Strange, 9 Beaver Hall Square, Montreal.

ENGINEERS' CLUB OF TORONTO.—96 King Street West. President, Willis Chipman; Secretary, R. B. Wolsey. Meeting every Thursday evening during the fall and winter months.

INSTITUTION OF ELECTRICAL ENGINEERS.—President, Dr. G. Kapp; Secretary, P. F. Rowell, Victoria Embankment. London, W.C.; Hon. Secretary-Treasurer for Canada, Lawford Grant, Power Building, Montreal, Que.

INSTITUTION OF MINING AND METALLURGY.—President, Edgar Taylor; Secretary, C. McDermid, London, England. Canadian members of Council:—Prof. F. D. Adams, J. B. Porter, H. E. T. Haultain and W. H. Miller and Messrs W. H. Trewartha-James and J. B. Tyrrell.

INTERNATIONAL ASSOCIATION FOR THE PREVENTION OF SMOKE.—Secretary R. C. Harris, City Hall, Toronto.

MANITOBA LAND SURVEYORS.—President, George McPhillips; Secretary-Treasurer, C. G. Chataway, Winnipeg, Man.

NOVA SCOTIA MINING SOCIETY.—President, T. J. Brown, Sydney Mines, C. B.; Secretary, A. A. Hayward.

NOVA SCOTIA SOCIETY OF ENGINEERS, HALIFAX.—President, J. N. MacKenzie; Secretary, A. R. McCleave, Assistant Road Commissioner's Office, Halifax, N.S.

ONTARIO PROVINCIAL GOOD ROADS ASSOCIATION.—President, Major. T. L. Kennedy; Hon. Secretary-Treasurer, J. E. Farewell, Whitby; Secretary-Treasurer, G. S. Henry, Oriole.

ONTARIO LAND SURVEYORS' ASSOCIATION.—President, T. B. Speight, Toronto; Secretary, Killaly Gamble, 703 Temple Building, Toronto.

THE PEAT ASSOCIATION OF CANADA.—Secretary, Wm. J. W. Booth, New Drawer, 2263, Main P.O., Montreal.

PROVINCE OF QUEBEC ASSOCIATION OF ARCHITECTS.—Secretary, J. E. Ganier, No. 5. Beaver Hall Square, Montreal.

REGINA ENGINEERING SOCIETY.—President, A. J. McPherson, Regina; Secretary, J. A. Gibson, 2429 Victoria Avenue, Regina.

ROYAL ARCHITECTURAL INSTITUTE OF CANADA.—President, F. S. Baker, F.R.I.B.A., Toronto, Ont.; Hon. Secretary, Alcide Chausse, No. 5. Beaver Hall Square, Montreal, Que.

ROYAL ASTRONOMICAL SOCIETY.—President, Prof. Louis B. Stewart, Toronto; Secretary, J. R. Collins, Toronto.

SOCIETY OF CHEMICAL INDUSTRY.—Dr. A. McGill, Ottawa, President; Alfred Burton, Toronto, Secretary.

UNDERGRADUATE SOCIETY OF APPLIED SCIENCE, McGILL UNIVERSITY.—President, J. P. McRae; Secretary, H. F. Cole.

WESTERN CANADA IRRIGATION ASSOCIATION.—President, Wm Pierce, Calgary; Secretary-Treasurer, John T. Hall, Brandon, Man.

WESTERN CANADA RAILWAY CLUB.—President, R. R. Nield; Secretary, W. H. Rosevear, 115 Phœnix Block, Winnipeg, Man. Second Monday, except June, July and August, at Winnipeg.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand and projected, contracts awarded, changes in staffs, etc.
Printed forms for the purpose will be furnished upon application.

PLANS AND SPECIFICATIONS ON FILE.

The following Plans (P.) and Specifications (S.) are on file for reference only unless otherwise noted at the office of The Canadian Engineer, 62 Church Street, Toronto:—

Bids close		Noted in issue of
4-11	Grading, sanitary sewers, cement walks, etc., Lethbridge, Alta.....(P. & S.)	3-14
4-15	Cement sidewalks, Battleford, Sask. ..(P. & S.)	4-4
4-30	Tunnel sewer, Edmonton, Alta. .....(S.)	4-4

(Battleford and Lethbridge plans and specifications are on file at The Canadian Engineer Office, 820 Union Bank Building, Winnipeg.)

TENDERS PENDING.

In Addition to Those in this Issue.

Further information may be had from the issues of The Canadian Engineer referred to.

Place of Work.	Tenders Close.	Issue of.	Page.
Battleford, Sask., laying cement sidewalks	Apr. 15.	Apr. 4.	68
Calgary, Alta., concrete structures	May 1.	Mar. 28.	70
Calgary, Alta., designs for aqueduct	May 1.	Feb. 22.	70
Calgary, Alta., steel highway bridges	Apr. 15.	Mar. 14.	68

Toronto, Ont., concrete walks ..	Apr. 19.	Mar. 28.	60
Winnipeg, Man., asphalt wagons.	Apr. 15.	Apr. 4.	72
Winnipeg, Man., machine shop..	Apr. 18.	Mar. 28.	60

TENDERS.

Arborg, Man.—Bulk tenders will be received up till May 1st, 1912, for all of the works and materials required in the erection and completion of a two-roomed school, Arborg. J. P. Palsson, secretary-treasurer, Arborg, Man.

Calgary, Alta.—Tenders will be received at the office of the Canadian Pacific Railway Division Engineer, Calgary, up to noon of April 15th, 1912, for the placing of contracts for subway at Ninth Avenue East, Calgary. Form of tender at Assistant Engineer's office, Strathcona, and Chief Engineer Winnipeg, also N. E. Brooks, Canadian Pacific Railway Division Engineer, Calgary.

Calgary, Alta.—Tenders will be received at the office of N. E. Brooks, Canadian Pacific Railway Division Engineer, Calgary, up to noon of April 22nd, for the placing of concrete for overhead bridge at Anthony Street, Strathcona. Forms of tender at this office, also at Assistant Engineer's office, Strathcona, and Chief Engineer, Winnipeg.

Calgary, Alta.—Tenders will be received up to noon of April 15th, 1912, for the erection of approximately 118 miles of single circuit telephone line in the Eastern Section of the Canadian Pacific Railway Company's Irrigation Block. Full particulars may be had on application. A. S. Dawson Chief Engineer, Canadian Pacific Railway, Calgary.

Edmonton, Alta.—Tenders will be received by the City Commissioners until April 30th, 1912, for the construction of a reinforced concrete sewer. (See Advt. in Canadian Engineer).

Hamilton, Ont.—Tenders will be received at the offices of Munro and Mead, Architects, Hamilton, up till noon, April 12th, 1912, for the various trades required in the erection of a Public school at Burlington, Ont. Plans and specifications may be seen at the offices of the Architects and also at the office of Mr. Blair, Burlington.

Macdonald, Man.—Tenders will be received by H. Grilk, secretary-treasurer, Municipality of Macdonald, until noon on Wednesday, April 24th, 1912, for the grading of about 40 miles of roads in the Municipality of Macdonald, location of which may be seen at the clerk's office, Sanford.

Macklin, Sask.—Tenders for the construction of a four room brick school building, will be received up to April 16th, 1912. Plans, etc., at J. F. Cairns' hardware store, Saskatoon. A. W. A. Corscadden, secretary-treasurer, Macklin, Sask.

Municipality of St. Paul, Man.—Tenders will be received until April 18th, 1912, for the draining and grading to the East two mile road, the Hoddinott road, the East Main road, and the West Main road. Plans, etc., at the Municipal Office at Birds' Hill, or at the office of the Highway Commissioner, Parliament Buildings, Winnipeg. W. Gorman, Secretary-Treasurer, Rural Municipality of St. Paul.

Ottawa, Ont.—Tenders for the construction of a concrete retaining wall at Long Branch Rifle Range, Toronto, will be received up till noon of April 15th, 1912. Plans, etc., at the offices of the General Officer Commanding 2nd Division, 215 Simcoe Street, Toronto; and the Director of Engineer Services, Department of Militia and Defence, Ottawa. Eugene Fiset, Colonel, Department Minister, Department of Militia and Defence.

Ottawa, Ont.—Tenders will be received until April 30th, 1912, for the erection of a lifeboat house and dwelling combined, at Bay View, N.S. Plans, etc., at the office of A. Johnston, Deputy-Minister, Department of Marine and Fisheries, Ottawa, and at post offices, Digby, Annapolis, Yarmouth, Weymouth, and Westport.

Ottawa, Ont.—Tenders will be received until April 22nd, 1912, for the construction of an 80-ft. single screw steel tug. Plans, etc., at the office of J. G. Sing, Esq., District Engineer, Confederation Life Bldg., Toronto; J. L. Michaud, Esq., District Engineer, Merchants' Bank Building, Montreal; G. G. Scovil, Esq., Superintendent of Dredges, St. John, N.B.; and G. M. Graham, Esq., Superintendent of Dredges, New Glasgow, N.S. R. C. Desrochers, Secretary, Department of Public Works, Ottawa.

Ottawa, Ont.—The call for tenders for the construction of a wharf and for dredging basin at Sarnia, Ont., has been cancelled. R. C. Desrochers, Secretary, Department of Public Works, Ottawa.

Ottawa, Ont.—Sealed tenders for improving lower extreme to Lock No. 15, will be received until April 26th, 1912, addressed to L. K. Jones, Secretary Department of Railways and Canals, Ottawa. Plans, etc., at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Resident Engineer of the Ontario-St. Lawrence Canals, Ottawa.

Ottawa, Ont.—Tenders for alterations to interior fittings, post office, Guelph, Ont., will be received at the office of R. C. Desrochers, Secretary, Department of Public Works, Ottawa, until April 17th, 1912. Plans, etc., can be seen on application to Mr. R. McLeod, caretaker, public building, Guelph; Mr. T. A. Bastings, Clerk of Works, Postal Station F, Toronto; and at the Department of Public Works, Ottawa.

Ottawa, Ont.—Tenders will be received until April 22nd, 1912, for interior fittings, Post Office and Customs, Essex, Ont. Plans, etc., with Mr. J. Laing, Clerk of Works, Essex; Mr. T. A. Hastings, Clerk of Works, Postal Station F, Toronto, and office of R. C. Desrochers, Secretary, Department of Public Works, Ottawa.

Penticton, B.C.—Tenders will be received until April 18th, 1912, for excavation, backfilling for, and making about seven miles of concrete pipe 18 inches diameter, including furnishing and hauling of materials; and hauling and laying of about two miles of 10-inch and 12-inch high pressure steel pipe, having partly flanged and partly ball and spigot joints. (See advt. in Canadian Engineer).

Regina, Sask.—Sealed tenders for electrical apparatus and supplies will be received by the City Commissioners, City of Regina, until noon of April 20th, 1912, for Sections 1 to 5, and until noon of May 15th, 1912, on Sections 6 to 9. (See advertisement in Canadian Engineer.)

Saskatoon, Sask.—Tenders will be received for all trades up to 20th April, 1912, for the erection of a residence and garage on Spadina Crescent for Chas. R. Hill, Esq. Plans and specifications at the office of Messrs. Thompson & Crockart, architects and civil engineers, Masonic Temple, Saskatoon.

Stratford, Ont.—Tenders will be received until April 15th, 1912, for mechanical filters, 8-ft. diameter by 20-ft. long, with all pipes, roses and fixtures. Full particulars may be obtained from W. H. Trethewey, Stratford, Ont.

Stratford, Ont.—Tenders will be received until April 22nd, 1912, for approximately 32,000 sq. yards of pavements. Specifications, etc., may be obtained on application to M. Ferguson, City Engineer. (See advt. in Canadian Engineer).

St. Norbet, Man.—Tenders will be received until April 23rd, 1912, for draining and grading of approximately 14 miles of road as follows:—8 miles on St. Mary's Road; 6 miles on Pembina Highway. All information may be had on application to the Municipal Engineer, D. R. Baribault, 607 Builders' Exchange Bldg., Winnipeg, Man. G. T. Landry, secretary-treasurer, for Ritchot, St. Norbert, Man.

Toronto, Ont.—Tenders will be received up to noon of Tuesday, April 23rd, 1912, for the construction of concrete abutments and concrete floors for the following bridges: Malton Bridge, North Woodbridge Bridge, and Cockburn's Bridge. Plans, etc., at the office of Frank Barber, Civil Engineer, 57 Adelaide Street E., Toronto. (See advt. in Canadian Engineer).

Toronto, Ont.—Tenders for the supply of one concrete batch mixer will be received by the Chairman, Board of Control, City Hall, Toronto, up to noon of April 17th, 1912. (See advertisement in Canadian Engineer).

Toronto, Ont.—Tenders will be received until April 23rd, 1912, for the construction of Sections Nos. 10 and 11, High Level Interceptor. G. R. Geary (Mayor), Chairman, Board of Control, City Hall, Toronto. (See advt. in Canadian Engineer).

Toronto, Ont.—Plans and specifications for large additions to the plant of the Goldie & McCulloch Co., Limited, Galt, Ont., are being prepared by T. Pringle & Son, Limited, Industrial Engineers, Continental Life Building, Toronto.

Toronto, Ont.—Tenders will be received by the Chairman, Board of Control, City Hall, up to noon of April 23rd, 1912, for the construction of Storm Overflow Sewer, Main Garrison Creek, Section No. 1. Specifications, etc., at the office of the City Engineer, Toronto. (See advt. in Canadian Engineer).

Vancouver, B.C.—Tenders will be received until May 2nd, 1912, for the following fire apparatus; One auto gasoline pumping engine; two auto hose wagons; one combination chemical engine and equipment for each car. Specifications may be seen at the office of Wm. McQueen, City Clerk, City Hall, Vancouver, B.C.

Winnipeg, Man.—Tenders are to be called at once for four miles of pavement by the Municipality of Assiniboia, Man. It will extend from the city limits, Portage Avenue to St. Charles. F. Ness, Clerk, Kirkfield Park, Winnipeg.

Winnipeg, Man.—Tenders for construction materials and supplies for the year 1912 will be received at the office of the Chairman of the Manitoba Government Telephone Commission, up to noon, April 22nd, 1912. Form of tender, specifications, etc., may be obtained from W. M. Houston, Supply Agent, McDermot & Charlotte Sts., Winnipeg.

Winnipeg, Man.—Tenders will be received up to noon of April 18th, 1912, for supply of labor and materials required for the erection of an electrical substation at Garson Quarries near Tyndall, Man. Plans, etc., at the office of the City Light and Power Department, 54 King St. M. Peterson, Secretary, Board of Control Office, Winnipeg.

Winnipeg, Man.—Tenders will be received by the Chairman, Board of Control, until April 16th, 1912, for supply of 1,250-⅞-inch diameter x 4-⅜-inch Tobin Bronze Bolts. Specifications, etc., at the office of the City Engineer, 223 James Avenue. M. Peterson, Secretary, Board of Control Office, Winnipeg.

Winnipeg, Man.—Tenders will be received up to noon of April 16th, 1912, for all trades except plumbing, heating and electric wiring required in the erection of a fireproof garage building on Henry Avenue, Winnipeg, for the Manitoba Government Telephone Commission. Plans, etc., at the office of the architect in the Telephone Building, at the corner of Charlotte St., and McDermont. F. C. Patterson, Chairman of Commission.

Winnipeg, Man.—Tenders for the erection and completion (except plumbing, heating and ventilation) of the new West End School Building, Yorkton, Sask., will be received by the Secretary-Treasurer of the Yorkton School Board, up to noon of April 22nd, 1912. Plans and specifications may be seen at the Winnipeg or Yorkton office of the Architect, J. Pender West, 607-9 Somerset Block, Winnipeg, and 9 Dunlop Block, Yorkton.

Winnipeg, Man.—Tenders for the supply of one or two electric trucks will be received at the offices of M. Peterson, Secretary, Board of Control Office, Winnipeg, Man., up to noon of April 17th, 1912.

CONTRACTS AWARDED.

British Columbia.—The B.C. Electric Railway Company has awarded a contract of 24 passenger cars to the St. Louis Car Company, of St. Louis. The cost of the new rolling stock with electrical equipment will be about $250,000.

Calgary, Alta.—The municipal council have awarded the following contracts for street paving:—

Curb and gutter, Crown Paving Company, 44c. per lineal foot.

Catch basin, Frank Fahrenbach and Company, $14.85.

Barrett Specification Roofs

Longest Wear for Lowest Cost.

THE cost per year of service is the only true test of a roofing.

It discloses the absolute superiority of Barrett Specification Roofs. That is why on large manufacturing plants, where costs are carefully computed, such roofs are almost invariably used.

Barrett Specification Roofs are inexpensive, costing much less than tin for instance, and little more than the best grade of ready roofings.

Their cost of maintenance is nothing, for these roofs require no painting; they can't rust and they will give satisfactory protection for 20 years or more.

Insurance underwriters classify Barrett Specification Roofs as "slow burning" construction acceptable on "fire-proof" buildings.

Barrett Specification Roofs are also immune from damage by acid fumes. That is why they are used extensively on railroad roundhouses.

On cotton mills, with their humid interiors, these roofs also give perfect satisfaction, for dampness does not affect them from below.

From the viewpoint of economy and satisfactory service, no other type of roof covering compares with Barrett Specification Roofs.

That is why they have won almost universal approval for use on flat-roofed structures of all kinds.

The Barrett Specification Roof illustrated above is 50,000 square feet in area and covers the Roundhouse of the Vandalia Lines (Penna. System) at Terre Haute, Ind.

The St. Louis Roofing Co., of St. Louis, Mo., were the Roofing Contractors.

Special Note.

We advise incorporating in plans the full wording of The Barrett Specification, in order to avoid any misunderstanding. If any abbreviated form is desired however the following is suggested:

ROOFING—Shall be a Barrett Specification Roof laid as directed in printed Specification, revised August 15, 1911, using the materials specified, and subject to the inspection requirement.

Copy of the Barrett Specification, with diagrams, ready for incorporation into building specifications, free on request.

The Paterson Manufacturing Co., Limited

Montreal Toronto Winnipeg Vancouver St. John, N.B. Halifax, N.S.

McGibbon Bros., all sidewalks in ward one, west of the Elbow River, and north of the main line of the C.P.R., at 9¾c. per sq. foot, and all in ward two at 9⅞c. per sq. foot.

Frank Fahrenbach and Company, all sidewalks in ward three and ward one, east of the Elbow River, between the Bow River and the main line of the C.P.R. at 9c. per sq. foot. C. M. Payne, all sidewalks in ward four at 9c. per sq. foot.

Calgary, Alta.—The contract for the supply of one 2,500-k.w. steam turbine with Vickers generator for the city of Calgary municipal electric light and power plant has been awarded to Messrs. Laurie & Lamb, for $42,750, and for switchboards and apparatus, to Messrs. P. S. McLaren, Ltd., for $6,040.40.

Calgary, Alta.—The City Council have passed recommendations of the City Commissioners for the awards of the paving contracts as follows: A contract for 100,000 yards of bitulithic pavement will be awarded to the Canadian Mineral Rubber Company at $2.50 per yard; 100,000 yards of sheet asphalt to the Calgary Paving Company at $2.05 per yard; 70,000 yards of asphaltic concrete to the Crown Paving Company at $2.12 per yard; 50,000 yards of bitulithic to the Bitulithic and Contracting, Ltd., at $2.85 per yard, and 25,000 yards of granitoid to the Alberta Granitoid Company.

Galt, Ont.—The contract for the erection of the new Y.M.C.A. building has been awarded to the lowest tenderer, Mr. A. E. Faulkner, of Brantford, the price being $45,242.50.

Kingston, Ont.—Dormitory, R. M. C.; contractor, Michael Sullivan, of Kingston.

Montreal, Que.—John Millen & Son, Limited, of Montreal, have been awarded the contract for chain drives, aggregating 200-h.p., for the big addition to the Grand Trunk Pacific Grain Elevator at West Fort William, which is being erected by John S. Metcalfe & Co., the well-known Grain Elevator Engineers. The chain drive selected is the famous Coventry Noiseless.

Niagara Falls, Ont.—Nine bids were received for the construction work of the 75,000 sq. yards of pavement, but the tenders were not opened. Bids were returned and the matter was deferred for 60 days. W. J. Seymour, City Clerk.

North Bay, Ont.—Additions to Land Titles Office Building; Messrs. Robert Wallace & Son, contractors for building addition; the Cochrane Hardware, Ltd., for heating, plumbing and wiring.

North Toronto, Ont.—Mr. C. E. Lewis, of Toronto, has received the contract for the erection of a concrete bridge on Albertus Avenue, for which he will receive the sum of $1,923.

Ottawa, Ont.—Two 150 cu. yd. capacity steel hopper scows; the Brown Machine Co., Ltd., of New Glasgow, N.B.

Ottawa, Ont.—Mr. Geo. Ambridge has been awarded the contract for the building for the Dominion Wire Cloth and Manufacturing Company, to be erected in Mechanicsville.

Regina, Sask.—"Contract Number 1," for excavating the trench, laying concrete pipes, and backfilling Seventh Avenue from Albert Street to Toronto Street, was awarded to Wilson, Townsend and Saunders, of Moose Jaw, whose figure was $18,312.38. This company's tender was also accepted for similar work from Fourteenth Avenue out to the septic tank. Here the tender was for $17,538.94. The other tenderers in both cases were Robert J. Leckey and the Parsons Construction Company. Wilson, Townsend and Company were awarded a $24,893 contract for the construction of two filter beds, one stand-by tank and pipe lines. For blocks for false floors in the filter beds, the tender of Freeland Brothers, at $4,693, was accepted. The contract for the steel roof over the filter beds went to the Western Steel and Supply Company, at $8,400.

Saskatoon, Sask.—The new sedimentation basin for the municipality will soon be completed. It is to give settling facilities to 700,000 gallons of water additional to the present supply.

Saksatoon, Sask.—Labor on sanitary sewers and water construction; Prices were all unit prices; Contract divided into three sections as follows: Section 1 to Messrs. Flanagan & Murphy, Dauphin, Man. Section 2 to Messrs. Robinson & Foster, Spokane, Washington; Section 3 to Mr. A. R. Campbell, Saskatoon.

Saskatoon, Sask.—Labor on storm sewers; Saskatoon Construction & Engineering Co., 36-inch storm sewer.

Vancouver, B.C.—The City Council have awarded the contract for the construction of the big concrete Balaclava Street sewer main, which will form a trunk in the Greater Vancouver sewerage scheme, to Palmer Brothers & Henning, giving that firm the preference over Romano, Pinto & Co. The tenders submitted to the board of works were:—Palmer Brothers & Henning, $89,071; Romano, Pinto & Co., $89,105.90. The Graff Construction Company tendered at about $2 lower than Palmer Brothers & Henning. These three were much lower than the other half dozen contractors who also figured.

Vancouver, B.C.—The contract for concrete work in connection with the proposed new piers of the Great Northern Railway on Burrard Inlet has been awarded to Messrs. Cummings & Kiehel, of Seattle. It will involve the expenditure of $125,000. Messrs. H. Chase & Co., Seattle, have the contract for pile driving. The dredging contract has not yet been let. The entire improvement will cost over $400,000.

Victoria, B.C.—The municipal council of Oak Bay have awarded the contract for the construction of a trunk sewer to Messrs. Naylor Bros., of Huddersfield, England; their price being $119,260.75. The other tenders were:—Robert McLean & Company, $138,400; Hugh McDonald, $145,359.45; Victoria Machinery Company, $153,545.90; Jeffry & Burton, $156,076.25; Jas. McDonald & Company, $168,267.

Victoria, B.C.—The municipal council of Oak Bay have awarded the contract for a supply of water pipe to Messrs. Robert McLaren & Sons, of Glasgow, through the Messrs. Forsyth & Co., who represent this firm. Their figures were $28,701.21 (including $690.50) for specials. Other firms tendered as follows:—Messrs. Evans, Coleman & Evans, $28,861.60 (including $675.70 for specials); Victoria Machinery Company, $29,203.07; W. J. Winterburn, $31,271 (including $567 for specials); Canada Foundry Co., $31,423.50 (including $675 for specials); Robertson Godson Co., $36,867.95; Hutchison Bros., $784 for specials.

Winnipeg, Man.—The Carter Halls Aldinger Company have been awarded the contract for the erection of large garage for the Detroit Electric Automobile Co. The cost of this work is estimated at $50,000.

RAILWAYS—STEAM AND ELECTRIC.

Province of British Columbia.—The Canadian Northern Pacific Railway are planning to extend their lines toward the north. A report states that tenders for this work will be called within six weeks.

Humber River, Ont.—The new concrete pier of the Grand Trunk Railway bridge crossing this river withstood the severe test satisfactorily when the river ice broke up.

Niagara Falls, Ont.—A report states that the management of the Canadian Northern Railway are considering the construction of a railway bridge across the Niagara River in order to gain an entrance to New York State.

Winnipeg, Man.—Plans for the new Canadian Pacific Railway yards at Winnipeg, include new shops, round-houses and bridges across the Red River. Two thousand men are employed on construction.

LIGHT, HEAT AND POWER.

Province of British Columbia.—The C.P.R. is constructing a large dam on Bull River, near Cranbrook. Electrical power will be supplied to towns in the Crow's Nest as far east as Hosmer and west to Cranbrook, Moyie and Fort Steele. The company is also erecting a sawmill there.

Moose Jaw, Sask.—The municipal commissioners have received a large number of replies to their tender for the power house extension. It is reported that the proposition for an oil operated plant will not be considered to any great length.

Port Stanley, Ont.—The Hydro-Electric rates for this town have been fixed as follows:—4c. per square foot and 5c. per kilowatt for actual current used; 12c. per kilowatt for the first 30 hours, and 5c. for time additional as a commercial current consumption basis. These rates are about 25 per cent. less than the charges on the former system.

Tyndall, Man.—The Municipal Light and Power Department of Winnipeg, Man., are about to erect a substation at Carson Quarries near Tyndall. M. Peterson, Secretary,

Board of Control, will receive tenders for the erection of the building until April 18th next.

Vancouver, B.C.—The estimates of city electrician Woodroofe for new lighting standards totals $235,000. The court of revision will report on the matter.

GARBAGE, SEWAGE AND WATER.

Edmonton, Alta.—The commission reporting on a water supply have made the following recommendations:—That an additional 6,000,000 gallon low lift pump, and an additional 6,000,000 gallon service pump be installed. Installation of gauges to determine run off and rain fall at Pigeon Lake. Take water from two sources only, Saskatchewan River and Pigeon Lake. That a further investigation be taken up.

Galt, Ont.—The municipal water board are preparing to install a synchronous motor in the pumping plant. The machine will operate on the mains of the hydro-electric commission. Specifications are prepared for a one-and-a-half million gallon pump for the above. Mr. E. O. Fuce is the town engineer.

Regina, Sask.—The municipality will sink three wells with a view of increasing the water supply.

Weston, Ont.—The ratepayers will vote and decide whether they will expend the sum of $40,000 on a new sewerage system. The system will be a trunk line emptying into a filtration plant near the Humber River.

BUILDINGS AND INDUSTRIAL WORKS.

Province of Alberta.—The Canadian Pacific Railway are preparing to proceed with considerable concrete work in connection with the irrigation scheme in this province. Mr. A. S. Dawson, chief engineer at Calgary, is in possession of the details.

Brantford, Ont.—A report states that the American Radiator Company will erect an important addition to their plant. The extension will be about 750 feet in length.

Province of British Columbia.—Mr. George Collins, of the Seal Cove Fish and Cold Storage Company at Prince Rupert has announced the rough details of a new cannery near Prince Rupert. It will cost about $300,000.

Fort William, Ont.—The Northern Navigation Company will construct a new steamer. The work will be done in the yards of the Western Drydock Company, who have secured the contract. It will be 425 feet long, 55 feet beam, and cost about $750,000.

Fort William, Ont. — The management of the Western Drydock Company will enlarge their present plant by the addition of two buildings. A new machine shop 270 by 100 and a blacksmith shop of smaller dimensions are included in the plans.

Granby Bay, B.C.—The management of the Granby Consolidated Mining and Smelting Company are considering the details of a new plant to cost $1,000,000. It is reported that the new work will start in May. Mr. F. M. Sylvester is the general manager of this company and the head office is at Trail, B.C.

Guelph, Ont.—A report states that the Guelph Carpet Mills will erect a new warehouse. It will be three storeys 60 by 60. Messrs. Tanner, T. Colwill & Tanner are the architects for the new structure.

Lethbridge, Alta.—The Board of Trade have announced that a large hotel will be erected in this city. The cost will be about $300,000. Messrs Paul Fader and J. F. Davis of Calgary, are interested in the project.

Montreal, P.Q.—A ten-story office structure will be erected on the corner of Notre Dame and St. Peter Streets. Mr. John Findlay is interested in the matter.

Niagara Falls, Ont.—The management of the Sanitary Can Company are planning to construct extensive additions to their present plant. The work includes considerable concrete and steel work.

Owen Sound, Ont.—This municipality will construct a new school at an estimated cost of $35,000.

Ottawa, Ont.—Mr. C. J. Booth will erect a seven story office building in this city. Work will start on the structure about the first of May next. Mr. Albert Ewart, has prepared the plans.

Port Stanley, Ont.—The members of the congregation of Christ Church are considering the erection of a new rectory. Messrs. Thomas Meek, M. Hyndman and H. Ellison comprise the committee that will report on the matter.

Port Colborne, Ont.—The Buffalo Union Furnace Company of New York, will erect a plant at this place for the manufacture of pig-iron.

Quebec, P.Q.—The Government will call tenders at an early date for the construction of a graving dock in this city. The tenders are to be in the hands of the proper officials by May 20th.

Quebec, P.Q. — The Federal Government have called tenders for the construction of the new drydocks at this point. Tenders close on July 2nd next. The successful bidder will receive 3½ per cent. subsidy for thirty-five years on $5,000,000. The dimensions of the drydocks will be 1,150 feet long, 137 feet wide, and 37 feet deep.

Regina, Sask.—A company has been formed to drill for natural gas, and will be known as the Western Gas & Oil Company. Mr. G. F. Baxter, of Pense, Sask., is the president of the new company. They will be equipped for a depth of 2,000 feet at present, and will increase this should occasion demand.

Regina, Sask.—The management of the Cockshutt Plow Company have let the contract for the erection of a new factory in this city. It will consist of three stories and a basement constructed on the property owned by the company in Block 77 with a frontage of 150 feet on Broad Street, and 100 feet on Fifth Avenue. The plans include two large-sized heavy capacity freight elevators. The total cost is estimated in the neighborhood of $120,000.

Saskatoon, Sask.—The work of enlarging the Empire Hotel has been commenced. Mr. Herbert Lancaster is in charge of the work and Mr. Sutton is interested in the business of the hotel. The work will add forty-four additional rooms to the building.

Saskatoon, Sask.—Mr. J. C. Drinkle will erect two large stores and office buildings in this city during the next few months.

Saskatoon, Sask. — Messrs. Thompson, Daniel & Colthurst are preparing plans for the construction of a new hotel for this city. The materials of construction will be concrete and brick with stone dressing. The building will be 100 by 130 and cost about $150,000. Mr. James Barry is the proprietor.

Stanley Springs, Ont.—The plant of the Western Brewing Company at this point will be enlarged by an addition to cost about $500,000. The head offices of this concern are in Winnipeg, Man.

St. Catharines, Ont.—The Canadian Bank of Commerce will erect a suitable branch office in this city during the coming summer.

St. John, N.B.—Messrs. Ames-Holden-McCready Co., Ltd., are about to erect a large warehouse in this city. It is to be of brick, five stories in height, 31-ft. x 100-ft.

Toronto, Ont.—The management of the Canadian Northern Railway announce their intention of erecting a ten-story office building on the site of the present offices of the company, Toronto and King Streets.

Vancouver, B.C.—Mr. A. A. Davidson is erecting an apartment house in this city at a cost of $150,000.

Vancouver, B.C.—A report states that the Dominion Government will erect a large terminal elevator at Burrard Inlet during the next year.

Victoria, B.C.—Mrs. S. J. Curry and Rev. T. E. Holling are interested in a project for the erection of a new church.

Victoria, B.C.—The Provincial Government have prepared plans and are about to call for tenders for the erection of a new court house, lock-up, and constables' quarters, at Arrowhead, and constables' quarters at Yale, B.C.

Welland, Ont.—The management of the Welland Machine and Foundry Company will erect a new foundry, a paint shop and storehouse and will install one or more travelling cranes.

THE TRIPLEX BLOCK

A Triplex Block hung from a temporary rigging and used for laying pipe.

What is the Life of a Triplex Block?

WE don't know. Triplex Blocks built by the Yale and Towne Co. at the very beginning—twenty-five years ago—are still in actual use. The Triplex Block of to-day possesses greater lasting powers. With its steel parts—its chain superior to any other—its non-wearing gear movement—and the guarantee of a rigorous test before shipment under a fifty per cent. overload. It will outlast the man who buys it, no matter how young he may be.

The Canadian Fairbanks-Morse Company

LIMITED

Fairbanks Standard Scales — Fairbanks-Morse Gas Engines
Safes and Vaults

MONTREAL ST. JOHN OTTAWA TORONTO WINNIPEG
CALGARY SASKATOON VANCOUVER VICTORIA

Winnipeg, Man.—The Detroit Electric Automobile Company will erect a fine garage for their cars in this city. Solid reinforced concrete will be used throughout, and the 60-foot front will be particularly handsome. It is designed to be the most thoroughly fireproof building in Winnipeg.

BRIDGES, ROADS AND PAVEMENTS.

Alton, Ont.—A large steel bridge near this town was badly damaged by the recent floods. The bridge was three years old.

Calgary, Alta.—The commissioners have recommended to the council that the following tenders for street paving be accepted: 70,000 yds. asphaltic concrete to the Crown Paving Company at $2.12, and when required by the engineer to coat same with squeegee at the price of 10c. extra; 100,000 yards sheet asphalt to the Calgary Paving Company at $2.05; 100,000 yards to the Canadian Mineral Rubber Company at $2.50; 50,000 yards of bitulithic pavement to the Bitulithic Contracting Company at $2.85; 25,000 granitoid to the Alberta Granitoid Company at $2.65.

Calgary, Alta.—The municipal commissioners have recommended that the following tenders for street paving be accepted:—70,000 yards asphaltic concrete, Crown Paving Company, $2.12, with squeegee coat, 10c. yard extra, $2.22; 100,000 yards street asphalt, Calgary Paving Company, $2.05; 100,000 yards Canadian mineral rubber, $2.50; 50,000 yards bitulithic, Bitulithic Paving Company, $2.85; 25,000 yards granitoid, Alberta Granitoid Company, $2.65. This covers work on last year's tender and work on Ninth Avenue East, from Twelfth Street East and Second Street East, from Eighteenth Avenue to Victoria Bridge.

County of Essex, Ont.—A movement calling for the construction of a memorial driveway along the river front has been started. Mr. Charles Montreuil, warden of this county, was elected president of the association discussing the project.

Ottawa, Ont.—The Ottawa Improvement Commission will construct a driveway at a cost of $10,000, and will convert an old cemetery into a park at a cost of $14,700.

Province of Saskatchewan.—The provincial government of this province have appointed a board for the purpose of administrating the affairs of the provincial highways, etc. A method will be worked out whereby the municipal authorities will aid the provincial officers in this work. Mr. A. J. McPherson, Regina, will, in all probability, be the chairman of the new board.

Toronto, Ont.—The City Engineer has recommended that the following pavements be proceeded with:—

Pelham Street, block pavement	$9,795
Dufferin Street, block pavement	11,022
Sherbourne Street, asphalt surface	14,484
Wyndham Street, bitulithic	4,604
Crescent Road, Roc-mac (reconstruction)	10,368

Vancouver, B.C.—Paving recommendations as local improvements, calling for a total expenditure of $532,652, of which the city's share would be $136,696, have been submitted by the City Engineer to the Board of Works..

County of York, Ont.—The pavement of the Lake Shore Road from the Humber River to Mimico will be of Dolarway and not of tar macadam as previously announced. Messrs. J. H. McKnight Construction Company, Ltd., will do the paving. The offices of this company are at 152 Bay Street, Toronto.

FIRES.

Deseronto, Ont.—The plant of the Standard Iron Company was damaged by fire to the extent of $50,000.

Hamilton, Ont.—The Hamilton Facing Mills were damaged by fire to the extent of $10,000.

New Toronto, Ont.—The Brown Copper & Brass Rolling Mills were destroyed by fire on Sunday, April 7th. The loss is estimated at $125,000.

Vancouver, B.C.—Fire damaged the Foster building on Hastings Street to the extent of $232,000. This sum includes the damage to the contents, which was distributed among retail stores occupying the lower portions of the building.

CURRENT NEWS.

Brantford, Ont.—During the ravages of the overflowing of the river, a large gas main was carried away which necessitated the shutting off of the gas throughout the city.

Calgary, Alta.—The management of the Builders' Exchange have been instructed by the members to request the Canadian Northern and the Grand Trunk Pacific Railways to give all contracting work to the local contractors when those roads enter the city of Calgary. They claim that as they do considerable freighting outside contractors should be excluded from railway work in this vicinity.

Collingwood, Ont.—The Collingwood Shipbuilding Company will construct a canal and lake steamer for Keystone Transportation Company at Montreal. The new vessel will be employed in the grain and coal carrying trade between Lake Erie and Montreal. It will be 258 feet long by 42.6 feet beam, 20 feet depth, 800 horse-power engines, and have a speed of ten miles an hour. The capacity will be 2,400 short tons, or 80,000 bushels of wheat, and the cost will be approximately $140,000.

Fort William, Ont.—Arrangements are under way for the installation of a fire alarm system in this city. The citizens voted in favor of spending $12,000 on fire alarms, and tenders will be received at the city hall up to April 15th.

Niagara Peninsula, Ont.—The Dominion Government will call tenders for the construction of the new Welland Canal at an early date.

Toronto, Ont.—The Dominion Government have made a grant of $218,517 for improvements to the harbor of this city.

PATENTS.

The following is a list of patents recently issued from the Canadian Patent Offices in Ottawa. This list is furnished by Messrs. Featherstonhaugh & Company, Royal Bank Building, Toronto:—

A. Hough, explosives; N. E. Lister, flangers for railways; W. McCloskey, mop wringers; H. E. Niblett, building blocks; J. J. Carrigan, wagon brakes; C. R. Cote, electric medical apparatus; M. L. Dansereau, weak measures and distributers; J. D. Hoffman, machines for making cement shingles and the like from plastic materials; C. J. Hickling, starters for explosive engines; J. L. Marcil, street indicators; G. Maude, cattle stanchions; A. A. Mowry, set works for sawmill carriages; M. M. Passy, cream removers for milk bottles; A. Perrault, egg whips; A. H. Reid, concrete; H. C. Shipman, games; A. C. Thompson, fitting spring for mattresses and the like; L. A. Whyte, containers.

The following is a list of patents recently issued through the agency of Messrs. Ridout & Maybee, Manning Chambers, Toronto, from whom further particulars may be obtained:

Canada:—Nathaniel & Gideon Beam, thresher; Charles Maples, cloches for French garden culture; J. C. Doust, clothes-line reel.

United States:—W. F. Scott, reinforced concrete; A. Nonnington & H. G. Ackers, production of calcium of cyanamide; The Massey-Harris Company, Limited, lever mechanism.

The following is a list of patents recently issued through the patent office of Herbert J. S. Denison, Star Building, 18 King Street, West, Toronto, from whom further particulars may be obtained.

C. J. Bothwell, adding machines; Jas. Payer, hat fastener; J. C. Royce, separable electrical connection; H. B. Croker, printing presses; C. L. Williams, sleeper or ground for walls; W. N. Nicholls and A. W. Carmichael, cleat for roofing; M. J. Haney, concrete block structures; A. Roebuck, snow plow; H. C. Hogarth, filter; J. H. K. McCollum, internal combustion engine; H. R. Winter, necktie; T. G. McGonigle, rotary engine; J. D. Hoffman, cement shingle machine; S. F. Leslie, coupling device; Geo. Maude, cattle stanchion; B. F. Johnston, gang plow; F. W. Lanchester, high speed reciprocating engines; M. J. Haney, package handling appliance; Geo. Borgfeldt & Co., sheaf of wheat.

How This Rubber Belting Cuts Production Cost

Don't let slipping belts waste power—drain away profits. Plug up the leaks—save time, money, **power,** by investigating—installing Goodyear Rubber Belting.

Goodyear Rubber Belting stands for *saved energy—economy.* Built up of plies of rubberized fabric, cured and vulcanized into the solid piece. Neither slips nor stretches. Has the cohesiveness of rubber with the enduring strength of a specially woven cotton duck fabric from which all stretch has been taken out. It is steam, water, weather and rot proof.

The same high-grade materials, the same skillful workmanship and the same years of experience that have built such famous service into the products of the Goodyear Tire & Rubber Co., U.S.A., is doing the same for Goodyear Rubber Belting and our many other rubber products.

GOODYEAR Rubber Belting

High Efficiency Belting

Every size for every purpose—1 inch to 60 inches wide—2 plies to 8 plies thick.

Goodyear Quality Belting

The highest grade made. Heaviest duck, best rubber, seamless, tough, durable. The saving main-drive belt for **Paper, Pulp** and **Lumber Mills**—for *all* mills where the horse-power transmitted is large and the demand for tensile strength is great.

Black Diamond Belting

Lighter in weight, lower in price than above, but same in *quality.* Great quantities sold to **Sawmill** trade. Hundreds of mill-owners say it gives better service than any other belt ever used.

Red Cross Belting

The ideal belt for **Thresher, Small Sawmill** and **Flour Mill** use. Built to meet competition, yet is far superior to all other third-grade belts because made of tougher rubber, heavier fabric (which means better friction) and better wearing service and cover.

Stitched Rubber Belting

We make this belting in **Quality, Black Diamond** and **Red Cross** weights for those preferring this type of belting.

Elevator Belts

We make a specialty of **Elevator Belts.** Our Leg and Lofter Belts used in hundreds of elevators. Give superior service because of greater strength. Buckets never pull out. Plies never separate. Long, efficient service guaranteed.

Conveyor Belts

For conveying crushed stone, grain, coal, ore, etc. Made in all thicknesses of face to suit requirements. Great toughness of rubber face prevents cutting and chipping; insures longest service.

IMPERIAL HIGH-SPEED FRICTION SURFACE BELT

Specially designed for planer, dynamo, generator or fan work where pulleys are small and high-speeded. If we haven't what you want in stock, we'll *make* it—and *remember*

Goodyear Rubber Belts quickly earn their cost in pains and power saved—yet they cost less than the common kind. Let our expert solve your problem. Send requirements or write for catalog to-night. In all of our business in Canada last year, we had to replace, because of slight defects, only $155.22 worth of goods.

TRADE INQUIRIES.

The following were among the inquiries relating to Canadian trade received at the office of the High Commission for Canada, 17 Victoria Street, London, S.W., during the week ending March 25th, 1912:—

A Birmingham firm manufacturing plate and wire springs and similar steel goods, school and machinery accessories, etc., including all kinds of small bent plate and wire goods, twists, bows, etc., to pattern or drawing, are desirous of introducing their goods to the Canadian market.

A correspondent in South Wales has a market for white oak staves, and would like to hear from Canadian exporters.

A correspondent at Frankfort-on-Main reports a large market in Germany for Canadian corundum, and would like to hear from miners and exporters in the Dominion.

A Scottish firm of rubber tyre manufacturers make inquiry for the names of Canadian manufacturers of rubber.

From the branch for City Trade Inquiries, 73 Basinghall Street, E.C.:—

A firm of importers in Genoa, Italy, invite offers from Canadian shippers of lard, tallow, greases and soap fats generally. They would also like to hear from producers of dried codfish and provisions.

ORDERS OF THE RAILWAY COMMISSIONERS OF CANADA.

Each week on this page may be found summaries of orders passed by the Board of Railway Commissioners, to date. This will facilitate ready reference and easy filing. Copies of these orders may be secured from The Canadian Engineer for small fee.

16177—March 25—Approving location of G.T.R. station to be erected at Houston, Coast District, B.C.

16178—March 25—Approving location of Kettle Valley Ry. from mileage 43.92 to 55, northwest of Midway, B.C.

16179—March 26—Approving location of three G.T.P. Stations situated in Coast District. B.C. (No name).

16180—March 28—Directing C.N.R. to put its main line running tracks in Saskatoon yard in good shape and condition before June 1st, 1912, pending completion of work train not to exceed six miles per hour.

16181—March 28—Authorizing Lachine Jacques-Cartier & Maisonneuve (G.T.R.) Railway Co. to cross certain streets in Montreal, Que., by overhead crossings, subways and level crossings.

16182—March 25—Rescinding Order 16122 of March 14th, 1912, and slightly amending Order 16095 March 7th, 1912, re C.N.R. Taking Lands town of Trenton, Ont.

16183—March 28—Rescinding Order 13060 of February 21st, 1911; and approving by-law of M.C.R. authorizing C. F. Daly, V.P., L. W. Landman, G.P.A., W. C. Rowley, G.F.A., and J. L. O'Brien, Chief of Tariff Bureau, to prepare and issue tariffs of tolls, etc.

16184—March 4—Rescinding Order 15938 of Febuary 6th, 1912, in so far as it authorizes construction of railway across Rachel Street, Lachine, Jacques-Cartier & Maissoneuve Ry.

16185—March 26—Directing G.T.R. to within 90 days from date of this Order install electric bell at crossing just east of Clarkson Station, Ont., 20 per cent. from Railway Grade Crossing Fund.

16186—March 26—Authorizing Province of Saskatchewan to construct highway across C.N.R. in S.W. ¼ Section 30, Twp. 47, R. 26, W. 2 M.

16187—March 27—Relieving C.P.R. from further protection at 1st highway south of St. Vincent Rd. mileage 91, near town of Owen Sound, Ontario.

16188—March 28—16189—March 26—Authorizing C.P.R. to construct three spurs from main line in S.W. ¼ of Section 28, Twp. 23, R. 29, W. 4 M., into and through Blocks Nos. 24, 25, and 30, and Block B. in subdivision of S.E. ¼ of Section 28, Twp. 23, R. 29, W. 4 M. And spur for the Calgary Brewing and Malting Co., at Coleman, Alberta.

16190—March 28—Rescinding Order 15683 of December 23rd, 1911, and recommending to the Governor-in-Council for approval rules of regulations of G.T.R. operating department.

16191—March 27—Authorizing G.T.P.B.L.Co. to cross with its Regina-Moose Jaw Branch the Moose Jaw Northwest Branch of the C.P.R. by undergrade crossing at Moose Jaw, Sask.

CAISSON SICKNESS.

A French authority has recently made public a report on his investigations into the above disease and has come to the conclusion that the distressing effects of the malady are due to the fact that when air is compressed the oxygen factor is reduced to four-fifths of the proportions that it held before compression.

An Engineering Weekly

THE RED RIVER BRIDGE FOR THE NATIONAL TRANSCONTINENTAL RAILWAY

By D. C. TENNANT.

The double track bridge over the Red River for the National Transcontinental Railway, has presented, both in design and construction, many very interesting problems. To such an extent is this true, that there will be room in this paper for only a general description of the more important features. The whole bridge, with its approach spans, comprises a length of almost half a mile. The bridge over Water Street, Winnipeg, shown at the left-hand side of plate No. 1, is the most westerly work of the Transcontinental Commission. Beyond this point the line is being constructed by the Winnipeg Terminal Co., for the Grand Trunk Pacific and Canadian Northern Railways.

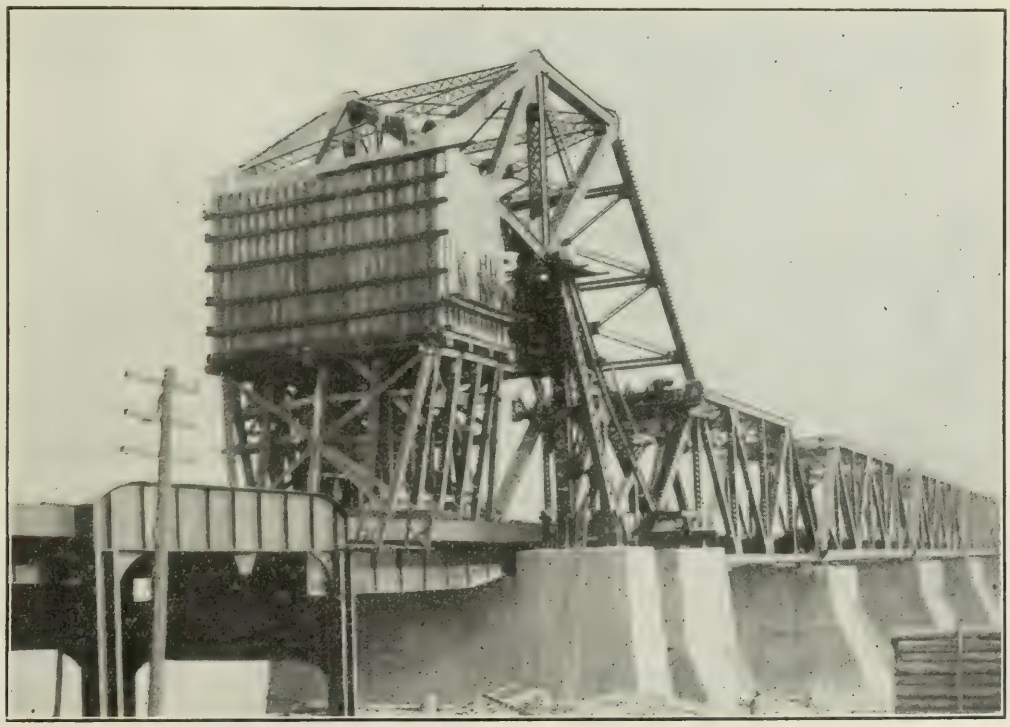

Fig. 1.—View Taken from the South Side Looking East.

Coming from the east, on the St. Boniface side of the river, the double track road is carried on an earth embankment with side slopes of one and one-half horizontal to one vertical, and the first span is a deck plate girder with solid floor, spanning a 67 ft. 2 in. clear opening at Taché Avenue. After another short stretch of earth embankment the road is carried over two spur tracks of the Canadian Northern Railway by a 58 ft. through plate girder span with floor beams, stringers, and wooden ties. This brings us to the main bridge over the Red River itself, and first we have four 150 ft. 0 in. C. to C. double track through truss spans, the most easterly one having one end supported on the same pier that carries the end of the girder span already mentioned, and the others resting on piers 1, 2, 3 and 4, which are carried down to rock in the bed of the river. Red River is navigable at this point for fairly large steamers, and a clear waterway of about 110 ft. width was required. As the bridge was at no great height above the water it became necessary to provide a span of some movable type. The deepest channel being near the Winnipeg shore where economy of space is ever becoming a more important consideration, it was decided to use a Strauss Trunnion Bascule span. The moving leaf—129 ft. 6 in. long C. to C.—is towards the east, the toe resting when the span is closed on pier No. 4, which also carries the end of one of the one hundred and fifty foot fixed spans. The counterweight tower is forty feet long C. to C., spanning between piers Nos. 5 and 6. Westward from this there is a viaduct crossing over two tracks of the Winnipeg Transfer Co., a spur railroad track, Mill Street, and a lane. As these are all

crossed on the skew, and as the line of the Transcontinental commences to curve to the south at a short distance beyond the Bascule span, it will be readily understood that the actual size of this viaduct, though not inconsiderable, gives a most inadequate idea of the amount of work in the design and manufacture. The curve continues to the west and south, the tracks being carried on an earth embankment with vertical retaining walls of concrete. The embankment is pierced at four points: first by Thistle Lane and a spur track, next by another spur track and then at Notre Dame Street and at Water Street, the opening at Notre Dame Street being 66 ft. 0 in. clear, and that at Water Street 60 ft. 4 in. clear. In general, the floors of the viaduct and of the isolated spans forming this western approach are similar to that of the Taché Avenue bridge, consisting of four deck plate girders, two under each track, carrying a concrete floor and ballast. The concrete floor is supported on I beams running across the tops of the deck girders and cantilevering out on each side supporting longitudinal facia girders. In the viaduct, and at Notre Dame and Water Streets, the main girders are carried on posts and heavy cross floor beams. Where the tracks cross under the viaduct, through plate girders were used instead of deck girders, to give the necessary headroom. At the two small openings in the embankment, for Thistle Lane and the two spur tracks, the solid floor was not necessary. A through girder span with four stringers under each track was used at Thistle Lane, and at the other opening the stringers rest directly on the retaining walls, without floor beams or side girders. As shown on Plate No. 1, the main bridge, with its long curved tail of a western approach spotted here and there with small bridges, resembles a huge rocket fired from Fort Garry station, which is only a fraction of a mile farther west.

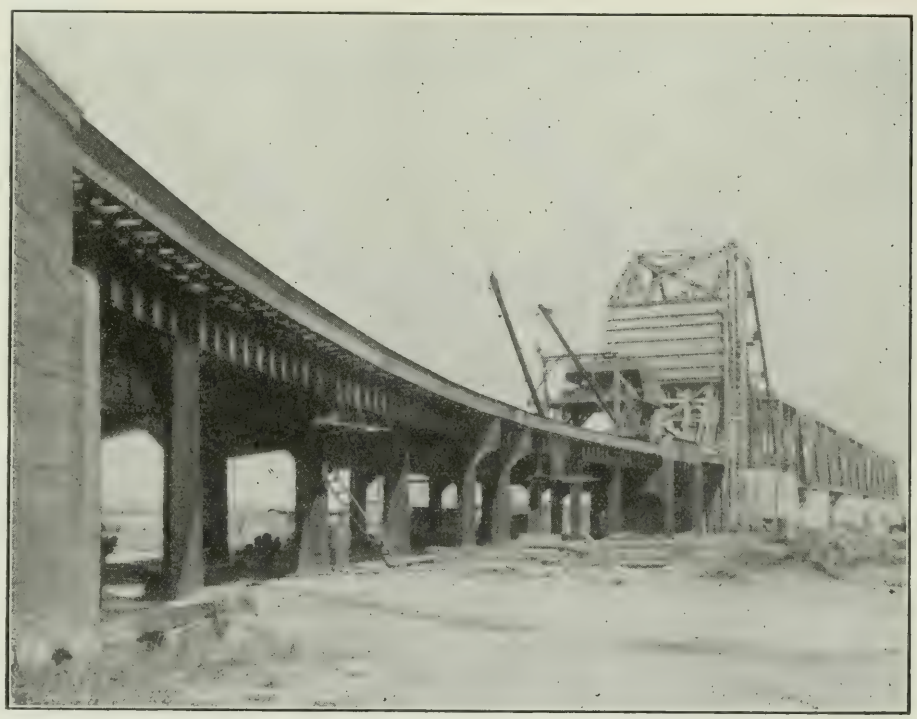

Fig. 2.—View Showing Viaduct and Erection Traveller.

The general design of substructure and superstructure was made in the Bridge Department of the Transcontinental Railway. The designing of the details of the whole of the steel work was made by the Dominion Bridge Company, of Montreal, the Strauss Bascule Bridge Company, of Chicago, furnishing the drawings and details of the Bascule span, from which the shop drawings were prepared. All detail shop drawings were made by The Dominion Bridge Co., and the steel work was manufactured by them at the Lachine shop and erected by their own erection department. The contractors for the substructure, including piers, pedestals, retaining walls, etc., were Messrs. Haney, Quinlan and Robertson, Toronto. The entire structure was completed at the end of the year 1911.

The river piers, numbered from 1 to 6 on Plate No. 1, are of concrete construction and of the dimensions shown in the plate. It has been stated that this is the only bridge in the vicinity in which the foundations rest on solid rock. The abutments and retaining walls on land are not carried down to bed rock, but rest on piles driven into the superstratum, which is a thick clay. The drawings of all concrete foundations were prepared by the National Transcontinental Railway.

The steel work was designed in accordance with the general specifications for steel superstructures of the Department of Railways and Canals, of 1908. The assumed live load was the two standard locomotives followed by the uniform train load, belonging to class "Heavy" of the specification, or a load of 120,000 lbs. on two axles 7 feet apart, whichever gave the greater stress. This live load is given in detail on Plate No. 1, and is the live load for which all Transcontinental Railway bridges are designed. To provide for impact the resultant from the dead and live load stresses is increased by the quotient of the square of the live load stress divided by the sum of the dead and live load stresses. In spans under 80 ft. in length a further allowance is made for impact by multiplying the live load by the factor $(1.40 - \frac{L}{200})$ in which L = the length of the loaded distance in feet, which produces the maximum stress. The permissible unit stress in tension on medium steel was taken at 16,000 lbs. per square inch. The allowable stress for compression was:

$$\frac{16{,}000}{1 + \left(\frac{L^2}{9{,}000\ R^2}\right)}$$

L and R both being in inches.

but in no case was the stress in compression allowed to exceed 13,000 lbs. per square inch. In the Bascule span the maximum allowable stress in either tension or compression with the bridge moving was 13,000 lbs. per sq. inch. The permissible stresses in shop rivets were for shear 10,000 lbs. per square inch, and for bearing 20,000 lbs. per square inch. All field rivets being driven by power, the number was increased ten per cent. over the number necessary for shop rivets. All rivets throughout the work were made ⅞ inch diameter.

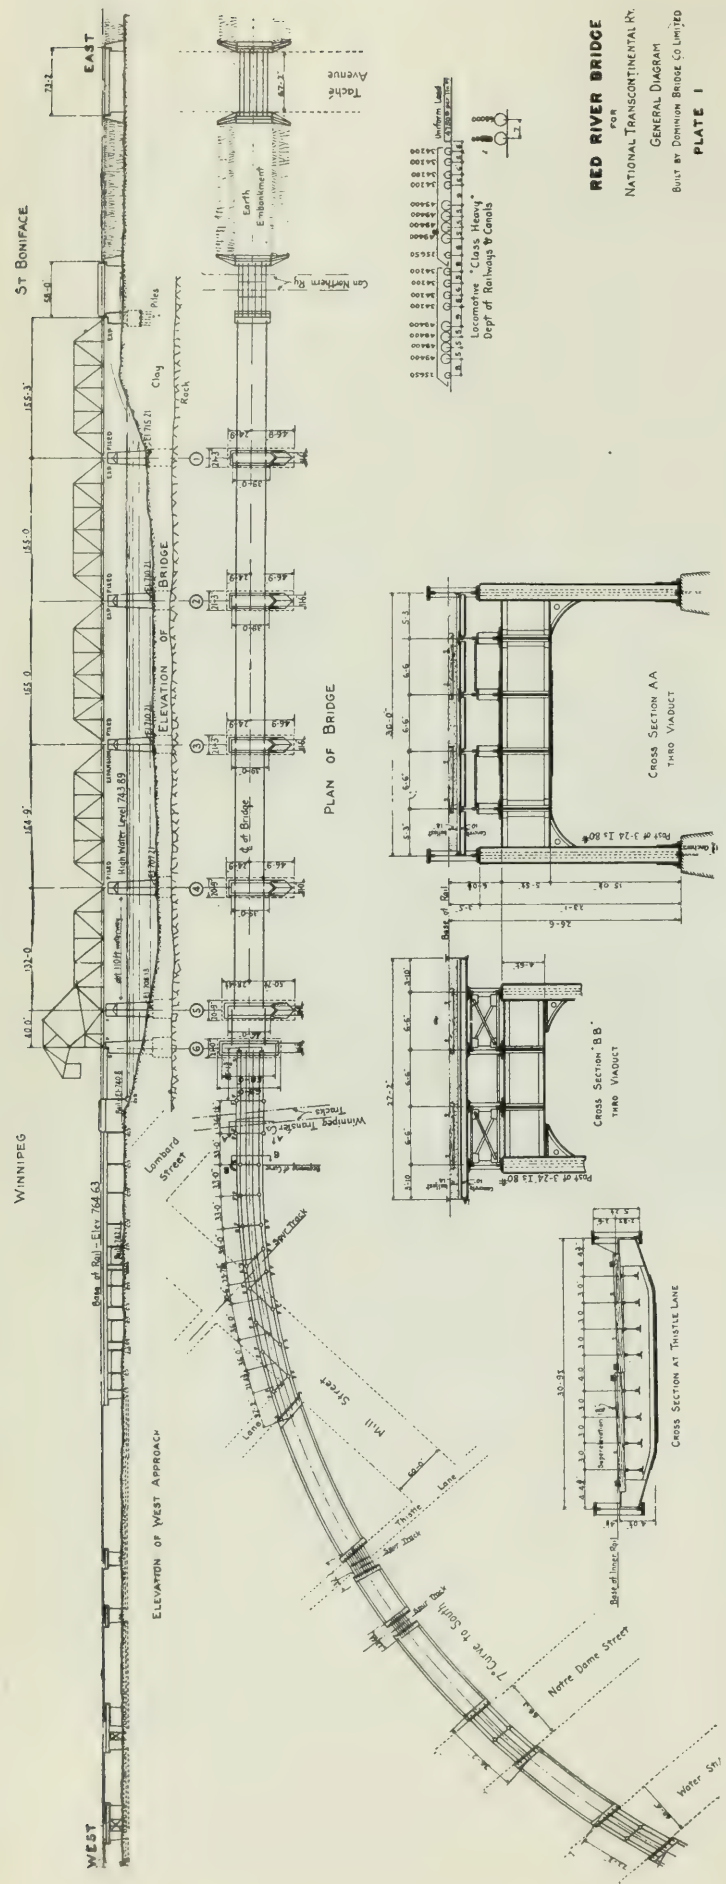
The deck span over Taché Avenue has a cross section similar to that shown on section B.B. on Plate No. 1. The cross beams carrying the concrete floor are 9 in. I's at 21 lbs. spaced 18 in. centre to centre. These rest on the top flanges

of the four main girders and cantilever out to the sides supporting facia girders 27 ft. 2 in. apart. The facia girders consist each of a 30 x 5/16 in. web with two 3 x 3 x 5/16 in. angles forming the top flange, and one 3 x 3 x 5/16 in. angle at the bottom. The top flange of the facia girders is set 4 inches above the base of the rail. The 9-in. cross beams support a concrete slab 10 in. thick, the top of which is 2¼ in. above the top of the beams. This concrete slab supports 14 inches of ballast, the top of the ballast being level with the base of rail, so that the top of the 9-in. beams is 16¼ in. below the base rail, or 20¼ in. below the top of the facia girders. The beams are connected to the facia girders with web connections and the girders are stiffened with vertical gussets from the top of every fourth cross beam. At the abutment there is an apron plate spanning from the last cross beam to the top of the ballast wall. The four main girders span the whole width of the street without posts, making a length centre to centre of end bearings of 71 ft. 0 in. They each have a 72 x 7/16 in. web plate and top and bottom flanges of two 8 x 8 x ¾ in angles, two 18 x 11/16 in. cover plates, and one 18 x ⅝ in. cover plate. These four girders are spaced traversely, making three equal spans of 6 ft. 6 in. centre to centre. There are no top laterals, as the concrete floor forms a most effectual bracing. The two girders under each track have a bottom lateral system, and all four girders are connected together with brace frames, spaced about twelve feet apart longitudinally. The pier members are of the Standard Transcontinental type, consisting of a heavy cast iron bed plate with a turned spherical disc surface on top, and a thick shoe on the girder dished on the under side to suit the disc, the shoe plate and casting together making a height of about 1 ft. 4 in.

In the 58-ft. through span over the spur tracks of the Canadian Northern Railway, the standard open floor of the Transcontinental was used with 8 x 10 in. ties notched ½ in. over the stringers, and laid in two lengths of 13 ft. 6 in. butting in the centre of the bridge, making the outer ends 7 feet from the centre line of the track. It was necessary to have 22 ft. 6 in. clearance from the base of rail of the spur tracks to the under side of the bridge, but only for a width of 7 feet over each track. It was, therefore, possible, by arranging the floor-beams to come between the tracks of the Canadian Northern, to allow their bottom flanges to be about 2 feet lower than the bottom of the stringers and main girders. The side girders are 31 feet apart and the bending moment on the floor beams consequently large, so that the extra depth thus obtained for them was most desirable. The cross section of this span is typically the same as that shown for Thistle Lane on Plate No. 1, but the outer rail has no superelevation as at Thistle Lane, and there are but two lines of stringers under each track instead of four. This span is divided by the two floor beams into three panels. The stringers—two under each rail—are built gidders, 30¼ in. deep. The floor beams have 60 x ⅜ in. webs and a flange composed of two 8 x 8 x ¾ in. angles, one 17 x 11/16 in. plate and one 17 x ⅝ in. plate. The bottom flange is curved up at the ends to meet the bottom of the main girders. The girders are 8 ft. deep, 3 ft. 3 in. below the rail and 4 ft. 9 in. above, and consist each of a 96 x ⅜ in. web and flanges of two 8 x 8 x ¾ in. angles, one 17 x ⅝ in. cover plate and two 17 x ½ in. cover plates.

Fig. 3.—Curved Western Approach, Looking From the East.

The material and general dimensions of the four 150-ft. through truss spans over the river are indicated on Plate No. 2, and Photo No. 1 gives an idea of the appearance of the completed bridge. The spans have 6 panels of 25 ft. each and are 32 ft. 0 in. deep, centre to centre of chords and 31 ft. 3 in. wide centre to centre of trusses. The main diagonals in the two centre panels were reversed from the customary direction, making them compression members when there is a symmetrical arrangement of the live load. This adds to the appearance of the truss, and it was also found to be economical on account of the reversal of stress in these members. The trusses are cambered 1⅜ in. at the centre. Longitudinal tractive force is provided for in the second and fifth panels of the bottom laterals, as shown on Plate No. 2, by the addition of some sub-laterals forming a triangular truss, the chords of which are the main laterals and the bottom flange of the floor beams, while the additional laterals and the bottom flanges of the stringers form the web members. There is no separate lateral system for the stringers, but at the centre of each panel there is a continuous line of brace frames, between the four stringers, and the centre brace frame is connected at the bottom to the intersection of the main bottom laterals. The bottom flanges of the stringers are also connected to the main laterals wherever they cross them. The portal strut and the intermediate sway struts at each truss vertical are tied to each other at their centre points and to the intersections of the main top laterals, by a continuous strut on the centre line of the bridge, of the same depth as the top chord and the intermediate struts. The intermediate struts are knee-braced to the truss verticals at each panel point. The details of the portal were arranged so that it could be set in place all riveted up without spreading the trusses. All abutting joints in the top chord were faced to bear. These top chord joints and all other joints and splices were riveted sufficiently to develop the full strength of the material. The bottom chord joints were also faced as a matter of good workmanship. The end gusset plates on the bottom chord were protected on their tops and at the ends from the weather, by a cover plate bent to conform to the profile of the gussets and bolted to connection angles on the gussets with ⅞ in. machine bolts, so that the bent covers could be removed whenever it was decided to inspect or paint the shoe diaphragms. The end reaction of 1,134,000 lbs. is taken care of by a shoe of cast steel 3½ in. thick riveted to the underside of the bottom chord, dished on the underside to a concave sperical surface of 3 feet radius to engage a lower convex casting 5 in. thick which in turn rests on three 2¼ in. plates riveted together, resting on a nest of eight 6 in. rollers, 4 ft. 3 in. long. This roller nest rests on a 2 in. plate, 4 ft. 11 in. by 5 ft. 0 in. The plate sits on the masonry with ⅜ in. sheet lead between to take up inequalities in the bridge seat. On the



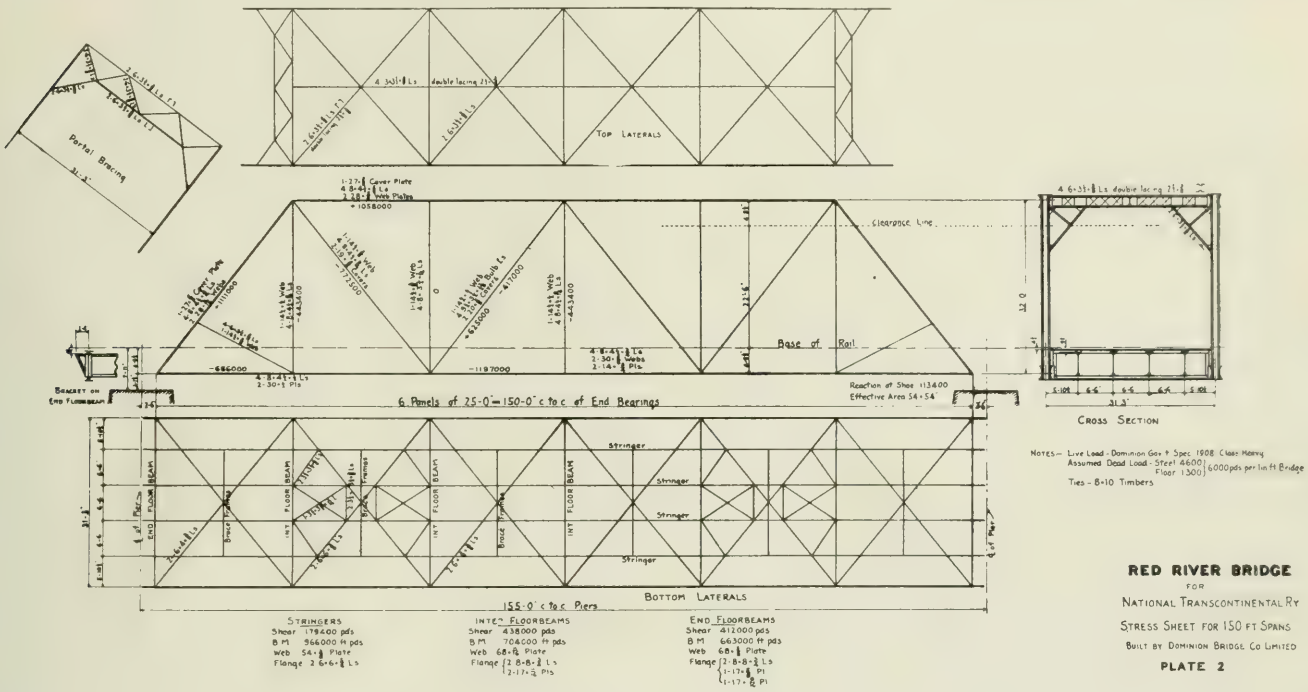
river piers there is an additional ¾ in. plate running continuously under the bed plate of the two adjacent spans. The spans are anchored at each corner by two 1¾ in. anchor bolts, 6 ft. 6 in. long, connecting to brackets on either side of the bottom chord, and running 2 feet into the masonry, set after the trusses are in place. It was desirable to have a fixed end next the toe of the bascule on pier No. 4, so the west ends of all four spans were made fixed and their east ends roller.

Leaving the bascule span in the meantime, let us note a few things in connection with the long viaduct of the western approach. Cross sections AA and BB on Plate No. 1 show typically the construction of the different portions. Except where the viaduct crosses over the tracks of the Winnipeg Transfer Co. and the other spur track, the cross section is as shown at BB, and similar to the span over Taché Avenue—four deck girders with 9-inch cross beams on top cantilevering out supporting facia girders. On the curve the superelevation of the outer rail is attained in the ballast of the floor. The longest and heaviest of the deck girders are the four spanning from pier 6 to the first bent. These are 54 ft. long centre to centre of bearings, and have each a 72 x 7/16 in. web and flanges of two 8 x 8 x ¾ in. angles, and two 18 x ½ in. cover plates. The smallest deck girder is one of 13 ft. 8 in. span at the 20 ft. 6 in. chord over the east side of Mill Street, and it has a 47 x ⅜ in. web and flanges of 2 ft. 6 in. x 4 x ⅜ in. angles. The 33-ft. girders have 46 x ½ in. webs and flanges, of two 8 x 8 x ¾ in. angles and one 18 x ⅜ in. cover plate, while the 36-ft. girders over Mill Street have 45 x 9/16 in. webs and flanges of two 8 x 8 x ¾ in. angles and one 18 x ⅝ in. cover plate. These deck girders have lateral bracing on the bottom flange only. In the 36 ft. 1¼ in. span over the Transfer tracks, deck girders would not have given sufficient under clearance, so through side girders were used, as shown on section AA, with one intermediate floor beam, which was skewed to suit the tracks and carries built stringers 27 in. deep, two under each track. The floor beam and the stringers were made flush on top with the 9-inch beams, so that these latter had to rest on shelf angles on the webs of the stringers and side girders; otherwise the construction is similar to the rest of the viaduct. A side view of this span is shown in Photo No. 1. The side girders are 70 in. deep. Crossing over the other spur track the span is only 23 ft. 7 3/16 in., so that there was no necessity for an intermediate floor beam or side girders, the stringers being plate girders 26 in. deep. Here, however, the supporting posts are only 19 ft. 6 in. apart transversely, and as the 9-inch beams do not cantilever it was necessary to put side brackets on the post, in order to carry the facia girders, which are 27 ft. 2 in. apart, and which are heavier than usual at this span, as they are designed to take the load of a derailed train, which load is ordinarily carried on the cross beams, cantilevering. The deck of the viaduct is carried throughout on posts and cross floor beams. The posts are 30 ft. apart crosswise for the through span and 19 ft. 6 in. elsewhere. The height from base of rail to top of concrete pedestals varies from 26 ft. 6 in. to 23 ft. 6 in. Most of the posts are made of three 24-in. I's at 80 lbs., but some are heavier, the heaviest being two at the sides of the Mill Street, composed of one 23½ x ⅝ in. web, four 5 x 3½ x ½ in. angles, and two 24-in. I's at 100 lbs. The heaviest cross girder is at the first bent west of pier 6, and has an 80 x ¾ in. web and flanges of two 8 x 8 x ¾ in. angles, two 18 x ½ in. plates, and

one 18 x 7/16 in. plate. Expansion was provided for at the points indicated on Plate No. 1; an apron plate was made to cover the tops of the cross beams adjacent to the expansion joint, to prevent the ballast from falling into the opening. The base of each post was anchored to the pedestal with two 1¾ in. anchors, and where a post is in a street the base is protected by a cast iron fender filled with concrete.

The cross section of the Thistle Lane span is shown on Plate No. 1. The floor beam was made parallel to the spur track. As the stringers were very close together it would have entailed considerable work to run a lateral system between them, so laterals were put only between the two centre stringers and between the side stringers and the main girders, the remaining stringers being connected up to this system with cross frames. The span over the next opening farther west is similar to the one at Thistle Lane, but it has no floor beam or side girders.

The spans at Notre Dame Street and Water Street have solid floors similar to the large viaduct, but the stringers are made flush on top with the cross beams and the side facia girders are carried on brackets from the post, as in the 23 ft. 7 3/16 in. chord of the viaduct. The stringers in both crossings are composed of one 44 x 9/16 in. web plate and flanges of two 8 x 8 x ¾ in. angles and one 18 x ⅝ in. plate. The facia girders are made 5 ft. 4¼ in. deep, which brings them flush on bottom with the main stringers and adds to the appearance of the bridges, as seen from the streets. In both cases there is a central bent, the posts and cross beams being similar to those of the long viaduct. In all cases where a ballast floor adjoins an abutment apron plates are used and the side facia girders are extended about 2 feet beyond the face of the ballast wall, so that there will be no possibility of the ballast escaping.



REINFORCED CONCRETE FOR HYPOCHLORITE SOLUTION TANKS.*

By Dr. Walter M. Cross.

During the year 1911 an experimental installation of the hypochlorite process for the approximate sterilization of the entire municipal water supply of Kansas City, Mo., was so remarkably successful in diminishing the sickness and death rate in the city on account of typhoid fever as well as other forms of intestinal disease, that the Kansas City Fire & Water Board undertook the construction of a permanent building and apparatus for the application of this purification process to the water supply.

A separate building was constructed to make possible the satisfactory storage, handling and making of the solution of hypochlorite ready for mixing with the sedimented water.

The building itself was designed by Mr. W. C. Root, architect, and the apparatus for use in connection with the sterilization process was installed under the direction and supervision of Mr. Burton Lowther, engineer in charge, and Mr. S. Y. High, superintendent of the waterworks department.

The apparatus for the handling of the hypochlorite and the supports for it are of reinforced concrete. It is to be observed that no other material is so well suited for use in connection with this sterilizing agent as good concrete for the reason that all other materials that are capable of oxidation are promptly attacked by the hypochlorite solution and become rapidly deteriorated. The prime consideration with regard to this class of installation is to employ such methods of construction and to use material that is so permanent in character as to obviate the necessity of repairs which would force the discontinuance of the application of the sterilizing agent even for an hour.

The basement of the building is used for storage of the reagent that is kept in reserve. The main floor is used to house the dilution tanks and the feeding devices, while on the floor above is placed the tank in which the hypochlorite

* From a paper presented at the eighth annual convention of the National Association of Cement Users.

is reduced to paste of a creamy consistency before being delivered to the dilution tanks beneath. This pasting tank, 3 ft. in diameter and 4 ft. high, is provided with a stirring device carrying two rather heavy rollers which are located horizontally at its lower end.

The rollers clear the bottom of the concrete tank only by a fraction of an inch, thus insuring the mashing and disintegration of all of the small lumps that are invariably present in commercial calcium hypochlorite. Owing to the fact that the action of the reagent on bronze is to form on the surface of it a fairly insoluble and protective coating of metallic carbonate and oxychloride, that metal appears to be the most available for use on all bearing and stirring or disintegrating devices that come in contact with the solution. Leading from the concrete pasting tank are pipes so arranged that the contents of the tank may be discharged into either of the large dilution tanks on the floor beneath. The outlet of the pasting tank is placed at a considerable distance from its bottom so as to avoid the possibility of drawing off with the paste any fragments of considerable size. The pipes carrying the paste are so arranged as to be readily cleaned in a few minutes in the event that they become clogged. Ultimately they are sure to become clogged if they are not occasionally cleared because of the formation in them of carbonate from carbon dioxide absorbed from the air.

The dilution tanks are hexagonal in form, 9 ft. in maximum diameter and 7 ft. high. Their walls are 6 in. thick. Although the difficulty experienced in properly disposing the reniforcing iron in the construction of a hexagonal tank is much greater than is the case in the building of a round one, the hexagonal tank is to be preferred on account of the fact that in a round tank a rotary stirrer does not produce nearly such thorough agitation and mixing of the solution of hypochlorite as the same stirrer can do in the hexagonal tank. The paste is mixed with water in the dilution tanks until a uniform solution of a strength of 2 per cent. occurs. The use of the two tanks makes it possible to adjust accurately the strength of the solution in one dilution tank while the contents of the other is being utilized. The dilution tanks are placed on supports high enough to permit the use of a gravity feed to the orifice box, which is placed on the floor of the room housing the big tanks.

Bronze pipes, 1½ in. in size, so arranged as to be readily cleaned in the event of stoppage, connect the dilution tanks with a gauging tank 4 ft. in diameter. This gauging tank contains a float, scale and pointer so arranged that the man in charge can accurately check the speed of outflow of solution from his orifice box into the big water main carrying the entire city water supply from the settling basins to the pumps. The solution passes through the gauging tank to the orifice box. Each division on the gauge represents 1 gal. of the hypochlorite solution.

The orifice box is oblong in shape and carries a float of about 250 cu. in. displacement. The float operates a valve which, by either opening slightly or closing, maintains the hypochlorite solution in the orifice box to a constant level. One end of the orifice box is of plate glass to enable the operator to see at a glance that the solution is filling the box to the proper height. Attached to the plate glass and covering a hole in it, is a hard rubber disc having near its periphery several slits, the adjustment of which represents the size of a stream of the per cent. hypochlorite solution that will be the proper amount to treat the quantity of water passing through the main. All movements of the hypochlorite solution after its preparation, are by gravity. Ample opportunity for the hypochlorite to react with any putrescible organic matter and germs in the water is afforded during the time in which the water passes through the centrifugal pumps, the flow line and a small storage basin at Turkey Creek before it is pumped to the domestic water users.

All of the stirring devices are run by an electric motor belted to a line shaft carrying clutches so placed as to make possible the running of any one of the stirrers whether or not any of the others are running.

The principle involved in the construction of practically all hypochlorite installations for the purification of water by the oxidation of germs and putrescible organic matter in municipal water supplies, is substantially the same as that in Kansas City. Concrete, usually reinforced, is universally used in the construction of all permanent apparatus for the preparation and solution of the hypochlorite for mixing with the water to be purified.

OIL-SHALE INDUSTRY.

Canadian capital interests of late have taken considerable notice of the industrial possibilities of the extraction of oil from the shale deposits of Eastern Canada. A short time back the Dominion Government conducted a number of experiments on these shales with a view of obtaining a report that would be of value in the industrial future of the properties covered by these bituminous materials. Fifty tons of the material were transported to Scotland and passed through the plant of the Pumpherston Oil Company's works, MidCalder, Edinburgh county, and from the resulting report we extract the following:

The testing of the New Brunswick oil-shales was conducted on a large scale, and with complete success, at the Pumpherston Oil Company's works, MidCalder, Edinburgh county, Scotland. The various operations were performed under the direct supervision of Dr. R. W. Ells—representing the Mines Branch of the Department of Mines, Canada—and of Mr. W. A. Hamor, assistant to Dr. Charles Baskerville, of the Science Faculty of the College of the City of New York—acting for the Albertite, Oilite and Cannel Coal Company, of that city.

In 1868 Prof. Henry Howe published a mineralogy of Nova Scotia, and concerning the oil-shales, reports in Hants county a 15 foot seam that will yield at least 20 gallons per ton. The non-productive coal-measures of Hants county afford large quantities of shale, which have led to the expectation of finding coal, but the amount of oil that they yield has not yet (1868) been ascertained. The deposits of shale in Antigonish county may be of the same age.

The centre of the Antigonish basin is occupied by highly bituminous limestone overlying the oil-coal and oil-shale beds and from this fact it is thought that the whole group is upper Devonian or lower Carboniferous rocks, which are not known in this country to contain coal beds of any value. On this point Prof. Howe mentions that in a depth of about 180 feet in the neighborhood of Windsor only one small seam of coal, some 6 inches thick, was found in 1864, and that in a shaft sunk at Hantsport in similar rocks, to a considerable depth, no coal was obtained.

The bituminous beds appear to be divided into two groups, the lower of which appears to be about 70 to 80 feet in thickness, 20 feet of which may be regarded as good oil-shale, including 5 feet of curly cannel rich in oil. The upper band, which lies in immediate contact with the limestone, cannot be much short of 150 feet in vertical thickness of strata, containing a large percentage of oil. Of this

great bed of oil-batt about 30 feet will in all probability yield from 20 to 25 gallons to the ton. The 5-ft. seam of curly cannel will yield at least 40 gallons crude oil per ton, and the 15 feet of the best section of the oil-batt will yield at least 20 gallons to the ton, and taking this as worth 25 cents per gallon at the shipping port, there are in all $370,533,325 worth of oil which can be obtained from 20 feet in thickness of strata, underlying 2,000 acres of land comprising a basin underlaid by at least 50 feet in thickness of beds rich in soil.

The quantity of oil-shale from the two mines at Pictou was about 4,000 tons, of the value of about $8.35 per ton at the place of shipment, and this was in part sent to oil-works in the United States. A portion of the stellarite was used in the Province to mix with ordinary gas coals as an enricher in the manufacture of illuminating gas. This shale was found in 1859.

By reference to Dr. H. S. Poole's map of the Pictou coal-field, published by the Geological Survey, 1904, the presence of this oil-coal is noted at a number of widely divergent points, so that it is evident that the material should occur in large quantity in this field. The raising of this mineral was stopped many years ago, on the discovery of the mineral oils in the United States shortly after 1860.

The shales tested in Scotland were from the County of Albert, N.B., and it is toward this locality that the capital referred to above has given the major portion of attention.

The commercial value of the oil-shale can be best inferred from a study of the prices and quantities obtained by distillation. Thus in the case of the shipment made from New Brunswick the yield of crude oil was found to be 40 gallons imperial, or 48 United States gallons, and of sulphate of ammonia 77 pounds. These, it may be mentioned, are practically the two most valuable substances obtained from the first distillation. A further series of distillations, or fractionations, will give other valuable by-products, but for the present the conditions attending the production of the crude oil and sulphate of ammonia may suffice, since for these two sufficient data is now available to form a fair estimate of the cost of manufacture, the value of the shales, and the possible profits to be expected from their manufacture.

Assuming the value of crude oil at present prices, per barrel, to be $0.025 per gallon, and of sulphate of ammonia, at £12 per ton, as $0.029 per pound, we have as the value of the shale tested in Scotland in 1908:—

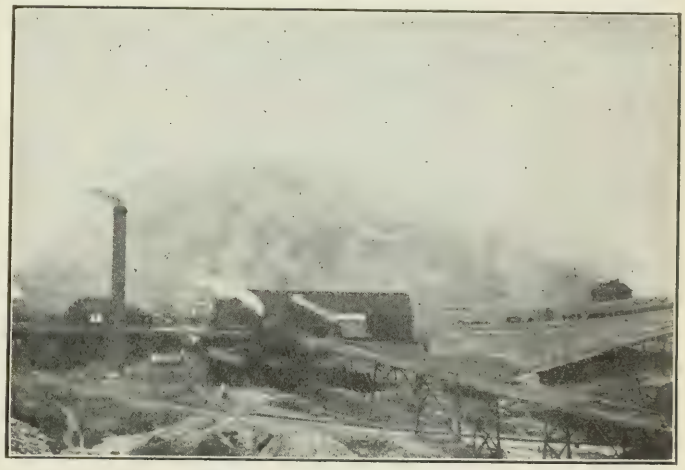
48 United States gallons crude at $0.025....	$1.20
77 pounds sulphate of ammonia at $0.029...	2.23
Bonus from government at 1½ cts. per gallon	.72
	$4.15

Should these oil-shales be worked and a new industry for Canada come into existence the engineer will find a new direction and field for the working of his profession.

Of late this great industry in Scotland has turned serious attention to the possibilities and application of electricity in the manufacture of oil from shales, and according to the Iron and Coal Trades Review, oil works in Scotland up to the year 1901 had not their power centralized or running economically, and it was often difficult to discern the nature of the work because of smoke and steam emanating from so many small steam plants. In 1901 the pioneer scheme for electrifying oil works was carried out by Messrs. J. Wishart and A. C. Thomson, of the Oakbank Oil Company, Limited, backed by a progressive board of directors. Many were sceptical, but the justification of the scheme is that nearly the whole of the Scottish oil companies have centralized their power and adopted electrical distribution. This has revolutionized the industry and enables the local firms to successfully compete with more fortunate oil companies in Russia, America, Galicia, etc., who have not to do any mining or retorting, but simply to bore for the oil.

To briefly describe the process, the shale from which the oil and ammonia are distilled outcrops in many cases at the surface. At Duddingston, for example, the mines were started in the mineral itself and the steam followed down. Some shales resemble slate in appearance, but the better qualities show a conchoidal fracture. Shale is in the Lower Carboniferous formation, and the following is a description of the working of an electric oil shale plant:—

In the upper portion of the retort the shale is heated to a temperature of 900 deg. Fah. and oil gas liberated Lower down in the retort the shale is subjected to a higher temperature, 1,700 deg. Fah. being maintained on the lower part of the retort externally. Some 80 gallons of water in the form of steam, per ton of shale, is sent into the bottom of the retort to aid in the formation of ammonia and to carry off vapours. The exhaust steam from the power-house is utilized in this way. If steam had not been necessary for this and other purposes of manufacture, oil engines would have been used as the prime mover. Exhausters are installed at the end of 24-inch gas mains and the gas is drawn from the retorts. It comes off at a high temperature



Breaker House, Showing Trams from Mine and to Retorts. Heaps of Spent Shale in Rear, Broxburn, Scotland.

and is conducted through multitubular heaters through which the feed water is passed. The temperature of the water is thus raised to 180 deg. Fah. The feed water then passes through a fuel economizer heated by the waste gases which heat the retorts externally. The feed water is at nearly 300 deg. Fah. before it goes into the boilers. After the gases have been condensed there still remains an incondensible gas which is scrubbed with water to remove the last trace of ammonia, also with mineral oil to remove the last trace of light spirit. One ton of shale can be mined and retorted on a consumption of 140 lbs. of coal.

The five boilers are of Stirling water-tube type and generate steam at 160 lbs. Chain-grate stokers are fitted, also an undertype conveyer for carrying away the ashes. The fuel is a dross having a mean calorific value of 10,700 B.Th.U. A CO_2 recorder is fitted which takes periodical quantitative analyses of the flue gases. It usually records 11 per cent. CO_2 gas.

The generating plant consists of two Westinghouse single-acting compound two-cylinder 18 by 30 by 16-inch engines coupled to Westinghouse 200-kw. alternators with belt-driven exciters; two Belliss-Morcom double-acting compound three-cylinder 21 by 23 by 16-inch engines and 500-kw. Twenty-five-cycle 3-phase Westinghouse alternators with direct-driven exciters. Each set has a generator panel consisting of isolating links, current transformer and ammeters, potential transformer, synchronizer, voltmeter plug and automatic oil switch. There are two shunt rheostats in the exciter field, one being mounted on the floor level for emergency, the other on the switchboard. There is also a rheostat in the rotating field. There are three single-phase (shell type) transformers 100-kw. each and one spare, transforming from 3,300 to 440 volts, and three 37 kw. single-phase and one spare to operate a 100-kw. rotary converter for use on the trolley wire. Another rotary of 150 kw. is also installed at the mines two miles away. They are run in parallel, both on A.C. and D.C. sides, which makes the drop on the D.C. a minimum. The transformers are delta on the high-tension and low-tension sides. The generators are star wound, the neutral being insulated.

The installation runs for months without a circuit-breaker coming out. The motor-driven exhausters have run for five years with a stop of only 1½ hours.

The trolley wire is No. 00, and the traction equipment consists of two locomotives each having two 25-horse-power series tramway motors geared to the axles. The armatures are in parallel, one resistance being used for both. The controllers are of tramway type with magnetic blow outs. Each locomotive will haul 20 wagons each containing 26 to 30 cwts. of shale. The wagons weigh 15 cwts. each.

A third locomotive has side rods and is fitted with a 100-horse-power series motor. It will haul 40 wagons. As the trolley wire has to pass under two roads and a railway arch it runs from 10 to 16 ft. above the ground. The trolley pole successfully follows the wire by the use of a long spring of 5-16 section and 33 turns 3-inch diameter.

The high-tension line has also to pass under the bridges and it is trifurcated into three-core cables at each bridge. The cable provides a good method of transposing the line. The trifurcating boxes are covered over, and the leads go through porcelain tubes. The reason for covering the box over was that the sun tended to soften the bitumen, and in one instance rain got in and caused a short in the box. Lightning has been on the lines twelve times, and none of the three cores has gone to earth.

The separation of costs in the operation of the plant is exceedingly difficult, as all economies are based upon lbs. of coal per ton of shale. The power required per ton of shale mined and retorted is eight kilowatts. The cost of running the power house, with maintenance, is 0.08d. per kw.-hour. The cost of running the locomotives is 0.05d. per ton mile. This includes cost of electric energy and the maintenance, etc. The steam consumption of the generating plant is 28.5 lbs. per kw.-hour, non-condensing.

THE STRIKE SITUATION.

There were three more strikes in existence, according to the Department of Labor's monthly record, in Canada during March than in February, and three more than in March, 1911. About 14 firms and 2,000 employees were involved. The loss in working days was estimated at 44,800, compared with 10,080 in February, and 33,600 in March, 1911. The only strike involving more than 200 employees was one of tailors at Toronto.

STRESSES IN FLOOR SYSTEMS OF REINFORCED CONCRETE BUILDINGS.

The following are extracts from the report of the Committee on Reinforced Concrete and Building Laws as presented by Prof. A. N. Talbot at the eighth annual convention of the National Association of Cement Users. The tests described in this report were made in the Wenalden building in Chicago and the Turner-Carter building in Brooklyn, both buildings of the beam and girder type of construction. The tests were conducted by members of the staff of the Engineering Experiment Station of the University of Illinois under the direct supervision of Professor A. N. Talbot and with the aid and co-operation of the contractors for both buildings.

The general method of the testing followed the plan outlined by Mr. Arthur R. Lord in the paper, "A Test of a Flat Slab Floor in a Reinforced Concrete Building," presented at the New York Convention. Holes were cut in the concrete until the reinforcing bars were bared and gauge holes were then drilled in these bars with spacings such as to give the proper gauge lengths. Where measurements of deformation of the concrete were desired, holes were cut in the concrete and a steel plug inserted in which the gauge holes were later drilled. These gauge lines were selected in places where it was thought that critical stresses would be determined. In some places for one reason or another the reinforcing bars were inaccessible and it was impracticable to obtain measurements to give information which would have been of interest. In some cases a series of gauge lines were used to determine the change of stress or distribution from one point to another as at the end of a restrained beam and across the flat slab between beams.

The measurements were made by means of Berry extensometers of the form developed at the University of Illinois. The instrument reads to 1/5,000 in. and is estimated to 1/10,000 in. In making measurement the legs of the instrument were inserted in the gauge holes, a reading taken, the instrument taken out and again inserted and read, and this proceeding repeated until a number of readings without serious discrepancies were found.

Wenalden Building Test.—The Wenalden building is a ten-storey reinforced structure located at 18th and Lumber Streets, Chicago. It was built by the Ferro-Concrete Construction Company, Cincinnati, Ohio, in accordance with the plans and specifications of Howard Chapman, architect. It is now occupied by Carson, Pirie, Scott & Company as a warehouse. The building is of the beam and girder type, with floor panels 15 by 20 ft. The girders are placed between columns in the short direction. Floor beams extend the long way of the panel, there being two intermediate beams built into and supported by the girders and a column beam built into and supported by the columns. The floor, 3⅞ in. thick (including the top finish), was built continuously with the beams and girders.

The reinforcement is the form used by the Ferro-Concrete Construction Company. The main reinforcing bars (twisted bars) are carried along the bottom of the beam from the end of a panel to a point beyond the middle of the panel where they are bent up to the top of the beam and carried horizontally to a corresponding point on the other side of the support, then bent down and continued along the bottom of the beam to the end of the next panel, these reinforcing bars thus having a length of two panels. In

the intermediate beams at the bottom and middle there are four rods ¾ in. square and in the side beams one rod ¾ in. square and three rods ⅝ in. square. In the girders there are four rods ⅞ in. square, the disposition of which is similar to that in the beams. By this plan there is twice as much of the main reinforcing steel in the bottom of the beam or girder at the middle of the span as there is at the top over the supports, except that four ⅜-in. square rods placed in the floor slab are also availale for end reinforcement of the intermediate beams. The beams are 6¼ in. wide and the girders 7½ in. The general position of the reinforcement is shown in the accompanying drawing. The position of the vertical stirrups is not shown.

The contractors report that the concrete was composed of one part Portland Cement, two parts torpedo sand, and four parts crushed limestone. Although the building was not fully completed when the test was made, the floor test had been built more than 12 months before the time of the test.

Method of Testing.—The test was made on the first floor of the building, which was the only one which could be reached with the loading material. At various points at the top and bottom of beams the holes were dug into the concrete until the reinforcement was bared and small gauge holes were drilled in the bars 6 or 10 inches apart for use in inserting the instruments with which the measurements of elongation were made. Where stresses in the concrete were to be measured, holes were cut in the concrete and short pieces of steel were set in plaster of paris. Gauge holes were drilled in these steel inserts in such a way as to give gauge lines 6 or 10 inches long. For the work of measuring deflections, steel balls were affixed to the under side of beams and girders at various places and other balls were placed about 7 in. lower on supports which had been built up independently of the observing platforms. A number of these points of deflection were used to determine the inflection points of the beams.

For any observation several instrument readings, usually five, were taken on each gauge line and these were averaged. Measurements were made on the calibration bar before and after each series of observations to permit corrections for instrumental changes.

Method of Loading.—The floor was designed for a live load of 200 lb. per square foot and the test load was made 400 lb. per square foot over panels loaded.

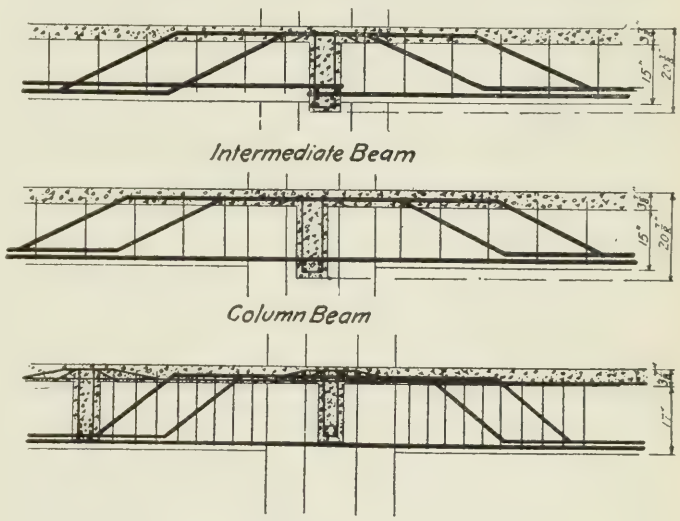
The loading was done by piling brick and bags of cement in piers separated by aisles in such a way as to give access for points of measurements and to prevent arching effects influencing the tests. The load was put on in increments of about 80 lb. per square foot of the total panel area, and a set of observations was taken at each increment of load. Brick was used in the first part of the loading and cement in the later work. The average weight of the brick was determined by weighing a considerable number and such care was given to determine the number of brick and sacks of cement that it is believed the weights of these materials are accurately known.

The following is the general plan of the test. A single panel was first loaded and this load was then removed. The load was then applied on three panels in tandem. Then, leaving this load on, a load was applied along three adjacent panels covering two-thirds of the width and making in all the equivalent of five loaded panels. The total load, which amounted to 60,000 lb., was then taken off by increments.

The Deformations and Stresses.—The results of observations for various gauge lines were plotted and from a study of these it was readily seen that the general trend of some of the lines should be taken rather than the absolute values.

In translating from unit-deformation to unit-stress the modulus of elasticity of steel was taken at 30,000,000 lb. per square inch and that of the concrete has been assumed to be 3,000,000 lb. per square inch. For simplicity the straight. line stress-deformation relation for concrete has been assumed, though it is evident that this relation does not hold for the higher stresses and that calculated stresses based upon this assumption are in excess of the actual stress The interpreted stress for a number of gauge lines is recorded in Table 1.

Table 2 gives calculated stresses and calculated bending moment coefficients. The first line of each set gives the calculated stresses in the reinforcement and in the concrete based upon the value of the bending moment quite commonly assumed in design calculations, 1/12 Wl, where W is the total distributed load on the beam and l is the span length. In these cases the span length was taken as 3 in. longer than the clear span. Measurements had been made upon the position of the bars and the depth of the reinforcement which were not always exactly according to the plans, and the calculations have been based upon the dimensions found. In the second line of each group the maximum stress obtained in the measurements is given in the column of stresses, and the bending moment coefficient (the coefficient of Wl) corresponding to these stresses is recorded in the adjacent column. In these calculations the common assumptions of design calculations are followed



Reinforcement in Wenalden Building.

except that the width of a T-beam is taken as equal to the distance from center to center of beams. In calculating the bending moment coefficient from the measured stress, the position of the neutral axis and the value of the moment arm are assumed to be the same as given by the ordinary assumptions. Although the stress in the reinforcement is measured at the surface of a bar of the outer layer, this stress is considered as being the same as that acting at the center of gravity of the group of bars, for the actual variation in the group is unknown and this method will give a bending moment coefficient larger than that found by considering that the stress in the bars of the other layer is smaller.

Table 1.—Stress Indications in Wenalden Building Test.

	Single Panel	Three Panels	Five Panels
Reinforcement at end of girder	.....	8,000	7,000
	7,000	12,000	13,000
	.....	.....	9,000
Reinforcement at middle of girder...	.....	10,000	11,000
	8,000	14,000	17,000
	6,000	16,000	17,000
Concrete at end of girder	1,100	1,600	2,200
Reinforcement at end of intermediate beam	.....	9,000	10,000
	2,000	9,000	14,000
	9,000	14,000	14,000
	9,000	16,000	16,000
	11,000	13,000	13,000
	13,000	13,000	14,000
Reinforcement at middle of intermediate beam	.....	14,000	16,000
	8,000	7,000	11,000
	.....	16,000	16,000
	6,000	11,000	11,000
Concrete at end of intermediate beam	.....	.....	1,300
	1,500	1,700	2,000
Concrete at middle of intermediate beam	Low	Low	Low

Table 2.—Maximum Stresses and Moment Coefficients in Wenalden Building Test.

Member	Reinforcement Stress	Reinforcement Coeffiient	Concrete Stress	Concrete Coefficient
Girder End	47,000	1/12	2,600	1/12
" End	13,000	0.023	2,200	0.07
" Middle	19,000	1/12	420	1/12
" Middle	17,000	0.075	.....	....

" End ..	15,000	0.019	.....	....
" Middle.	26,000	1/12	.....	....
" Middle.	11,000	0.035	.....	....

It will be seen that in the tests with three and five panels loaded the highest stress observed in the reinforcement in the middle of the intermdiate beams was 16,000 lb. per square inch and the highest stress observed at the ends of the beams was 16,000 lb. per square inch. The stresses observed in bars having similar positions were lower, and probably the highest stress is not representative of the general stresses. However, it may be best to make comparison on the basis of the highest stresses.

The bending moment given in the table as derived from the measured stresses is 0.06 Wl at the middle of the beam and 0.037 at the end of the beam. Measurement of the compression of the concrete in this test was less satisfactory than the measurement of the reinforcement deformations, and considerable variation was found at the different points of observation. Not enough gauge lines gave satisfactory measurement to warrant making quantitative conclusions, but the indications of the action of the concrete may be useful. The value of the bending moment which corresponds to the concrete stresses, on the assumptions made, is 0.067 Wl for the end of the beam. For the middle of the beam the stresses were so small and the indications so irregular that no value of bending moment can be given.

In the beams at the sides of the panel (column beams) the stresses were in general somewhat lower, but with a full loading a stress of 15,000 lb. per square inch at the middle of the beam was observed and 11,000 lb. per square inch at the end.

Fewer measurements were made on the reinforcement of the girder. A stress of 17,000 lb. per square inch was observed at the middle of the girder and 13,000 lb. per square inch at the end. On the same assumptions these values correspond to bending moments of 0.075 Wl and 0.023 Wl, respectively. The stress in the concrete at the end of the girder was also very high, but the corresponding bending moment (0.07 Wl) is less than that for a restraining beam.

Calculating with the usual assumptions of beam formulas, the total compressive stress in the concrete at the end of the beam is greater than the total tensile stress in the reinforcement. Two elements probably enter into the results, the tensile strength of concrete which may be considerable as distributed over the width of the floor, and an arching action of the structure. However, it should be noted that the value of the bending moment coefficient derived from the reinforcement stresses at the middle of the beams and girder is not much less than values commonly used and also that the calculated resisting moment developed at the end of the beam based on the concrete stresses is not far below the amount usually assumed.

Attention should be called to the fact that the compressive stress in the concrete, both that calculated from an assumed bending moment and that calculated from the measured deformation, is much higher than that to be found by the use of the parabolic stress deformation relation and the actual stress will be less than that given in the table.

Measurements were made on the concrete at the top of the floor slabs in a direction parallel with the beams to find the distribution of compressive stresses between beams. These measurements were not fully satisfactory, but within the limits of accuracy of the measurements no difference in the amount of shortening over the beam and at points between beams could be determined and the whole floor evidently acted as a part of the compression member of the T-beam so formed.

Test Cracks.—The surface of the beam and girder had received a white coat, which permitted very fine cracks to be detected, much finer than may be observed on uncoated concrete. In the test, as the load was applied, fine tension cracks in the concrete through the middle of the length of the beam were observable at stresses in the reinforcement corresponding to the stresses at which load cracks are detected in the tests of beams in laboratory work. To an experienced observer development of the cracks was confirmation of the measurements of the low stresses developed in the reinforcement. Upon removal of the load most of these cracks closed until they were not visible to the eye.

As the calculated reaction on the end of a girder was upward of 40,000 lb., it will be seen that the vertical shearing stresses were very high. Diagonal tension cracks developed in these girders just outside the junction with the intermediate beams, making an angle of nearly 45 deg. with the horizontal. These cracks did not entirely close on the removal of the load. No measurements were taken to determine the diagonal deformations. It seems probable that the restraint at the end of the girder and the tensile strength of the concrete acted to prevent the fuller development of these cracks. No diagonal cracks were observed in the beams. As may be expected, the deflection in the middle panel was greater for one panel loaded than when three panels were loaded.

POTASH IN "BORAX LAKE."

The two Federal Bureaus of the United States engaged in the search for potash—the Bureau of Soils of the Department of Agriculture, and the Geological Survey of the Department of the Interior—are in receipt of promising telegraphic news from their field representatives. A potash deposit of apparently great importance has been discovered at Borax or Searles Lake in the northwestern corner of San Bernardino County, California. This lake or playa is the last remaining pocket of a once much greater lake which has almost dried up and its central depression contains a large body of crystalline salts known to consist of common salt and sulphate and carbonate of soda with smaller quantities of borax. This salt body is saturated with brine, and interested persons, stimulated by the governmental search for potash, recently secured an analysis of old sample material from this brine. The result being significant, the lake was visited jointly by representatives of the Geological Survey and of the Bureau of Soils, who took brine samples from six wells distributed over the salt flat. Analyses of these samples have been made by the co-operative laboratory at the Mackay School of Mines, at Reno, Nevada, and show an average of 6.78 per cent. of potassium oxide (K_2O) in solution. The average salinity of the brine is 43.82 grams of the solids per one hundred cubic centimeters. Comparison of results indicates that the brines are nearly uniform throughout the flat. The probable importance of the deposit is due to the occurrence of the potassium salts in soluble form in a natural saturated brine, and under climatic and other conditions especially favorable to its separation and recovery by solar evaporation. Existing data give reasonable assurance that the brine saturated salt body is at least 60 feet thick and covers an area of at least eleven square miles. Assuming the salt body to contain twenty-five per cent by volume of the brine, the total amount of potassium oxide is estimated at over four million short tons. This estimate is believed to be very conservative, and the available tonnage may well be expected to exceed ten million tons, which would supply the country, at the present rate of consumption of potash, for thirty years. At any rate, it appears that this locality constitutes a very important source of potash in probably readily available commercial form.

Methods of separating potash from brines are now under investigation by the Bureau of Soils.

Borax Lake or Searles Lake is one of the many playas or intermittently wet and dry lakes common throughout the arid regions of the West. It lies between the Argus and Slate ranges, in the Mohave Desert of Southern California. Borax Lake was the original scene of the famous 20-mule team borax mine, the borax being hauled in great wagons drawn by 20 to 28 big mules to the Southern Pacific Railroad at Mohave, a distance of 80 miles. The lake or flat is about 10 miles long and 5 miles wide, and has received the drainage from the surrounding hills for many thousands of years, vast quantities of dissolved minerals being thus concentrated in it. The water has been evaporated under the intense heat of the long, hot seasons, but the salts have remained, so that for most of the year, in fact often throughout the year, the bed is a glistening plain of white salts, in attempting to cross which under a brazen sun men have lost their lives.

The mirage plays its strange tricks here, and at the dryest places the traveller can generally see what appears to be a broad expanse of water covering the bed a little way ahead—always a little distance off, until he approaches the shore of Borax Lake. Then, when he looks behind him, he sees the water apparently covering the ground over which he has just come. The lake occupies a valley made by faults—breaks and slips in the earth's crust—where a great area has been dropped down. Borings have been made through the mud and water underlying the lake to a depth of some hundreds of feet, the deepest borings made bringing up hot mud.

A reconnaissance of the general region was made by one of the geologists of the United States Geological Survey in 1900, and is described in the Survey's Bulletin 200, now out of print. Borax Lake itself, however, was not visited. The lake is also shown on a map in Water-Supply Paper 224 of the Survey, "Some Desert Watering Places in Southeastern California and Southwestern Nevada." Its nearest railroad is the Owenyo branch of the Southern Pacific, running from Mohave past Owens Lake. Borax Lake is situated about 20 miles from the station of Searles, on this railroad.

Many useful and curious minerals are found in the muds and other deposits of Borax Lake, including, of course, borax. Among them are gypsum, glauberite, carbonate and sulphate of soda, salt, thenardite and hanskite. The last carries as much as 2.33 per cent. of potassium, equivalent to 4.44 per cent. of potassium chloride.

The salts are not evenly distributed over the surface of the lake. Borax was found plentifully over about 3 square miles, common salt is everywhere, and sodium carbonate and sodium sulphate are widely distributed. One boring is said to have passed through 28 feet of solid trona (hydrous carbonate of soda) of great purity. At other places there is 25 feet of solid mixed sulphate and carbonate of soda with smaller quantities of other salts. Although the lake bed is dry most of the time, a few inches under the outer crust there is always water—a bittern heavily impregnated with salts.

Several years ago an English company attempted to work the soda deposits on an extensive scale, but for some reason the work has not been pushed. This company sunk a number of wells, casing them through the soda deposits. It was found that a heavy stream of water could be pumped continuously without preceptibly lowering the water level. Potassium chloride and sulphate, the forms in which potash salts are most likely to be found in such deposits, are among the most soluble of salts and are likely to be much more generally diffused than salts less easily soluble. That the entire body of water and mud in the lake contains potash in a more or less uniform degree, is indicated by the results thus far attained. However, there are modifying agencies, such as springs and streams, that bring in fresh water, for the movement of water through the lake will be slow owing to the presence of the sand and salts that fill the basin.

RAILLESS TRAMS IN LONDON.

It is announced by the Highway Committee of the London County Council that they have decided provisionally to recommend the council in due course to seek authority in the Session of Parliament of 1913 to enable it to run cars on the railless trolley system of electric traction on certain routes. In order that the information which will be required to be given as evidence in support of the bill may be prepared, it will be necessary for certain experiments to be carried out and for diagrams and drawings to be made, and they therefore ask the council to sanction the expenditure of $1,000 for this purpose.

BRIDGES AND RAILWAYS IN NOVA SCOTIA.

It must appear to a casual observer that the eastern portions of this country do not, in a general way, receive the same amount of publicity as falls to the lot of the central and western parts. The reason for this might be difficult to state, but that the Province of Nova Scotia is not lacking in government engineering enterprise is amply demonstrated by a report recently issued from the offices of the Provincial Engineer at Halifax. In this report the matter of provincial railways is shown to be in a satisfactory condition, but no construction work was attempted during the past year. Railway surveys and preparations, however, have been exceedingly active.

The Intercolonial Railway with a mileage of 467 miles, owned and operated by the Federal Government, and coming under the control of the Minister of Railways; the Dominion Atlantic Railway with a mileage of 221 miles, coming under the jurisdiction of the Railway Commission; and the following lines coming under the jurisdiction of the Government of Nova Scotia and therefore under this Department:—

Cape Breton Railway Company with a mileage of	31	miles.
Colchester Coal and Ry. Co. with a "	4	"
Cumberland Coal and Ry. Co. with a "	32	"
Halifax and South Western Railway—		
Halifax to Yarmouth with a "	247	"
Bridgewater to Middleton with a "	55	"
Liverpool and Milton with a "	5	"
Mahone to Lunenburg with a "	7	"
Caledonia Branch with a "	22	"
Victoria Beach Branch with a "	40	"
Inverness Railway and Coal Co. with a "	61	"
Maritime Coal, Ry. & Power Co. with a "	15	"
Midland Railway with a "	58	"
Minudie Railway Company with a "	6	"
Nova Scotia Steel & Coal Co.'s. Ry. with a "	12	"
Sydney and Louisburg Railway with a "	52	"

A total of ten companies with a mileage of 647 miles.

Owing to the fact that there has been little or no railway construction in the Province for the last two or three years, whereas the railway mileage in Canada has increased very greatly, Nova Scotia, which three years ago had one mile of railway for about every three hundred and fifty people and which had almost as much mileage in proportion to its population as any part of Canada, is now somewhat behind in that respect.

The last returns show a mileage of 1,333 in Nova Scotia for a population of about 500,000 or one mile for every 370 people whereas that of Canada shows a mileage of 25,400 with a population of 7,200,000 or one mile for every 285 people.

On the completion, however, of the Halifax and Guysboro Railway, which is now an assured fact and which will add about 10 per cent. to the mileage in Nova Scotia, this will probably bring us very nearly up to the same proportion as that of Canada and in any case will then provide almost all parts of Nova Scotia with railway accommodation.

The returns for the year show an increase of nearly twenty per cent., so that there is a general improvement as regards gross receipts. As regards operating expenses there is also a considerable increase, so as to overbalance in some cases the increase in receipts, thus reducing the net receipts below that of last year. On the whole, however, there is ms a general increase in the net receipts, there being an increase in the Inverness Railway and Coal Company, the Maritime Coal, Railway and Power Company and the Sydney and Louisburg Railway.

As has happened for the last four or five years, the Cape Breton Railway and the Nova Scotia Steel Company's Railway show a loss on operation for the year. The Sydney and Louisburg, the Maritime Coal, Railway and Power Company and the Inverness Railway and Coal Company show a profit of between $1,500 and $1.650 per mile, equal to over five per cent. on $30,000 per mile, certainly a very good showing. The Halifax and South Western Railway and the Cumberland Railway and Coal Company show a small profit.

If we examine the operating expenses, however, we find as usual a great difference between the various companies, but not nearly as much as usual. This is probably due not so much to the fact, that there has been a change in the working of some of the lines, but that the figures are more correctly made up as far as train mileage is concerned.

The receipts per mile vary from $280 in the case of the Cape Breton Railway Company to $8,763 in the case of the Sydney and Louisburg Railway and the operating expenses from $587 in the case of the Cape Breton Railway Company to $7,134 in the case of the Sydney and Louisburg Railway.

The Government of Nova Scotia undertakes the construction of all large bridges and the majority of these bridges are of iron and steel superstructure with abutments of concrete. The steel superstructure is in all cases let by tender and contract, the contract including not only the supplying of the materials but its erection and the providing of the flooring. The piers and abutments are constructed and built by the Department by day labor. During the past year contracts for the erection of the iron and steel portions of eighteen bridges, with a total of twenty-seven spans. The largest of these bridges was constructed at Wallace Harbour, N.S. The distance across this stretch is 3,110 feet.

After careful examination it was decided that the most economical method would be to build five spans of 100 feet, one of 150 feet crossing the main channel and a draw span of 100 feet, making a total of seven hundred and seventy-three feet over all, including the piers, with an embankment of earth protected with stone for the remaining twenty-one hundred feet.

Careful soundings were taken, and in the channel at a depth of 27 feet below low tide mud and oyster shells were encountered, which continued for about 25 feet more to solid rock. This rock was found to continue across the whole bed of the stream at pretty much the same level, but rose gradually towards the shore. The surface of the mud at the abutments being about 12 feet, and the surface of the rock about 18 feet below high water.

Owing to the prevalence of the Teredo it was necessary to have all the submerged timber in the foundation creosoted. Creosoted cribs were built on the shore and floated into place, piles were driven, spaced about 4 feet apart, and the cribs were filled with rock, the whole being brought up to a little above low water. On this foundation the concrete was started, and carried up to the top of the piers and the whole work was done by day labor. The embankment of earth and stone contained about thirty-seven thousand yards.

This work was carried on along with the work of the substructure under the superintendence of Mr. Thomas Rawding, and the season closed with the work practically completed and for a much less sum than that of the lowest tender and the whole work reflects great credit on the skill and economy with which it was carried out by the superintendent.

The Canadian Engineer

ESTABLISHED 1893.

ISSUED WEEKLY in the interests of the CIVIL, MECHANICAL, STRUCTURAL, ELECTRICAL, MARINE AND MINING ENGINEER, THE SURVEYOR, THE MANUFACTURER, AND THE CONTRACTOR.

Managing Director: JAMES J. SALMOND.
Managing Editor: T. H. HOGG, B.A.Sc.
Advertising Manager: A. E. JENNINGS.

ICEBERG DETECTION.

The recent terrible catastrophe, in which the White Star liner, Titanic, collided with an iceberg on her initial trip, brings to mind a question of the possibilities of preventing such accidents. The detection of icebergs by means of thermometer reading has been considered for some time, but until within the last few years no practical results seemed possible. About eleven years ago Dr. H. T. Barnes Macdonald, Professor of Physics of McGill University, investigated the condition underlying the formation of frazil and anchorites by means of the micro-thermometer. Since that time the micro-thermometer has been developed, until now it is possible to determine temperature variations of water of a few thousandths of a degree. This highly-developed instrument records temperature so minutely as to pick out the slightest variation in sea temperature, and opens up a new field of work in studying the small variations in the surface temperature of the sea. Investigations carried on during the past two years show that the micro-thermometer is capable of recording a temperature gradient of one-tenth of a degree per mile with accuracy. There appears to be little question that it will become an important instrument in the detection of icebergs in ocean travel, for the tests already made show that it is capable of such detection up to a distance of two miles, and the effect remains for seven miles past the berg. If the Titanic had been equipped with such an instrument, even at the present state of its development, no doubt the accident would have been prevented.

As noted by Dr. Barnes, there remain a number of problems to be solved in connection with the successful application of the micro-thermometer to the detection of icebergs. They are, however, academic questions, and, while it is unsafe to predict the whole result of the most unfavorable conditions until experiments are actually tried, still it appears that where navigation is most important the conditions are the best for the operation of the micro-thermometer.

WATER POWERS IN NEW YORK STATE.

During the past five or six years there has been great agitation throughout New York State to induce the Legislature to take over the development of all water powers, and the generation, transmission and sale of electric power to the municipalities and factories of the State. Up to the present time, those favorable to the proposal have been unable to secure legislation. On March 27th a measure was passed by the Senate, in line with the State Conservation Commission requests, providing for the development of the State-controlled water powers. Considerable objection was raised to the measure, it being claimed by the opponents of the bill that if the State developed its water powers they would be compelled to buy private water powers and establish steam plants to be able to furnish 1,500,000 horse-power, which is the amount used in the State, as the State water powers have a maximum capacity of only 220,000 horse-power. In his explanation of the provisions of the bill, Senator Bayne stated that it proposed to give the people the sole benefit from the development of the water powers of the State, and the consequent generation of electricity, instead of turning the State resources over to private corporations. Under this bill the State will develop and distribute electric power made possible by the construction of water storage dams directly to muni-

cipalities and factories, without permitting private corporations to act as middlemen.

If the above measure is carried into force, as no doubt it will, it will be a great benefit to the citizens of the States. The State-owned water powers are practically all of them storage propositions, so that their development will mean many other advantages to the State, in the prevention of flood conditions and the conservation and regulation of the water supplies.

New York State has gone a step farther than the Province of Ontario, in that the State will develop its own power, while the Province only distributes power bought. It is only a question of time, however, until Ontario, if the Hydro-Electric policy is to be a success, must develop auxiliary water powers to tie with the present system, in order to relieve peak load condition, and this, no doubt, will mean water storage conditions similar to those confronting New York State.

GAS-ELECTRIC CARS.

The development of the steam locomotive has almost reached a climax. The highest possible state of efficiency has been obtained, and, while it may increase in size, still the steam locomotive as a piece of mechanism is very nearly perfection. The application of oil fuel to the locomotive has opened up the final field, and a number of these oil-burning locomotives are now being used in the West. A new era has dawned for Canadian roads in the use of the gas-electric motor car on a steam line. The Canadian Northern Railway have just bought a new gas-electric car for tourist use between Quebec and Indian Lorette. This is the first car of its type to be used in Canada, and the Canadian Northern are to be congratulated on their enterprise. The cost of operation of such a car, including all maintenance charges, roadbed, etc., averages about eighteen to twenty cents per car mile, although on one line in the United States the operation costs have been reduced to about eleven cents per car mile. The cost compares very favorably with the electric trolley, and there seems to be no reason why there should not be a widespread use for these cars in Canada. For suburban service and for building up feeder and branch lines their use is amply justified, and there is no doubt, now that the car has been developed to a practical state of efficiency, that other roads will see the advantages of their use.

EDITORIAL COMMENT.

The University of Manitoba has been having many difficulties with regard to methods of finance. The early days of educational institutions are usually troubled ones. We are glad, however, to understand that the University Council and the Provincial Premier have had a conference, at which it was decided to re-organize the University and provide additional land for expansion.

* * * *

Steel street cars are rapidly growing in favor. There have been many new installations recently in the United States and a few in Canada. The Ottawa Electric Street Railway Company has just placed an order for twenty new steel cars, the entire construction throughout being of steel, except for the doors and windows. As wood becomes more and more costly and the uses for steel increase, we will probably see greater numbers of these cars in use.

ONTARIO PORT ON HUDSON BAY.

Now that Ontario is to have a port on Hudson Bay, the harbor facilities on James Bay are a matter of considerable importance. Mr. Sydney C. Ells has completed a report of an exploration trip in that vicinity.

From time to time and in a very general way in considering a possible terminus on tide water at James Bay, the estuaries of three rivers—the Albany, the Moose and the Harricanaw—have usually been mentioned. All three streams are of considerable size, are old-established canoe routes—especially the Albany and the Moose—and all lie within the boundaries of the Province of Ontario. Incidentally, it may be said that, apart from these three locations, there is absolutely no other point on James Bay (and within the boundaries of this province) where a potential tide-water terminal can be said to exist.

Regarding the first of these—the Albany River—the stream is for a distance of several miles above its mouth divided into minor channels by numerous islands. The force of the main volume of the river is thus dissipated, with the natural result that many bars and shoals everywhere obstruct the narrow channels. At the outer bar, sailing boats drawing three feet of water must wait for the tide before coming in. In the face of existing conditions, it is, indeed, difficult to understand why the estuary of the Albany should ever have been seriously considered as a possible harbor site.

In the case of the two remaining possibilities, Mr. Ells reports that the estuaries of the Moose and of the Harricanaw, conditions appeared somewhat more favorable. Preliminary surveys were, therefore, made at these two points. The plans which are the result of this work are submitted herewith, and will serve to roughly illustrate such relative as well as absolute advantages as may be looked for at either of these places. In each case some uncertainty still exists regarding the exact range of spring and neap tides, all observation regarding rise and fall being made during the progress of the surveys, and, therefore, extending over but a limited period.

RETURN OF CREDENTIALS.

LETTERS TO THE EDITOR.

To the Editor.

Sir,—Perhaps the experience gained by the writer in answering advertisements in technical papers for engagement in professional work may be of some advantage to others.

In answer to one firm, having gone to a good deal of expense in order to place clearly the extent of his experience, the writer asked that certain typewritten documents, being copies of his credentials and testimonials, might be returned, facilitating in every way the return of the same, but though he has written again he has not been favored with the return of the documents.

If the applicant's qualifications were not suited to the special requiremens demanded, there surely was no need for such a lack of common decency. Granted that in many cases we are generally foolish enough to sell hard brainwork for a remuneration less than manual work we at least hope to be treated with a little more consideration than is generally meted out to a foreign laborer, and due to the small remuneration we are not in the position of some big manufacturing company, that can distribute gratis such copies of their credentials and papers with little felt expenditure.

AN ENGINEER.

A NEW WATER-TESTING DEVICE.

Engineers and superintendents of municipal water supply plants have often wished for a means of determining a change in the composition of the water without resorting to the usual tests as conducted along chemical lines.

There are not many principles on which to establish a method of determination outside of the fact established by Kohlrausch that the electrical conductivity of pure water containing any electrolytic substance in solution is due almost entirely to the dissolved substance, and not to the water itself. The following table is the result of a series of experiments conducted with a view of determining the relative conductivities of waters usually reported as pure.

Source of Water.	Conductivity at 20° C.
Distilled Water:—	
Obtained by F. Kohlrausch, after occupying ten years in cleaning the glass receiver of the distilling apparatus	0.2
Supplied by Messrs. Hopkin & Williams, London; an abnormally pure sample	1.2
Supplied by Messrs. Hopkin & Williams, London; average of several samples	2.0
Supplied by a retail chemist, Birmingham	5.0
Supplied by a retail chemist, London	8.0.
Supplied by a retail chemist, London, (another sample)	14.0
Condensed water, from the hotwells of condensing engines:—	
Shoreditch Electricity Works, London	3.3 (a)
Westminster Electric Supply Corporation, Eccleston Place Station	3.6 (b)
Messrs. Belliss & Morcom's Works, Birmingham	11.7 (c)
Public Water Supplies:—	
Glasgow, from Loch Katrine	34
Manchester, from Thirlmere	48
Blackburn	65
Birmingham, from Rhayader, Wales	80
Dewsbury	109
Glasgow, from Gorbals Waterworks	119
East Surrey Water Company, from wells in chalk (softened by Clark's process)	135
London, West Middlesex District (after softening by Clark's process)	163
London, West Middlesex District (after softening by boiling)	180
Southampton	185
Paris	312
London, West Middlesex District (as supplied by the Metropolitan Water Board)	390
Cooling Water:—	
Westminster Electric Supply Corporation, Eccleston Place Station	472
Messrs. Belliss & Morcom's Works, Birmingham (canal water)	1,760
Sea water; average of samples taken off Harwich and off the Isle of Wight	50,000

(a) This is the lowest value observed by Mr. Digby.

(b) This is the calculated value for no leakage; the lowest value observed by Mr. Partridge was 4.1.

(c) The condenser was in perfect order, and the high value is probably due to the discontinuous working of the steam plant.

Working upon this fact there has of late been perfected an apparatus known as the Dionic water tester, the joint invention of Messrs. Digby and Biggs, of England, and introduced to the American continent by Mr. James G. Biddle, of Philadelphia, Pa., U.S.A.

This apparatus is not used to supplant the usual chemical determinations, but is used as an indicator of any variations in the organic contents after their quantities have been determined by a chemist.

The complete apparatus is shown in Fig. 1, where G is a bent glass tube to contain the water under test, and A and B are the electrodes for passing the electric current through the water. The electrodes are connected by wires to a direct-reading conductivity meter M, and a continuous-current hand-driven dynamo E; so that by turning the handle W of the dynamo, a current traverses the meter and the water in the conductivity tube G. The pointer of the meter is deflected, and comes to rest at some point upon the scale which directly indicates the conductivity of the water in the tube. The test is completed as soon as the pointer has come to rest, usually in two or three seconds.

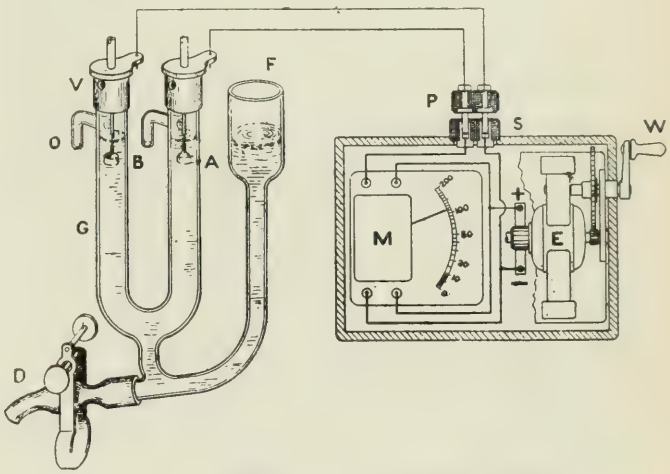

Fig. 1.—Diagram of Dionic Water Tester.

The tube G is made long enough, and the electrodes are given sufficient surface, to make the electric resistacne in the parts of the current-path immediately surrounding the electrodes negligibly small compared with that of the length of water in the tube. Hence, gas bubbles may accumulate on the electrodes without making any observable difference in the measured conductivity. Moreover, gas bubbles liberated from the electrodes rise upwards and escape freely at the upper ends of the tube; they can never diminish the conductivity by traveling downwards into the path of the electric current. The electrodes are short hollow cylinders of platinum, so that they present a large surface, from every part of which gas bubbles are free to escape upwards.

Whatever gas is formed in the electrodes is very small and is all washed away when fresh water is poured through the tube preparatory to another test.

Although the current used is very small, never exceeding .004 amperes under normal conditions, and the time during which it flows is very short, there is more than enough time to establish the maximum polarization of the electrodes: so that unless some means were adopted to eliminate it the error due to back-electromotive force would be considerable. This difficulty is removed by taking the electromotive force into account when calibrating the scale of the conductivity meter. Evidently, any back-electro motive force will make the conductivity of the water in the tube appear to be less than it really is; and what is done is to mark the divisions on the scale so that they represent

the true conductivity of the water. To do this it is necessary to take a fair average value for the back-electromotive force of polarization. With bright platinum electrodes in a dilute salt solution the back E.M.F. is about two volts, and this is the value allowed for in marking the scale. The dynamo generates a constant pressure of 100 volts, so that any variations in back E.M.F. above or below two volts are negligibly small by comparison and do not produce any observable error. To maintain the necessary constancy of pressure the dynamo is fitted with the constant-speed clutch. The effect of this device is to keep the pressure constant at 100 volts within one-quarter of a volt, when the dynamo handle is driven at any speed above that at which the clutch is adjusted to slip.

The conductivity meter measures directly, and without calculation, the conductivity of any electrolytic solution in the tube to which it may be connected. The indication is given by an index which ranges over an engraved scale, graduated in units of conductivity.

Conductivity (specific conductance) is the reciprocal of specific resistance, and the most convenient for the purpose of water-testing is the reciprocal of one megohm. No one has given a name to the reciprocal of one megohm, and we must be content to call it simply one unit. In the conductivity meter the scale extends from zero up to 2,000 units.

Referring to Fig. 1, it will be seen that the conductivity tube is so constructed that by pouring water into the funnel F, and allowing it to overflow through the outlet pipes O O, every part of the tube is thoroughly washed out, and any products of electrolysis which may have accumulated upon the electrodes are at the same time swept away by the water. The air vents V V ensure a steady flow from each outlet without any syphoning action. A drain pipe D of pure rubber is provided at the bottom of the tube for the purpose of drawing off the contents at the conclusion of a test. Normally, the drain is closed by a pinch-cock. Water may be left standing in the tube for days at a time without the slightest trace of contamination from the rubber finding its way into the conductivity tube. The only other materials in contact with the contents of the tube are glass and platinum.

The tube is mounted on a strong teak stand designed to afford as much protection as is consistent with accessibility.

The conductivity meter and dynamo are fixed inside a box and once for all connected up to each other and to the terminals of the socket S, which is fixed on the outside of the box. The two-pin plug P is permanently connected up to the electrodes A and B by means of a short length of well insulated twin-flexible cable. Hence, all the user has to do in order to connect the tube to the meter is to push the plug into the socket.

The dynamo and conductivity meter do not need any attention, and, in fact, the box containing them is closed and sealed by the makers. The dial is visible through a window in the top of the box, and the handle of the dynamo is folded back into a recess when not in use.

In making a test the conductivity tube is placed at the edge of a table or bench, so that the overflow and drain pipes may discharge into a vessel of some sort standing below. The meter-box is put down close alongside the tube. The connecting plug is disengaged from its place on the tube-stand and pushed into the socket on the meter. Then the pinch-cock is opened for a moment to make sure that no water previously tested remains in the drain pipe. When the pinch-cock is closed again, the water to get tested is poured into the funnel and allowed to run out of the overflow pipes, until at least a whole tubeful of the water has been discharged. In this way any traces of previous tests are thoroughly washed out. After the dynamo is speeded up and the index needle comes to rest a note is made of its position on the scale and the temperature of the water.

The conductivity of a water is an isolated and barren fact in itself, but becomes a valuable factor when comparisons are available with a known composition, and may be used in many ways, as shown by the following examples.

After the source of hardness in a water is determined by chemistry periodic teste with this apparatus will indicate the slightest changes in the composition of the water as regards the amount of calcium or magnesium carbonates, and it is quite possible after a few experiments to deduct with accuracy the parts per million or the grains per gallon of these constituents. It is also possible to prepare a series of plotted curves of the results of the readings after certain known quantities of quick lime have been added as a softener. As the quantity of lime is increased the conductivity diminishes until a minimum is reached, beyond which the conductivity of the water is increased. The point of minimum conductivity indicates the correct quantity of lime.

In such cases where it is desired to keep a check on the purity of a water supply the use of this instrument dispenses with all analysis excepting the first one to establish the quality of the organic contents; reading obtained at frequent intervals and showing no important variations in the reading will indicate that no changes in the organic contents or purity of the water. By this means the cost of testing is practically confined to the initial outlay for the instrument. The instrument may also be employed to indicate leakage from a surface condensor for boiler priming, for measuring the solution of rivers for periodic tests at sewage works, for the determination of the relative purity of distilled water and for many other purposes.

CAR WORKS AT PORT ARTHUR.

A group of well-known Eastern Canadian financiers and manufacturers, headed by Messrs. F. B. McCurdy, J. R. McLeod, F. M. Brown, and their associates, have concluded arrangements with the city of Port Arthur for the immediate erection of a modern steel and wood car plant, with a capitalization of $5,000,000. These people are the organizers of the Nova Scotia Car Works, Limited, which is operating successfully in the city of Halifax.

For some time past negotiations have been under way between this syndicate and the representatives of Port Arthur. At a meeting of the board of trade and the council of the city of Port Arthur, all details were finally decided on by which the company, which will be known as the Ontario and Western Car Company, Limited, will establish its plant. The company will employ 1,000 men and as the plant will be located at the head of navigation, the center of Canada, it will be in a position to supply freight and passenger cars to the various transcontinental railways at the point where they are most needed. It will also, owing to the geographical location, be able to assemble materials more cheaply, and therefore build cars at a lower cost than any other plant in Canada.

A great deal of credit is due to the Industrial Commissioner, Mr. N. G. Neill, who has been the means of promoting this enterprise and interesting Eastern capital.

PROPOSALS FOR DUST SUPPRESSION AND ROAD IMPROVEMENT.*

By Dr. Guglielminetti.

Owing to the fact that I have, on hygienic grounds, devoted my attention for about ten years past to the study of dust suppression (road-tarring), and that I am a member of the permanent International Road Commission at Paris, which has addressed itself to the practical solution of this problem —viz., the adaptation of existing roads to the new motor traffic—I have lately received several enquiries from Switzerland (among others from Colonel Pfyffer, of Lucerne, and Mr. Megevet, of Geneva) as to what is actually being done in Switzerland against the dust, the prevalence of which is undoubtedly one of the chief causes of the embitterment of the Swiss people against automobilism.

When it is remembered that even during the past excessively hot summer the residents on roads much frequented by motors were obliged to keep their windows closed all day long on account of the dust, that country seats on such roads have depreciated in value, that for a width of several yards near the dusty country roads the cattle refuse to eat the grass, that the clothes and hats of people taking a Sunday walk are spoilt, without mentioning the injurious effect upon our health of this dust as a vehicle of various disease germs—bearing all this in mind, it is not to be wondered at that the vast majority of the Swiss people are embittered against the relatively small minority of motorists. One cannot altogether blame the people, but, on the other hand, the entire blame does not rest upon the motorists.

If a motor, with its broad, absorbent rubber tyres, drives—even at a reasonable speed (30 kilometers = 19 miles per hour)—over a road covered with a layer of dust some inches thick, one must not be surprised at clouds of dust being raised. But if the same motor drives at the same speed on a well-made and well-cared-for country road on which no dust is lying, then there is no dust nuisance there; and, speaking generally, it may be said the better the road, and the more resistance the material with which it is made, the less dust there will be. Now, it would certainly cost too much to cover long stretches of road with asphalt, wood, or paving-stone, which is at present being done, as far as possible, in towns where the traffic is heavy; for country roads in several districts, however, improvement is attempted by making the roads more resistant and by watering, tarring, etc., to lay the dust on their upper surfaces.

The chief requisites for a well-kept road are good road material and a steam roller to roll the road metal in properly.

The solution of the dust problem is, therefore, more or less a question of money. Owing to the yearly increase of general traffic, and especially since the spread of motoring, the need of good roads is becoming ever more urgent in all countries, and naturally also in Switzerland, and therefore the earlier method of road maintenance is no longer sufficient.

Proposed Sources of Funds.—From whence, then, are these necessary additional expenses to be obtained? Speaking generally, it is not only motorists who benefit by well-kept roads, but also carriers, residents on the roads, etc. Good roads are ever a sign of a country's development. Via vita, it is said—i.e., The Way is Life.

Every country ought nowadays to make it a point of honor to have good roads, but every advance costs sacrifices; it is only stagnation that is cheap. An inferior gravel is cheaper than a good one, but it does not last so long; and as the result of a bad road metal everything suffers: there is excessive dust in summer, much mud in rainy weather, and carriers are obliged to reduce their loads. The same applies to the rolling: one horse can draw almost as much on a good, smooth road as two horses on a road covered for miles with loose gravel. The rolling in of the gravel by the heavy traffic is a direct pecuniary loss for every carrier, and by the end of the year it has cost the district more than it would have done to hire or purchase a steam roller. The same applies with almost equal force to road tarring; the initial outlay is greater, but the durability of the road is thereby prolonged to such an extent, and the costs of road maintenance for the period are so much reduced, that the final balance-sheet shows a saving has been effected.

Now, it is beyond all doubt that every Cantonal Government perceives the utility of good roads, yet it cannot possibly make the corresponding increase in its road budget all at once. It is, therefore, very necessary that help should be forthcoming from those whose interests are chiefly concerned. Among these I reckon first of all the motorists (foreign and native), then proprietors of hotels and restaurants, traffic unions, villa residents, all of whom will doubtless be ready and willing to furnish a financial contribution towards a better road maintenance. Motorists who—as, for example, in Aargau—are paying taxes of 10 francs only for a 30-horse power motor car, have told me that they would willingly be prepared to pay taxes up to 100 or 150 francs if these were spent on improving the roads; and such a not too excessive taxation would at once produce an additional yearly revenue of 20,000 francs (£800) for Canton Aargau. If, now, every first-class hotel would contribute, say, 1 franc per bed per annum, and the smaller hotels, say, 50 centimes, this would also yield quite a respectable amount; moreover, the occupier of a country mansion with a garden adjacent to a dusty road would perhaps be willing to spend a few hundred francs in order to be free from dust. At least this is what I have been able to accomplish in the South of France, where the hotels and traffic unions, casinos and villa owners, together with the communes, pay one-half and the State pays the other half of the cost for road-tarring, or for water-sprinkling where tarring is not practicable. This dust laying has in several French departments quite done away with the dust nuisance, and between Nice and Mentone in the height of the season there are more than a thousand motors running in a day, and yet no one complains any more of the dust, notwithstanding the long and warm period of drought on the Riviera. And now the hotel proprietors have nothing more to pay, because the tarring is paying for itself.

Money, however, is not yet everything; much must also depend on how it is spent. As in every other kind of construction, considerable progress has been achieved of late years in road making; and the problem of adapting existing roads to the new traffic at the lowest cost was the subject of two International Road Congresses—at Paris in 1908 and at Brussels in 1910—which were promoted by the French Government, largely as the result of a petition from our Dust League. To these conferences thirty-three civilized States sent their delegates, Switzerland itself, as well as several individual cantons and towns, being also officially represented.

Although it cannot be affirmed that any miraculous remedy against dust was discovered at these two congresses,

* Laid before the presidents and delegates of the Swiss Motor Club and the Traffic and Hotel Union.

yet several ways and directions were indicated, along which a nearer approach is being made towards the solution of this problem, and some general rules were laid down which can be very well adapted for every country, and therefore for our beloved Switzerland also.

A Proposed Conference.—For the purpose of obtaining an exchange of opinions on the money question—i.e., how to procure the necessary means—as well as on the cheapest and quickest method of adapting some of the greater main roads for motor traffic, according to the nature and weight of the traffic, the kind of stone, the situation and condition of these roads, etc., it appeared to me that the best way would be to have an Inter-Cantonal Conference of the Directors of Public Works, with the cantonal engineers —a conference to which those chiefly interested, motor clubs, hotel and traffic delegates should be invited, as well as the borough engineers of the larger towns.

I have for this purpose already visited the following directors of public works, Messrs. Councillor Dr. Haab (Zurich), Councillor Keller (Aargau), and Councillor Brodbeck (Liestal), and, indeed, with the presidents of the local motor sections (Messrs. Wunderli-Volkert, An-der-Auer, Bâle, and Francke, Zurlinden, Aargau) and the directors of public works, have gladly welcomed the proposal for a road conference of that kind. Dr. Haab at once declared himself ready to convene such a conference of directors, as he had formerly invited a conference of directors of justice, military affairs and finance, conditionally on his obtaining the necessary assent of his colleagues, of which, however, he felt confident. All three directors thought the moment was opportune, as an ill-wind is blowing over motor affairs in Switzerland at the present time, and there is undoubtedly a tendency to restrict the motor traffic considerably, if not prohibit it altogether. They did not conceal from us that with them the conditions are just now very unfavorable for motorists, and that as quickly as possible it must be ascertained what can be done to counteract the enormous dust nuisance, especially on certain great main roads. There would shortly be sent from the police headquarters to the respective cantons an agreement proposal on behalf of a uniform regulation as to the speed limit for motors, and the directors of public works are in great embarrassment about making such a proposal to their authorities if nothing is going to be done against the dust. Proposals have already been made, first, to debar from certain roads, and only to allow motoring on certain other roads; secondly, to permit the motor traffic only at certain times, and on Sundays, especially, to prohibit it; thirdly, specified roads within villages and communes to be regularly sprinkled with water, or to be tarred, etc. Now, if these various questions could be discussed, and also answered by the directors of public works unitedly, that would be a very welcome result.

Such a conference would afford an opportunity for an exchange of opinions on the possibility of selecting some of the greater through roads and giving special attention to those places thereon which suffer most from dust. In this way the Zurich Motor Club, for example, has already assisted some villages and communes in procuring water-sprinkling casks, and the Cantonal Government of Aargau has also placed steam rollers and tar-machines at the disposal of the communes. It should not matter in which cantons these dusty districts be; indeed, even the cantonal roads nowadays no longer serve only for intercommunication between different places in one canton, but are becoming more and more through roads. A foreign motorist no longer asks in which canton he is; if he is driving on a bad road, he simply says: "The roads in Switzerland are bad." It may be said, too, that the Aargau roads serve not only the Aargau man, but also the Zürich, Berne, or Bâle man who drives through Aargau. It is, therefore, very desirable that there should be a maintenance centre for individual through roads, and it is perhaps possible that the Traffic Office proposed by Mr. Seiler, member of the National Council or Parliament, would form such a centralization of the voluntary contributions for roads improvement.

At a conference such as that suggested above the cantonal engineers would perhaps ascertain which road metal comes cheapest, whether slag (Flusschotter), at 6 francs the cubic metre, or Swiss basalt, at 28 francs; why road tarring is very successful in the cantons of Bâle, Vaud, and Geneva, and less successful in the cantons of Zürich, Lucerne, etc.; how large a traffic must be to make it more economical to replace the road metal by stone paving or asphalte; if it would not be more advisable to hire steam rollers instead of purchasing them. These and several other questions of the kind might be dealt with.

If by means of such a road tribunal a solution of these burning questions could be found which should satisfy residents on the roads, as well as frequenters and users of these roads, a great advance would thereby have been made, and the best proof would be given to the Swiss people that the motorists intend to make good, as far as is in their power, any damage done by them, and we hope that in the general interest those on the other side will then meet the new traffic with somewhat less of antipathy.

APPROXIMATE QUANTITIES FOR TIMBER RAILWAY BRIDGES.

In the March issue of the Manitoba Engineer, a new technical magazine published by the University of Manitoba, appears an article by A. J. Taunton, giving approximate quantities for timber railway bridges. Mr. Taunton says that these figures refer to bridges on the C.N.R., and must be modified to suit other structures. For pile trestles the piles may be estimated directly from the profile, the deck and caps running at about 2,700 f.b.m. per opening of 14 ft. 9 in., and a small allowance for dump plank and bracing depending on the height being made. Allow for lengths of pile in ordinary soil 15 feet more than the height from ground to cut-off. The iron will be about 60 lbs. per M. The piling on frame trestles is also obtained from the profile. The f.b.m. timber may be approximately obtained by multiplying the area of the opening between end bents, the ground, and the base of rail by a factor K, the value of which may vary from 11 to 13½. For long low trestles K may be as high as 13½, and for short deep ones the low limit (11) will be reached. The ratios of the area of the toe slopes at the ends to the whole area, and the timber in the deck to the total quantity, will considerably influence the value of K. Good guessing on the part of the estimator is necessary; thus, combined with experience and judgment, should give very fair approximate results. The iron will be 57 to 60 lbs. per M.

The following figures are for Howe trusses, exclusive of falsework:—

Span in feet	Equivalent D.G.S. Loading	f.b.m. Timber	lbs. Iron
60	Class III.	33,000	13,000
60	" Heavy ...	42,000	28,000
80	" III. ...	56,000	40.000
120	" II.	....	58.000

(Steel angle blocks used.).

STRAIN MEASUREMENTS OF BRICK PAVEMENTS.*

By James E. Howard.†

A material of superior properties for street pavements is present in the vitrified paving brick of current manufacture. Such excellent qualities have been reached that attention is necessarily attracted by this valuable clay product. The manufacturers of paving brick have done their part in a commendable manner and produced a paving material which has a crushing strength comparing well with strong natural stone, and which exceeds that of many varieties.

A well made paving brick possesses high resistance against abrasion, it is nearly impervious to moisture, in which respect it presents an important sanitary advantage, and furthermore it is attractive in appearance and beautifies a city where it is used.

The mechanical features of manufacture are under such control that regularity of form is secured and with that follows the opportunity of securing a pavement with an even surface, a feature of decided economic importance considering its bearing on the tractive force required for transportation purposes. The necessary material for manufacture seems favorably distributed in many States. From the manufacturing end the problem of producing a satisfactory paving material has been well solved.

The question now appears to be an engineering one to ascertain the manner in which the useful properties of paving brick can best be availed of. The engineering side of the question, however, is a broad one directly concerning the welfare of many communities.

The Bureau of Standards in the performance of its regular functions pertaining to investigate tests of structural materials has inaugurated tests on paving brick in place in the pavements. Laboratory tests on the properties of brick have been carefully made many times and in many places, the results of which are familiar to all. The present tests are intended to extend information to the behavior of the brick as found under service conditions, measuring the strains which are developed in the pavements themselves and from the deformations judge of the stresses or loads which are involved.

Conditions in a pavement are complicated, and in approaching the subject it is essential to make a careful analysis of the case, ascertain and define what the elementary features consist of and so shape the work that one feature after another may be taken up and investigated. Notwithstanding the apparent complexity of the subject it nevertheless admits of being resolved into elementary factors and each in sequence made the object of experimental inquiry.

Some preliminary work was done a year ago at Indianapolis. It has since been extended at Cleveland, during which the bureau has had the co-operation and aid of Mr. Will P. Blair, secretary, and other members of the National Paving Brick Manufacturers' Association, also officials of the cities of Cleveland, East Cleveland and Lakewood.

The work in those cities has been directed toward acquiring data upon the relations of the street car tracks to the pavement and upon the effect of variations in temperature in stressing the pavement. These questions are quite distinct from those which relate to the supporting capacity of pavements against heavy wheel loads, or durability in the matter of wear or surface abrasion. So many streets furnish successful examples of pavements which have carried heavy traffic for a term of years that it was not thought necessary to include such observations at this time.

The tests on the relations of the street car tracks to the pavements consisted of measuring the elastic depression of the track under the weights of cars and acquiring information on its influence on the adjacent pavement. The elastic depressions of the rails were measured on different types of tracks, selecting among the number places where maximum rigidity was likely to prevail.

In general it was found that the vertical elastic movement of street car tracks, that is the difference in level of the rails between a loaded and an unloaded state is greater than can be followed by a monolithic pavement without the formation of cracks alongside the track. Occasionally track in the very best condition may not display excessive depression, but the uncertainty of maintaining such a state renders it hazardous to make a bond between the pavement and the track.

There is in addition to the momentary elastic depression a bodily settlement of the track resulting from insufficient support of the roadbed. Such settlement, when it occurs, involves a permanent depression altogether too great to consider in connection with those lesser movements which we are now describing. The bodily settlement of the car track, however, is a feature which cannot be left unmentioned. Cases are so flagrant at times that a good pavement can hardly be made use of by reason of the ruts of the trolley tracks.

In these tests the sensitive leveling apparatus employed in the observations was such that the presence of a trolley car could be detected by the depression which is caused even in the pavement at a distance of ten feet from the track in the direction of the sidewalk. Such an observation was made on a relaid pavement in which a tar filler had been used, and substantially at that distance with a cement filler, or from 10 to 12 feet away.

At the intersection of two streets, where no trolley tracks were present, the depression caused by the weight of a man was detected at a distance of 12 feet. This observation was made at a place where the hollow rumbling sounds of passing vehicles indicated the pavement did not rest upon the sand cushion or foundation. It was noticed that the pavement at the crown of the street responded more promptly in respect to change of level to a load coming upon it from the side rather than along the centre line of the street.

Pavements are elastic as the properties of the individual brick and the cement filler would indicate, but the amount of transverse bending which a brick or a cement grouted pavement will endure without cracking is very limited in its extent. This is particularly the case when the material is strained in tension. A wider elastic range prevails for compression loads, substantially in the ratio of the compressive to the tensile strength, or from ten to one or more.

Concerning the effects of changes in temperature on the integrity of pavements, data were acquired by the method of strain measurements, a description of which method was presented at your last annual meeting. Gauged lengths of 20 inches each were established in the pavement, in number exceeding 300. It has been found feasible to measure these gauged lengths with an accuracy, commonly to the nearest ten-thousandth of an inch. In this manner thermal changes may be followed very closely.

* Abstract of paper delivered to the twenty-sixth annual convention of the National Brick Manufacturers' Association, March 4 to 9, 1912.

† Engineer-Physicist, Bureau of Standards, Washington, D.C.

Gauged lengths were located at the sides and at the middle of the street, in both crosswise and longitudinal directions. During the time in which these strain measurements have been in progress a range of pavement temperatures of 66 degrees F. has been experienced.

In general the expansions or contractions of the crosswise gauged lengths proceeded with greater regularity than the longitudinal movements. Modifying conditions influenced the longitudinal movements and a drop in temperature yielded results which showed normal contraction on some gauged lengths, on others a very slight change, while certain of the measured lengths, those spanning cracks in the pavement, were longer at the lower temperatures.

It was found that transverse cracks which open with a drop in temperature do not always entirely close again, but displayed a tendency to progressively increase in width. Probably that was due to fine particles of sand and abraded material of the pavement lodging in the open fissures. A repetition of the process caused a progressive lengthening of the pavement. During a period of 52 days one set of measurements showed the combined effect of decrease in temperature and progressive increase in width of crack amounted to .0395, practically four hundredths of an inch. This occurred on a pavement which had been laid about four months. The crosswise gauged lengths on the same street and during the same period of time contracted regularly with, lowering of temperature, the maximum amount observed being .0039.

A number of earlier determinations on the coefficient of expansion of building brick gave a value in the vicinity of .0000040 per degree F. This value seems to fit the present tests fairly well. The observed changes were somewhat less than called for by the above value of the coefficient, but the actual range in temperature of the brick was not ascertained with precision. Surface temperatures of the brickwork were used, and not unlikely the range in mean temperature was less than the recorded amount.

Taking the observations as they were made, the contraction of the 40-ft. roadway of Euclid Avenue, for a range in temperature of 100 degrees F. was 0.1043 and 0.1101 respectively at two sections of the roadway. The contraction called for on the basis of the above mentioned value of the coefficient would be 0.1920. That is the total amount, one-half of which might be considered as affecting each side.

During sunny days the temperature of the pavement naturally goes considerably higher than the temperature of the air a few feet above it. Observations on this feature showed a difference of 38 degrees on one occasion. The temperature of the air was, on the day in question, 64 degrees, four feet above the pavement. On the pavement in the shadow of the curb it was 69 degrees. In a freshly drilled pocket for a reference pin, on the sunny side of the street, the temperature was 85 degrees, while in the sun at the angle of the pavement and curb the thermometer rose to 102 degrees.

In the laying of a cement grouted pavement a critical period is encountered at the very outset, during which care must be exercised just as in every cement structure, in order to avoid the formation of incipient cracks before the cement grout has had time to set and acquire strength. On account of the excess of water used in making grout the setting is much retarded and several days may elapse before a substantial degree of hardness is acquired.

During this period the pavement should remain at a constant temperature, if it were possible, day and night. A drop of 20 degrees calls for a contraction of about one-tenth of an inch in a length of 100 feet. It is a fortunate circumstance in laying a pavement when a minimum range in temperature is experienced during the first 48 to 96 hours after grouting. Incipient cracks have been developed at a very early period following the grouting, resulting in injury to the street even before it was opened to traffic. Hot, sunny days followed by cool nights are menacing to freshly grouted pavements.

Transverse cracks have been started, which ultimately extended across the street, by the influence of the end joints of the edge stones against which the pavement was laid. The usual manner of laying pavements, with joints broken in one direction only, affords favorable paths for cracks once started to extend from curb to curb.

Recently an opportunity was furnished for inspection of the streets of the city of Panama, where brick pavements, cement filled, have been laid from five to six years. The pavements were without expansion joints at the sides. There are no street car tracks in Panama.

The pavements are in very fine condition. In one place only were cracks of any kind noticed.

At Panama the temperature is quite high throughout the year, and while the nights are cool still the drop in temperature is not great. It is believed that equable thermal conditions have contriubted toward maintaining the integrity of these pavements, and that pavements in southern climates should in general be aided by the smaller range in temperatures over those experienced in northern climates.

In conclusion, the results now available point to the undesirability of bonding the pavements with street car tracks, excepting possibly those of the very best construction. Cracks parallel to and adjacent to the tracks are likely to develop if the pavement is called upon to follow the usual elastic depression of the rails. Obviously there can be no lateral thrust to the pavement if the rails are left free to depress.

The strain measurements show that transverse expansions and contractions proceed with greater regularity than longitudinal movements. A progressive change in length or creep of a portion of the pavement is due to alternate changes of temperature, open cracks being partly filled with abraded material and prevented from closing when a rise in temperature occurs.

Cautionary warning is found in the behavior of pavements which have developed transverse cracks in the early stages after grouting. At this time exposure to a wide range in temperature is undesirable.

Pavements are probably benefitted by a certain amount of compressive stress in a longitudinal direction. Transverse cracks will be kept closed so far as possible, and if the compressive stress is not excessive spalling would not be induced. The open ends of paved streets, having no buttresses to take the thrust, may be expected to develop transverse cracks.

The minimum amount of crowning necessary to turn the water is advantageous to enable the pavement to resist compressive stresses without causing rupture during spells of sudden heating. Bends and reversed curves in streets are disadvantageous to the pavements.

A superior material is provided in paving brick of current manufacture, the use of which requires careful engineering skill, and it appears that questions pertaining to the effects of temperature changes are among those which require most prominent attention.

SMOKE ABATEMENT.

THE POSSIBILITY OF ESTABLISHING A NEW STANDARD OF SMOKE EMISSION FOR FACTORY CHIMNEYS.*

By Dr. John S. Owens.

My primary object in bringing this paper before you is to suggest the basis for a discussion of the question of smoke emission standard, in the hope that some properly organized effort may be made to deal with the difficulties which have hitherto prevented the adoption of a proper standard.

I do not think that anyone will contradict me when I say that the emission of dense smoke from furnaces consuming bituminous coal is unnecessary and indicative of waste of fuel and bad furnace construction or working. It is true that there are a few special cases, such as heating brewery vats and pottery kilns, where the emission of dense smoke for short periods is by some still considered essential, but it is open to question if this opinion is justifiable. At the same time, it should be remembered that the total absence of all smoke is in practice usually impossible of attainment when the economy of manufacturing processes requires the burning of bituminous coal. An illustration of the difficulty of avoiding all smoke is provided by the large electric generating stations, where unforeseen variations of load occur, such as the increase due to a London fog, with its accompanying demand for artificial light. In such a case as this, it may be necessary to fire up fresh boilers very rapidly, and there is no known furnace which will admit of the smokeless combustion of bituminous coal, until the temperature of the combustion chamber has attained a sufficient height. Even in steady working it is practically impossible to avoid all smoke; a faint brown smoke is regarded as indicating more efficient working of boiler-furnaces than none at all. The emission of some smoke may, therefore, be regarded as inevitable.

The present position, therefore, is this: we know that dense smoke is unnecessary, and that entire absence of smoke is impossible of attainment, but we have not yet settled what, being fair and reasonable, should be permissible in the way of smoke, having regard to the improved methods of combustion which are now at the disposal of manufacturers. This is the question an answer to which is, I submit, within our reach and should be sought for.

The Public Health Act of 1875 supplies the present standard by which smoke is judged throughout the country, except in the case of a few important cities possessing special powers on the subject. In this Act it is stated that "Any chimney not being the chimney of a private dwelling-house sending forth black smoke in such quantity as to be a nuisance shall be deemed to be a nuisance liable to be dealt with summarily under the Act."

There is an alternative method provided by this Act under which proceedings can be taken in respect of fire places or furnaces in connection with factories which do not "as far as practicable consume the smoke arising from the combustible used therein." In practice, however, it has been found that this method of abating smoke is unworkable, owing to the lack of some standard defining the meaning of the words "as far as possible."

The standard "black smoke in such quantity as to be a nuisance" takes cognizance of two separate things in relation to smoke: its quality—that is, it must be black, and its amount—that is, enough to cause a nuisance; but, while these two essentials are taken into account, it is done in such a way that it would be practically impossible to prove in any particular case, either that the smoke was black, or that it was in sufficient quantities to be a nuisance. The point I wish to make is that the two essentials, kind and quantity, form part of the standard.

Since the date of the Public Health Act of 1875, sufficient improvements in the methods of burning bituminous coal have been made to call for a reconsideration of the present standard, and the adoption of a more up-to-date one, which will conform in a reasonable way with the possibilities of modern practice. It is unnecessary to deal at length with the evils attending the emission of smoke, from the point of view of the public. They have to breathe the smoke-polluted air of cities, useful energy and money have to be expended in cleaning away soot, buildings are injured and blackened, the daylight and sunshine are cut off, and in many other ways harm is done which, to a great extent, might be avoided if we had a sound, legally-enforced standard for smoke emission, based on the known results which the proper application of modern methods of combustion give. Manufacturers would then use the best methods of combustion and the most suitable appliances. The loss to the manufacturer in soot, estimated as a percentage of his fuel bill, is probably not more than ¼ to 1 per cent., and this is not great enough to induce much effort to save it. On the other hand, the loss to the public due to the injuries inflicted by smoke is certainly many times greater; hence it is more to the interest of the public than of the manufacturer to reduce smoke.

One difficulty which has always existed is that of dealing with large and small fuel consumers by means of a single standard, and this has militated against the establishment of a more rational standard than that laid down in the Public Health Act. Clearly we cannot limit a large manufacturer to the emission of the same total quantity of soot as a small one. His furnaces might be better designed, and combustion more perfect, than in the case of the small consumer, but the total quantity of soot emitted might be much greater. Such a limitation would, therefore, work unfairly against the large fuel consumer.

At first sight it would seem that the total quantity of soot emitted by any chimney would be the soundest thing to limit, since it determines the amount of pollution of the air by soot from a particular source; but on closer examination it appears that this is not really the best basis. What we are concerned with is the total pollution of the air by soot due to all chimneys in any particular neighborhood. For example, the erection of an electric generating station where large quantities of fuel are burned may, by displacing many small consumers who had previously to generate their own power, actually cause a great reduction in the amount of soot poured into the air. At the same time the total quantity of soot emitted from such a station might be many times greater than that previously emitted by any one of the smaller power units which it displaced; in spite of the fact that the combustion might be better and the amount of soot per ton of fuel burned much less.

What we may reasonably ask for is, that the best and most smokeless methods of combustion should be used. If we could, therefore, fix a sound standard which would be some measure of the efficiency of the methods and appliances used from the present point of view, it would work no hardship against the large fuel consumer.

We come, then, to the conclusion that what is wanted is a standard of efficiency of combustion from the smoke-

* Paper read before Section G of the British Association at Portsmouth.

prevention point of view. This must clearly take into account the amount of fuel burnt, and, if we could measure it, the proportion of the fuel passing out of the chimney as soot would be the ideal standard.

It is the aim of engineers to provide a definite quantity of air for each pound of coal burnt, hence the amount of soot per unit volume of flue gases would vary approximately as the amount of soot per unit weight of fuel, when the air supply is so regulated to suit the amount of fuel burnt. In such cases the measurement of smoke density would be a sound basis for comparison as to efficiency of combustion. It would also be a fair standard to fix, since it would measure the polluting power of the smoke emitted so far as soot is concerned.

I therefore suggest that the word "black" in the present standard should be altered to "smoke of a density exceeding" some fixed standard. The standard should, however, also include a time of emission, and the form suggested is "smoke which exceeds a certain density (as measured in a way to be determined), and which is emitted for a period exceeding so many minutes per hour."

It is necessary next to consider the question of how the smoke is to be measured, since this is an essential part of the problem of establishing a sound standard.

We may set ourselves to measure any one of the following:—

1. Total quantity of soot emitted in a given time.
2. Weight of soot emitted as percentage of fuel burnt.
3. Density of smoke or weight of soot per unit volume of flue gases.
4. Ratio of density to a standard.
5. Color.
6. Opacity, or degree of blackness.

In addition to deciding which of these objects to aim at we must keep in view that whatever method is used, it must give reasonable accuracy and a fair basis of comparison between chimney and chimney, or with a standard; it must also be easily applied from outside the factory by a single observer.

It may be mentioned here that the standard maximum adopted by the Alkalis Act of 1906 for the emission of muriatic acid in smoke or noxious fumes is one-fifth of a grain per cubic foot.

Considering now the various methods of measurement referred to above:—

Total Soot Emitted.—This measures the amount of pollution by a particular chimney, but takes no account of the amount of fuel burnt. As stated previously, it would be unfair to limit a large fuel consumer to the same total quantity of soot as a small one, even supposing we could measure it in a practical way. Its estimation implies access to the chimney and at least two measurements—that is, density of smoke and volume of flue gases.

Percentage of Fuel Lost as Soot.—To measure the weight of soot as a percentage of fuel burnt is open to the same objections as the measurement of the total quantity, but it implies at least the measurement of density of smoke, volume of flue gases, and weight of fuel. It would be a fair basis for a standard, but is quite impracticable as a method for the use of sanitary inspectors.

Density.—A quantitative measure of the density of the smoke might be obtained by the filtration method, in which the soot from a known volume of smoke is trapped and weighed, but it would be too cumbrous for general use. Density can also be measured optically, in which cases access to the chimney or factory would be unnecessary. It would give a fair measure of efficiency of the plant, and a good basis of comparison whatever the quantity of fuel burnt or diameter of the chimney.

Color.—The measurement of the color of smoke may be dismissed as useless, since color bears no relation to quantity of soot emitted or evil done by the smoke.

Opacity.—To measure the opacity of a smoke column or its degree of blackness, which is the commonly accepted method now adopted, is worse than useless, since it is misleading, because opacity alone, unless adjusted for thickness of column, is neither a measure of the density of smoke nor of the amount of pollution of the air. The smoke from different chimneys cannot be fairly compared on this basis because of their different diameters. All smoke-charts, such as the Ringlemann or Donkin, measure the opacity in a crude way; similarly, photographic methods, by which a photograph of the smoke-column is compared with standard shades, are open to the same objections. Instruments in which smoked glass is matched to the shade of the smoke, and in which no adjustment is made for chimney diameter, are equally objectionable. In a word, all these methods are only useful to compare chimneys of similar diameter, or the smoke from the same chimney at different times; when used for general comparison they are misleading.

We are thus reduced to a measurement of smoke density as the only satisfactory basis to work on. I will, therefore, go into this method in more detail.

Suppose we can measure the weight of soot in a column of smoke 1 sq. ft. in section, and the same length as the diameter of the chimney.

Let S = weight of soot in such a column.
V = velocity of flue gases in f.p.s.
D = diameter of chimney in feet.

The weight of soot in 1 cu. ft. of smoke will be $= \frac{S}{D}$,

and the weight emitted per second—

$$\frac{\pi D^2 V S}{4 D} = \frac{\pi}{4} D V S,$$

or D V S × a constant; that is, it varies as the volume of flue gases × the weight of soot per cubic foot. The amount of soot emitted will therefore vary directly as the volume of flue gases, assuming the density to remain constant. Or if we measure only S, the amount of soot emitted will vary as S × V D. If we assume V to be a constant value, the weight of soot emitted will vary as S × D, and the density of the smoke as S ÷ D. This shows that the measurement of S alone is of little use unless an adjustment is made for D, and it must be noted that all smoke-charts now in use measure something which depends on S alone, but neglects D. It also points to the conclusion that with an adjustment for D, the measurement of S can be made to give a fair approximation of the relative weight of soot emitted or to the density of the smoke.

We can measure S indirectly on the basis of the light obstructed. For example, we may compare the degree of opacity of the smoke with a smoked glass which obstructs as much light as a smoke column of known density and thickness. Suppose, then, we take such a glass of an opacity equal to that of a column of smoke of unit thickness and standard density, we might prepare an instrument having several shades of such glass, the lightest being the standard for the smallest chimney, followed by other shades made by superimposing various thicknesses of shade 1, corresponding to various thicknesses of smoke column or chimney-diameter. We could then, by comparing the smoke at the top of a chimney with such a set, say whether or to what extent the standard was being exceeded.

Suppose, for example, the smoked glasses are numbered in the ratio of their thickness, and that No. 1 matches a smoke of density G in one-foot column, the density of smoke matching glass No. N in a column D feet thick will be $\frac{N G}{D}$; that is, the density will vary as $\frac{N}{D}$, and can be given quantitatively by calibrating shade No. 1 to correspond with a known density of smoke in a column one foot thick.

If we attempt to measure the opacity or light cut off by the smoke, we get a figure which does not bear a simple relation to the smoke density such as is borne by the thickness of the smoked glass which matches the smoke. I refer to this because attempts have been made to measure the light obstructed as a basis for comparison between smoke from different chimneys.

Assuming, then, that we can observe with fair accuracy the density of smoke by such a method as I have described, the next step is to fix a certain maximum density which must not be exceeded. This could probably be best defined as: Such a density as would, when viewed by transmitted light alone and in a layer of a certain thickness, permit to pass through it a certain percentage of the light falling on it. This might be referred to a standard density. With improvement in furnaces and appliances for the more perfect combustion of bituminous coal this standard could be altered so as to represent fairly what might be expected from the current state of knowledge and invention.

It would be necessary then to provide an instrument to enable a comparison with such a standard to be easily made. The accompanying drawing illustrates one which I have designed to meet the requirements laid down in this paper. This is in the form of a small telescope, having fixed in the optical system at a point which may be brought into the focus of both object-glass and eye-piece, a revolving eccentric disc containing a number of graduated smoked glasses arranged in cells round the centre. The glasses only fill half of each cell so that by revolving the disc, as each cell with its glass is brought successively into the axis of the telescope, the smoke may be viewed through the open half of the cell and matched to the glass in the other half. The glasses are numbered in the ratio of their thickness, and a table is provided giving the number of the glass divided by the diameter of the chimney, and thus a figure which is a measure of the density of the smoke, and can be made to read the actual weight per cubic foot of soot in the smoke if desired. This necessitates the inspector knowing the chimney diameters in his district; but these may be tabulated once for all. I have found when, in instruments for smoke measurement, the smoke is viewed through a small aperture, as is essential in order not to take in too much background, that it is impossible to get true results owing to the eye being unable to focus at the same time the object aperture and the object; so that the edges of the aperture are hazy and ill-defined. This results in the whole aperture, when small, being overlaid by a hazy film, due to its ill-defined edges, which film prevents accurate readings of the smoke shade. The same applies to the aperture containing smoked glasses for comparison.

There are many difficulties remaining which apply to all optical methods of measuring smoke, but before enumerating these it is well to remind you that we have no other means of attaining our object, since all methods requiring access to a factory or a chimney are useless from the sanitary inspector's point of view. It is easy to imagine the welcome such an inspector would get on presenting himself at the door of a factory and announcing that he had come to measure the density of the smoke from the chimney. Even assuming that he was given access to the chimney, it is unlikely that the dense smoke he had seen from outside would be permitted to continue for him to measure.

I draw attention to this so that while recognizing the difficulties in the way of applying optical methods of measurement too much weight should not be given to such difficulties, nor should the presence of drawbacks to a method prevent its use if it fulfils its purpose, and a better is not forthcoming.

Turning now to a short review of these difficulties, it is well to consider what are the factors which influence the apparent density of smoke, as given by an observation based upon its degree of blackness; these are:—

1. The true density of the smoke.
2. Diameter of chimney.
3. Background of smoke and shade it is compared with.
4. The color of the smoke particles.
5. The size of the smoke particles.
6. The amount and color of the light falling on the smoke from the observer's side.
7. The direction of the line of vision.
8. Presence or absence of wind.
9. The observer's personal factor.

There is not time to discuss each of these in detail, but I may say that 1, 2, and 3 can be dealt with satisfactorily, 4 and 5 are probably sufficiently constant not to affect results seriously, excluding exceptional cases, 6 is the most difficult to deal with, and should be allowed for in making observations, 7 can be overcome, to a great extent, by keeping the angle which the line of vision makes with the horizon fairly constant, 8 would not, as a rule, be a serious obstacle, while 9 is not, I think, of great importance.

Assuming, then, that we have decided on the method of measurement to be adopted, and on the type of standard to be fixed, the question remains, how is the standard to be arrived at? It would seem that this might be done best by the appointment of a technical committee, which would make observations over a certain period, say a year, of certain selected representative chimneys, where up-to-date and well-designed furnaces are installed, and bituminous coal is burnt. A consideration of the results of such observations, both as to smoke density and time of emission, should enable the committee to fix a fair and reasonable standard, both as to the density of the smoke, and the time during which such density should be permitted.

Time does not admit of a consideration of the reasons for and against the legal enforcement of a standard. There is not, however, much room for discussion, for the fact that a legally-enforced, if unsatisfactory, standard has existed for thirty-six years proves that a standard is necessary, and that, to be of use, it must be legally enforcable. The present standard of "black smoke in such quantity as to be a nuisance" has utterly broken down, owing to the impossibility of proving to a magistrate's satisfaction that the smoke emitted was literally black. I have tried to show that it is now possible to fix a sound and workable standard for smoke emission, and to apply it in a practicable way.

RECENT CHANGES IN STEEL WORKS.

The Canadian Bridge Company have recently purchased a large stock of shares of the Wm. P. McNeil Company, New Glasgow, Nova Scotia. Mr. K. W. Bash has been appointed vice-president and engineer, and Mr. W. McNeil is the president and manager of the new company. Extensive improvements were made to the plant during the past year resulting in a well-equipped works for the manufacture of structural steelwork and further improvements are anticipated in the near future. Other than the changes noted above, the policy of the company will remain intact.

THE SCHUMACHER BRIQUETTING PROCESS.*

By Prof. Joseph W. Richards.

Fresh blast-furnace flue dust mixed with from 5 to 10 per cent. of its weight of magnesium chloride or calcium chloride solution, that is to say, with from 0.25 to 2 per cent. of its weight of magnesium chloride or calcium chloride, acquires the property of setting within a short time, from 15 to 60 min., and forming a hard cemented briquette. Alkaline solutions have no action such as described. When treated in this way the flue dust briquette sets very hard, apparently from pure excess of cementing and setting power. It is, therefore, possible to mix with the flue dust a considerable proportion of inert ore or like material, which has no setting power by this process. A particularly strongly cementing flue dust will carry as much as three times its weight of fine ore or the like, and yet produce a satisfactorily strong briquette.

The Cambria Steel Company has installed at Johnstown, Pa., a small plant consisting of two presses, with a combined capacity of 250 tons of briquettes per day. One of the presses is of the mechanical type, with hydraulic safety regulator; the other is a Ronay hydraulic press. The first makes briquettes the size of an ordinary firebrick, the latter makes briquettes cylindrical in shape, 8 in. long and 8 in. in diameter and using considerably higher pressures than the former.

As seen in operation recently, the warm flue dust from the dust catchers was stored in one hopper, while fine ore, containing from 10 to 12 per cent. of moisture, and quite cold, was stored in another hopper. A rotating feeding device formed a stream of these materials, passing it into the mixing trough with an ordinary spiral, into which at the same time was run a 30 per cent. solution of calcium chloride, the flow of which was regulated by a hand valve. The trough fed the mixture directly into the hopper of the press. The flue dust was warm, approximately at 200 deg. F.; the ore was ice cold; the solution was cold. The mixture fed to the press was just warm to the touch; the bricks going from the press were decidedly hot and steaming, and where loaded into the car they were quite hot to the touch and steamed vigorously. This heating of the mixture as soon as compressed into briquettes is a characteristic of the process, and is an index of the rapid chemical reaction taking place which results in the cementing of the material.

The flue dust carries 18 to 20 per cent. of coke, which is all carried into the mixture, the mixture being 70 of ore to 30 of flue dust. There is from 5.5 to 6 per cent. of coke in a finished briquette. The saving of this coke, 20 per cent. in weight of the flue dust used, represents sufficient value to pay for the entire cost of the briquetting of the dust.

As to physical properties, a briquette made of flue dust, tested by the author, absorbed 11.5 per cent. of its weight of water, representing 27 per cent. of voids, a very satisfactory porosity. Several hundred tons of these briquettes were already in the ordinary furnace bins, ready for use in the furnaces, and appeared to have stood carriage to that point and a drop of 10 to 20 ft., and also subsequent action of ice and snow for several weeks, without deterioration; only a few were broken, and but little dust was made.

* Abstract of paper read before the recent meeting of the American Institute of Mining Engineers.

NEW TYPE OF FURNACE.

The essential feature of the Cayley Robinson furnace, of which a demonstration was given recently in London, E.C., is the gasification of the coal in one chamber and the combustion of the gas in another. The gasification process having been started by lighting the coal in the ordinary way, a small quantity of live coke is transferred from the fire into the adjacent combustion chamber in which the gases are made to circulate centrifugally by means of a jet of steam, and in which, it is claimed, they are completely consumed without ash, smoke, or clinker. The steam is generated from water in a coil of pipes placed in the combustion chamber. No actual tests have yet been carried out with the furnace, but it is stated that over 75 per cent. of the calorific value of the fuel is utilized, and that in a kitchen stove, constructed on this system, 1 lb. of coal has achieved the same results as are usually obtained with about 8 lb. in the ordinary pattern. Experiments are now being carried out with a view to adapting the principle for use in locomotives.

EFFECT OF HEAVY LOADING AND COLD ON RAILS.*

The 4½-in. 65-lb. section of the New York Central & Hudson River Railroad, in service 8½ years in the Fourth Avenue tunnel in New York City, carried 51,000,000 tons with a loss of about ¼ in. in depth of the metal upon the head of the rail. This was an English make of rail with a heavy base and thin head. The 5-in. 80-lb. section which replaced this section was in service eight years and carried 65,000,000 tons with a loss of about ⅛ in. of metal upon the head before it was removed. The 6-in. 100-lb. New York Central section, which was rolled in 1892, and replaced the 5-in. 80-lb. section, was removed in July, 1899, carried 95,000,000 tons and is still in yard service. The loss of metal on the top of the tunnel was about twice as rapid as it was from the same tonnage.

The 6-in. 100-lb. section of rail in 1895 of 0.06 phosphorus and 0.65 in carbon on the "inbound main" from 1895 until August, 1907, carried 375,000,000 tons with a loss of about ⅛ in. in depth on the head of the rail.

The light earlier sections could carry from 60,000,000 to 75,000,000 tons before they were rough and unsuitable for passenger traffic, and when in a location where the tonnage was only 250,000 to 500,000 tons per month, would last in the track many years. The heavier sections which replaced the light ones carried much greater tonnages from the increase in the density of traffic. Their larger area of metal also gave them a capacity for greater tonnages.

The 100-lb. rails in the Fourth Avenue tunnel at the present time carry daily from 150 to 200 train movements. The tonnage per month is in some places nearly as much as the light rails were subjected to in one or two years' service.

Table 1 shows the increase in freight ton-miles from 1890 to 1900, nearly doubled, while it trebled for 1910.

It has been stated that the former rails seem to last so well due to the elimination of the poorer quality of rails by the service in the track. The older rails were cold rolled by the light wheel loads until the surface was sufficiently

* From report of Am. Railway Eng. Assoc. by Dr. P. H. Dudley.

hardened to bear the recent heavier loads without much increased abrasion. New rails of the same section and practically the same physical properties would, when subjected to heavier wheel loads, lose more of the metal by wear, before the surface was rolled as hard as the former sections, and their rate would be much faster.

Dr. Dudley states that it is not considered advisable at the present time to make the composition of the rails which are to be subjected to the present heavy wheel loads so hard that at first they will entirely resist the cold rolling effect of the passing wheels. It is better to make the physical properties of the rails such that a slight flow of the metal will take place under the various worn wheel treads which will run over the rails, and in this way the surface will accommodate itself to the average treads passing over the heads, the surface becoming gradually hard, and in a short time the flow of metal is pracitcally arrested.

In rails which are too soft the surface may be worn away by the wheel loads before it becomes sufficiently hardened for the long wear or the drivers slip on the rails, producing a layer so hard as to require their removal from the track.

The mileage shown for 1830 to 1850 had been constructed mostly with strap iron rails. The mileage for 1850 to 1870 was mostly iron rails, though about one-fifth was steel rails. The mileage for 1880 was more than one-half laid with steel rails, while in that shown for 1890, 1900 and 1910 the mileage would be mostly steel. It would have been impossible to have constructed the mileage shown for 1910 without the invention of Bessemer steel. We have in the United States about 40,000,000 tons of steel in the track, of which 2,500,000 tons are of the basic open-hearth steel.

Basic Bessemer steel and basic open-hearth steels are used abroad in Germany, England, also in Africa, and the wear on the rails under their light wheel loads, particularly on the curves, is stated to be much more rapid than desired. they do in our Northern States and Canada. They use The temperatures in those countries do not fall as low as higher carbon rails in France as a rule than we do in this country with excellent effect. Their wheel loads are also much lighter and they maintain their rotundity for a longer period than the wheels here under our heavier wheel loads and long distance runs.

One of the problems confronting the railroads to-day in those States where the temperatures fall to 20 and 40 deg. below zero is to secure a sufficiently homogeneous metal in the 33 and 36 in. wheels for the entire circumference of the tire or wheel tread to maintain its rotundity. The 36-in. wheels make 560.2 revolutions per mile, and with their static load of 5 tons, the accumulated tonnage upon the tread of the tire or wheel would amount to 2801 tons for each mile which it runs.

The locomotive drivers of 79 in. in diameter make 255.3 revolutions per mile. The Pacific type engines have static loads of 14.3 tons per driver, consequently the static load per mile run upon the metal is 3,651 tons. These figures are sufficient to show that their tonnage upon each portion of the bearing surface on the tread repeats the load for each revolution and for high speed trains with great rapidity, consequently the accumulated tonnage on the tires and wheels enlarges according to the distance run.

First, the direct one which affects the metal, decreasing its ductility, but increasing its tensile strength, elastic limits and modulus of elasticity to a slight extent and making it more sensitive to shocks.

Second, indirect effect by contraction of the metal which may set up the tensile stresses of some magnitude in the rails before the ends rend in the splice bars. The intensity of this effect on the rails is greater in countries subject to temperatures near or below zero, and subject to cold waves from the north, where the temperatures fall many degrees below zero or fall in a short time and continue cold for a few days until broken by a warm wave from a tropical climate.

The experience of the railroads in the Northern and Western States this winter is more severe than ever before. Rails which have heretofore been quite free from breakages have been rendered mor susceptible to the wheel effects of the passing trains and a larger number broken than ever before reported. Such conditions have been studied to render the rails more ductile or of greater tenacity and toughness to withstand the shock of passing wheels in temperatures of from 20 to 40 deg. below zero.

The service tests of rails of large ductility or tenacity and toughness of metal in large tonnages, scattered in many States, show during the past winter an almost entire freedom from breakages and indicate that much has already been accomplished. It is now possible from a definite chemical composition to determine what ductility or toughness may be secured when the steel is properly purified in the bath, and thus increase the factor of safety in the output of the rails.

It seems that to most engineers of maintenance of way who are not conversant fully with the actual steps of the different processes of manufacture, a specification for chemical composition and a few subsequent tests for quality would be sufficient to secure rails to withstand the present service. This is by no means the case, for it is only by a knowledge of the manufacture of the steel and its subsequent use in the track that one obtains the requisite knowledge to provide for the various conditions of service to which rails are subjected.

It is the duty of users of rail to advise the manufacturers of the type and, as far as possible, the cause of failures and breakages of rails in the tracks. The gathering of statistics of rail failures of the past few years and discussing them with the manufacturers has resulted in a co-operation to improve the quality of the output of rails.

It must be remembered that with the present wheel loads and high speeds of the train movements the time factor for reversal of the stresses under the wheels and in the wheel spacing has been materially shortened by the present schedules. The wheel loads also require stresses of large magnitude to be distributed in a shorter time than was necessary with slower speeds and lesser wheel loads.

Table 1.—Miles of Track and Tonnage.

	1830.	1840.	1850.	1860.	1870.	1880.	1890.	1900.	1910.

UTILIZING THE WASTE HEAT OF THE OPEN-HEARTH FURNACE.*

A. Pfoser.

While the most strenuous efforts are being made to utilize the slightest improvements in the efficiency of power plants—steam engines and gas engines—with a view to economizing fuel, and great saving is being effected in this respect by the extended employment of waste-heat plant, the question of increasing the efficiency of furnaces by utilizing their waste heat is comparatively neglected. In smelting works it is true that the waste heat is used for steam raising; but even then the gases pass away into the chimney stack at such a high temperature that the waste of heat is enormous. Apart from this, however, the utilization of the waste heat from open-hearth furnaces is a matter deserving consideration.

The gases leave the open-hearth furnace at a temperature of 600 to 700 deg. C., which entails a very great loss of heat, and considerably lowers the total efficiency of the plant. According to F. Mayer, the heat balance of the open-hearth furnace plant is approximately as follows, expressed in percentages of the total heat generated by the coal consumed:—

	Per cent.
Total net useful effect	27
Losses by radiation from furnace and producers	29
Loss of heat in the waste gases	31
Combustible matter in producer cinders	3
Loss by radiation from producer	10
	100

It is evident, therefore, that the useful effect of the whole plant could be considerably increased by an improvement in the utilization of the very high losses sustained in the waste gases; but at present, no means are available for recovering the waste heat from the gases for utilization in the furnace plant itself.

The idea which first suggests itself, namely, increasing the size of the producers so as to obtain a higher degree of preliminary heating of the gas and air, and thus utilize the heat of the waste gases more effectually, is impracticable, because the pre-heating already raises the gas and air temperatures to that of the waste gases, and therefore cannot be improved upon. Consequently, the only course open for the time being is to utilize for extraneous purposes any waste heat that is capable of being recovered, steam raising being the most important to be considered.

In utilizing the waste heat of the gases so as to lower their temperature from 600—700 to 300 deg. C., about 1¾ tons of steam, at a pressure of 146 lbs., could be raised per hour from a 34-to 35-ton open-hearth furnace, consuming 27 cwts. of coal, with a heating value of 7,200 calories. Assuming 1 lb. of coal to produce 8 lbs. of steam, and that the steam would be utilized day and night for 300 days in the year, this would correspond, in the case of the above furnace, to a saving of 4½ cwts. of coal per hour, or, with coal at 16s. per ton, to an annual saving of £1,330. This saving of coal, amounting to 16.7 per cent. of the total consumption, would amend the heat balance as follows:—

	Per cent.
Total useful effect	27+16.7=43.7
Losses by radiation from furnace and producers	29.0
Loss in waste gases	31.0−16.7=14.3
Combustible matter in producer cinders	3.0
Loss by radiation from producer	10.0
	100.0

* Iron and Coal Trades' Review.

The total efficiency of the open-hearth steel plant is thus improved to the extent of 16.7 per cent. by the provision of a waste-heat boiler.

It is essential that the furnace draft should not be interfered with in the slightest degree by the interposition of such a boiler, the production of steel being the main factor in the working of the furnace. Consequently, the chimney stack must be able to produce the same draft in the furnace as before, in spite of the frictional resistance opposed by the boiler surfaces to the passage of the gases; and the fulfilment of this condition will necessitate an increase in the height of the stack. In many cases this increase will be too great to be obtained with the existing stack, and either a new stack will have to be built, or artificial draft created. In either case, the initial outlay will be recouped in 1½ to 2 years. With artificial draft, the provision of an economizer behind the waste-heat boiler will enable the temperature of the gases to be reduced to 150—200 deg. C., thus increasing the output of steam by about 20 per cent.

METALLURGICAL INVESTIGATIONS.

The work in the Metallurgical Department of the National Physical Laboratory, London, during the last year, included a continuation of the study of the alloys of aluminium with zinc and with zinc and copper together; the metallography of steel at high temperatures; the melting point of iron; the effects of strain at high temperature; and brittleness in steel. In some tests on the inflammability of flake charcoal the material was tested under various conditions of air supply, from 5 to 62 cubic feet a minute for a cubic foot of charcoal; and it was found that spontaneous combustion occurred when the temperature reached from 96 to 110 deg. C., according to the air supply, but that at lower temperatures there was no sign of spontaneous heating. At the request of Lloyd's Register the effect of exposing the charcoal to a current of air containing 5 per cent. of sulphurous acid gas was also tried, and the very startling result was obtained that even at the ordinary temperature (18 deg. C.) spontaneous combustion occurred when the charcoal had been exposed to a current of such air for hours. These experiments show clearly the danger which is involved in using this gas for disinfecting purposes in places where charcoal is used in the walls. The behavior of decayed wood has also been studied from the point of view of spontaneous combustion, but so far as the samples yet tested are concerned this material appears markedly less inflammable than charcoal.

MINING ACCIDENTS IN ONTARIO.

A report by E. T. Corkill, provincial inspector of mines, issued by the Ontario Bureau of Mines, shows that in 1911, 49 men were killed in accidents at mines, metallurgical works and quarries regulated by the Mining Act. The number of men killed and injured is distributed as follows: Mines, 36 killed and 86 injured; metallurgical works, 9 killed and 25 injured; quarries, 4 killed.

The number of men employed at mines is approximately 9,423, so that the ratio of men killed was 3.82 per 1,000. The causes of fatalities underground were: Falls of ground, 2; shaft accidents, 8; explosive accidents, 16; miscellaneous, 7. Of the three men killed on the surface, 2 were the victims of an explosion. These figures show a marked decrease in the accidents from falls of ground and in surface casualities, but a large increase in those caused by explosives.

The following classification distributes the responsibility for the causes of the fatal mine accidents: Due to dangers inherent in the work, 10; arising out of defects in the mine workings, 10; due to fault of fellow workman, 2; due to fault of injured person, 14. Of the 86 non-fatal accidents, 12 were due to explosives. The inspector notes that the provisions of the mining regulations most frequently broken by the workmen are those referring to the use of explosives.

STRIKES DURING FEBRUARY.

The strike situation in Canada continues on the whole favorable according to the latest reports of the Department of Labor. Few disputes of importance occurred during February, the one affecting most employees being that of the cloak and garment workers in the employ of T. Eaton Company, Toronto and Montreal. About 600 employees were affected by this dispute. Altogether there were twelve strikes in existence during February affecting about 50 firms and 1,200 employees. The loss of time in working days was approximately 10,000, compared with 12,000 days lost from the same cause during January, and over 32,000 days lost in February, 1911. Eight strikes remained in existence at the close of the month.

UNIVERSITY OF TORONTO ENGINEERING ALUMNI.

There was a very successful and enthusiastic gathering at the University Club, Vancouver, B.C., on March 30th, of the Engineering Alumni of the University of Toronto, Pacific Coast branch. This branch of the society was organized in Vancouver in January last, the membership being restricted to graduates and undergraduates of the engineering faculty of the University of Toronto and the old School of Practical Science, to the number of about fifty.

Speeches from a number of prominent engineers were included in the function. Among them were Mr. James H. Kennedy, chief engineer of the Great Northern Railway, who replied to the toast of the "Old School," of which he was one of the first graduates. Mr. E. B. Hermon, the president, replied to the toast "The Engineering Profession," Mr. W. A. Clement to "The Canadian Society of Civil Engineers," Mr. R. A. Thomson to "The Canadian Mining Institute," Mr. George Haynes, city engineer of North Vancouver, to "Municipal Engineering"; Mr. A. P. Augustine to "The British Columbia Land Surveyors"; Mr. James Hartney to "The Electric Engineers"; Mr. L. E. Jones and Mr. F. T. Smith to "The University of Toronto," and Mr. K. A. MacKenzie to "The General Engineering Alumni of the University of Toronto"; Mr. F. Broadfoot to "The American Society of Civil Engineers," and Mr. J. A. Mackenzie to "The American Society of Mining Engineers"; Mr. Fyfe and Mr. Broadfoot to "Athletics."

The alumni memorialized the occasion in the University Club by presenting to the club a handsome picture of the University of Toronto, main building. Dr. Wilson, the president of the club, accepted the gift in an appropriate speech.

ENGINEERING NOTES.

Regina, Sask.—During work on the pump well several employees of the city accidentally located a water gusher A five-inch pipe was laid down and the pressure forced the liquid over the end of the pipe which was left clear of the ground. An eight-inch pipe was added, forming an extension of about eight feet above ground level, and the pressure was sufficient to cause the water to flow with some force over the top of this. An investigation will be held, and in the mean time it is hoped that an additional source of water supply has been located.

Calgary, Alta.—Construction work on a new subway under the Canadian Pacific Railway tracks has been started. This subway is on Ninth Avenue East.

Vancouver, B.C.—The architects of this city are now making plans for an exhibition of their works. The display will be composed of line and wash drawings, photographs and models, and will, in all probability, be held in the Pacific Building. Mr. N. A. Leech is president of the association.

Montreal, P.Q.—The Canadian Autobus Company have made a proposition to the city council of Montreal regarding the inauguration of a line of cars on the streets of this city.

Ottawa, Ont.—The new intake pipe was in operation on April 9th last. A decided increase in the water pressure was noticed.

Hull P.Q.—A report states that the average daily water consumption in this city is 1,800,000 gallons, and the average amount pumped about three million gallons. The difference is supposed to be due to leaks in the mains. The individual consumption of water in this city is 166.66 gallons per day.

Regina, Sask.—The Regina Engineering Society has been formed. Mr. A. J. McPherson, late city commissioner, is president of the new organization. The organization has as its members nearly every engineer in the city, and it is proposed to take steps in the near future for the formation of a provincial body. The following list of officers will form the executive of the organization until the annual meeting, which will be held in November: First vice-president, H. S. Carpenter; second vice-president, L. A. Thornton; secretary, J. A. Gibson; corresponding secretary, R. O. Wynne-Roberts; treasurer, R. M. Blackburn; librarian, E. J. Wenger.

PERSONAL.

Mr. H. L. Thompson, of Vancouver, has been appointed construction engineer for the municipality of Burnaby, B.C.

Mr. I. F. Willsie has resigned his position as city engineer for the municipality of London, Ont.

Mr. Harry F. Clayton has been appointed vice-president and general manager of the Canadian Boving Company, Limited. The head offices of this company are in Toronto.

Mr. A. J. McPherson has resigned his position as city commissioner of the city of Regina, and will consider the appointment of chairman of the new Highway Commission of Saskatchewan.

Mr. John Callaghan, of Winnipeg, Man., has been appointed chief engineer of the Pacific Great Eastern Railway and assistant to Mr. B. B. Kelliher, of the Grand Trunk Pacific.

OBITUARY.

A well known trade journalist in the person of **Mr. Ivan Macdonald** has passed away. Mr. Macdonald was the founder and for a time managing editor of "Construction," a journal that devoted its talents to the architectural element. Mr. Macdonald was a Canadian, and had been engaged in editorial work for some years. His death was due to pneumonia. He was thirty years of age.

MEETINGS.

AMERICAN INSTITUTE OF CONSULTING ENGINEERS

The members of the above institute met in the rooms of the Engineers' Club, West 40th Street, New York City, on Wednesday evening, April 17th, to discuss the question of "Engineer Commissioners." This discussion took place after an enjoyable dinner had been served.

THE SCIENTIFIC CLUB OF WINNIPEG.

The annual meeting of the above was held in Winnipeg on Tuesday, April 2nd last. The secretaries reported that during the year 11 ordinary meetings had been held, at which 18 communications had been made. Of these, 7 belonged to the physical and chemical division of natural science, and 11 to the biological division. The following committee was elected for the ensuing session: Hon. treasurer, Prof. Parker; hon. secretaries, Prof. Vincent, A. T. Cameron; additional members of committee, Principal Bletcher, Prof. Evatt, R. T. Hodgson, Dr. Leeming, Dr. McClung and Dr. Torrance.

CENTRAL RAILWAY CLUB MEETING.

Nearly two hundred attended the annual banquet of the Central Railway and Engineers' Club at the Walker House, Toronto, April 8th. The president, Mr. James Bannon, presided. Amongst those who spoke to the various toasts were: Dean Galbraith of the University of Toronto, Ald. Alfred Maguire and President Willis Chipman of the Engineers' Club.

COMING MEETINGS.

CANADIAN INSTITUTE.—198 College Street, Toronto. Saturday Evening Lectures, 8 p.m. April 20th—"Chemical Interpretations of Vital Phenomena," illustrated. Prof. Leathes. Toronto Univerity. April. 27th—"Early Economic History of Canada," S. A. Cudmore. Toronto University. Nominations.

THE CLEVELAND ENGINEERING SOCIETY.—Special Meeting, Tuesday, April 23rd, 1912, Chamber of Commerce Bldg., Cleveland, O. "Steel and its Heat Treatment" (Illustrated), by Robt. R. Abbott, Metallurgical Engineer, The Peerless Motor Car Co. F. W. Ballard, Secretary.

ONTARIO MUNICIPAL ASSOCIATION.—Annual convention will be held in the City Hall, Toronto, on June 18th and 19th, 1912. Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ont.

ENGINEERING SOCIETIES.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—413 Dorchester Street West, Montreal. President, W. F. TYE: Secretary. Professor C. H. McLeod.

KINGSTON BRANCH—Chairman, A. K. Kirkpatrick; Secretary, L. W Gill; Headquarters: School of Mines, Kingston.

OTTAWA BRANCH—
177 Sparks St. Ottawa. Chairman, S. J. Chapleau, Ottawa; Secretary, H. Victor Brayley, N.T. Ry., Cory Bldg. Meetings at which papers are read, 1st and 3rd Wednesdays of fall and winter months; on other Wednesday nights in month there are informal or business meetings,

QUEBEC BRANCH—Chairman, W. D. Baillairge; Secretary, A. Amos; meetings held twice a month at room 40, City Hall.

TORONTO BRANCH—96 King Street West, Toronto. Chairman, T. C. Irving; Secretary, T. R. Loudon, University of Toronto. Meets last Thursday of the month at Engineers' Club.

VANCOUVER BRANCH—Chairman, C. E. Cartwright; Secretary, W. Alan. Kennedy; Headquarters: McGill University College, Vancouver.

VICTORIA BRANCH—Chairman, F. C. Gamble; Secretary, R. W. MacIntyre; Addrses P.O. Box 1290.

WINNIPEG BRANCH—Chairman, J. A. Hesketh; Secretary, E. E. Brydonejack; Meets every first and third Friday of each month, October to April, in University of Manitoba, Winnipeg.

MUNICIPAL ASSOCIATIONS

ONTARIO MUNICIPAL ASSOCIATION.—President, Chas. Hopewell, Mayor, Ottawa; Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ontario.

SASKATCHEWAN ASSOCIATION OF RURAL MUNICIPALITIES.—President, George Thompson, Indian Head, Sask.; Secy-Treasurer, E. Hingley, Radisson, Sask.

THE ALBERTA L. I. D. ASSOCIATION.—President, Wm. Mason, Bon Accord, Alta.; Secy-Treasurer, James McNicol, Blackfalds, Alta.

THE UNION OF CANADIAN MUNICIPALTIES.—President, W. Sanford Evans, Mayor of Winnipeg; Hon. Secretary-Treasurer, W. D. Lighthall, K.C., Ex-Mayor of Westmount.

THE UNION OF NEW BRUNSWICK MUNICIPALITIES.—President, Councillor Siddall, Port Elgin; Hon. Secretary-Treasurer J. W. McCready, City Clerk, Fredericton.

UNION OF NOVA SCOTIA MUNICIPALITIES.—President, Mr. A. S. MacMillan, Warden, Antigonish, N.S.; Secretary, A. Roberts, Bridgewater, N.S.

UNION OF SASKATCHEWAN MUNICIPALITIES.—President, Mayor Bee, Lemberg; Secy-Treasurer, W. F. Heal, Moose Jaw.

UNION OF BRITISH COLUMBIA MUNICIPALITIES.—President, Mayor Planta, Nanaimo, B.C.; Hon. Secretary-Treasurer, Mr. H. Bose, Surrey Centre, B.C.

UNION OF ALBERTA MUNICIPALITIES.—President, Mayor Mitchell, Calgary.; Secretary-Treasurer, G. J. Kinnaird, Edmonton, Alta.

UNION OF MANITOBA MUNICIPALTIES.—President, Reeve Forke, Pipestone, Man.; Secy-Treasurer, Reeve Cardale, Oak River, Man.

CANADIAN TECHNICAL SOCIETIES

ALBERTA ASSOCIATION OF ARCHITECTS.—President, G. M. Lang Secretary, L. M. Gotch, Calgary, Alta.

ASSOCIATION OF SASKATCHEWAN LAND SURVEYORS.—President, J. L. R. Parsons, Regina; Secretary-Treasurer, M. B. Weeks, Regina.

ASTRONOMICAL SOCIETY OF SASKATCHEWAN.—President, N. McMurchy; Secretary, Mr. McClung, Regina.

BRITISH COLUMBIA LAND SURVEYORS' ASSOCIATION.—President, W. S. Drewry, Nelson, B.C.; Secretary-Treasurer, S. A. Roberts, Victoria, B.C.

BUILDERS' CANADIAN NATIONAL ASSOCIATION.—President, E. T. Nesbitt; Secretary-Treasurer, J. H. Lauer, Montreal, Que.

CANADIAN ASSOCIATION OF STATIONARY ENGINEERS.—President, Wm. Norris, Chatham, Ont.; Secretary, W. A. Crockett, Mount Hamilton, Ont.

CANADIAN CEMENT AND CONCRETE ASSOCIATION.—President, Peter Gillespie, Toronto, Ont.; Secretary-Treasurer, Wm. Snaith, 57 Adelaide Street, Toronto, Ont.

CANADIAN CLAY PRODUCTS' MANUFACTURERS' ASSOCIATION.—President, W. McCredie; Secretary-Treasurer, D. O. McKinnon, Toronto

CANADIAN ELECTRICAL ASSOCIATION.—President, N. W. Ryerson, Niagara Falls; Secretary, T. S. Young, Canadian Electrical News, Toronto.

CANADIAN FORESTRY ASSOCIATION —President, John Hendry, Vancouver. Secretary, James Lawler, Canadian Building, Ottawa.

CANADIAN GAS ASSOCIATION.—President, Arthur Hewit, General Manager Consumers' Gas Company, Toronto; J. Keillor, Secretary-Treasurer, Hamilton, Ont.

CANADIAN INDEPENDENT TELEPHONE ASSOCIATION.—President, W. Doan, M.D., Harrietsville, Ont.; Secretary-Treasurer, Francis Dagger, 21 Richmond Street West, Toronto.

CANADIAN MINING INSTITUTE.—Windsor Hotel, Montreal. President, Dr. A. E. Barlow, Montreal; Secretary. H. Mortimer Lamb, Windsor Hotel, Montreal.

CANADIAN PEAT SOCIETY.—President, J. McWilliam, M.D., London, Ont.; Secretary-Treasurer, Arthur J. Forward, B.A., 22 Castle Building, Ottawa, Ont.

THE CANADIAN PUBLIC HEALTH ASSOCIATION.—President, Dr. Charles A. Hodgetts, Ottawa; General Secretary, Major Lorne Drum, Ottawa.

CANADIAN RAILWAY CLUB.—President, A. A. Goodchild; Secretary, James Powell, P.O. Box 7, St. Lambert, near Montreal, P.Q.

CANADIAN STREET RAILWAY ASSOCIATION.—President, D. McDonald, Manager, Montreal Street Railway; Secretary, Acton Burrows, 70 Bond Street, Toronto.

CANADIAN SOCIETY OF FOREST ENGINEERS.—President, Dr. Fernow, Toronto.; Secretary, F. W. H. Jacombe, Department of the Interior, Ottawa.

CENTRAL RAILWAY AND ENGINEERING CLUB.—Toronto. President G. Baldwin; Secretary, C. L. Worth, 409 Union Station. Meets third Tuesday each month except June, July and August.

DOMINION LAND SURVEYORS.—President, Mr. R. A. Belanger, Ottawa; Secretary-Treasurer, E. M. Dennis, Dept. of the Interior, Ottawa.

EDMONTON ENGINEERING SOCIETY.—President, J. Chalmers; Secretary, B. F. Mitchell, City Engineer's Office, Edmonton, Alberta.

ENGINEERING SOCIETY, TORONTO UNIVERSITY.—President, J. E. Ritchie; Corresponding Secretary, C. V. Ross.

ENGINEERS' CLUB OF MONTREAL.—Secretary, C. M. Strange, 9 Beaver Hall Square, Montreal.

ENGINEERS' CLUB OF TORONTO.—96 King Street West. President, Willis Chipman; Secretary, R. B. Wolsey. Meeting every Thursday evening during the fall and winter months.

INSTITUTION OF ELECTRICAL ENGINEERS.—President, Dr. G. Kapp; Secretary, P. F. Rowell, Victoria Embankment. London, W.C.; Hon. Secretary-Treasurer for Canada, Lawford Grant, Power Building, Montreal, Que.

INSTITUTION OF MINING AND METALLURGY.—President, Edgar Taylor; Secretary, C. McDermid, London, England. Canadian members of Council:—Prof. F. D. Adams, J. B. Porter, H. E. T. Haultain and W. H. Miller and Messrs W. H. Trewartha-James and J. B. Tyrrell.

INTERNATIONAL ASSOCIATION FOR THE PREVENTION OF SMOKE.—Secretary R. C. Harris, City Hall, Toronto.

MANITOBA LAND SURVEYORS.—President, George McPhillips; Secretary-Treasurer, C. G. Chataway, Winnipeg, Man.

NOVA SCOTIA MINING SOCIETY.—President, T. J. Brown, Sydney Mines, C. B.; Secretary, A. A. Hayward.

NOVA SCOTIA SOCIETY OF ENGINEERS, HALIFAX.—President, J. N. MacKenzie; Secretary, A. R. McCleave, Assistant Road Commissioner's Office, Halifax, N.S.

ONTARIO PROVINCIAL GOOD ROADS ASSOCIATION.—President, Major. T. L. Kennedy; Hon. Secretary-Treasurer, J. E. Farewell, Whitby; Secretary-Treasurer, G. S. Henry, Oriole.

ONTARIO LAND SURVEYORS' ASSOCIATION.—President, T. B. Speight, Toronto; Secretary, Killaly Gamble, 703 Temple Building, Toronto.

THE PEAT ASSOCIATION OF CANADA.—Secretary, Wm. J. W. Booth, New Drawer, 2263, Main P.O., Montreal.

PROVINCE OF QUEBEC ASSOCIATION OF ARCHITECTS.—Secretary, J. E. Ganier, No. 5. Beaver Hall Square, Montreal.

REGINA ENGINEERING SOCIETY.—President, A. J. McPherson, Regina; Secretary, J. A. Gibson, 2429 Victoria Avenue, Regina.

ROYAL ARCHITECTURAL INSTITUTE OF CANADA.—President, F. S. Baker, F.R.I.B.A., Toronto, Ont.; Hon. Secretary, Alcide Chausse, No. 5. Beaver Hall Square, Montreal, Que.

ROYAL ASTRONOMICAL SOCIETY.—President, Prof. Louis B. Stewart, Toronto; Secretary, J. R. Collins, Toronto.

SOCIETY OF CHEMICAL INDUSTRY.—Dr. A. McGill, Ottawa, President; Alfred Burton, Toronto, Secretary.

UNDERGRADUATE SOCIETY OF APPLIED SCIENCE, McGILL UNIVERSITY.—President, J. P. McRae; Secretary, H. F. Cole.

WESTERN CANADA IRRIGATION ASSOCIATION.—President, Wm Pierce, Calgary; Secretary-Treasurer, John T. Hall, Brandon, Man.

WESTERN CANADA RAILWAY CLUB.—President, R. R. Nield; Secretary, W. H. Rosevear, 115 Phœnix Block, Winnipeg, Man. Second Monday, except June, July and August, at Winnipeg.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand and projected, contracts awarded, changes in staffs, etc. Printed forms for the purpose will be furnished upon application.

PLANS AND SPECIFICATIONS ON FILE.

The following Plans (P.) and Specifications (S.) are on file for reference only unless otherwise noted at the office of The Canadian Engineer, 62 Church Street, Toronto:—

Bids close		Noted in issue of
4-15	Cement sidewalks, Battleford, Sask.	(P. & S.) 4-4
4-30	Tunnel sewer, Edmonton, Alta.	(S.) 4-4
4-30	Subway, Saskatoon, Sask.	(P. & S.) 4-18
4-30	Trunk sewer, Edmonton, Alta.	(S.) 4-11

(Battleford and Saskatoon plans and specifications are on file at The Canadian Engineer Office, 820 Union Bank Building, Winnipeg.)

TENDERS PENDING.

In Addition to Those in this Issue.

Further information may be had from the issues of The Canadian Engineer referred to.

TENDERS.

Brandon, Man.—Tenders will be received by the City Clerk, Brandon, until noon of April 18th, 1912, for the supply of 4,000 bbls. of best quality Portland cement to be delivered f.o.b. cars, Brandon. R. E. Speakman, City Engineer.

Calgary, Alta.—Tenders will be received by A. S. Dawson, Chief Engineer, Canadian Pacific Railway, Calgary, up to noon of May 15th, 1912, for approximately 4,250,000 feet B.M. of timber, and 80,000 cubic yards of excavation. (See advertisement in Canadian Engineer.)

Fort William, Ont.—Tenders will be received by the Works Committee at the office of the City Clerk up to 15th day of May, 1912, for the complete installation, including all buildings, of a fifty-ton incinerator plant and the operation of same for a period of three months after completion. John Wilson, City Engineer. (See advertisement in Canadian Engineer.)

Guelph, Ont.—Messrs. Colwill and Tanner have been appointed architects and will start on the plans immediately for the new Dominion Linen Mill, and tenders will be called for shortly.

High River, Alta.—Tenders will be received by the Secretary-Treasurer, until 8 p.m., April 30th, 1912, for the following works:—

Contract "A"—Labor laying water mains and sewers.
" "C"—Furnishing materials for and erecting water tower.
" "D"—Furnishing C.I. water pipes and special castings.
" "E"—Furnishing fire hydrants, gate valves, etc.
" "O"—Labor on main outfall sewer.
" "S"—Furnishing sewer pipes and junctions.
" "W"—Furnishing 4,500 ft. of 12-inch wooden pipe.

Tenders will be called shortly for power house, machinery and sewage disposal works.

Plans and specifications at the office of the Engineers, Toronto and Winnipeg, and at the Town Hall, High River, Alta. R. A. Wallace, Esq., Mayor. Chipman and Power, Engineers.

Kerrisdale, B.C.—The Corporation of the Municipality of Point Grey is prepared to receive tenders up to April 29th, 1912, for the construction of outfall sewer, main sewers, laterals, manholes and other relative works in the Kerrisdale district. Particulars may be obtained from Mr. D. W. Johnston, Municipal Engineer, Municipal Hall, Kerrisdale. H. Floyd, Clerk, Municipal Council, Kerrisdale.

Moose Jaw, Sask.—Tenders will be received by the City Commissioners, until noon April 30th, 1912, for the construction of a reinforced concrete subway under the Canadian Pacific Railway Company's tracks on Eleventh Avenue. Plans, etc., at the office of the City Engineer or City Clerk, Moose Jaw. (See advt. in Canadian Engineer).

Moose Jaw, Sask.—Tenders will be received until April 24th, 1912, for the erection of a Public Library Building in Crescent Park in the city of Moose Jaw. Plans, etc., can be obtained from Messrs. Reid & MacAlpine, Architects, Howden Block, Moose Jaw. W. F. Heal, Secretary, Public Library Board, Moose Jaw.

North Vancouver, B.C.—Tenders will be received up to noon of April 22, 1912, for supplying 500 lineal feet of 16-in. steel water pipe, according to specifications prepared by the City Engineer, copies of which may be obtained at the Engineer's office, North Vancouver. George S. Hanes, City Engineer.

Ottawa, Ont.—Tenders will be received until May 10th, 1912, for widening lower entrance channel-way, Sault Ste. Marie Canal. Plans, etc., at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Engineer in charge, Sault Ste. Marie, Ont., at which places form of tender may be obtained. L. K. Jones, Secretary, Department of Railways and Canals, Ottawa.

Ottawa, Ont.—Sealed proposals will be received at the Public Works Department up to the 2nd day of July, 1912, for the construction of a dry dock in the Port of Quebec. Dimensions of dry dock to be not less than 1,150-ft. usable length, 110-ft. clear width at entrance, and at least 37-ft. in depth over sill and keel blocks at ordinary high water Spring tide, and to be in three compartments. Dry dock will be located either at Lauson or in the estuary of the River St. Charles, or on the Beauport flats, and applicants will be required to submit with their proposal a report signed by their engineer or engineers setting forth in detail: (1) the respective advantages from the viewpoint of the shipping interests of each of the above-mentioned sites; (2) plans and specifications with full and detailed estimates of cost. R. C. Desrochers, Secretary, Department of Public Works, Ottawa.

Ottawa, Ont.—Separate tenders will be received at the Department of Public Works, until April 30th, 1912, for the supply of hardware, brushes, manilla rope, packing, paint and paint oil, hose, wire rope, oils and greases, steam pipe, chain and steam fittings for the departmental dredging plant. R. C. Desrochers, Secretary, Department of Public Works, Ottawa.

Ottawa, Ont.—Structural Competitive Designs for a monument to be erected at Ottawa, Canada, to His Late Majesty King Edward VII., will be received at the Department of Public Works, Ottawa, up to October 1st, 1912. Full particulars may be had on application to R. C. Desrochers, Secretary, Department of Public Works, Canada.

Ottawa, Ont.—Plans have been completed and tenders will be called shortly for the construction of a new Government steamer to be used in the customs patrol service in the Gulf of St. Lawrence. Vessel will be of steel, will have a length of 200 feet, and cost a quarter of a million dollars.

Ottawa, Ont.—Tenders will be received by G. J. Desbarats, Deputy-Minister of the Naval Service, Department of the Naval Service, up to noon of June 17th, 1912, for the design and construction of a new Fishery Protection Vessel for Service on the Pacific Coast. (See advt. in Canadian Engineer).

Ottawa, Ont.—Tenders for interior fittings, post office, at Nanaimo, B.C., will be received at the Department of Public Works, Ottawa, until April 22, 1912. Plans and specifications to be seen on application to Mr. James May, Clerk of Works, Nanaimo, B.C.; Mr. W. Henderson, Resident Architect, Victoria, B.C., and at the Department of Public Works, Ottawa.

Ottawa, Ont.—Tenders for the erection of a frame schoolhouse on the St. Mary's Reserve, near Fredericton, N.B., will be received at the office of J. D. McLean, Assistant Deputy and Secretary, Department of Indian Affairs, Ottawa, up till noon of May 2nd, 1912. Plans and specifications may be seen at the office of N. J. Smith, Indian Agent, Fredericton, or at the office of the Department of Indian Affairs.

Prince Albert, Sask.—Tenders will be received by the City Commissioners up to noon of April 30th, 1912, for the construction of concrete sidewalks.

Contract 12 H.—About 3 7/10 miles.
Contract 12 J.—About 4 9/10 miles.

Specifications, etc., may be obtained at the office of the City Engineer, of Prince Albert. C. O. Davidson, Secretary-Treasurer, Prince Albert, Sask.

Regina, Sask.—Tenders will be received until Saturday, April 20th, for a three-story fire-proof building for the Engineers' and Plumbers' Supply Company, Limited. Plans and specifications can be seen at the office of N. R. Darrach, Architect, Western Trust Building, Regina.

Saskatoon, Sask.—Tenders will be received by the City Commissioners, up to noon of May 17th, 1912, for furnishing material for and construction of Superstructure 23rd Street Subway. (See Advertisement in Canadian Engineer).

Selkirk P.O., Man.—Tenders will be received until May 7th, 1912, for the building of a bridge over Gunn's Creek, on Lot 162, St. Andrews; bridge to have concrete abutments and a wood top, and to be built according to plans and specifications, which may be seen at the Municipal Office, or at the Department of Public Works, Winnipeg. Thos. Bunn, Secretary-Treasurer, Selkirk P.O., Man.

Winnipeg, Man.—Tenders will be received until April 30th, 1912, for the erection of twelve additional rooms to existing Britannia School, Hampton Street, St. James. Revised plans and specifications can be seen at the office of E. D. Tuttle, Architect, 701 McArthur Bldg., Winnipeg.

CONTRACTS AWARDED.

Calgary, Alta.—Messrs. Doyle & Thompson, 20 Elma Block, Calgary, have received contract for the erection of a school to cost $172,000.

Calgary, Alta.—The contract for the erection of the new King George school in Pleasant Heights was awarded to Jones & Lyttle for $125,620, while the heating and plumbing contract for the building was given to Grant Bros., whose figure was $21,850.

Campbellton, N.B.—Interior fittings, post office; Edward Bates, contractor, St. John, N.B.

Hamilton, Ont.—A report states that the contract for the supply of concrete poles for the hydro-electric service has been awarded to Messrs. Hancock and Sons, brick manufacturers, Hamilton.

Lansdowne Park, Ottawa, Ont.—Machinery Hall; contractors, Messrs. Alexander & Campbell, Ottawa; cost, $81,309.

Lethbridge, Alta.—Contracts for the Galbraith school and for the physical culture building to be erected in connection with the Westminster school, were let to the Lussier Construction Company; the cost of the former being $55,000, and of the latter, $5,950. The Wm. Head Company got the heating and plumbing contract for $14,000. Others tendering for the Galbraith school were: S. Stanford, $59,000; Hotson & Leader Co., $63,000; Odmark Bros., Macleod stone, $56,550, Bedford, $56,550; W. P. Bayne, Macleod, $58,109, Bedford, $57,478; W. H. Holt, Macleod, $56,800, Bedford, $57,270; Smith Bros. & Wilson, Macleod, $56,200, Bedford, $55,850. The building will be of Bedford stone.

Montreal, Que.—General contractor E. G. M. Cape, Beardmore Bldg., Montreal, has received the contract for an addition to the Sarah Maxwell School to cost $37,000. The iron work contract has been awarded to Phoenix Bridge & Iron Works, Ltd., 83 Colborne Street.

Port Arthur, Ont.—Messrs. Barnett & McQueen, Fort William, Ont., have received the contract for the construction of a steel dock for the Canadian Northern Railway, to cost $40,000. Sub-contracts for piling, etc., have been awarded to the Thunder Bay Harbor Improvement Co.

Prince Rupert, B.C.—Messrs. Evans, Coleman & Evans, of Vancouver, have the contract of supplying Prince Rupert with 3,800 feet of 18 inch diameter steel pipe.

Saskatoon, Sask.—Messrs. Fielding & Shepley, of St. Paul, Minn., have received the contract for laying of approximately 23,100 square yards of sandstone block pavement, their price being $117,810.00. Other tenderers were the Forest City Paving and Construction Company, London, Ont., at $124,740, and Messrs. Pastoret & Lawrence, Duluth, Minn., at $126,588.

Toronto, Ont.—The contract for the supply of T-rails for use on the new civic car lines to be constructed on St. Clair Avenue, has been awarded to the United States Steel Products Co., Montreal. The T-rail tender is $35,996, 80 pounds to the foot, and the girder rail tender for 90-pound rails is $43,195. Other contracts for bars, etc., go to the Rail Joint Co. of Canada.

Vancouver, B.C.—Tenders received for the widening of the approaches to the Main Street bridge were: Messrs. McKenzie, Broadfoot & Co., $7,495; T. R. Nickson & Co., $8,635; La Placa Bros., $7,180. The last named was accepted.

Vancouver, B.C.—The contract for the construction of the south section of the Bridge Street trunk sewer has been awarded to J. Shunn, Esq., of Vancouver, for $30,158.00. Eleven other bids were received.

Tarvia

Preserves Roads
Prevents Dust—

Charles Street, Stratford, Ontario, showing "Tarvia Modern Pavement."

Adding to the Life of Macadam

Ordinary macadam belongs to the past. It is not adequate to meet the demands of modern automobile traffic.

It must be discarded or "tarviated.'

A tarviated road costs a little more than ordinary macadam but lasts so much longer that the addition of the Tarvia is more than paid for in the reduction of maintenance.

Tarvia makes a firm elastic matrix around the stone, filling all voids, excluding water, and resisting pulverization of the surface.

For an old road that cannot be rebuilt or resurfaced, the "sprinkling" or "surface" treatment known as "Tarvia B" treatment is highly effective. One treatment will give excellent results for a season, or even longer, depending upon the amount of traffic. This treatment is quite inexpensive.

Tarvia gets at the original causes of road waste and disintegration. Oils and other devices simply make the dust too heavy to rise. They have little or no bonding or preservative properties.

Tarvia is made in three grades:—

Tarvia X, for road construction.

Tarvia A, for use in surfacing old roads and keeping them dustless.

Tarvia B, for dust suppression on old roads.

Road Engineers, road authorities, automobile owners and residents along macadam roads are invited to send for our booklet.

Winnipeg, Man.—The Canadian Mineral Rubber Company, Winnipeg, has been awarded contract for the supply of from 1,200 to 1,500 tons of asphalt cement at $23.50 per net ton.

RAILWAYS—STEAM AND ELECTRIC.

Kingston, Ont.—A report states that the Kingston and Pembroke Railway will expend $205,000 this summer on improvements over the line.

Ottawa, Ont.—The Minister of Railways has placed an order for rolling stock to be used on the lines of the Intercolonial Railway. The sum involved is about $1,125,000. The orders include nine freight locomotives from the Canadian Locomotive Works at Kingston, 400 steel box cars from the Nova Scotia Car Company, two dining cars and two sleepers from the Canadian Foundry Company, and six first-class coaches from the Preston Car Company. In addition a number of flat cars, stock, refrigerator and coal cars are to be ordered.

Ottawa, Ont.—The management of the Ottawa Electric Street Railway Company recently placed an order with the Ottawa Car Company for twenty new steel street cars. The cars will be manufactured of steel throughout excepting the door and window frames.

South Vancouver, B.C.—The ratepayers of the Ferris Road district have prepared a petition calling for an extension of the electric car line from Main Street.

Toronto, Ont.—The municipal railway department under the management of the city engineer, Mr. Rust, has been authorized to purchase the following track supplies without tenders being called for: 6,000 steel ties, 24,000 rail clips, 24,000 tie bolts, 18,000 wood ties.

The track laying programme of the Canadian Northern Railway for this year includes the following works:—Montreal to Hawkesbury, 58 miles; Ottawa to Ottawa River, 32 miles; west from Ruel, Ont., 100 miles; east from Port Arthur, 108 miles; branch lines and extensions in Alberta and Saskatchewan, 400 miles; British Columbia, 75 miles; Sydenham, O., to Ottawa, 80 miles; relaying track on main line west, 200 miles; total, 1,053 miles.

LIGHT, HEAT AND POWER.

Niagara Falls, Ont.—The Dominion Government have decided to construct a new power house and pumping station at this point. This will remove the present plant from Table Rock and increase the efficiency of this department.

Ottawa, Ont.—The estimates for civic lighting call for cluster lights to be installed on Lady Grey Road for a distance of about two miles.

Welland, Ont.—The municipal council have passed a by-law whereby that body will offer the Welland Electrical Company the sum of $50,000.00 for their plant.

GARBAGE, SEWAGE AND WATER.

Cobourg, Ont.—A large water tank belonging to the municipality was demolished by a fall recently. It will cost about $25,000.00 to replace, but it is unlikely that such will be done.

Hull, P.Q.—The ratepayers of the Wrightville district have arranged for the installation of a new sewage system which is to be completed by June 1st, next.

Ingersoll, Ont.—Preliminary steps have been commenced for the installation of a sewerage system for this town. Mr. Chipman, C.E., Toronto, will advise the municipal council in the matter.

Ingersoll, Ont.—The ratepayers of this town will assume control of the water works after May 1st next. The price paid for the property complete was $125,000.00.

Kingston, Ont.—The municipal board of health have requested the city council to install a filtration plant for the purification of the drinking water.

St. Catharines, Ont.—The municipal council have adopted an extensive sewer construction programme which will entail the expenditure of about $25,000.

BUILDINGS AND INDUSTRIAL WORKS.

Barrie, Ont.—The municipal board of education are planning to erect a new collegiate building. The plans as submitted to the members call for an expenditure of approximately $65,000.00.

Guelph, Ont.—Plans for a factory of the Dominion Linen Mills have been prepared. They call for the construction of four buildings of pressed brick and steel sash. The main building will be 380 x 150 with 30 foot windows.

Mildmay, Ont.—The Roman Catholics of this place are about to construct a new church. Mildmay is near Stratford, Ont.

Montreal, P.Q.—The Montreal Association for the blind are erecting a handsome school building in this city.

Regina, Sask.—The Roman Catholics of this city are planning to erect a new cathedral. Bishop Mathieu is taking charge of the preliminaries.

Regina, Sask.—Plans have been prepared for the new Grand Trunk Pacific station at this point. It will be two stories in height, 600 x 250 including the train sheds.

Roche Percee, Sask.—A brick manufacturing concern has been organized to operate in the vicinity of this place. The promoters plan a $30,000 plant with a daily capacity of 40,000 brick. Mr. G. T. Cross, manager of the City Ice and Coal Company, Moose Jaw, Sask., is the president of the new company.

Saskatoon, Sask.—The Board of Education have called tenders to be in by April 25th next for the erection of a new school in the district of Westmount.

Smith's Falls, Ont.—The management of the Canadian Northern Railway will erect a new railroad station in this town.

Toronto, Ont.—A syndicate will erect a five story building at the corner of Bay and Queen Streets. Sir Richard Cartwright is the head of this syndicate.

Vancouver, B.C.—The management of the Molsons Bank are about to erect a handsome branch office in this city. H. L. Stevens and Company, Architectural Engineers, are preparing the plans. It will be of brick six stories in height.

Vancouver, B.C.—The congregation of Trinity Church (Anglican), have decided to erect a new church structure. The rector, Rev. H. Beecham, will appoint a committee to handle the matter.

BRIDGES, ROADS AND PAVEMENTS.

Carleton County, Ont.—The officials of this county have recently given serious consideration to the matter of good roads and repairs to the ones now in use. The council expressed their opinion on the necessity of the purchase of three or four road machines, but no definite action has, as yet been taken. Mr. A. P. Wilson, Osgoode, Ont., is interested in the matter.

Central Ontario.—Reports from Barrie, Ont., of the damage to country bridges from the flood indicate that the loss will amount to about $50,000. A special meeting of the Simcoe County Council will be held to discuss the situation. Five bridges on the Nottawasaga and Boyne Rivers are completely demolished.

Guelph, Ont.—The municipal council have decided to erect a bridge over the river and the Canadian Pacific Railway tracks at Hefferman Street. It will be a foot bridge.

Lower Ontario.—Several bridges along the road of the Canadian Pacific Railway will require considerable repair work following the damage caused by the recent floods. The trains of this company will operate on the lines of the Grand Trunk between Toronto and North Bay during the next few weeks.

Montreal, P.Q.—The municipal council have taken definite steps towards the construction of a subway below the Canadian Pacific Railway tracks on Park Avenue. The structure is to cost between $250,000 and $400,000. The Railway Board will consider the matter at their sitting in Montreal on April 22nd.

Victoria, B.C.—Arrangements are being made for a conference between the Minister of Public Works and several municipalities in this neighborhood to discuss the question of paving the main highway between Vancouver and New Westminster.

Victoria, B.C.—The Municipal Streets Committee have ordered the construction of a new bridge across the ravine of the Gore Road. The City Engineer recommends a reinforced concrete structure at a cost of $24,371. The chairman of the committee, Alderman Stewart, will co-operate with the engineer on the selection of this bridge or a steel structure to cost $32,300.

FIRES.

Fort William, Ont.—A large rink was destroyed by fire in this city recently; the loss is placed at $35,000. The structure was known as the Arena.

Montreal, P.Q.—Fire caused considerable damage to part of the plant of the Caledonian Iron Works. The damage was confined to the moulding shop.

CURRENT NEWS.

Edmonton, Alta.—Recent tests of the new high pressure pumps of the city resulted in a satisfactory report being made by the fire chief.

Ingersoll, Ont.—An inspection of the various dams in the vicinity of this town will be made following an order from the mayor's office.

Lethbridge, Alta.—There is an active movement among the members of the Municipal Board of Trade calling for gas boring operations to be commenced. Some time back the sum of $30,000 was laid aside for this purpose, and of this about $16,000 was spent in an unsuccessful attempt to locate this utility. Several encouraging reports are now to hand and it is on the strength of these that the renewed activities are being undertaken.

Vancouver, B.C.—A new telegraph line will be constructed from this city to Powell River. This line will cost $27,400, and will be installed by the Federal Government.

TRADE ENQUIRIES.

From the branch for City Trade Inquiries, 73 Basinghall Street, E.C.

A London company would like to get into touch with a reliable firm of engineers in Canada who could introduce and sell their oil extraction plant.

ORDERS OF THE RAILWAY COMMISSIONERS OF CANADA.

Each week on this page may be found summaries of orders passed by the Board of Railway Commissioners, to date. This will facilitate ready reference and easy filing. Copies of these orders may be secured from The Canadian Engineer for small fee.

16192—March 29—Authorizing C.N.O. Ry. to cross Sydenham Lake, in Twp. of Loughborough, Ct. Frontenac, and rescinding Order No. 15026 of Oct. 10th, 1911.

16193—March 26—Approving revised location of Algoma Central & H.H. Ry. between mileage 123.74 to 130.87 and connection with N.T.R. at Grant, Ont.

16194—March 28—Authorizing Department of Public Works, B.C., to cross with Park Ave., C.P.R. in Slocan City, B.C.

16225—April 3—Directing that local tolls of Vancouver, Fraser Valley & Southern Rly. Co., on lumber, etc., shall be same as charged by C.P.R. and G.N.R. for similar distance within their corresponding territories, and directing that joint through rates on lumber to be on basis of one cent per 100 pounds, etc.

16226-27-28—April 3—Disallowing increased tolls of G.T.P., C.N.R., and C.P.R. from 1st day of April, 1912, and restoring lower tolls in effect immediately before that date being rates from Westfort, Port Arthur, Fort William.

16229—April 4—Extending until 1st Oct., 1912, time for completion of C.N.R. spur authorized by Order 15322, March 29, 1911, in city of St. Boniface, Man.

16230—April 4—Extending for 6 months from 30 March, 1912, time for completion of extension of A.C. & H.B. Ry. to Bruce Street, Sault Ste. Marie, Ontario.

16231—April 3—Granting certificate of correction to G.T.P. B.L. Co., for errors in Regina-Moose Jaw Branch location plan.

16232—March 25—Approving location of C.P.R. station at Griffin, Sask.

16233—April 8—Approving Order of Exchequer Court of Canada appointing Frank W. Blair, Dudley E. Waters, and Newman Erb, Receivers of the Pere Marquette R.R. Co., in Canada.

16234—March 11—Rescinding Order 16004 of February 15th, 1912, and authorizing C.N.R. to cross C.P.R. at Lambton, by means of an undercrossing, Twp. of Etobicoke, County York, Ont.

16235—April 1—Amending Order No. 15558, of Dec. 5, 1911, by adding clause directing city of Winnipeg to reimburse .P.R. for services of flagman, etc., at crossing.

16236—April 3—Authorizing Lachine, Jacques Cartier & Maisonneuve Rly. Co. (G.T.R.) to cross Montreal Street Railway by means of overhead bridges at three streets in Montreal.

16237—April 1—Directing that C.N.R. and C.P.R. protect crossing on Main Street, Gladstone, Man., by watchman.

16238—April 1—Directing G.T.P. Ry. to grade a new crossing parallel with Main St., and open Beaver Hills Road across its right-of-way in village of Ituna, Sask.

16239—April 2—Dismissing application of residents in vicinity of Carrot Creek, Alta., re G.T.P. siding.

16240—April 1—Refusing application of farmers in vicinity of Pleasant Point, near Carberry, Man., for an order directing C.P.R. to construct a siding.

16241—April 1—Directing C.N.R. to fence its right-of-way along the Qu'Appelle, Long Lake & Sask. Rv., between Saskatoon and Regina, that is now unfenced, under penalty of $50 per day after 1st Nov., 1912.

16242—April 2—Directing G.T.P. to cease discriminating in carriage of freight traffic in favor of its contracts as against general public over its line from Hinton, Alta., to west thereof; subject to fine of $100. Petition of towns in B.C. and Alta.

16243—April 6—Authorizing C.N.O. Ry. to cross four highways in Twp. of Nepean, Carleton County, Ontario.

16244—April 6—Authorizing C.N.R. to cross with its Calgary-Edmonton Branch 6 highways in Alberta.

16245—April 1—Authorizing C.N.R. to construct spur to city of Saskatoon Power House, Saskatoon, Sask.

16246—April 3—Authorizing C.N.R. to cross 5 highways in city of Strathcona, Alta.

16247-48—April 4—Approving location of Campbellford, Lake Ontario & Western Rv. (C.P.R.) Glen Tay to Belleville Branch Line from mileage 15, across Twps. of Oso, Bedford, and Hinchinbrooke, crossing K. & P. Ry. near Parham station to westerly boundary of Twp. of Hinchinbrooke, at mileage 38.5, Ct. Frontenac, Ont. And location of Glen Tay to Cobourg Line from mileage 38.5 to mileage 58.5 in United Counties of Lennox and Addington.

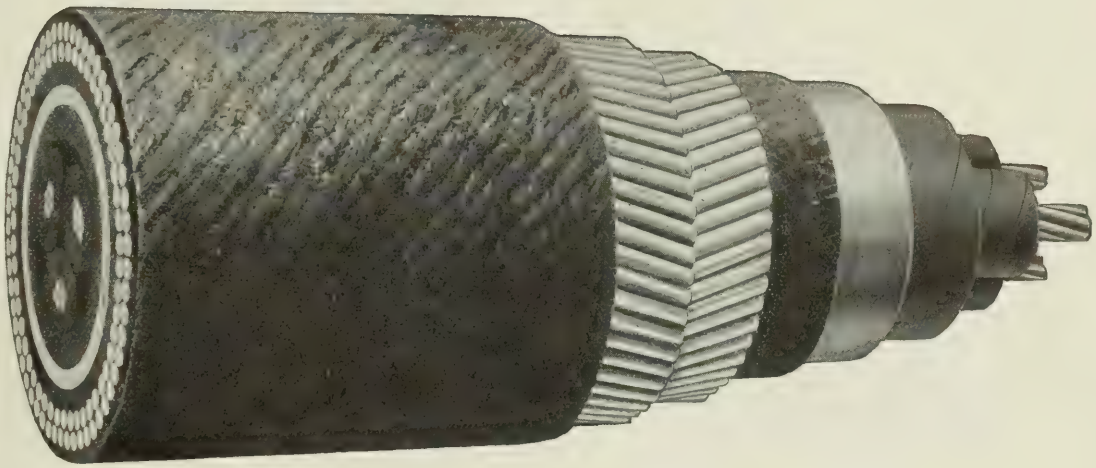
16249—April 4—16250—April 6—Authorizing G.T.P. Ry. to construct bridge across Fraser River at mileage 316 and 274 west of Wolf Creek, B.C.

16251—April 2—Refusing application of G.T.P. B.L. Co. re right-of-way Tofield-Calgary Branch.

The Cable across the St. Lawrence River

FROM

Pt. Aux Tremble to King Edward Park.



The longest paper insulated Sub-marine Power Cable on the Continent (supplied and installed by The Canadian British Insulated Co., Ltd., for the King Edward Park Company,) No. 6 B. & S. Gauge, 3 conductor, paper insulated, lead covered double wire armoured and juted.

1½ miles long—13,200 volts

We are prepared to undertake contracts for the Supply and Installation complete of Power Cables under a Five Year guarantee.

WE WANT YOUR ENQUIRIES

Canadian British Insulated Co., Limited

HEAD OFFICE - MONTREAL

16252—April 3—Authorizing G.T.B. B.L. Co. to cross the Brandon Branch of the C.P.R. by overhead bridge in N.W. ¼ of Sec. 26, Twp. 10, Range 18, west P.M., Man.

16253-54—April 2—Authorizing C.P.R. to take lands for construction of permanent snow fences in Twp. of Pickering, Ct. Ontario, Ont.

16255—April 4—Relieving C.P.R. from erecting and maintaining fences on portion of its Calgary Subdivision, Alta.

16256-57—April 6—Authorizing G.T.P. B.L. Co. to cross with its Calgary Boundary Branch the C.P.R. Aldersyde Branch in N.E. ¼ of Sec. 4, Twp. 12, R. 23, west 4th M., and in N.W. ¼ of Sec. 26, Twp. 19, Range 28, west 4th M. Interlocking plants to be installed at the two crossings.

16258—April 6—Authorizing G.T.P. B.L. Co. to construct, maintain and operate "wye" connecting its Alberta Coal Branch with Yellowhead Pass Coal & Coke Co.'s Spur, Alberta.

16259—April 9—Rescinding Order 8462, Oct. 29th, 1909, and directing the G.T.P. to construct an overhead crossing on the Fort Saskatchewan Trail; detail plans to be filed within 30 days, and work to be completed within ninety days from approval of plans under penalty of $100 per day, North Edmonton, Alta.

16260—April 10—Authorizing C.P.R. to construct spur for Chinook Coal Company, Ltd., at Kipp, in the Province of Alberta, and rescinding Order 16088, of March 7th, 1912.

16261—April 9—Authorizing G.T.R. to construct spur into premises of Western Foundry Co., Ltd., town of Wingham, Ontario.

16262-63-64—April 9—Authorizing C.P.R. to reconstruct bridge No. 22.5 on its Newport Subdivision; bridge 32.6 on its Ottawa Subdivision; and bridges 24.8, 30.7, 32.2, and 35.8 on its Farnham Subdivision.

16265—April 9—Authorizing C.P.R. to construct its Moose Jaw Southwesterly Branch across highway at mileage 36.63.

16266—April 10—Approving revised location of C.N.O. Ry. in the Twp. of Litchfield, mileage 59.13 to 59.73 from Ottawa, Ont.

16267—April 10—Approving location of C.N.R. Co. (Montreal-Port Arthur Line) through Twps of MacTennan, Scadding, Street and Davis, in Dist. of Sudbury, mileage 405.36 to 421.09 from Montreal.

16268—April 10—Authorizing C.N.O. Ry. to connect its tracks with C.P.R. at mileage 2, in Port Arthur, only, for construction purposes only.

16269—April 9—Authorizing C.N.R. to construct its Calgary-Strathcona line across 25 highways in Alberta.

PUBLIC SERVICE OF CANADIAN RAILWAYS.

During the year ended June 30, 1911, there were carried by the railways of Canada 37,097,718 passengers and 79,884,282 tons of freight. These figures show an increase over the preceding year of 1,203,143 passengers and 5,401,416 tons of freight.

The following table shows the number of passengers carried for various periods:—

	Passengers carried.
1875	5,190,416
1890	12,821,262
1894	14,462,498
1901	18,385,722
1908	34,044,992
1909	32,683,309
1910	35,894,575
1911	37,097,718

The freight record for the same periods was as follows:—

	Tons of freight 2,000 lbs.
1875	5,670,837
1890	20,787,469
1894	20,721,116
1901	36,999,371
1908	63,071,167
1909	66,842,258
1910	74,482,866
1911	79,884,282

In 1875 the number of passengers and tons of freight carried were nearly equal. Thereafter, the development of freight traffic proceeded more rapidly than did the development of passenger business.

The number of passengers carried in 1911 was 37,097,718—an increase of 3.3 per cent. over 1910. The number of passengers carried one mile was 2,605,968,924, representing an increase of 139,239,260 as compared with the preceding year. The density of passenger traffic—as represented in the number of passengers carried one mile per mile of line—was 102,597. These figures show a gain of 2,855 over 1910. The increase since 1907 has been 11,676.

The following is an interesting table:—

	1910.	1911.
Tons hauled	74,482,866	79,884,282
Tons hauled one mile	15,712,127,701	16,048,478,295
Tons hauled one mile per mile of line	635,321	631,829
Average haul, miles	211	200
Freight train mileage	50,184,108	52,498,866
Mixed train mileage	6,441,440	6,277,468
Revenue from freight	$116,229,894	$124,743,015
Average tons per train	311	305
Average cars per train	18.15	18.03
Average tons per car	17.13	16.91
Average receipts per ton per mile, cent.	.739	.777

The following is an analysis of the commodities which constituted the freight traffic of 1911 and the preceding year:—

	1910. Tons.	1911. Tons.
Products of agriculture—		
Grain	7,435,573	7,545,516
Flour	1,916,934	2,124,080
Other mill products	1,037,282	1,166,323
Hay	1,084,966	1,611,621
Tobacco	40,880	51,672
Cotton	84,928	114,827
Fruit and vegetables	969,122	957,237
Other products of agriculture	321,666	238,260
Products of animals—		
Live stock	1,314,781	1,437,965
Dressed meats	546,791	561,220
Other packing house products	277,739	369,906
Poultry, game and fish	154,820	189,201
Wool	28,814	42,602
Hides and leather	199,853	211,301
Other products of animals	242,208	378,507
Products of mines:		
Anthracite coal	7,498,509	6,017,858
Bituminous coal	9,166,572	12,514,372
Coke	1,384,254	1,416,632
Ores	3,636,607	3,802,162
Stone, sand, etc.	4,084,968	4,417,290
Other products of mines	381,112	483,922
	1910. Tons.	1911. Tons.
Products of forests—		
Lumber	7,302,037	7,364,964
Other products of forests	5,766,903	5,873,383
Manufactures—		
Petroleum and other oils	500,167	591,651
Sugar	617,231	614,529
Naval stores	37,007	18,422
Iron, pig and bloom	889,881	887,801
Iron and steel rails	717,081	616,980
Castings and machinery	1,189,214	1,137,218
Bar and sheet metal	568,901	939,916
Cement, brick and lime	2,254,934	2,495,178
Agricultural implements	434,928	540,061
Wagons, carriages, tools, &c.	173,137	205,106
Wines, liquors and beers	245,626	274,162
Household goods and furniture	388,631	412,529
Other manufactures	1,997,541	4,840,434
Merchandise	2,518,190	2,438,089
Miscellaneous	7,073,078	4,981,385

PROPOSED DRY DOCK AT SAULT STE. MARIE.

A shipbuilding plant and dry dock is to be built at Sault Ste. Marie. The company is working under an Ontario charter, with share capital of $1,200,000 and a proposed bond issue of about $1,000,000. The dock will rate under class C, or third class and will be entitled under the Dry Docks Act to a subsidy from the Dominion Government of 3 per cent. on cost for 20 years. The town of Sault Ste .Marie has also bonused the company to the extent of $5,000 per annum for 20 years, with a binding arrangement as to taxes.

The capital is being supplied by a group of French and Belgian capitalists represented by Mr. Charles Casoretty, LL.D., C.E., of Paris, France. The contract for construction is to be let at once. The operations at first will be confined to the dry dock, to the marine railway and to shipbuilding. Several orders for vesels have already been promised. Later, it is likely that other lines will be added, such as cars, engines, locomotives and the Williams and Janney power transmission device. This is an initial investment in Canada on the part of these capitalists and it may be followed by other investments of an industrial nature.

THE TRIPLEX BLOCK

A Triplex Block hung from a temporary rigging and used for laying pipe.

What is the Life of a Triplex Block?

WE don't know. Triplex Blocks built by the Yale and Towne Co. at the very beginning—twenty-five years ago—are still in actual use. The Triplex Block of to-day possesses greater lasting powers. With its steel parts—its chain superior to any other—its non-wearing gear movement—and the guarantee of a rigorous test before shipment under a fifty per cent. overload. It will outlast the man who buys it, no matter how young he may be.

NON-METALLIC PRODUCTS OF CANADA.

A production of 30 tons of actinolite valued at $330 was reported in 1910; no returns of production being received for 1909.

Returns from three smelters in which arsenic is recovered give a production in 1910 of 1,502 tons valued at $75,328, as compared with 1,129 tons valued at $64,100 in 1909. There were also 547 tons of arsenical ore shipped in 1910, valued at $5,716, as compared with 224 tons valued at $3,346 in 1909. The exports of arsenic in 1910 were 2,256 tons valued at $173,932, and in 1909, 1,556 tons valued at $119,673. The imports of arsenious oxide, in 1910, were 260,415 pounds valued at $6,891, and of sulphate of arsenic 257,451 pounds valued at $8,946.

The shipments of asbestos in 1910 were 77,508 tons valued at $2,555,974, and of asbestic 24,707 tons valued at $17,629. The shipments in 1909 were 63,349 tons of asbestos valued at $2,284,587, and 23,951 tons of asbestic valued at $17,188. The shipments in 1910 consisted of 3,740 tons of crude asbestos valued at $664,508, and 73,768 tons of mill stock valued at $1,891,466. Considerable quantities of both crude and of mill stock were held in manufacturers hands at the close of the year. Exports in 1910 were 71,485 tons valued at $2,108,632, as against 56,971 tons valued at $1,729,857 in 1909. Imports and manufactures of asbestos in 1910 were valued at $230,489, and in 1909, $196,742.

Shipments of chromite in 1910 were reported as 299 tons valued at $3,734, as compared with shipments of 2,470 tons valued at $26,604 in 1909.

The total sales of grain corundum in 1910 were 1,870 tons valued at $198,680, as compared with sales in 1909 of 1,491 tons valued at $162,492.

Shipment increased from 12,783 tons valued at $40,383 in 1909, to 15,809 tons valued at $47,667 in 1910. The exports are recorded as 10,834 tons valued at $35,234 in 1909, and 15,601 tons valued at $47,962 in 1910.

A small production of fluorspar was reported in 1910, of which two tons valued at $15 were shipped from the mine. About 7,461 tons of fluorspar were used during the year in steel plants.

Shipments of crude and milled graphite during 1910 totalled 1,392 tons valued at $74,087, as against 864 tons valued at $47,800 shipped in 1909. The production of artificial graphite in 1910 was reported as 1,221 tons, as compared with 257 tons in 1909.

Exports of plumbago in 1910 are reported as 788 tons valued at $53,008, and manufactures of plumbago valued at $66,658. Exports in 1909 were: Plumbago, 1,004 tons valued at $52,440, and manufactures of plumbago valued at $864. Imports of graphite in 1910 were valued at $112,853 and included. plumbago not ground, $4,867; blacklead, $10,048; plumbago ground and manufactures of, $45,042; and crucibles of clay or plumbago, $52,896. In 1909 the imports were valued at $94,392, including: plumbago not ground, $5,075. blacklead, $11,638. plumbago ground and manufactures of, $37,538; and crucibles of clay or plumbago, $40,141.

The production of grindstones, scythestones, and wood pulp-stones in 1910 was 3,973 tons valued at $47,196, as compared with 4,275 tons valued at $54,664 in 1909. The exports in 1910 included: stone for the manufacture of grindstones, 308 tons valued at $338; and manufactured grindstones valued at $23,164; the exports in 1909 were: stone for the manufacture of grindstones, 125 tons valued at $1,685, and manufactured grindstones valued at $13,942. The imports of abrasives in 1910 included: grindstones valued at $71,394; burrstones, $854; emery in bulk crushed or ground, $40,400; manufactures of emery, carborundum, etc., $92,890; pumice stone, $14,829. The 1909 imports comprised: grindstones valued at $69,554; burrstones, $2,001; emery in bulk crushed or ground, $29,752; manufactures of, $66,777, and pumice stone, $11,291.

The total shipments of gypsum crude and calcined in 1910 were 525,246 tons valued at $934.446, as compared with shipments of 473,129 tons valued at $809,632 in 1909. The tonnage of gypsum mined or quarried in 1910 was 548,019 tons, and the quantity calcined, 69,889 tons. In 1909, 493,086 tons of gypsum were mined and 63,670 tons calcined. The shipments in 1910 included: crude gypsum, 469,573 tons valued at $508,686; ground gypsum. 6,121 tons valued at $17,390, and calcined gypsum 49,552 tons valued at $408,370. In 1909 shipments comprised: crude gypsum, 423,474 tons valued at $457,038; ground gypsum, 8,814 tons valued at $26,159, and calcined gypsum, 40,841 tons valued at $326,435.

The exports of gypsum in 1910 were: 346,081 tons of crude gypsum valued at $416,725, and gypsum ground or calcined valued at $12,306. The 1909 exports were: 315,201 tons of crude gypsum valued at $372,286, and gypsum ground or calcined valued at $2,787.

The imports of gypsum in 1910 were valued at $169,798, including: crude gypsum, 12,271 tons valued at $21,073; ground gypsum, 6,690 tons valued at $13,242, and plaster of Paris, 19,045 tons valued at $135,483. The total value of imports in 1909 was $141,715, made up of: crude gypsum 3,958 tons, valued at $12,507; ground gypsum, 10,737 tons valued at $16,779, and plaster of Paris, 19,116 tons valued at $112,429.

Shipments of magnesite in 1910 were 323 tons valued at $2,160, and in 1909, 330 tons valued at $2,508.

The value of the mica production in 1910 as reported by mine operators was $190,385, as compared with $147,782 in 1909. The exports of mica in 1910 were 937,263 pounds valued at $330,903, as against 717,066 pounds valued at $256,834 in 1909.

Shipments of barytes in 1909 were 179 tons valued at $1,120, and no production was reported in 1910. The purduction of iron ochres in 1910 was 4,813 tons valued at $33,185, as compared with 3,940 tons valued at $28,093 in 1909.

The export of iron oxides in 1910 were 1,746 tons valued at $29,839, as against 658 tons valued at $7,956 in 1909. The imports in 1910 were: ochres and ochrey earth and raw siennas, 1,246 tons valued at $31,926; and oxides, dry fillers, fireproof umbers, and burnt siennas, 868 tons, valued at $23,467. The total imports in 1909 were valued at $39,497.

FERTILIZATION BY SEWAGE.

An investigation by Muntz and Massie in Paris, has shown that a permanent meadow yielding 4½ tons of hay per acre requires 120,000 cubic feet of sewage for phosphoric acid and 150,000 for potash; and that by irrigating with 150,000 to 175,000 cubic feet, given in eight or ten instalments during the growing season, the crops have sufficient for both water and nutritive material. Some land receives ten times this quantity.

COMPRESSION TEST FOR STONE BALLAST.

The committee on ballast of the American Railway Engineering Association has presented in its report for 1912 a compression test which the Office of Public Roads on the Department of Agriculture has agreed to make. The compression test is described in the report of the committee as follows:

A cylinder 2 in. in diameter and more than 2 in. long is drilled from the specimen of stone to be tested, by means of a diamond core drill, and sawed to a length of 2 in. by a band saw fed with emery. The specimen is finally faced off on each end by means of a power-driven grinding lap, on which water and emery are continuously fed.

The cylinder then has both ends embedded in plaster of paris, the bed being made as thin as possible and both ends being made parallel. The cylinder is next mounted on an Olsen test machine on a special bearing block between blotting papers, three thicknesses being placed at each end, between the cylinder and the steel-bearing faces of the machine. The load is then applied at a speed of 0.152 in. per minute, the machine being kept balanced during the application of the load.

The committee believes that with the former physical tests of stone for ballast and the compression test added, sufficient information will be given by which to compare the character of stone from various quarries from which it is proposed to obtain ballast.

The advantage of using approved physical tests of stone for ballast is pointed out to be the determination of the character of the stone and its fitness for ballast without the expense of opening quarries and of using the stone before it is known whether it will be suitable for ballast or not.

Seven Great Money-Saving Packings

Engineers and machinists throughout the Dominion are saving thousands of dollars in *time alone* by using Goodyear Packings—*short cuts* to *RESULTS.*

Installed quickest and most easily. *Outlast* all others. Recognized by all who *know packings*, as the highest standard of excellence. Use one of these great

GOODYEAR Packings

Magnet Sheet Packing

Meets *every requirement*—Boiler Room or Machine Shop. Made of special compound that *resists heat* hence the *only* packing thoroughly adapted for high pressure uses. Makes tight joint under air or hot or cold water pressure. *Unaffected* by oil, liquor, ammonia, or alkali. Retains elasticity.

Magnet Gasket Tubing

For high pressure. Like Magnet Sheet Packing this tubing is unaffected by heat, makes tight joint, can't *blow out.* Cut any length to fit any size manhole, hand-hole, plate or pipe flange. Put up in convenient boxes with rubber core and tape.

Round Duck Packing

Fine quality cotton duck with round core. Used like Hydraulic Packing, *only for lower pressure.*

Hydraulic Packing

Best Packing for pump cylinders, inside-packed plungers pumping hot or cold water, and hydraulic elevators. Unexcelled for boiling water and high pressure hydraulic work.

Cloth Insertion Packing

For cold and warm water pipes. Unexcelled in pliability, smoothness of finish and strength of cloth insertion. Made of heavier fabric than any other similar packing on the market.

Square Duck Packing

Good quality cotton duck and friction to stand cold water. Cut accurately into squares.

Square Duck With Rubber Back

Specially adapted for elevator use. Made of superior cotton duck, gum back Makes packing tight, practically no friction. Gives many times service of other packings of same nature.

Valves

Unaffected by oil. Used in hundreds of industrial plants. Specially made to meet specific conditions.

Goodyear Packing, Belting, Hose and other rubber sundries enable you to capitalize the brains and experience of the world's greatest rubber goods experts—the knowledge and skill that underlies our reputation as well as that of the Goodyear Tire & Rubber Company, Akron, Ohio, the best known plant of its kind in the United States.

Our sales of the last four months 50% greater than those of last year. Defective goods returned only $23.93.

CITY OF LONDON, ONTARIO.—ENGINEERING DEPARTMENT.—Applications are invited by the City Council for the position of Assistant City Engineer of London. Such applications must be enclosed in plain envelopes, and marked Assistant City Engineer, and filed with the City Clerk not lated than five o'clock on Thursday, April 25th, 1912. A full statement of qualifications and references must accompany each application. Geo. W. Wright, City Engineer.

CIVIL ENGINEER, German graduate, 35 years of age, with 17 years' experience, desires position with Canadian firm of Engineers or Contractors. Trolley and Railroad construction; engineer in charge of preliminary and location surveys; reinforced concrete works; paving works; irrigation. Expert estimator and designer. Box 26, The Canadian Engineer.

MECHANICAL ENGINEER—Desires position of responsibility. Holds British Board of Trade, first-class certificate, 12 years' experience running large triple expansion engines and boilers, refrigeratoring, machinery, and drawing office experience, commercial experience in Consulting Engineer's office. Apply John Bear, 335 Langside St., Winnipeg, Man.

YOUNG ENGINEER who hopes to graduate in May would like to secure an opening on the staff of some Civil Engineer or Surveyor. Box 44, The Canadian Engineer.

ASSISTANT Works Manager, at present with reputable firm of engineers in England, would like responsible position with Canadian firm. First-class testimonials. Draughtsman, Estimator, Superintendent, Organizer, and controller of men. Scotch nationality and training. Age 35. Box 238, Canadian Engineer.

WANTED.— Engineering draughtsman, accustomed to Railway work. Apply stating age, education, salary expected, etc., to Box 38, The Canadian Engineer.

FOR SALE.—New 500 B.H.P. Mirrlees-Diesel crude oil engine 200 R.P.M., delivery six weeks. Guaranteed fuel consumption full load 0.45 lbs. B.H.P. hour. Apply, Heaps Engineering Company, Limited, 445 Hastings Street, Vancouver, B.C.

PARSONS TRENCH EXCAVATOR FOR SALE.—Will excavate trench 28 to 78 inches in width up to 20 feet deep. Also has special frame and equipment for trench 22 inches in width up to 14 feet deep. In good condition and well supplied with extra parts. J. H. McKnight Construction Company, Limited, Toronto, Ont.

PLANT FOR SALE.—Little Giant Special Steam Shovel, 1¼-Yard Dipper. Also Large Size Steam Pile Hammer. The Randolph Macdonald Company, Limited, Toronto, Ont.

SAND, GRAVEL AND STONE SUPPLY.—Screen gravel a specialty. John Johnson, Colwell P.O., Ontario. Phone 79 B., Barrie.

MECHANICAL ENGINEER wants position. Several years works manager with modern engineering firm. Experienced draughtsman, mechanic, cost estimator and salesman. Steam, gas and oil engines, boilers, hydraulic pumps and mining machinery. Highest references. Box 24, The Canadian Engineer.

AN ENGLISH ENGINEER with ten years' experience in sewerage and sewage disposal works and water supply, is anxious to secure a position where such knowledge would be useful. Box 46, The Canadian Engineer, Toronto.

WANTED.—Architectural draftsman, capable of taking entire charge of designing large residences, schools, etc. Apply Box 48, The Canadian Engineer, Toronto.

CHEAPEST PRINTER ON EARTH.—Booklets, Catalogues, Price Lists, Handbills, and ANY other fine Printing for the Engineering Profession, at fiercely competitive prices. Russel Smart Advertising Agency, 40K, Chancery Lane, London, W.C., England.

Contractors' Plant
FOR SALE

1 70-ton Steam Shovel, Atlantic (used three weeks)
3 Four-Wheel Dinkey Locomotives (narrow gauge)
20 Dump Cars 4 c.y. capacity (narrow gauge)
1 Mundy Hoisting Engine and Boilers, 4 drums, capacity 10 tons (used three weeks)
1 No. 5 Smith Concrete Mixer, complete
7 Little Giant 43¾ B Steam Drills, complete
5 Centrifugal Pumps, all sizes
9 Duplex Pumps, all sizes
2 Pulsometer Pumps, different sizes
3 Hayward Orange Peel Buckets, ¾ c.y. capacity (used three weeks)
20 Waggons (Dump and others)
3 Erie Boilers on wheels, 25 h.p.
10 Derricks (all capacities)
1 Steam Sheet Pile Hammer
21 Holland Carbide Lights
6 Empire Coal Oil Lights
6 Lockwood Automatic Steel Dump Skips, 4 c.y. capacity
4 Flat Cars (hand brake) Standard Gauge
1 7 x 9 Dodge Crusher
2 25 H.P. Leonard Clipper Engines

Also Rails, Ties, Skips, Plows, Tools of all kinds, Pipe, Repair Parts, etc., etc.

The whole in excellent condition, located near Montreal, and ready for inspection and shipment.

A NEW USE FOR THE ELECTRIC ARC.

The use of the electric arc as a heater of furnaces has been brought prominently before the public of late but the use of the arc as a means of displacing rivets in metal work would appear to be a novel departure in the use of this important agency. The British Insulated and Helsby Cables, Limited, of Prescott, Lancashire, England, have recently perfected a spot welder to replace riveting in sheet-iron ware.

In appearance the machine resembles a common machinist drill but the back portions of the machine enclose suitable resistance and transforming apparatus while the drill attachments are replaced with two electrodes for heating the material to be welded to the proper temperature. The electrodes, suitably shaped, are brought to bear on the spot where the weld is desired and a heavy current at low pressure is passed between the plates which rapidly brings the metal to the desired temperature. The current is interrupted when this condition is reached and the white hot metal is compressed by suitable means thus forming a strong clean weld. The electric power must be applied to the welder in the form of a single phase alternating current. The electrodes are constructed of copper and a stream of water is directed around them in order to reduce the wear. The resulting welds are very strong and tough and give the appearance of a slight abrasion on the metal.

MERIWETHER SYSTEM

CONTINUOUS RE-INFORCED CONCRETE PIPE

PATENTED

Manufacturing 39 inch Pipe—St. Lambert, Que., Canada

LOCK JOINT PIPE COVERS NORTH AMERICA

Sewage flowing through Lock Joint Pipe reaches the Atlantic Ocean, Pacific Ocean, Gulf of Mexico, Hudson's Bay and the Great Lakes.

Lock Joint Pipe is in use for sewers and water conduits in the following States: Massachusetts, Connecticut, New York, New Jersey, Delaware, Pennsylvania, Maryland, Virginia, Kentucky, Georgia, Florida, Ohio, Illinois, Kansas, Washington and Oregon.

The following Provinces of Canada: Quebec, Ontario, Saskatchewan and British Columbia.

And in the Island of Cuba.

The Lock Joint Pipe Company is the largest manufacturer of reinforced concrete pipe in the world.

NORTHERN ONTARIO.

The two sections of Canada next to receive the impetus of capital, immigration and enterprise are Northern Ontario and the Peace River district. Both are rich in natural resources and possibilities but as yet are practically undeveloped. The natural resources and trade prospects of Ontario's Northland are exhaustively treated in a report just issued by the Toronto Board of Trade. It deals at length with the wealth of natural resources consisting of 20,000,000 acres of splendid agricultural lands, large mineral deposits, an enormous aggregate in water powers, and a considerable area of valuable timber lands. The assets, says the report, are the foundation of great industrial and trade expansion. Today, even, with but the fringe of the vast area settled, the annual purchasing power of the territory between North Bay and Cochrane is $45,000,000.

The report shows that Quebec province is getting considerable business in Northern Ontario. Many thousands of miners' and prospectors' boots are sold in the North by a Detroit firm, although Ontario houses are doing a good business. The competition of the French province is well assisted by railroad facilities, which will be improved. The distance of four cities from the town of Cochrane is shown in the following table:—

City.	Miles from Cochrane.
Toronto	480
Quebec	568
Montreal, via North Bay	613
Winnipeg	775

The present difference in distance between Cochrane and Toronto and Montreal is 133 miles in favor of Toronto. With the completion of the Grand Trunk Pacific, the distance of Cochrane to a Quebec centre will be reduced to only 88 miles in favor of Toronto. These are points which the Ontario business man cannot afford to overlook and which the Quebec houses have well in view.

How far this competition has extended in two recent years is seen in classified statements, supplied by the Temiskaming and Northern Ontario Railway Commissioners, showing the freight traffic into Northern Ontario from Quebec and Ontario points respectively. In 1909 the freight shipped from Quebec points was 11,404 tons, compared with Ontario's 162,904 tons. In 1910 the tonnage from Quebec showed a decrease from the previous year of 1,312 tons, while the tonnage from Ontario showed a decline in the same period of no less than 45,905 tons. Whatever was the cause of the aggregate decrease in the freight shipments, Ontario bore practically the whole of the burden, Quebec managing to maintain its business almost at the same level as in the previous year.

Examining the figures of 1910, it is found that the largest shipments from Quebec province were: cement, 1,688 tons; fruits and vegetables, 271 tons; hardware, 976 tons; hay, 894; machinery, 693; manufactured goods, 1,584; merchandise, 1,550.

The mining development of the North is treated at length. The ideal mining region, continues the report, is that in which the maximum amount of industry is created by the mineral itself and retained in the district. Of the twelve smelting companies receiving or bidding for Cobalt ores at the end of last year, six were Canadian, four American, one British and one German, with a New York agency. Trade naturally is given impetus by the establishment of additional plants. The question of a special effort to retain for Northern Ontario the smelting of its ores deserves the serious consideration of mine managers, the Government and its railway commissioners, the smelting companies and capitalists generally.

In 1910, as in former years, the tonnage treated in Canada was less than that shipped to the United States for treatment. The Canadian smelters, however, treated ore of a higher grade, with the result that they accounted for a little more than 50 per cent. of the total tonnage. In 1910 the three Canadian companies which have their plants at Copper Cliff, St. Catharines and Deloro treated 16,700,000 ounces. Three new smelting companies, with works at Orillia, Toronto and Swansea, are now entering the market for the purchase of ore from the Cobalt camp.

Smelters operated in Ontario should be able to compete well with foreign companies. The freight charges on ore shipped from Cobalt to Hamburg, Germany, for instance, were $13.47 per ton shipped via Montreal during the summer and $15.20 per ton via Boston in winter. This compares with a rate from Cobalt to Copper Cliff, for example, of $5.20 per ton, assuming that the value of the ore is above $49 and under $100 per ton. The establishment of smelters near the mines would have had an initial advantage in freight rates.

The Temiskaming and Northern Ontario Railway runs through two distinct countries. From North Bay to North Cobalt is chiefly a rocky country where minerals pay dividends. Therefrom to the terminus of the Government railroad at Cochrane is excellent farming land, which, in its natural state, is heavily laden with good timber. Even in the mining districts the soil has been cultivated to a small extent. The sight of a thriving potato patch within a few feet of a well-known silver mine at Cobalt brings to mind the picturesque window box of flowers in the city slum—it looks out of place, but is welcome, useful, and illustrates possibilities. The potato patch at Cobalt is an index of what can be accomplished on the land farther north, where, so far as we know, minerals do not tempt the farmer from his avocation, and where the soil has growing qualities equal to those to be found anywhere in the Dominion.

The valuable combination in Northern Ontario exists in few other lands. The water powers are largely found among the pine and hardwood forests and in many cases are contiguous to mineral deposits. Thus the raw materials and the power for their manufacture are side by side. There is scarcely any limit to the possible industrial development as a result of the Northland's water power resources. The waterfalls and the lumber may co-operate in the establishment of sawmills, sash and door factories, planing mills, pulp mills, match factories and other woodworking industries. The waterfalls and the minerals may co-operate in the establishment of stamp mills and other mining plants.

Electrically driven railways might act as feeders to the main and branch lines of the Temiskaming and Northern Ontario road. Development is accomplished on the lines of communication. The transportation of lumber, ore, raw and finished materials, and supplies would thus be facilitated, the water powers being the basis.

With the rapid progress made in the science of transmitting electric energy, many other industries can avail themselves of cheap power without necessarily building their factories in the immediate vicinity of the waterfall. Flour mills, sugar factories, chemical factories and many others could take advantage of the water resources.

The Canadian Engineer

An Engineering Weekly

THE GRAND TRUNK PACIFIC RAILWAY.

The Grand Trunk Pacific Railway Company, which was incorporated by Act of Parliament, 1903, is under agreements with the Canadian Government for the construction and operation of a line of railway across Canada, from the Atlantic to the Pacific Ocean, wholly within Canadian territory, of an estimated mileage of main line of 3,600 miles; in addition to which there will be constructed several branch lines of considerable length and importance, including a branch from the main line southerly 188 miles to Fort William and Port Arthur, on Lake Superior, for the purpose of reaching navigation on the Great Lakes; also from the main line southerly about 229 miles to North Bay or Gravenhurst, in the Province of Ontario, to make connection with the lines of the Grand Trunk Railway Company of Canada, and another from the main line southerly to Montreal.

This great undertaking has been projected to meet the pressing demand for transportation facilities in British North America, caused by the large tide of immigration which is now flowing into the country from Great Britain, Northern Europe, and still more extensively from the Western States of the United States of America.

The authorized capital stock of the company is $45,000,000, of which $20,000,000 may be issued as preferred. The Grand Trunk Railway Company of Canada is to acquire all of the common stock (except shares held by directors) in consideration of guarantees, etc., and must retain a majority holding during the term of the agreements with the government.

Constructing Line North of Lake Superior.

Mr. Charles Melville Hays was the originator of this project, and, according to Mr. Frederick A. Talbot, of London, England, who has made a considerable study of this railway and its history, Sir Wilfrid Laurier and his government must be credited with their great share of the work by securing the consent of the people of Canada to participate in such a project as a government transcontinental railway. The whole of the western country was canvassed religiously. No one knew for whom these parties were working, or just what the scheme in hand comprised, as it was revealed in a somewhat hazy manner. Secret meetings were held in the cities, large towns, villages, and even in remote settlements. Extreme caution had to be taken to prevent any tangible particulars of the undertaking reaching the management of the C.P.R., insomuch as the Canadian Pacific regarded the West as its own territory.

Investigation of the dormant wealth of the land through which it was to pass caused the promoters of the enterprise

On North Shore of Lake Superior.

to keep the line well to the north, so as to open a new country in the widest sense of the word. President Hays adopted a sound policy when he decided on following more the methods of the English railways, and that the first cost was to be the last. Any one connected with English railways knows how solidly this construction work is carried out, and that there are absolutely no permanent ways in the whole world better constructed.

The Grand Trunk Pacific called for the irreducible minimum in curvature and grades—the former were to be no sharper than four degrees and the latter not to exceed four tenths. The railway threads the mountains with a "ruling" grade of four-tenths, or 21.12 feet to the mile, against both east and westbound traffic. Rises not exceeding 52.8 feet to the mile have been sought diligently by railroad builders in North America.

The Dominion Government undertook to build one-half of the line from the Atlantic seaboard to Winnipeg, and to control it as a national undertaking, while the Grand Trunk Pacific was to construct the second half, stretching from Winnipeg to the Pacific Coast, and the government would assist in the construction of this latter section, inasmuch as it involved the crossing of the Rocky and Cascade Mountains, by guaranteeing the first mortgage bonds.

By deciding upon Winnipeg as the dividing point between the two parts the undertaking was split into sections of almost equal length, the eastern division measuring 1,801

miles from Moncton, while the western division is 1,755 miles in length.

The eastern terminus of the railway will be at Moncton, New Brunswick, from which point the seaport of Halifax will be reached over the Intercolonial Railway, a branch line being projected to St. John. The distance from Moncton to the first named port is 185 miles, and to the latter 89 miles. The western terminus will be at Prince Rupert, British Columbia, on the Pacific Coast, near the southern boundary of Alaska.

Commencing at Moncton, the line will take the most direct practicable route within the Province of Quebec, to the city of Quebec. At Chaudiere Junction, five miles above Quebec, the new line will cross the St. Lawrence River, thence taking a direct route, passing in the vicinity of Lake Abitibi, and to the north of Lake Nepigon, to Winnipeg, Manitoba.

Owing to the physical character of the country the Western Division is subdivided into the Prairie Section and the Mountain Section; the former extending from Winnipeg via Edmonton to Wolf Creek, Alberta, a distance of about 916 miles, and the latter, as its name indicates, being the section over the mountains from Wolf Creek, Alberta, to Prince Rupert, British Columbia, about 840 miles.

The country through which the Prairie Section of the railway will pass, contains land now known to be well adapted for the growing of wheat, which in extent is four times the wheat growing area of the United States, and is the great agricultural belt of the North-west. This land, which is now being rapidly taken up by settlers, produces rich crops the first year of cultivation and will furnish a large traffic for the railway as rapidly as it can be extended, therefore amply warranting the company in assuming the payments of the interest charge on the cost of construction, from the beginning. The Mountain Section, however, passing through the mineral deposits, will require a little longer time for development, and as stated, the government has therefore assumed the payment of the interest charges under its guarantee of three-quarters of the cost of construction, for the first seven years after completion (waiving their right of recourse on the company in the event of default, for an additional three years), and allowing for the period of construction, which is fixed at seven years, not until 1919 will the company be required to assume this liability beyond the interest charges on the one-quarter of the cost of construction under the guarantee of the Grand Trunk Railway Company of Canada.

Returning to the question of gradients, mentioned above, the Grand Trunk Pacific will benefit from these exceptional conditions by the great economy and low cost of operation which can be obtained from the commencement, when this item is of such importance in the case of a newly constructed railway at a time when the traffic and the revenue therefrom must of necessity be light, although with the gradual evolution of the enterprise and from explorations which are being made in all directions, it would appear that the period of light traffic will be of short duration.

The Mountain Section of this railroad lies between the 52nd and the 57th parallels of latitude. It is probable that no other area in North America can equal this portion of British Columbia in her natural resources. Where there is no agriculture and pasture, there is mining or lumbering to be developed, and where there are none of these, although they often occur in one district, there is at least trapping and hunting. Lying as it does, far to the north, the climate conditions have in the past been supposed to be extremely severe during the winter season, but the fallacy of this impression is rapidly becoming known on account of the reverse conditions actually existing, due in part large to the proximity of this territory to the Pacific Ocean and the influence of the Japan current. Before the House of Commons Agriculture Committee recently Mr. Elihu Stewart, Dominion Superintendent of Forestry, in testifying as to the resources and conditions concerning the northern country, having particular reference, however, to the district adjacent to Great Slave Lake, which lies many hundred miles still more northerly of where the Grand Trunk Pacific will be constructed, said that the growth of vegitation in the Mackenzie Basin was surprising, the sun in the summer being visible for about twenty hours out of twenty-four. On July 15th, at Fort Providence, near Great Slave Lake, on the Mackenzie River, about 550 miles north of Edmonton, Mr. Stewart said he saw wheat in the milk, potatoes in flower,

peas fit to use, tomatoes, turnips, rhubarb, beets, cabbage, onions and other garden vegetables. The strawberries had been ripe there for some time, and the people had currents and gooseberries. To illustrate the heat, he said at Fort Chipewayan it had been 100 degrees in the shade for several days and nights. Indians coming from the Alaska boundary to meet the steamer Wrigley had lost two dogs from the heat in the Arctic Circle. He thought systematic exploration would show a surprising amount of good country, extending down from Slave Lake to Peace River. Along the Mackenzie River, spruce grew clear to the shores of the Arctic Ocean. There were aspen, white poplar, balm of gilead and birch growing as far north as Fort Macpherson. Mr. Stewart said that on Slave River he had passed a bank of burning coal about twenty miles in length near Fort

Norman, which Mackenzie had reported burning in 1789.

The track is laid continuously from Fort William on Lake Superior via Winnipeg and Edmonton to Prairie Creek, Alberta, 1,412 miles, and a daily passenger train service between Winnipeg and Edmonton, 792 miles, was inaugurated July 3rd, 1910. Train service has also been established between Fort William and Winnipeg and between Edmonton and the end of the track at Prairie Creek.

Thriving towns are springing up where a few months ago there was nothing but the bare prairie; grain elevators, warehouses, dwellings, stores and other evidences of remarkable activity are presented immediately following the laying of the track. The growth is especially astonishing at the division points or terminals of Rivers, Man., Melville, Watrous and Biggar, Sask., and Wainwright and Edson, Alta., and there are many other towns which give promise of notable development.

OPTICAL DETERMINATION OF STRESS.

In his second lecture at the Royal Institution, London, Eng., on "Optical Determination of Stress and Some Applications to Engineering Problems," Professor E. G. Coker first discussed the determination of the lines of principal stress by optical means, taking as an illustration a particular case in which the central lines of a series of dark bands of inclination were shown on a tension member having two fine saw-cuts in it, which diminished its effective cross section by one-half. Great use might be made of the lines of equal inclination, as the positions of the dark bands appeared to be independent of the physical properties of the material. Professor Filon had, in this way, verified experimentally some of the results of his mathematical researches in elasticity, by observations of bands of this type. For many purposes, however, a method which made use of both isoclinic and isochromatic lines was convenient, but it was important to be able to distinguish between black bands which denoted no stress at all and those which showed the positions for which the planes of principal stress coincided with the principal planes of the polarizing and analyzing apparatus. In a general way it was possible to distinguish between each kind, if the stressed plate of material were turned round in its own plane, and was viewed in a beam of plane polarized light between crossed Nicols. Some bands moved while others remained stationary, and the former could be identified as isoclinic lines and the latter as belonging to the isochromatic group. It was often convenient to show this latter system in their true relation to one another, without disturbance by the dark bands due to the optical system. This might be accomplished by using circularly polarized light. Any stressed specimen, viewed under such conditions, showed at every point a color proportional to the difference of the principal stresses, and, since the shear was proportional to this difference, a picture of the shear stress throughout the plate was obtained.

Sudden Changes of Section.—Proceeding to consider a few cases which arose in practical applications of engineering work due to sudden changes of section, the lecturer said one of the simplest examples was afforded by a rivet hole. The effect of a simple pull was to cause a complicated stress distribution in the neighborhood of the hole, due to the crowding together of the lines of stress. It was easy to show experimentally that, if the hole was small compared with the breadth of the plate, the maximum stress rose to about three times its normal value, and theoretical calculation verified the experimental values. In a line of rivet holes the maximum stress at the minimum section could be readily determined. In a riveted joint the distribution was still more complicated, because the stress was carried from plate to plate by the direct pressure of the shanks of the rivets, and some idea of the intricate nature of these practical problems might be gained by comparing similar members under the same loads, in which the rivet holes were first without rivets; secondly, had rivets inserted; and, finally, had rivets in them by means of which the load was applied to the member.

Another type of discontinuity was afforded by semi-circular holes and rectangular slots in plates and beams. For example, in a tension member with two semi-circular notches in it, away from the discontinuity the lines of principal stress formed a rectangular system, but as they approached the notch they came closer and closer together, and at the waist the nearness together of the lines at the periphery indicated that the greatest stress was reached there. If the notches were small compared with the breadth, the stress rose to twice its normal value. If the notch was rectangular the stress at the re-entrant corners became very great. A similar notch in the form of a square hole in a plate forced the lines of stress to pass through the narrow spaces on each side of the hole, and here, again, the corners of the square showed by the close spacing of these lines, and the color effects on the specimen, how great was the influence of this kind of discontinuity.

Another subject of interest and of great importance in practical work related to the behavior of members like springs, hooks, links of chains, and the like, in which the curvature of the member was an important factor in the distribution of stress due to an applied load. A case which had some resemblance to that of a circular hook section was found in some forms of boiler, in which the flues containing the fire grate and for the circulation of the hot gases of combustion were corrugated in order to increase their strength. The determination of the stress distributions in members like these and in the parts of machines and the like, which it was the special province of the mechanical engineer to construct, was one of the greatest complexity, and long experience of the behavior of materials obtained by first-hand acquaintance in some particular branch of this profession as in, for example, the design and construction of tools or locomotives, could not be replaced by any experiments on models. They could help, however, and indeed mechanical engineers did not require to be convinced on this matter, as the use of models of machines for all kinds of practical purposes was the rule and not the exception.

THE MOTOR SHIP "SALENDIA."

The East Atlantic Company have recently purchased a new vessel designed for ocean traffic and propelled by oil engines.

The "Salendia" is 350 feet long with a beam of 53 feet, and a gross tonnage of 4,964 tons, and is fitted with two sets of four cycle Dissel motors, each with eight cylinders 20.8 in. by 28.7 in., giving together 2,500 i.h.p. at 140 r.p.m. built like the vessel herself, by Messrs. Barmeister & Wain, of Copenhagen. With a dead-weight cargo of 7,400 tons the displacement of the vessel is 9,800 tons, with a speed of 11 knots, on a consumption of 500 lbs. of oil an hour. The storage capacity of the double batten being for 900 tons or sufficient for a round voyage of 20,000 miles at full power. The vessel left her berth in the West India docks recently and the manœuvring necessary in order to bring her into the lock afforded a great demonstration of the ease with which the engines were started and reversed.

ELECTROLYTIC SEWAGE TREATMENT.

Oklahoma city drains mostly into the North Canadian River, but partly over the divide to the north into Deep Fork. Two years ago the city built a septic tank, costing $8,000 to accommodate some of the people on the Deep Fork slope. Later on bids were received for contact beds to purify the septic effluent. The lowest bid for the cantact beds was $17,000, and at this stage of the proceedings Mr. A. J. McMahan (representing the Electro-Sanitation Co., of Los Angeles) offered to install an electrolytic sewage treating plant for $12,000 and guarantee the results. The unsatisfactory results from the septic tank wrought a change of policy on the part of the city council and instead of building the contact beds, the council, on advice of W. C. Burke, then city engineer, entered into a contract November 4, 1910, for the installation of an electrolytic plant to treat the Deep Fork sewage.

Before the plant had been in operation two months, the use of the septic tank was abandoned except that the small grit chambers are utilized for eliminating the coarser matters. A by-pass now takes the sewage around the main chambers of the septic tank to the reservoir of the electrolytic plant. The results are much more satisfactory without the help of the septic tank. The plant is described in a recent issue of "Engineering and Contracting" by Mr. Howard V. Hincley, consulting and supervising engineer, Oklahoma City.

Description of the Plant.—There is a 36,000 gal. reinforced concrete reservoir designed to hold the night run of sewage for the present and eventually to act in the capacity of an equalizer to relieve the plant of any sudden fluctuations in the rate of flow at different hours of the day. Three 8-inch supply pipes conduct the sewage from reservoir to treating flumes. A wasteway carries the treated sewage into the gulch. The supply pipes are separately operated by three valves. The electrical machinery is on a platform about 15 ft. x 18 ft., 2½ ft. above the floor and about even with the tops of the flumes. On this platform are also a table and a filing case. The drive consists of a 7½ h.p. alternating current motor using commercial current at 220 volts. This motor is direct connected, under the switchboard, to a 3 kw. multipolar direct current generator and exciter, all resting on a single bedplate 2 ft. x 5 ft. The combination is designed and built for this special service and delivers to the copper cable conductors of 1,000,000 circular mills 800 to 900 amperes at a voltage of 1½ to 3, these being the limit between which the desired results are obtainable, varying somewhat with the character of the sewage. A double pole, double throw, knife switch allows the reversal of the current at pleasure and a knife switch at the upper end of each flume cuts on or off the current for that flume. Owing to the high amperage as compared with the low voltage the switches and conductors are necessarily heavy. If only one flume is in use the ammeter is set at 270 to 300. The building is of concrete blocks 18 ft. x 50 ft. on the inside with flat roof and beams exposed on the inside, 8ft. high over platform and 10½ ft. high over main concrete floor which has a slope of 1 in. and on which the flumes are supported on wooden blocks 6 in. x 6 in. x 26 in. The building has one 3 ft. x 7 ft. door, one 6 ft. x 7 ft. double door, and 12 pivoted windows about 3 ft. x 3 ft. just above the ground line.

Electrodes.—In each flume there are ten electrode sets spaced about 6 ins. apart, each set consisting of 27 cast iron plates each 3/16x10x24 ins. Alternate plates of each set form the anode and cathode respectively, and are both separated and electrically connected by cylindrical bushing conductors. These are fitted upon bolts on which they are drawn together for contact by nuts back of the hangers. As these bolts hold up only the ends of the plates, two other bolts of ⅜-in. iron covered with 1/16-in. rubber tubing are passed through the plates in the same plane with the conductor bolts, and on these bolts the plates are separated by cylindrical insulating bushings of hard rubber. Each of the 810 cast iron plates is capped for its entire length with a copper channel of No. 23 (16 oz.) copper 1½ in. x 24 ins., weighing ¼ lb. These copper caps add to the chemistry of the treatment and materially lengthen the life of the electrodes by protecting the plates along the upper edges where the corrosion would otherwise be abnormal. The plates must be decomposed to perfect the treatment, but it is desirable to have the decomposition as evenly distributed as possible and the gases arising tend to throw the reactions to the tops of the plates. Each set of plates with bolts, insulators and hangers forms a complete detachable, interchangeable unit.

Flumes.—The three flumes are 18 ins. deep, 22 ins. wide and 30 ft. long, made of 2-in. plank, dressed and painted three coats, held in shape by light bolts every 16 ins. in sides and bottom and by light iron straps across the top every 6 ft. The flumes are spaced 3 ft. apart; where the planks butt against each other wooden splines are used and there is no trouble in making a tight flume. Each flume has two insulated copper bus bars ⅜ in. x 1¼ ins., which bring the current from the knife switch at head of flume and from these bus bars the plates are charged through copper straps connecting the bus bars with the hangers. These straps have each 1/10 the conductivity of the bus bars. Baffles 3 ins. high, prevent any truant microbes from scampering among the floor under the plates. They are of sheet metal hinged at the upper edge over a light rod so that when not in use they may be lifted by a wire handle out of the way for washing out. Fixed baffles of sheet metal on the sides of the flumes projecting 1½ in. and located at the upper ends of the electrode sets, prevent the truants from sneaking along the sides of the flume. Two inches of clear space is allowed under the plates for flushing. At each end of the flume there is about 18 ins. of clear space and between the electrodes about 6 ins. At the lower end of each flume is a cross plank on which is fitted an adjustable weir gate which both regulates the depth of the water over the electrode plates and measures the flow. The weir is adjusted by means of nuts on two vertical bolts but it is found in practice that the spring of the plate and bolts is ample to hold the weir in position and the nuts are seldom used. There is also a washoutgate, that lifts up out of the way for flushing. The water is generally kept 2 ins. deep over the plates, as this seems to give as good results as either greater or less depths.

Operation.—The current from the commercial wires is turned on to the motor which drives the generator. The ammeter is set at 270 to 300, according to the operator's judgment. The valve is opened to supply raw sewage from the reservoir to one flume, or the ammeter may be set at 810 to 900 and the valves open to all three flumes with volt meter reading from 1½ to 3. The baffles are lowered and presently the plates are submerged and the sewage becomes milky. It is in a state of thorough and minute ebullition and before it commences to flow over the weir at the foot of flume it is covered with a white foam of gas bubbles. The impurities in the sewage passing between the plates which are spaced ½ in. apart, and which are alternately

anodes and cathodes, have become the electrolyte, short-circuiting the current, and millions of globules of water have been decomposed into the original elements, hydrogen and oxygen, which, being liberated in the nascent or formative state, produce remarkable results. The offensive odor, which is strong in the reservoir, has disappeared upon entering the flume. Sulphuretted hydrogen cannot exist in the presence offerric oxide in the electrolytic treatment. The treatment goes on down the flume and down into the gulch below the plant as the sewage and froth of gases roll over each other. There is no scum on the treated sewage except the white froth of generated gases and there seems to be a material lessening of the scum previously accumulated in the gulch.

The time taken by a particle of sewage to pass through the flume and through the ten electrode sets when treating 250,000 gals. per flume per 24 hours, is about 3 minutes. An increase of amperage gives an increase of diffusion or volume of current and consequently of ebullition, while an increase of voltage puts more iron and copper into the chemistry of the treatment. A very small portion of the sludge is collected upon the plates through the agency of the ferric hydrate. Several years ago, when the "Electro" was in the embryonic state, the plates were cleaned by steam through perforated pipes laid on the bottom of the flumes. This was both expensive and unsatisfactory. They are now cleaned by simply reversing the current, and the sterilized sludge, when thrown off from the plates, has the color of ferric oxide. By the reversal of the current the uneven corrosion of the plates is again eliminated. The low voltage necessary to decompose the water and organic matter is in contrast with that reported by Mr. J. L. Campbell in 1908 when he utilized the same process for removal of scale from hard boiler water at a pressure of 112 to 115 volts, the treatment costing $479 per million gals. The electrolytic method—ideal for sanitary or organic purification—seems so far to be wholly unsuited for the removal of scale.

Chemistry.—The process is electro-chemical. Oxygen, hydrogen and chlorine are liberated in the nascent state; are powerful reagents and render the effluent neutral—a result not obtained by either chemical or biological treatment. Owing to oxidization no traces are left of albuminates or nitrogenous bodies, which give so much trouble in the way of secondary putrefaction in septic treatment. Nitrates are changed to nitrites and the iron and copper compounds coagulate and clear the effluent. The oxy-chloride of lime and magnesia destroys dangerous (including typhoid) bacteria, while the free sulphuric acid generated in the process kills cholera germs if present.

Compared with Electrolytic Plant at Santo Monica, California.—The electrolytic plant at Santa Monica, Cal., has its outfall in the surf at the bathing pier. Even there—with nature lashing the oxygen of the air and the chlorine of the sea water into her purification process by wave action—a nuisance was noticeable when the plant was temporarily shut down. What then might be expected when a half-million gallons of sewage are dumped daily into a dry gulch, for six months of one of the driest seasons ever known in Oklahoma, and especially when the septic tank, and later the grit chamber, have been periodically cleaned out and emptied into the same dry gulch? The official report of the city bacteriologist says that "below the tanks (flumes) and long before the material has reached the creek the outflow was clear and quite limpid and distinctly free from odor."

Bacterial Reductions.—The following tests, made at three different times at two different places, tend to show a reasonable percentage of destruction of pathogens in the process, as well as a reasonable uniformity of results obtained.

Dr. Frederick Salathe, Santa Monica, Cal., reported November 16, 1908, bacteria removed 99.1 per cent. "And those remaining were completely destroyed."

Louis A. Turley, state bacteriologist, Norman, Okla., reported October 2, 1911:

	Per cent.
Flume No. 1 reduction—Total bacteria	86.0
Flume No. 1 reduction—Disease bacteria	98.5
Flume No. 2 reduction—Total bacteria.....	88.0
Flume No. 2 reduction—Disease bacteria	98.4
Wasteway 20 ft. below reduction—Total bacteria....	92.5
Wasteway 20 ft. below reduction—Disease bacteria..	99.0

Clarence E. Lee, city bacteriologist, Oklahoma City, reported September 30, 1911:

	Per cent.
Flume No. 1 reduction—Total bacteria	99.75
Flume No. 2 reduction—Total bacteria	99.82
Wasteway 20 ft. below plant—Red. total bacteria....	99.83

Dr. Lee says, "It is a noteworthy fact that after leaving the plant the number of germs relatively decreases and the ordinary algae, which do not seem to be affected in the least by electrolysis, relatively and rapidly increase. I find from examination that those germs which are not killed by this process are so markedly inhibited that they are easily cared for by the ordinary algae found in all surface water; consequently with increased admixture with ordinary algae and exposure to air and sunlight the objectionable features are rapidly removed in proportion to the distance from the plant. The findings 20 ft. below the plant correspond to several thousand feet below in small streams in untreated material."

Referring to the last quotation above the absence of odor in the gulch after six months of deposit of sewage therein (the septic tank and grit chamber having always been cleaned out into the gulch) seems quite remarkable. The gases carried into the gulch, tumbling over and over with the water, seem to have continued the purification work far below the plant.

On recommendation of Guy E. Blackwelder, Commissioner of Public Works, the Deep Fork plant was unanimously accepted by the municipal commissioners October 6, 1911, and plans have been ordered for a similar plant for the Packingtown district which is to treat not less than two million gallons daily and to cost not more than $42,000.

Sludge.—One of the greatest nuisances of sewage treatment in the disposal of the sludge. With a reasonable breaking up of the legitimate solids by a long run or by centrifugal action there is but little sludge that needs to be taken out, the finer particles all being thoroughly oxidized in the flumes. As to whether the coarser and foreign matter shall be held back by baffles or by screens or both is simply a matter of detail. Experience with this plant seems to indicate top and bottom baffles followed by a vertical screen over face of grit chamber outlet—the screen to be handy of access through the manhole cover for cleaning.

Cost of Operation.—The cost of current guaranteed not to exceed $750 per annum or $2.74 per million gallons should probably average about 810 amperes at two volts costing 4 cts. per kw. hour plus 25 per cent. motor loss equals $709.50 per annum. The item of plate renewals is not guaranteed but in the Santa Monica plant treating a half million gals. per day, this item has not exceeded $150

per annum. The attendant at the Oklahoma City plant is paid $55 per month and has the use of house and grounds. His duties keep him busy for two or three hours a day. He could easily handle two or three plants, a mile apart—or five miles apart, if fairly well connected by street car service.

The total estimated cost of operation, including proper fixed charges, is given in Table I.

Table I.—Estimated Cost of Operating Oklahoma City Electrolytic Sewage Purification Plant.

For—	per annum.	Per million gallons.	Per thousand gallons. Cents.
Electric current	$ 709.50	2.59	0.259
Attendant	660.00	2.41	0.241
Lights	40.00	0.15	0.015
Total operating	$1,409.50	$5.15	0.515
Renewal of plates	200.00	0.73	0.073
Depreciation of electric machinery	100.00	0.37	0.037
Five per cent. on investment	800.00	2.92	0.292
Total operating and fixed charges	$2,509.50	$9.17	0.917

The investment charge is computed upon $16,000, of which $1,000 is for attendant's residence and $15,000 is understood to be the price hereafter for a three-quarter million gallon plant. This plant, however, being introductory, was built "under the market" for $12.000. In a larger plant these figures would be reduced 20 to 30 per cent. It seems inadvisable to make any statement as to the general cost of electrolytic treatment of sewage per capita—even approximately—as long as water consumption per capita is reported all the way from 30 to 300 gals. per day and sewage flow from 15 to 300 gals. The cost must be computed upon the basis of the sewage flow in each case.

Conclusions.—The work done by this plant seems to justify the following conclusions: 1. That the septic tank in connection with the electrolytic sewage treatment is a hindrance—not a help. 2. That sedimentation in connection with the electrolytic treatment of sewage is neither necessary nor helpful. 3. That a centrifugal for atomizing the solids and a screen, or series of baffles, or both, for the elimination of the incorrigibles, seems advisable. 4. That a forebay or reservoir, which may be used to hold the night run during the earlier life of the plant, and to act as an equalizer when operated 24 hours a day, is advantageous. 5. That the necessary chemicals for the treatment of sewage are furnished by the electrolytic process. 6. That the nuisance and expense of handling sludge may be largely (but not wholly) eliminated. 7. That the effluent from the electrolytic treating plant is sterilized, deodorized, neutral, non-putrescible and harmless.

TELEPHONES USED IN THE RECENT REVOLUTION IN MEXICO.

A report from Mexico states that the latest revolution, planned by General Campa, is responsible for an improvement of the telephone as a war instrument. General Campa is an electrical engineer and has formed a corps of line-men which precede the main detachments and are instructed to have telephonic communications completed with the other commanders and the base of supplies by the time that General Campa arrives on the scene of activities

RECENT IMPROVEMENTS IN RAILROAD TRACK LAYING.

Railroad track laying is becoming a great factor in the industrial world as time advances, and the recent improvements placed on the market to aid in this work are of interest not only as a means of improving the methods now employed, but as original ideas connected with the engineering profession generally. Most of the apparatus about to be described is dependent on the electric current for operating power and as this factor is not always available, the company manufacturing these goods (The Chicago Pneumatic Tool Company, Fisher Building, Chicago, Ill.) have devised a portable gas-driven generator that will operate some of the smaller devices and will doubtless be improved and enlarged so as to operate machines for heavier work. In municipalities and upon the tracks of electric lines current is available for the maintenance of the larger machines and the operation of these, except in isolated cases, has so far been confined to this class of track.

Fig. 1 will present an accurate idea of the electric spike-driving apparatus that is capable of placing 5,000 screw spikes firmly in the track during one working day.

The car is built with a welded steel frame, the whole being carried on flat elliptic springs. It is equipped with

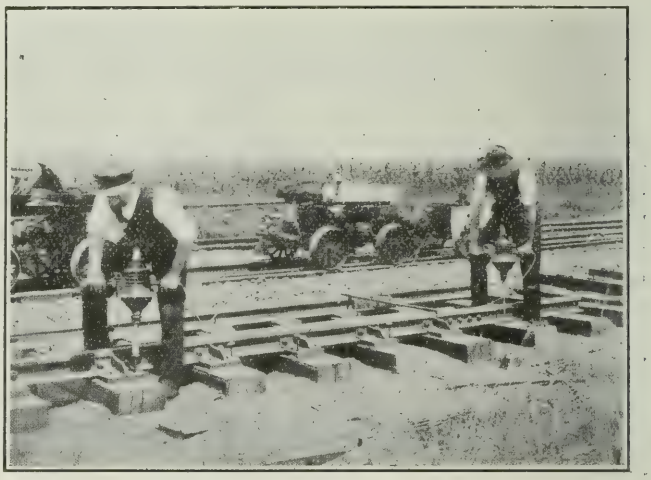

Fig. 1.

a 12-horse power gasoline engine, direct connected through a suitable clutch to a 6-kw. 125-volt direct current generator, suitable transmission for the car, also being provided, which gives a speed of fifteen miles per hour. This outfit is capable of operating two electric spike drivers; four electric wood boring machines, and an electric grinder, which is mounted on the car for the grinding of the tools. A reel containing five hundred feet of cable is mounted on the car and a light portable switch-board, containing the magnet switches and plug connectors, is provided, to which to connect the spike drivers and wood boring machines. Seventy-five feet of cable is attached to each of the portable tools, thus giving a range of action of five hundred and seventy-five feet on each side of the car, or a total of eleven hundred and fifty feet.

The car weighs fourteen hundred pounds, and can be easily set off of tracks in service out of the way of passing trains.

The spike driving end of the machine is illustrated in Fig. 2(A), and consists of a specially wound, portable electric motor, with suitable gearing, the electric circuit being controlled by means of a magnet switch, mounted on the portable switch-board, previously referred to. This switch itself is under the direct control of the operator by means

of a push button on the driver, and the tool may be started or stopped at the will of the operator. In regular operation, the tool is started by the operator and automatically stopped by the opening of the magnet switch when the spike is driven home. This magnet switch, which is shown in Fig. 2(B), is adjustable so that spikes may be driven just as tight as occasion may require.

This company manufacture a car for inspectors and others whose business necessitates them being in close touch with the track work. This car has the same general outside appearance as that used for the spike drivers, but is fitted for the conveyance of eight workmen and their tools and will maintain a speed of twenty miles an hour.

The engine of this car has no cooling device, yet it never overheats and will run under almost any climatic condition. It is remarkably simple in construction and has the fewest possible number of parts. It is economical in fuel consumption, runs smoothly and steadily, and is so easy to operate that only a little instruction is required to enable any one to run it.

The engine is equipped with a special carburetor designed and built for it. This carburetor has the same simplicity of construction and operation which distinguishes the engine itself. It has neither needle valve or float. It is easily adjusted and once regulated needs no further attention.

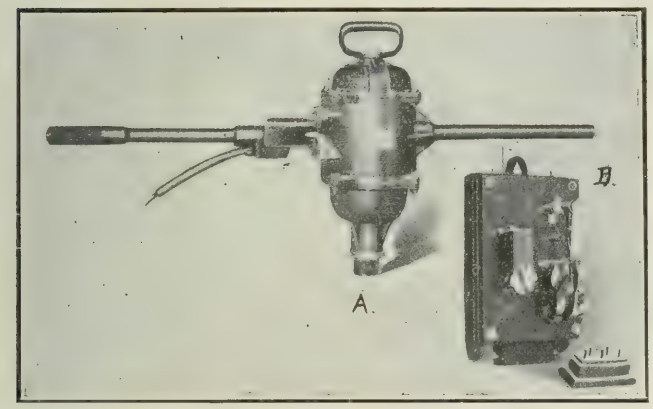

Fig. 2.

The cars are all equipped with magneto ignition system. A special high-tension magneto is utilized, and the use of timer, spark coil and dry cell battery is dispensed with. The magneto used upon the cars is very simple in design, but is efficient, reliable and durable. It has no electrical contacts, no moving wires and requires no switch or timer. It has no adjustments and no parts which can be adjusted. It produces a very hot spark, and the strength of this spark is quite independent of the speed at which the car is running. The only parts of the magneto which are subject to wear are two hardened steel blocks, which can be replaced at a very small cost. The wear upon these blocks is very slight, however, and on actual test a car was run five thousand miles without any part of the magneto showing any appreciable wear. The working parts of the magneto are enclosed and it is both dirt and water proof The only outer wires required are those running to the spark plugs. It operates equally well in either direction, and thus does away with a reversing switch when used with a reversible motor. In addition to furnishing a more reliable ignition, the use of this magneto eliminates the possibility of coil and timer troubles, also the necessity of replacing battery cells, which is always present on cars having dry cell battery ignition.

The car has a slatted seat top hinged to open full length and every portion of the mechanism is accessible to the operator easily and quickly. The tray frame has a box for carrying tools and a twelve-inch foot-board for the operator. The car has two-lever control and a brake that is easily reached by the operator from any position. Fig. 3 is from a photograph of this car.

Tools and other appliances operating under currents

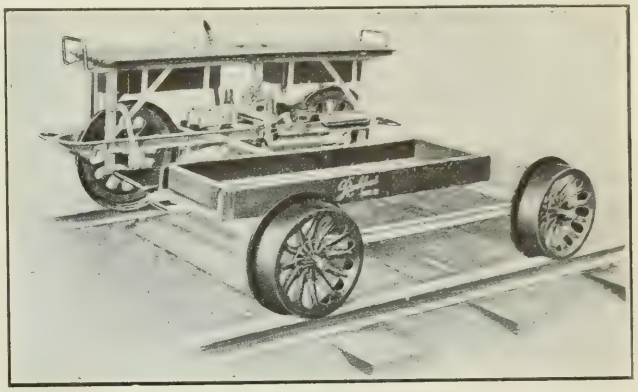

Fig. 3.

of low voltage would not require the care and forethought spent upon the track drill shown in figure 4 A and designed for use upon street and interurban railways. The high voltage and rough handling to which tools for this class of work are subjected calls for the careful design, insulation and general construction. An examination of the cut will show that the frame of this drill does not bolt to the track, but is simply hooked over the rail to be drilled, the operator holding down the other end by sitting on the seat provided, and thus brings him into convenient position to operate the feed. The side spindle of the drill permits of close drilling to the ties without the use of an angle attachment, and the vertical adjustment screw with guides for the drill affords a ready means for locating the holes vertically on ordinary tee or deep girder rails. The horizontal rods are of heavy seamless drawn tubing, and the bearing surface of the drill guides on the rods is very long, insuring true, straight holes, so essential for efficient bonding. The cross-

Fig. 4 A Fig. 4 B.

bar carrying the feed nut is located on the horizontal rods by means of eye pins which are easily withdrawn for the rapid removal of the drill from the track after drilling the hole or for sharpening the drill points. A series of holes in the horizontal rods provides means of accommodating varying lengths of bits. The drill proper may be removed from the frame by taking out four caps which allow the tool to be used as an ordinary electric portable drill. The magnets of this motor are wound for a pressure of six hundred volts.

Figure 4 B illustrates a heavy duty portable electric track grinder for use in grinding joints or for bonds. It carries a 6 x 1¼ x ⅝ emery wheel and revolves at a speed of 2,400 r.p.m., and has plenty of power for rapid work.

THE CONSTRUCTION OF WOOD BLOCK PAVEMENTS.*

By Day I. Okes.

As the success of a creosoted block street is dependent upon a continuous smooth surface, it is essential that the concrete foundation surface have as near the contour of the final pavement surface as possible. Where gravel concrete is used, it is advisable to have the foundation surface made by drawing a template over it. Where stone concrete is used, work should be done to a template curve.

The cushion upon which creosoted blocks are laid should never exceed 1 in., and it should be either ¾ or ½ in. where concrete is templated to an even surface; in fact, the use of the sand cushion under creosoted block streets is essential only in order to obtain a smooth wearing surface of creosoted block pavement.

Sand is not generally designated for the cushion material. Where there is vibration of pavement, as between car tracks, it is most advisable to use a mortar cushion. The manner of placing this cushion is to mix the sand and cement dry, and pull it with a template in a similar manner to pulling the sand cushion. The blocks are then placed and rolled to the final surface contour, the pavement surface is flushed with water in order to dampen the mortar cushion, and is left set up. After the pavement becomes dry the filler can be applied.

In the case of a creosoted-block pavement under heavy traffic, the motor cushion is preferable to the sand cushion, inasmuch as the set in this mortar cushion prevents washing of water leaking through the interstices and prevents displacement of the block surface due to flowing of the cushion and consequent rutting under heavy loads.

The objection to this mortar cushion is the time required to set before the pavement can be used. It has the advantage of making possible the use of the sand filler on lighter traffic streets, inasmuch as it provides against the washing away of the cushion during the iron-out of the pavement and the sealing of the joints. It is advisable to do away with a bituminous filler which becomes sticky in hot weather.

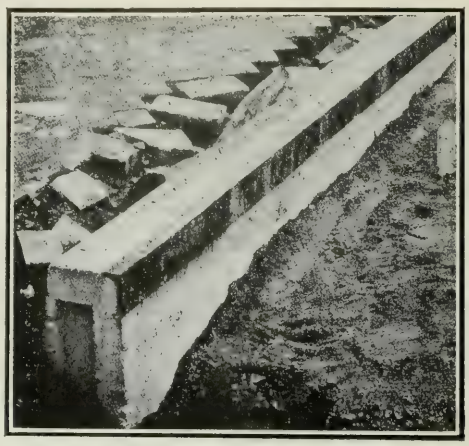
Provision may be made for expansion, first, by producing a block of the kind of wood and oil, and with the required impregnation to allow a minimum percentage of absorption under conditions where water or moisture surround the block entirely, or to provide by construction a sealing of the blocks on the bottom by a mortar cushion and on the four sides by means of a bituminous filler.

As to a satisfactory oil or treatment to be used for creosoted wood block paving from a constructor's standpoint, there has been trouble with heavy, or, as it is called, "waterproofing" oil in the bleeding of the blocks. It is sometimes contended that this bleeding is due to the manner of treatment and to the action of the blocks expanding in the street. However, when the use of a lighter oil under 1.10 sq. gr. is prevalent, trouble was not experienced with the oil exuding and staying on top of the pavement. So if a straight-run creosote oil is used and provision is made against absorption of moisture by the use of a dry mortar cushion and a bituminous filler which would not cut back by the oil from the blocks or would not soften and run in the hot weather —that is to say, an asphaltic-base bituminous filler—there would be a minimum amount of expansion and movement of the blocks. Such a pavement laid smooth would remain so under traffic and weather conditions.

* Abstract of paper presented at annual convention of Wood Preservers' Association, Chicago.

PREPARED CONCRETE CURBING.

A method of lessening the labor of paving and sewer work has recently been introduced by a company in Pittsburg, U.S.A., and is conducted on the same lines as that used in the manufacture of other concrete objects.

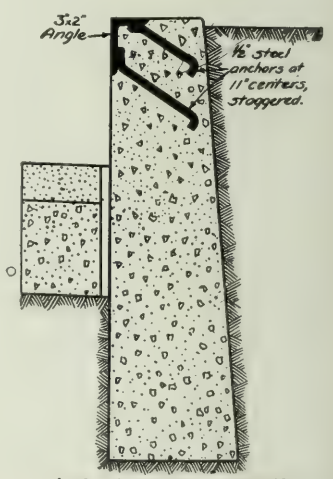


Concrete Curb Set to Grade.

The shop system of manufacturing concrete curb units for assembly in the field, eliminates all form work on the street and makes construction in any weather possible. Under good shop conditions, it should be possible to obtain a finished product of high quality at a cost comparable with that for the cast-in-place curb of equal quality. The curb as made, ready to ship, is 5 feet long and of three sections, one 6 by 24 inches for block paved streets under heavy traffic; another 6 by 21 inches for brick and asphalt paved streets under heavy traffic and a 5 by 24-inch section for block paved streets under light traffic. The exposed corner of each is protected by a steel angle held in place by anchors electrically welded to the back of the angles and embedded in the body of the concrete. These anchors are of ½-inch round rod and extend nearly to the opposite face, and are placed on 11½-inch centres. The sections are cast with mortise and tenon joints, so that they lock securely when placed.

The Neville Concrete Co., Neville Island, Pittsburg, who are the only manufacturers of this curb in the field at present, have sold to the city of Pittsburg over 20,000 feet, for use within the city, and are trying to have it adopted as standard by the city of Pittsburg.

The welded angle is not patented, but the company's location with regard to steel mills will probably make it possible for them to manufacture and sell the steel for use by other concrete products manufacturers at a price lower than would otherwise be obtained, even were they to use the same electrical welding machines.



Detail of Angle Protection and Anchors.

The cost of the 5 by 21 inch section, the smallest size, is 41 cents per lineal foot, f.o.b. Pittsburg, and for the 6 by 24-inch size, the largest, 48 cents per lineal foot. This makes it possible for them to compete satisfactorily with other types of curb over a radius of seventy-five to a hundred miles out of Pittsburg.

NOTES ON STRUCTURAL STEEL DESIGNS.*

By Albert Reichmann.

Structural steel nowadays is used so very extensively in the construction of our railroads, industrial buildings, office buildings, apartment buildings, and in almost every means of conveyance, that it represents a large part of the capital outlay in our railroad, industrial and real estate undertakings. For this reason it is of the utmost importance that the most rigid economy be exercised in its use. By an economic design is meant a design wherein the cost of material and labor entering into the construction of said design will be a minimum. In other words, the writer considers a well designed structure one which will most efficiently perform its function with a minimum outlay of capital and the lowest annual maintenance charge.

One of the most important features of a material to be used in construction work, consists in the ease and simplicity, together with the safety and reliability, with which one member can be attached to another. In the case of wooden construction it is almost impossible to make a connection of one member to another with any degree of certainty and use ordinary factors of safety. In the case of reinforced concrete, or, more properly speaking, concrete reinforced with steel, where the joints are largely dependent upon the adhesion of the concrete to the steel, the question of connections is an uncertain problem. In structural steel, owing to its homogeneous nature and uniformity of strength, it is possible to mathematically determine the value of connections of one member to another with reasonable margins of safety and secure a perfectly safe structure. Owing to the importance of securing reliable connections of one member to another, it is perfectly natural that the type of connections used in steel structures should be one of the most important subjects to be considered in structural steel designs. It will be observed that the question of connections is, therefore, given very careful consideration in this paper.

The first iron and steel bridges designed by our American engineers were typically American. That is to say, our type of construction was radically different from that used by other nations. The question of cost was given the most careful study, and justly so, as the railroad companies which purchased these structures had a very difficult time to make both ends meet. In those days the rolling stock of our railroads was very light; the volume of traffic was very small, and the trains did not move over the railroads with the high speed of to-day.

The type of structure referred to is the pin-connected span. When first introduced it was built of any length ranging from 30 ft. upwards. It was very popular owing to the small amount of metal required in its construction, the ease with which its members could be transported over great distances, and the facility with which it could be erected. These bridges were built at a time when the science of building structures of metal was in its infancy. As a consequence most of the old-time bridges were built with very inferior details. Owing to the rapid increase in the weight of the rolling stock of the railroads, they were soon taxed to their capacity and unfortunately sometimes beyond their capacity. As a result it did not take long for these old-time bridges to develop imperfections and it soon became apparent that the pin-connected bridge was not the ideal type of structure to be used in every case.

* Paper delivered to the Western Society of Engineers, Nov. 8th, 1911.

The next step was the introduction of the plate-girder bridge and the riveted-truss bridge, and it soon became common practice to build plate girders for all spans from 20 to 75 ft. in length, and from 75 to 125 ft. various forms of riveted trusses, and spans over 150 ft. of the pin-connected type. In other words we began to follow the practice of European engineers in the building of our shorter span bridges.

Now, let us analyze why we departed from the old-time practice of building pin-connected bridges and substitute the use of the riveted bridges. In the first place the old time pin-connected span was used without consideration of span length. The shorter pin-connected spans, owing to their extreme lightness, the small moment of inertia of their tension members, poor lateral bracing, and generally inferior details, vibrated excessively under traffic. The fact that these small pin-spans were used out of the sphere which naturally belonged to them, led a great many engineers to abandon the pin-connected span almost entirely and of recent years we have adopted more extensively the use of the all-riveted span for our longer span bridges. It has occurred to the writer, however, that in many cases we have substituted riveted spans for our long span bridges where a pin-connected structure would have been preferable.

The ideal span to build would be one that is free from vibrations and without secondary stresses, but as this is impossible, the problem then is to select that type of design which has the minimum number of objectionable features. For an ordinary simple truss span there are four types of construction to be considered:

First, the truss with built up chords and diagonals and riveted connections throughout, or what is ordinarily called a riveted span. In this type of construction the span should be made as deep as good designing will permit. The dimension of the chords and web members should be made as narrow in the plane of the truss as permissible. By increasing the depth of the trusses the connections of the diagonals to the chords become smaller; the deformation of the truss under load becomes smaller and consequently the secondary stresses become smaller.

The problem of selecting the proper dimensions of the various members forming a joint requires a great deal of skill and judgment. In the first place the various members should be slender, so as to be as flexible as possible, in order to reduce the secondary stresses due to the bending of the member. On the other hand, with slender members it is exceedingly difficult to concentrate the rivets in the connections. This calls for the rivets to reach far out into the members; hence the use of large gusset plates. The longer the connection becomes, the more uncertain the action of the rivets, and therefore the more objectionable the connection. The size of the gusset plates may, in many cases, be reduced by connecting the main member to both sides of the gusset plate by means of an auxiliary connecting plate. By this means the rivets connecting the main member to the gusset plate take double shear and thus the number of rivets can be reduced in proportion.

The slenderness of members calls for compression members with small moments of inertia, and therefore they are not so economical as a column as one with a greater moment of inertia. In the case of tension members it means thicker material and, therefore, more waste due to deductions on account of rivet holes.

Thus we are confronted with the problem of selecting members having large dimensions of their cross-section in the plane of the truss, with the possibility of their connections being concentrated to a minimum, and, as a consequence thereof, of having large secondary stresses due to

bending of the connecting members. Or, on the other hand, selecting a cross-section with the least width possible, which in turn calls for small moments of inertia; that is to say, the members are not economical compression members, nor are they economical tension members, as the material becomes too concentrated. The great problem is, therefore, to know just where to draw the line in the selection of the various members.

In order to somewhat overcome the effects of the secondary stresses in riveted-truss spans, some of our specifications call for their partial elimination by lengthening and shortening the various truss members, amounting to the respective distortions due to dead load plus one-half the live load, and reaming of the chord splices, while the chords are assembled in a straight line, and then forcing them in their proper position before the connections of the diagonals to the chords are drilled or reamed. This is all right as far as it goes in the shop, but when the structure is actually being erected it is an altogether different proposition. If the chords were first riveted together and then put on their camber blocking before they were connected to the diagonals, these results might in a measure be obtained.

Before a long fixed span can be swung it is necessary to rivet all the tension splices in the chords, so that it is very probable that a large part of the refinement that was put on this work in the shop is lost in the field.

Second, the truss with built-up continuous chords and built-up diagonals, pin-connected throughout. The vertical posts and diagonals are connected to the chord by means of pins, which in the case of a continuous chord become very small, owing to the fact that the pins merely transmit the increment of the stress to the chords. It is sometimes found desirable to rivet such posts and diagonals, as in case of reversal of stresses in these members, in order to avoid the wear in the pin holes. In such cases the stresses to be transmitted to the chords are very small indeed; consequently the connections are small and, therefore, secondary stresses are also very small. This type of construction can be designed by making the chords sufficiently shallow in order to make the same flexible and the diagonals sufficiently wide in the plane of the truss, so that they are sufficiently strong to rotate upon the pin and overcome the pin friction when the structure deflects. It is believed that this type of construction has a minimum amount of secondary stresses.

The only objection to this type of span is that it weighs more than a span with eye-bars used as tension members, and that the tension chords must be spliced in the field before the span can be safely swung, which in many cases is very objectionable as in most long-span bridges it is desirable to make the span safe in the least time possible.

Third, the truss with the chords built up and made shallow in order to be flexible; diagonal eye-bars, pin-connected.

Fourth, the truss with bottom chords and diagonals made of eye-bars. While this type of construction is pin-connected throughout and theoretically articulated, the joints are actually more or less rigid, due to the friction of the bearing of the eye-bars on the pins. In order to reduce to a minimum, the secondary stresses due to pin friction, it is desirable to make the bars as wide as permissible and still not exceed the allowable bearing value of the eye-bars upon the pins.

It is extremely difficult to determine the amount of secondary stresses in a pin-connected bridge, due to the weight of the bridge itself, inasmuch as it is impossible to determine the frictional resistance upon the pins which the various members encounter in righting themselves, while the camber blocking is being removed and the span swung.

While the action of eye-bars in a structure is not perfect —that is to say, that bars have more or less secondary stresses—nevertheless, they are one of the safest articles used in the construction of a bridge. When we are using an eye-bar we can feel that we are using something about which our knowledge is reasonably complete. It seems to the writer, however, that it is the common practice of engineers either not to use eye-bars at all or else to use them rght up to the limit of their capacity as determined by full size tests. They seldom figure out what amount of economy could be obtained by using an eye-bar with a somewhat lower unit stress on the same basis that they use a riveted member. In the case of a built-up tension member, there is a large amount of material which is wasted, inasmuch as it does not enter into or carry part of the primary stress; namely, such material as is added to take care of the deductions from this section, necessary on account of rivet holes, and material added for lattice-bars, batten plates, etc. If they realized that they could add considerable material to their eye-bars and still use them with economy, they might not be so adverse to their use. This material added to the eye-bars would reduce the normal stress in the eye-bars to such an extent that the secondary stresses could be entirely ignored.

The vibration of pin-connected spans may be reduced in several ways. First, by making all of the members built-up, with, comparatively speaking, large moments of inertia in the plane of the truss; second, by making the eye-bars sufficiently wide so that their deflection, due to their own weight, will not be too great; third, by weighing down the bridge by means of a ballasted floor. The writer cannot help but feel that when we come to our longer span bridges, the pin-connected type bridge is the proper one to build. The main advantages of a pin-connected span with eye-bar tension members, are that it weighs less than other types of construction and can be built in the shop with extreme accuracy so that there is little possibility of encountering trouble in erection through faulty workmanship. Erection can proceed with greater rapidity than with the riveted span, and the writer believes that less skill is required in designing a pin-connected span than a riveted span.

Lateral Bracing.—There is a feature in our long span bridges which should be considered very thoroughly, and that is the question of lateral bracing for the compression chords. In the shorter span bridges the loads allowed for wind bracing are ample to provide sufficient material to take care of the actual wind stresses, and also to hold in alignment the compression chords. However, in very long span bridges, the question of providing sufficient lateral bracing for the compression chords to hold them in proper alignment, so that the compression chords will act in unison throughout their entire length and in reality form one compression member when considered in a horizontal plane, should be carefully considered. In this respect the lateral bracing, in addition to performing the function of wind bracing, also performs the same function that the lattice bars do to the individual compression members. However, in the case of an ordinary member the lattice bars connect continuous members, whereas, the lateral bracing must hold in alignment members which are not thoroughly spliced, and are, therefore, more liable to be out of true alignment on account of imperfect workmanship.

It is not an easy matter to determine the amount of lateral bracing which it is necessary to provide to hold the compression chords in proper alignment, owing to the fact that we have not made sufficient tests of large size compression members to determine just how much material is re-

quired to hold in proper alignment the main sections of a compression member.

This same question of uncertainty applies to the proper bracing of the top flange of our through plate girder bridges. The writer is well satisfied that a large number of our designers do not have the same margin of safety in the compression flange of their through plate girder bridges as they have in the tension flange. Some recent tests of plate girders show that the ultimate strength of the top flange is about the elastic limit of the material. In order to make the top flange of a through plate girder bridge the same strength as the bottom flange, we should have some formula to guide us in the proper proportioning of the top flange. A formula for this purpose can be developed only by a series of experiments. However, in the meantime it seems to the writer that we should apply our column formula to these flanges. Of course, the value of intermediate supports should be given proper consideration.

Another feature in our plate girder designs, which the writer is inclined to believe will cause our engineers some regret, is that they have not as a rule increased the thickness of their web plates in the same ratio that they have increased their flange areas. This is especially true of the long plate girder spans. When the large web plates are rolled at the mills the edges of the plate cool first, which causes the plate to become "dished." In order to eliminate this dishing or buckles in the web, it is necessary to put these web plates in the bending rolls until the buckles are eliminated. After this the plates are straightened for use. There can be no question but that there are heavy secondary stresses in all these large web plates. In addition to this the web plates are more exposed to corrosion than any other part of the structure and if there is any deterioration in this structure, the web plates will show the greatest portion of this deterioration.

In many cases stringers and the shorter span plate girders could be built not only better, but also cheaper, by omitting stiffeners altogether, except at end connections or bearing points and in cases where necessary on account of other connections, and putting a like amount of material in the web, thereby obtaining a much stronger web and adding some to the strength of the flanges.

It frequently happens that heavy portal or sway bracing is attached to the upper parts of bents, leaving the lower portion unbraced, and due consideration is not given to the bending which this portal or sway bracing might induce into the columns; the columns are merely provided with ordinary lattice bars below the portal or sway bracing instead of being provided with proper web plates or cover plates to transmit the shear to its proper destination.

Lattice bars should be eliminated where it is practicable, inasmuch as their function consists merely in holding members together, and they do not assist materially in transmitting the main stresses, whereas, if a solid plate were used it would form a part of the member as well as take care of any local shear that might be manifest.

In order to get accurate workmanship in large compression members, they should be so designed that they can be completely assembled in the shop before riveting. This practically means that even some of the smaller compression members should have lacing bars with at least two rivets at each end, in order to keep in proper alignment the members while they are being riveted in the shop. The larger members should have sufficient diaphragms to insure the proper amount of rigidity.

There is a tendency among engineers to over-rivet their compression and tension members to make the material act as a unit, and it often happens that the material is weakened by this means. Material should be used as it comes from the mills with as little labor on it as possible.

In many cases the specifications call for symmetrical sections, but do not mention the fact that the connections should be symmetrical or at least an equal number of rivets on each side of the centre line of the member.

Some engineers are inclined to lay down rules to others which they themselves are not following—for instance, in trough floor construction used extensively for track elevation purposes. These troughs are filled with concrete and become inaccessible for painting and inspection. The writer believes that much better results might be obtained by using I-beams and reinforced concrete decking on top of the I-beams with ballasted floor on top of the concrete. In this way the structural material is always accessible for painting and inspection.

In the designing of our mill buildings, especially where high speed traveling cranes are used, special attention should be paid to the proper distribution of the lateral forces induced by the traveling cranes throughout the building. In cases of this kind, the bottom chords of the roof trusses should be provided with a good lateral system extending the full length of the building, so that the lateral forces will be thoroughly absorbed throughout the structure.

Nickel Steel.—Of recent years some of our engineers have been advocating the use of nickel steel and other steels of high ultimate strength. Inasmuch as the modulus of elasticity of nickel steel is the same as that of carbon steel, the structures designed with these steels of high ultimate strength, where the unit stresses are from two and one-half to three times those used for ordinary carbon steel, the deformation and deflections will be from two and one-half to three times those of structures built of ordinary carbon steel. As the deformation of the structure increases the secondary stress also increases in proportion. What is more, even if the secondary strains have been rectified for the dead load, the deflections due to the live load will be much greater in proportion in structures of nickel steel than in those of carbon steel, for the reason that the weight of the live load in this case is much greater in porportion to the weight of the dead load than is the case where ordinary steel is used. In addition, the deflections caused by the passing of the live load over the structure are much greater owing to the increased unit stress employed.

For the above mentioned reasons, structures built of steel of high ultimate strength should be designed with the minimum secondary stresses. One of the worst features in connection with the use of nickel steel has been that some of our engineers have used carbon steel in conjunction with nickel steel. Take the case of a simple truss span, where the chords are made of nickel steel and the lateral bracing is made of carbon steel. The two chords are tied together by the lateral bracing forming one compression member, and any deformation which takes place in the chords due to the compression of the same must be borne proportionately by the laterals. This means that the lateral bracing may be stressed up to its elastic limit, while the chords themselves are not stressed beyond their usual requirements.

In stating that nickel steel and carbon steel should not be used together, is meant in such parts of the span that act in unison. For instance, there can be no objection to the use of carbon steel in a nickel steel structure for floor beams and stringers, or such members as act independent of the main structure, provided ample provision is made for the stringer connections to expand. These are points, however, which can be taken care of in the design of the structure.

Secondary Stresses.—The future development of our bridges depends upon the careful consideration and elimination, as far as possible, of the secondary stresses. It will be observed that in none of the various types of spans considered is it possible to eliminate entirely the secondary stresses in the chords. The secondary stresses may be reduced by the selection of the proper section for the diagonals and their attachments to the chords. Secondary stresses are developed in trusses through the connections of the lateral bracing and the floor system. In a through bridge the elongation of bottom chord produces an elongation in the bottom laterals, resulting in heavy secondary stresses in both the floor beams and laterals when they are attached to the stringers and intermediate points. In a deck bridge the top chord being in compression is reduced in length, while the bottom flange of the stringers is elongated more or less, for which reason the stringers should be provided with extension joints at the floor beams in order to avoid excessive secondary stresses.

To minimize the effect of secondary stresses in a truss, it is well to omit knee bracing and sway frames at intermediate panel points.

The main posts of a truss should be made the full depth of the truss wherever possible; in other words, bracing to increase the efficiency of posts and the use of sub-struts, materially increases the secondary stresses. Floor beams should be made deep and centrally connected to the posts. In order to avoid chord stresses to be transmitted to stringers, their end connections should be made flexible. This can be done by using a wide gauge of the outstanding leg of the angle connecting the stringer to the floor beam.

When a truss with subdivided panels is used the unit stress of the floor beam hangers should be very low so as to keep down the elongation in same, as the elongation of the hanger produces heavy secondary stresses in the chords to which it connects.

Aside from the make-up of the various members of a truss span and their connections, a great deal depends upon the type of span itself. Secondary stresses are very materially increased or decreased according to the type of the truss, whether it is a single intersection, a multiple intersection or a multiple intersection with vertical posts or without vertical posts.

Another source of secondary stresses in a truss is due to the fact that the bottom laterals are, as a rule, attached to the bottom of the post quite a distance below the bottom chord, so that the chord stresses in the lateral system must travel through bending in the post into the bottom chord. Besides this defect, laterals are not generally run in centrally with the chord, thereby inducing uneven distribution of chord stresses.

A DIAGRAM FOR SUPER-ELEVATION OF RAIL.

The engineering department of the Ohio Electric Railway, with Gaylord Thompson as chief engineer, has distributed to its roadmasters and section foremen a diagram showing the correct super-elevation to be used on the outside rail for various speeds and curves. A description of the diagram with the reproduction accompanying, is taken from the Electric Railway Journal. The curves on the diagram have been plotted from the accepted super-elevation formula. The limits which the company considers are proper for safe elevation and speed are shown by the irregular heavy black line. The speed of cars and elevation of outside rail must be inside this line. Thus, on a 4-deg. curve the track elevation, according to this diagram, should not exceed 4½ in. and the speed of the car should not exceed 40 m.p.h. On a 20-deg. curve the elevation should not exceed 6 in. and the speed 21 m.p.h. For a 50-deg. curve the figures are respectively 3 in. and 9 m.p.h. A note on the chart says that where line poles are spaced 100 ft. apart four times the number of poles passed in seventeen seconds is about the speed of the car in miles per hour. The broken line designated as one-half the speed at which cars would overturn on level track was computed by using the super-elevation formula in transposed form.

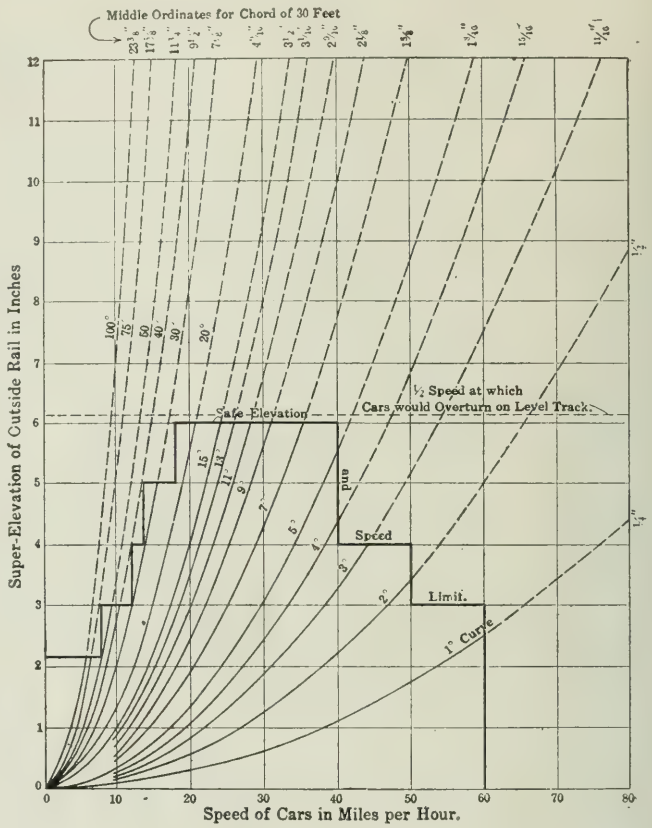


Diagram Showing Correct Super-Elevation to be Used on the Outside Rail for Various Speeds and Curves.

Trackmen, as a rule, are unable to determine accurately the degree of curve. They depend usually on their ability to compare by observation any given curve with one of known curvature. Hence to the diagram information has been added by which the trackmen can easily determine the degree of any curve. At the upper part of the diagram, at the ends of the lines representing the super-elevations of each curve, the mid-ordinates for a 30-ft. cord are given. These mid-ordinates are not wholly of assistance in determining the degree of curve and in checking the super-elevation, but are very valuable to check the curvature when rails are being bent to sharp curves with a roller bender.

The outer rails of all curves on the Ohio Electric Railway are being elevated to conform to the super-elevations given on the diagram, in general repair work and on new track construction. The diagram has been in use for several years.

ENAMEL PAINT FOR STEEL WORK.

Messrs. Wailes, Dove & Company's "Bitumastic" solution and enamels have been adopted for painting the gates and structural steel work in connection with the Panama Canal. Messrs. Wailes, Dove & Co. are represented in Canada by Machau & Hebron, Montreal.

THE UTILITY OF COKE OVEN TARS AS ROAD MATERIALS.*

The rapidly increasing use in this country of refined coal tar in the treatment and construction of roads and the fact that an immense quantity of coal tar will ultimately become available for this purpose through the installation of by-product coke ovens make it highly desirable to obtain accurate information as to the properties of coke-oven tars which are being produced at present.

While, in the manufacture of coal gas, the production of tar is absolutely unavoidable, this is not true of the manufacture of coke for metallurgical purposes. There are two general types of coke ovens in use at present, in one of which no attempt is made to recover the volatile products of the coal. This is the oldest form of oven, known as the "beehive," and is extensively used in this country to-day. Coke ovens in which the by-products are saved are now used to some extent in this country, and sooner or later will undoubtedly replace the old-style oven entirely, and thus increase our output of tar enormously. With the development of the road-tar industry, which promises to consume vast quantities of tar, and the necessity for refining such tars before use, the general adoption of by-product ovens is only a matter of time. What this will mean in the increase in tar production can be imagined from the fact that in 1908, out of a total of over 26,000,000 tons of coke produced in coke ovens, only a little over 4,000,000 tons were obtained from by-product ovens. About 22,000,000 tons of coke were, therefore, produced without recovery of the tar. As the average yield of coke per ton of coal was 66 per cent., this would represent the consumption of over 33,000,000 tons of coal. Upon the basis of a yield of 10 gals. of tar per ton of coal, it may be seen that over 330,000,000 gals. of tar were lost in 1908 which might have been saved. As the actual production of coal tar both from coke ovens and gas houses amounted to about 101,000,000 gals., it is evident that over three-fourths of our possible production of tar as a by-product was lost during that year. At a valuation of 2½ cts. per gallon, this means a loss of over $8,000,000. At a conservative estimate, the tar lost each year from non-recovery coke ovens is sufficient to build 9,000 miles of tar macadam road 15 ft. wide.

In order to determine the character of coke-oven tars at present being produced in the United States, it was first necessary to obtain samples from all of the known plants.

From a total of 31 manufacturers to whom questions were submitted 30 replies were received, but 4 of these reported their plants as not in operation. The remaining 26 furnished samples of their crude tar for examination and answered the questions in so far as they were able. Upon receipt of each sample the entire contents of the package were thoroughly mixed and a representative sample taken for analysis.

The statements relative to the maximum temperature to which the coal is brought during distillation indicate that two of the plants run below 970° C., that a total of 22 run not over 1,150° C., that 9 run from 950° C. to 1,150° C., and that only 5 run above 1,150° C. The maximum temperature of firing the retorts is, however, reported in most cases as being higher than the maximum temperature to which the coal is brought.

The maximum percentage of free carbon reported is from 16 to 24 per cent., but 17 manufacturers reported the maximum percentage of free carbon as being 12 per cent.. or under, and only 4 as 16 per cent. or over.

Analyses of the samples received were made, the work consisting in determining the specific gravity, free carbon, or organic matter insoluble in c. p. carbon disulphide upon a 15-minute digestion at room temperature, material soluble in carbon disulphide, percentage of ash, and percentage of different fractions obtained by distilling a 250 c. c. sample in a 750 c. c. tabulated glass retort with the thermometer so placed that the top of the bulb was level with the bottom of the juncture of the stem and body of the retort.

The gravities of the samples examined range from 1.133 to 1.214 and that the great majority are lower than 1.200. This in itself indicates low percentages of free carbon. The minimum percentage of free carbon was 2.73, the maximum 16.80, and the average for the 26 samples 8.38. Eighteen samples contained less than 10 per cent. of free carbon and 8 more than 10 per cent. About two-thirds of these products might, therefore, be considered as low-carbon tars and the other third as medium-carbon tars. The amount of ash in no case exceeded 0.16 per cent., and in most cases it was practically nil. This is, of course, also true of practically all gas-house coal tars. The percentage of water present varied from a trace to 10.1 per cent. by volume, but in only 3 instances did it exceed 5 per cent. It is of interest to note that 14 of the pitch residues, remaining after distillation had been carried to 315° C., were either soft or plastic —a condition which has seldom been noticed by the author in the distillation of gas-house coal tars. The amount of solids which crystalized or precipitated out of the different fractions was found to vary greatly.

Results were also calculated upon a water-free basis—i.e., the percentages are expressed in terms of the actual tar exclusive of water. Considering these products according to type, the tar produced by the Koppers ovens contained the lowest percentage of free carbon, the Semet-Solvay tars the next lowest, the United Otto next, the Otto Hoffman next, and the mixed tar from the United Otto and Rothberg ovens contained the highest percentage of free carbon. For the sake of comparison the minimum, maximum, and average percentages of free carbon for each of these types are shown in Table I.

Table I.—Percentage of Free Carbon in Coke-Oven Tars.

(Water-free basis.)

Type of oven.	Percentage of free carbon. Minimum.	Maximum.	Average.
Koppers	2.81	3.95	3.38
Semet-Solvay	4.04	9.00	6.74
United Otto	5.26	12.55	9.00
Otto Hoffman	8.62	14.69	1.216
Otto Hoffman and United Otto (mixed)	11.51	13.52	12.51
United Otto and Rothberg (mixed)	17.17	17.17	17.17

The percentages of various fractions for the different types of tars overlap to such an extent that no detailed comparison will be made. The maximum, minimum, and average total distillates to 315° C. for the different types are, however, given in Table II.

*Abstracted from a circular prepared by Prevost Hubbard, Chemist, U.S. Office of Public Roads, and issued by that office.

Table II.—Percentage by Volume of Total Distillate to 315° C. in Coke-Oven Tars.

(Water-free basis.)

Type of oven.	Percentage by volume. Minimum.	Maximum.	Average.
Koppers	30.5	36.0	33.3
Semet-Solvay	22.6	40.8	29.9
United Otto	25.6	38.5	32.6
Otto Hoffman	25.3	43.6	36.0
Otto Hoffman and United Otto (mixed)	19.9	32.1	26.0
United Otto and Rothberg (mixed)	26.9	26.9	26.9

From this table it is evident that wide variations exist in the relation of total distillate to pitch residue in the coke-oven tars produced in this country, and this is even true of different tars produced by the same type of oven.

Straight coal-tar road binders or refined coal tars are usually manufactured by subjecting the crude material to a process of distillation with or without steam or air agitation. Distillation is carried to the point at which the residuum remaining in the still has obtained the desired consistency at normal temperatures, and this involves the removal of certain of the more volatile oils present in the crude material. For use in construction work a soft and almost fluid pitch is often produced, and the consistency of this pitch is controlled by means of a melting point of float test. When the crude tar runs abnormally high in free carbon, it is sometimes mixed with crude water-gas tar before distillation. Water-gas tar contains a very low percentage of free carbon, and by properly proportioning the two a product is obtained, upon distillation, which does not carry more than the maximum limit of free carbon set by manufacturers. What the maximum limit should be is a much mooted question among those who have given thought to this matter. The governing considerations are: (1) What is the most economical limit from the standpoint of manufacture? and (2) What is the proper limit with regard to the utilization of the product as a road material? For a number of reasons, which it is unnecessary to mention in this circular, an excessively high-carbon tar is difficult to distill properly and, with other things equal, the lower the percentage of carbon the easier and shorter the distilling process. From this standpoint, therefore, by-product coke-oven tars are well adapted to the manufacture of road binders. Moreover, because of their low percentage of free carbon, they may be employed in a manner similar to water-gas tars, when it is desired to utilize a crude high-carbon tar in the production of a medium-carbon tar road binder.

In an ordinary road tar for use in construction work where free carbon is present to the extent of about 20 per cent., the proportion of total distillate, below 315° C., to pitch residue is approximately 1 to 4. Where this relation exists the pitch residue is hard and brittle. A residue which is soft or plastic is to be preferred, as it would indicate longer life during service, and where such a residue is present the proportion of distillate would naturally be lower for a given consistency, as the distillates may be considered as fluxes for the residues.

In conclusion it may be said that indications point strongly to the fact that by-product coke ovens will eventually play a most important part in the road-material industry. The future demand for economical bituminous road binders in the United States will undoubtedly exceed the supply, and this in spite of the natural increase in petroleum and asphalt road binders. If such is the case, the present loss of enormous quantities of tar, to say nothing of gas and ammonia, because of the use of beehive ovens, is a matter worthy of the utmost consideration on the part of all who are interested in the conservation of our resources.

WIND PRESSURE.

The report of the National Physical Laboratory, London, presented at the meeting of the General Board, contains particulars of the work carried out last year, and of work it is proposed to undertake during the current year. Dr. Stanton, in the Engineering Department, has continued his study of the lateral variation in the pressure of the wind at any instant over an area of considerable extent, by means of the comparison of the mean pressure record of Dines tubes connected in parallel with the corresponding record of a single tube. Six pressure tubes, 60 ft. above the ground, and 70 ft. apart from each other, were linked up to a recorder so constructed that the movement of the maximum index was proportional to the arithmetical mean of the pressures in the tubes. Another precisely similar recorder was connected to a cluster of six pressure tubes which was so arranged on one of the towers that the six orifices were enclosed in an area of less than 2 sq. ft. The assumption made was that at any instant the pressure in each tube of the cluster was the same, so that a comparison of the maximum readings of the two recorders during any interval of time gave the ratio of the maximum pressure attained at the position of the cluster to the maximum average pressure attained at the six distributed positions. For this work it was necessary to erect four auxiliary steel towers, each 60 ft. high, which were placed between the existing towers. Each of the 12 Dines tubes was connected by a pair of 3/8-inch lead pipes 250 feet long to the recorders in the observation hut. During the last three months of last year there were several favorable opportunities for making observations, and it is now considered that sufficient data have been obtained to enable a prediction of the wind pressure over an area of several thousand square feet to be made from observations at a single point in the area. There remains the investigation of the effect of the more or less exposed nature of the site on the lateral variation of wind force, and for this purpose it will be necessary to carry out similar experiments elsewhere. By the kindness of Sir John Wolfe Barry, permission has been received from the Bridge House Estates Commissioners to make observations on the Tower Bridge.

CANADA AS A CHEMICAL PRODUCING CENTRE.

The importance of the chemical industries of this country and the opportunity for the growth of their foreign business has been recently exemplified by a report which states that negotiations have been entered into between the British War Office and a large chemical manufactory in this country for the supply of acetone for ammunition explosives. Acetone is a by-product in the distillation of wood for the manufacture of charcoal and wood alcohol.

It is proposed to use the substance as a binder for cordite, which is composed of nitro-glycerine, in a similar manner to the use of kieselguhr, a porous earth that is used as a binder for dynamite.

THE COST OF FIRE.

The fire losses in Canada for the first three months of the current year total $6,904,217, an average of $2,301,405 per month. This is equal to a daily loss of $76,310. In other words, $3,179 worth of property has been burned every hour since the new year dawned, or $53 every minute. This is an appalling fire loss, and little is being done to check such extravagant waste of capital.

The National Board of Fire Underwriters of the United States, continuing its plan of education on the need of better protection, issued an exhaustive classification of fire losses in 1909, showing why the insurance companies are forced to ask higher rates in America than in Europe, and why rates in America itself necessarily vary. Taking thirty of the largest cities of the United States, the per capita loss in 1909 was shown to vary from $1.36 in St. Louis to $4.55 in Kansas City. Higher per capita loss was shown in some of the smaller centres, like the city of Racine, where it ran to $24.29. The total annual fire loss is estimated at $200,000,000, and fire specialists go so far as to assert that $150,000,000 of this is waste from negligence or lack of precautions. The table of comparisons drawn up by the underwriters from consular returns in 1905, the only recent year in which statistics of the kind were gathered in Europe, showed an average loss of 61 cents per capita for thirty European cities as against $3.10 for 252 American cities. Taking the number of fires to each 1,000 of population here and in Europe, it was found to be 4.05 in the United States against .86 in Europe.

The annual average losses for six nations in Europe were compiled from records of varying years and years grouped, with this result:—

Country.	Annual fire loss.	Loss per capita. Cents.
Austria	$ 7,601,389	29
Denmark	660,924	26
France	11,699,275	30
Germany	27,655,600	49
Italy	4,112,725	12
Switzerland	999,364	30

Or an average loss per capita of 33 cents.

The fire loss per capita in the Dominion last year was $3.02.

In Berlin, where the losses amount annually to less than those of one moderately large fire in the United States, the excellent conditions are due to the attention paid to the methods of construction. Building police have authority to compel the use of iron and steel girders, fireproof stairways and roofing, heavy fireproof ceilings, and all details that may diminish the risk of conflagration.

Canada cannot claim to be making untrammeled progress until its fire record has been improved considerably.

INCREASED WATER FOR THE CHICAGO DRAINAGE CANAL.

The Board of Trustees of the Chicago Sanitary District have recently applied for a permit to increase the diversion of water from Lake Michigan, and, amongst many others, the Commission of Conservation of Canada protested strongly against such action. The Chicago drainage canal is now taking 4,167 cubic feet per second, and the request of the trustees was that this should be increased to 10,000 cubic feet per second. The

Commission of Conservation have issued a pamphlet embodying their protest, which was presented at Washington on March 27th. The reasons given why no increase should be made in the amount now allowed are interesting, and deserve wide publicity. Among other things, the statement is made that the drainage canal has already cost $62,000,000. Its advocates have insisted that there was no other feasible method of treating Chicago's sewage.

It is pretty clearly understood at the present time that the dilution method of disposing of sewage, as practised by Chicago, has proved a failure, for already the canal has silted up from deposits of slush, and this must be removed by dredging. Already ill effects are noticeable on the Great Lakes from the present diversion, for reports of the United States engineers show a drop of four inches in the lake's levels due to the canal. While it is undoubtedly true that controlling works at the foot of Lake Erie would preserve the mean level of the lakes, it is easily seen that the River St. Lawrence would suffer, since the water passing down the canal would be abstracted from the river.

There seems no good reason why the request of Chicago should be granted. In fact, there is every reason why it should not be granted. A great number of cities in Europe are purifying their sewage. Many cities and municipalities in the United States and Canada are doing likewise. Methods of sewage disposal have arrived at the stage where it is quite possible to secure a high degree of purification with a reasonable expenditure of money. The city of Chicago, therefore, should be compelled to treat their sewage so that the present canal will be able to take care of the effluent.

CONCRETE PAVEMENTS.

The interest in concrete pavements at the present time appears to be considerable. During 1910, in the United States, about 700,000 square yards were laid. Last year figures recently compiled show that about five times that amount, or approximately 3,000,000 square yards, were laid throughout the country. In Canada it is hard to say how much has been constructed the last two years. However, the amount has been comparatively small compared with the above. There appears to be little uniformity as to methods of construction, but this, however, will be adjusted as more pavement is laid and publicity given to the methods used. There are indications even now of standardization of certain of the methods. The main objections or difficulties with concrete pavements appear to be the white glare of the surface, dust, and lack of resiliency. The question of joints, both transversal and longitudinal, is not adequately settled, and there is discussion as to the use of one or two layers or coats in the construction of the pavement. Some engineers are using lamp-black, or a coloring matter, mixed with the cement, to tone down the concrete and give a grey color pleasing to the eye, and they claim good results, although there appears to be some little difficulty in securing an even color.

Expansion joints are the source of differences of opinion. Most engineers appear to favor the use of transverse expansion joints at intervals of about twenty feet, although a few use no expansion joints whatever. If it were possible to get along without transverse joints and preserve the pavement from cracks and breaks, it would undoubtedly be better, for the edges of these joints appear to be productive of much trouble. The corners soon chip off, and the continuous passing of vehicles gradually forms an unsightly depression. Where pavements have been laid, in some cities, the edges of the joints are protected with steel angles in order to prevent these depressions. It is an open question, however, as to the advantage to be gained by this. If transverse joints are employed, the best method would seem to be the use of a very narrow strip of soft wood, which could be withdrawn and the joint filled with bitumen or tar.

Longitudinal joints appear to be used, more on account of construction reasons. By the use of a longitudinal joint down the centre of the pavement it is much easier to screed and finish the surface; the difficulty of screeding the full width of street is manifest. These joints, however, are open to serious question, as they would appear to invite the formation of ruts.

The use of one or two layers or coats in the laying of the pavement is open to discussion. With the use of one course, the entire pavement is laid in one operation and with one mixture. The surface is formed by tamping and troweling, forming a coating comparatively smooth on the top. The two-coat method seems to be the most in favor, and, providing careful methods are used in construction, will undoubtedly give good results. The bottom coat is a leaner mixture than the top, the top coat being made of about an inch and a half, or two-inch wearing surface. To secure good results with this method the two mixtures must be laid almost simultaneously in order that the materials may bond.

There has been a good deal of concrete pavement laid in the United States and a little in Canada, which has been covered with a thin coating of bituminous material, applied hot, and sprinkled with a layer of fine gravel or stone screenings. The result of recent investigations by Professor Smith, of Michigan University, shows that the expansion and contraction of concrete is due, not, as commonly supposed, to the effects of heat and cold, but rather to alternate wetting and drying. If this be true, it would be logical to assume that the application of a waterproof coating to the surface of concrete pavement would save the use of expansion joints.

As concrete can be laid more cheaply than any other type of permanent pavement, since it forms the base of all permanent pavements, there appears to be a wide future for its use. By the provision of a higher curb it may be used temporarily and afterwards converted into a brick or asphalt pavement, the original concrete pavement furnishing the base of the new pavement.

EDITORIAL COMMENT.

In all the talk of heroism shown by the passengers on board the Titanic, most people seem to have lost sight of one part of the crew who, above all others, showed magnificent qualities of courage. Of the engineers on board ship, not one was saved, all remaining at their posts below deck until the vessel sank.

* * * *

The annual report of the Interstate Commerce Commission of the United States, just issued, shows that there has been an increase in the number of derailments due to defective track much greater than would be accounted for by the increase in mileage and volume of traffic. The report states that the construction of cars and locomotives is tending towards an ever-increasing standard of dimensions without a proportionate betterment of track condition. This is a state of affairs to which the railway engineer must devote immediate attention. There is no doubt that the weight of rolling stock and the speed of trains have increased in a greater rate than the improvement in rail design and roadbed.

A NEW GAS-ELECTRIC CAR.

The management of the Canadian Northern Railway have recently introduced on their lines a self-propelled car that bids fair to solve the problem of cost reduction on the branch lines. The car presents many interesting features to the engineer, not the least being the method of transmitting the propelling power to the wheels and low operating cost.

In general appearance the car is similar to the palace types, used behind a steam locomotive, but its mechanical construction, of course, is greatly different. In the front portion of the car illustrated in Figure 1, is contained the power plant which consists of an eight-cylinder, 550 r.p.m., 4-cycle, 200 h.p. gas engine of the V type, direct connected to an eight-pole, 600-volt, commutating pole, electric generator. The magnet frame of the generator is bolted directly to the end of the engine frame, and the outboard bearing is ring oiled and contained in a three-arm bracket. The engine base is of cast iron and is provided with hand holes fitted with clamp covers for the inspection of the main bearings, etc. The bore of the cylinder is 8 inches and the stroke 10 inches. The exhaust and inlet valves, the air starting check valves and the spark plugs are mounted in dome shaped cylinder heads which are thoroughly water jacketed and are secured by four large studs tapped directly into the crank case. The cylinders are provided with auxiliary exhaust ports which are uncovered by the piston at a point near the bottom of the stroke, allowing the major portion of the hot gas to pass out through a water-cooled valve.

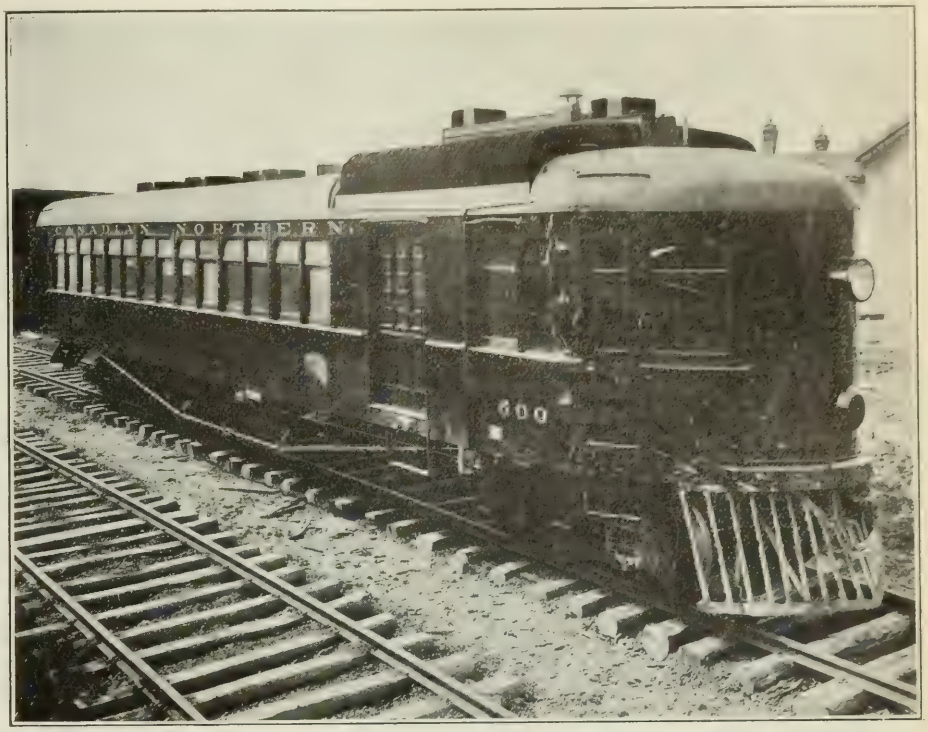

Fig. 1.—View of Car.

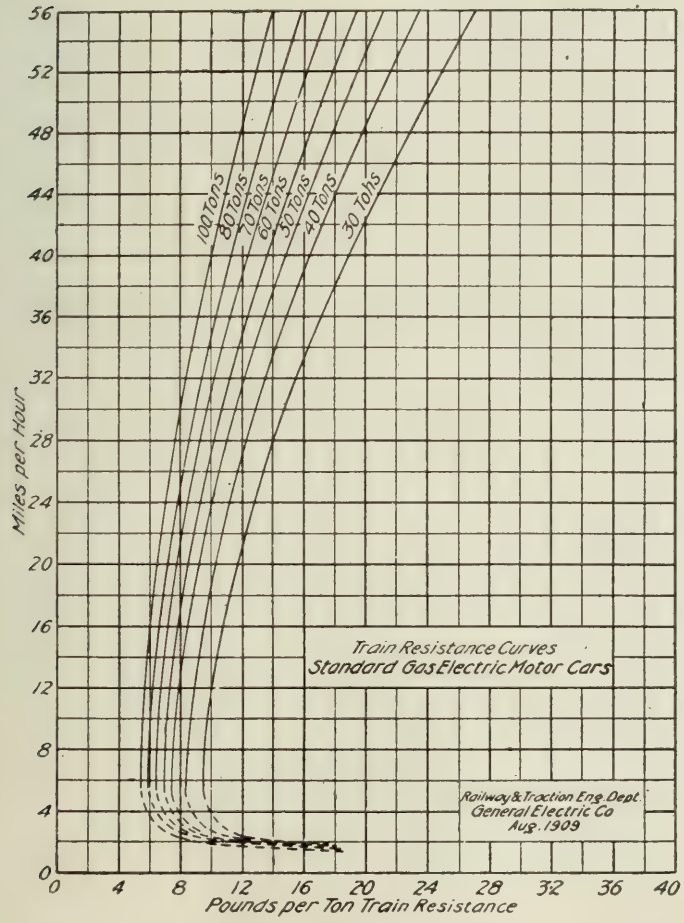

All the valves are operated by two cam shafts actuated by a single reduction gearing from the main crank shaft; one cam shaft being located on either side of the engine. The pistons are of the trunk type fitted with five cast iron rings. The lighting of the car is not dependent upon the main generator, a combined air compressor and lighting dynamo being included in the equipment for that purpose. The air compressor provides an initial charge for starting the main engine. This compressor has a displacement of 45 cubic feet of free air per minute, and the lighting generator has an output of 1½ kilowatts at 125 volts. A centrifugal governor is provided to insure a constant speed from the engine, of 600 r.p.m.

The forward truck of the car is provided with two standard 600-volt railway motors; these are of box framed, oil-lubricated, commutating pole type, and are mounted directly on the axles, and equipped with standard gears and gear cases.

The electrical control of these motors differs to a considerable extent from the method employed on an ordinary street car. By means of a special controller the driving motors are placed progressively in series and parallel; the voltage is governed by varying the strength of the generator field. This is accomplished by the movement of a single handle on the controller box. Separate handles are provided for reversing the car and for throttling the engine.

The car provides seating capacity for about seventy-five persons when the seats are arranged in a similar order to that of a steam railway carriage, and was built by the General Electric Company, at Schnectady. The Canadian General Electric, however, will build these cars for the Canadian market.

This car was recently given one or two practical working tests on the lines of the Canadian Northern Railway. The first trip was made from Toronto to Richmond Hill and the car was under the personal supervision of important officials of this railway. A second and longer trip was made on the following day; the line of travel was from Toronto to Trenton, a distance of 115 miles. During the latter trip about fifty gallons of gasoline were consumed and the operating expenses were about 18 cents per car mile.

At times this car reached a speed of 50 miles per hour, but it is declared by the manufacturers that under extraordinary conditions of roadbed the car can attain a speed of 75 miles per hour.

Owing to the success of this car it is probable that it will be the forerunner of others of a similar type.

TIMBER EXPANSION IN FLUMES; CAUSES AND REMEDIES.

By Godfrey Sperling.*

Several well-defined cases showing longitudinal expansion of timber occurred in flumes constructed during the year 1910 by the Centerville Mining & Milling Co., in Boise basin, Idaho. These flumes were built by contractors who had erected many similar structures in these placer-mining districts and it is particularly interesting that those built by the Centerville Co. were the first recalled wherein the expansion in a direction parallel to the grain was so marked as to be measurable and productive of such large stresses as to be more or less directly traceable to the failure of the higher portion of a long flume.

Experiments by the Forest Service at its various timber-testing stations indicate that the shrinkage of wood in a direction parallel to the grain is very small, and seems to be considered negligible. F. Roth writes: (Timber Forestry, Bulletin No. 10) "Since only an insignificant longitudinal shrinkage takes place (being commonly less than 0.1 in. per 100), the change in volume in drying is about equal to the sum of the radial and tangential shrinkage." That the shrinkage was appreciable in certain species of western soft woods has been brought to the writer's attention at various times by timber constructors. The cases referred to here, however, are the most marked and measurable expansion rather than shrinkage was here manifested.

A smaller straight flume 800 ft. in length showed an expansion of 0.75 ft., as measured from the movement of the mud sills at both ends, to which the last length of flume boards were spiked. This gives 0.083 per cent. expansion.

The timber for the flume box was logged and sawed during the months of July and August, 1910, from mature western yellow pine, and piled with drying strips in the sun. The timber selected was reasonably free from knots and sap-wood and contained little pitch wood. The flume was built about September 1; rains occurred in October and heavy snow fall, thawing and freezing, drying and soaking alternated during the winter until water was turned into the flume April 1. The expansion was measured after water had been in the flume one week and did not change appreciably thereafter.

The boards in the flume box were laid while dry, longitudinally, fitting tightly, end to end, and it can be assumed that the measured expansion very nearly represents that due to soaking and resoaking from air-seasoned condition to the saturation point. Had there been no opposing force to the free expansion of the timber, the measured expansion would represent the sum of expansion due to soaking and the thermal expansion. The latter at an average daily variation of the atmospheric temperature of 30 degrees F. would amount to about 0.1 ft. in 800 ft. of pine timber. Since the daily variation of temperature of the flume timber was about the same as that of the water which was nearly constant through the day, the thermal expansion can be neglected.

One of the forces opposing the free expansion of the flume was the resistance of the mud sills at either end set in firm soil about 2 ft. below the surface of the ground, with a retaining power of about 2 tons per sq. ft.; this would create a compressive stress in the flume box of about 75 lbs. per sq. in. Another opposing force was the resistance to longitudinal movement offered by the flume bents. These were built of square, sawed timbers, set on sills without anchors and without longitudinal diagonal bracing. On these bents the flume box was spiked. After expansion, these bents, near the ends of the flume, leaned toward the flume ends visibly. These bents offered perhaps less resistance to the expansion than that offered by the mud sills at either end. The total force generated by the expanding wood it is impossible to ascertain closely. It was certainly greater than the sum of these two opposing forces and continued to increase up to the saturation point. If we affect an analogy between the compressive stresses generated in a block of wood with its ends held fixed, and tending to expand, due to added moisture, to a block of wood under compression, we can assume that the attempted deformation due to moisture is proportional to unit stress generated. Taking 1,060,000 as the elastic modulas (Tremann, "Effect of Moisture on Wood," Forestry Bulletin No. 70) for resoaked pine wood, $\frac{S}{0.00083} = 1{,}060{,}000$. $S = 870$ lbs. per sq. in., this would represent the maximum unit compressive stress due to resoaking to the saturation point.

The main flume, 4,700 ft. long, was built during September, 1910, of similar material to the small flume. It was also subjected to the same exposure and water was turned in at the same time.

The movement of the mud sills at either end of this flume did not appear more marked than that of the shorter flume. Being built partly in curves, the compressive force in the flume box due to soaking had the effect of lifting the inner posts of bents on curves and actually did lift these posts from the sills on curves of the lower part of the flume. Bents as high as 36 ft. were observed in that condition carrying the entire load on the outer posts of the bents.

The dead load per bent of 16 ft. calculated from weights taken from dimensions of the flume was 3,600 lbs. and the live load of 10 second ft., the capacity of the flume with a cross-sectional area of 2.67 sq. ft., or 2,665 lbs. per 16 ft. bent. The total dead and live load was 6,265 lbs.

The distance from centre of bent to foot of post for a 36-ft. bent was 8.5 ft. Then by resolution let P equal the radial force acting at each bent at the flume box level.

$P = \frac{6265 \times 8.5}{36} = 1{,}480$ lbs. sufficient to lift inner post of a 36-ft. bent.

The radius of the curve at this point was 425 ft., the central angle for a 16-ft. bent was 2° 10′, tangential deflection was 1° 5′; therefore, the compressive stress in the flume box necessary to create this force P is $S = \frac{P}{\text{Cos. } 1° 5'} = \frac{1480 \text{ lbs.}}{.0184} = 78{,}200$ lbs.

* Transactions American Metallurgical Society.

The cross sectional area of the flume box is 80 sq. ins., giving a unit compressive stress of 980 lbs. per sq. in., or 110 per cent. of the unit stress arrived at in the smaller flume, and is, therefore, in close agreement therewith. The actual stress in the flume box, allowing for resistance caused by the bents which had no longitudinal diagonal bracing either, did not likely exceed 1,100 lbs. per sq. in. Some buckling, but no rupture was observed in the flume box of either large or small flume.

The relative small expansion noted at the ends of this long flume is accounted for as being thrown into the curves. It appears here that the stresses generated by expanding timber, due to moisture approximate those created in timber under compression.

The flumes were built for placermining purposes where the comparatively short life required and the lower first cost with higher maintenance was an economy and therefore justified the type of construction used. While these features were obtained, criticism might be made of the details of framing used. For instance, no longitudinal diagonal bracing was employed—only longitudinal ties and struts from bent to bent were used. In the latter (apparently an oversight) they were discontinued at one bent joint near the end of the highest part of the flume. It was at this point where the outer post buckled in the direction of the missing strut and all the joints on same level buckled and failed in the same direction, wrecking about 800 ft. of flume from 60 to 95 ft. high. The upper joints of bents, with flume box, dropped vertically and were pushed from 6 to 8 ft. into the ground.

It appears then that the wrecking of the flume was caused primarily by the expansion of the wood box due to soaking. The maximum forces possible from that source were acting and failure occurred at the weak point in the design. This experience shows that suitable provision for expansion of timber should be made where expansion parallel with the grain might be of material effect. More data on the subject of longitudinal expansion of various species of wood would be of help to engineers; nothing definite having come to the writer's attention.

The writer is indebted to Walter C. Locke, civil engineer, of Boise, Idaho, who had charge of the rebuilding of the wrecked portion of the flume, the most of the data concerning the flumes above described. In the rebuilding, an expansion joint allowing 6 ins. of longitudinal movement was used at the ends of curves, also a space of one-half inch was left between the ends of boards in the flume boxes.

PUBLIC UTILITIES IN EDMONTON.

The February report of these utilities presents a better appearance than that of January for the same civic departments. The municipal telephone system showed a surplus of $912.81. The telephone rentals amounted to $7,417.60; long distance tolls, $3.10; rental of buildings, $95, and bank interest, $119.07, making a total of $7,634.77, and less discounts, which amounted to $274.54, the revenue totalled $7,360. The maintenance expenditure amounted to $1,300.89; operation, $2,496.09, and interest and redemption, $2,650.44, making a total expenditure of $6,447.42. Deducting the expenditure from the revenue, a net surplus of $912.81 is shown. During February there were 109 services installed, and the average rent per 'phone was $2.06, and the cost and maintenance per 'phone $1.80, thus leaving a net revenue of 26 cents per 'phone.

The waterworks department showed a surplus of $459.45. The revenue, less discounts amounting to $1,233.43, was $14,348.43. The total expenditure for the month amounted to $13,888.98, which included a pumping plant charge of $6,373.78; operating and administration, $1,400; maintenance, $1,965.53; and interest and redemption, $4,249.47. The capital expenditure for the month amounted to $14,307.75, leaving a balance of capital account of $253,108.12.

The water pumped through the distribution system was 99,083,240 gallons, at a cost for pumping of 6.42 cents per 1,000 gallons. The revenue for sale of water was $9,527.48, and for frontage tax and miscellaneous $4,820.95, giving a total revenue per 1,000 gallons of 14.51 cents. There were 40,500,000 gallons of water supplied through meters and 58,583,240 supplied otherwise. The revenue from metered services amounted to $4,775.94, and unmetered services $4,751.54. The sum of $15,106.44 represents the month's profits from the operation of the electric light department. The total revenue for the month was $31,103.25, after discounts amounting to $1,120.82 had been deducted. The expenditure in this department amounted to $17,117.63.

The capital expenditure in the engineering department amounted to $819.85, and the capital expenditure on construction $52,108.57. The sum of $5,883.58 was expended on maintenance of boulevards, bridges, and sidewalks and sewers. The operating expenses amounted to $317.18, and the administration $3,166.42. The sum of $580.49 was netted from sundry items.

There were 6,957 tons of coal used at the power plant; the electric power plant boiler consumed 4,512 tons; pumping plants, 493; gas power plant, 383; and stocked, 1,569. The cost of alternating current amounted to $15,007.29, and the total output of alternating current was 544,339 kw.h. at 2.76 cents per kw.h. The gas plant alternating current cost $3,908.78. The direct current, steam driven, cost $5,995.73, covering a total output of 199,400 kw.h. at a cost of 3 cents per kw.h. The water pumping plant was supplied with $8,634.51 worth of power, which covers 119,424,310 imperial gallons pumped at a cost of 7.23 cents per 1,000 gallons. The total power-house expenses amounted to $28,231.22 on the north side, and $3,613.31 on the south side.

All these foregoing departments were operated on a paying system; such was not the case with the street railway, as an examination of the following will show.

The total revenue for the month was $26,033.76, which amount is made up as follows: Passenger receipts, $25,101.93; special cars, $207.75; hauling freight cars, $123, and advertising, $315.26.

The expenditure amounted to $28,111.67, out of which there was $3,027.32 expended on maintenance, $10,854 on operation, $8,856.93 for power charges, and $5,372.54 for capital charges. The total car mileage for the month amounted to 86,342.33 miles.

The deficit came to $2,077.91.

TOUR OF BRITISH ENGINEERS.

A party of engineers and engineering students from the universities, polytechnics and great works throughout Great Britain have left England on a tour of the United States and Canada. Landing at Quebec, they will cross the continent to Vancouver. They will then make their way through Washington, Oregon, and California, will visit all the chief attractions of the Southwest and return east through Colorado and the middle west, ending the tour with visits to New York, Washington and Boston.

The great railways, bridges, tunnels, steel works and latest buildings will all receive attention from the engineers, while other experts will examine financial and banking arrangements.

PRACTICAL FORESTRY FOR WATERWORKS.*

Most of the land on the protective areas which you control may be classed as agricultural land, brush land, sprout land, woodland, marsh land, and newly made land.

I believe most of you do not favor agriculture on your lands, as the plowed land is apt to be badly washed in the spring of the year. The snow, and the surface layers of the soil, melt under the spring rains before the frost has left the lower layers of the soil. This brings an objectionable amount of sediment into your reservoirs—and this is especially true where the land is heavily manured, as it must be to carry on successful agriculture. Therefore, the only agriculture possible for most of you is the annual cutting of hay lands. As the hay lands run out, their only agricultural use is for pasture, and finally, as they gradually deteriorate, they are reduced to brush land.

All of your brush land and any pastures which are yielding poor feed and small returns can probably be put to more profitable use by planting them to white pine.

Probably, in the case of those of you who control the largest protective areas, a large proportion of your territory is sprout land. Often such land has been bought by your companies with the privilege of cutting the timber reserved to the owner. For this land there is no treatment practicable except to let it grow up with perhaps the addition of a few hundred white pine trees per acre scattered in the openings between the bunches of sprouts.

I understand that the best practice to-day for the protection of watersheds involves the drainage of all swamps so that where these are wooded they are converted into what I have termed woodland. Where there are open meadows, the draining practically puts them in the same class as newly made land. By this term I mean to designate the land which you have made by excavating peat and mud from the beds of your reservoirs and piling it on the adjacent low lands. All of this newly made land, if well drained, is suitable for planting with white pine.

Woodland that is found in the protective areas of the waterworks of New England cities and towns consists largely of sprout hardwoods often reinforced in the older stands, to some extent, by a natural understory of hemlock or of mountain laurel.

In many cases the prevailing popular impression that it is a good thing to burn over, every year, hardwood land, and even pine land, has been further strengthened in the minds of waterworks men in their effort to keep the hardwood leaves out of the reservoirs. The damage that burning over the woods every year causes is not readily apparent to men whose chief interest is not in the woods. They fail to notice that the quality of the woods as a timber-producing machine is lowered each year, and that the water runs off quicker, year by year, bringing a larger and larger amount of silt into the reservoirs. The proper solution of the leaf nuisance lies not in annually burning the leaves, but in cutting away some of the hardwood trees along the edge of the reservoirs and planting white pine, Douglas spruce, and hemlock to catch the leaves. The softwood trees do not make an objectionable amount of litter in the water and their dense evergreen foliage serves to keep the hardwood leaves from blowing into the reservoirs.

In managing your woodlands on forestry principles you have the advantage over all other forms of ownership in the fact that neither the taxes on the land nor a high interest rate are really chargeable against the forestry work. If the land were bare, and kept bare, the water companies would still have to pay taxes on it in order to protect the quality of the water. Such large stable public service concerns can borrow money at an interest rate that is far more favorable than that of any other forest owner except the State. You must also maintain patroleum to keep your watersheds from pollution These men can serve without additional expense as a fire patrol, to detect, report, and extinguish forest fires. You have men on your summer pay-roll whom you want to keep with you. By giving them a job of cutting cordwood, by the cord, you can help them without raising the cost of improving your woodland. Your holdings must be relatively near large cities. That means abundant labor, cheap transportation, and an unlimited market for your products. There is no owner better situated to practice forestry than the water companies and the municipally owned waterworks.

Hardwood land does not retain water so well as softwood land. The softwood trees, by shading the ground all winter, retain the snow better. Their foliage keeps the warm air under them from cooling as quickly or as much as it does in the hardwood land. The mat of fallen needles on the ground keeps the frost out of the soil. Their dense foliage keeps the wind and sun from drying off the winter's accumulation of snow at the top. When a rain or warm thaw comes, the snow melts off at the bottom and the water sinks into the soil gradually, to be slowly added to your water supply through springs instead of rushing down over the surface all at once in spring, at the very time when your reservoirs are already overtaxed by flood waters from agricultural lands farther upstream. Hardwood trees evaporate from their foliage far more water during the summer than a similar area of softwood trees.

Of all the softwoods, white pine is the most profitable to grow in this region. From the time that a plantation first reaches a commercially marketable size at from twenty to twenty-five years of age it does not cease to yield an annual increase in its money value over that of the year before of over eight per cent. until it is fifty years old.

For this reason it is desirable to plant white pine as much as possible wherever planting is advisable. It is also desirable to replace the hardwoods by pine as quickly as possible; all the more so, as the white pine is not subject to attack at all by the browntail moth and in pure stands it is not damaged by the gypsy moth.

It will pay you to market much of the smaller material as thinnings, and concentrate the growth of your hardwoods in the best specimens until they are ready to be made into saw timber. Then underplant the open growth of hardwood with white pine seedlings a couple of years before making the final cutting of the old hardwood. When the old hardwood is removed you have a pine plantation already started which only needs the filling of a few blanks where the small pines have been killed and a small amount of brush cutting in about three years, and six years later, to leave it in good condition to grow until it is thirty years old.

There is only one spacing of white pine trees that is commercially practicable and that is about six feet apart each way. If they are planted closer than that they soon become too crowded, and long before the material which must be removed in a thinning has any commercial value they become too spindly and stunted to grow at a profitable rate. The expense of close planting is also enormous. If white pine is planted at a greater distance apart than about six feet it grows limby and bushy and is subject to great damage by the pine weevil. Plantations set out six feet apart each way grow straight and with small knots at a

* A paper read by Ed. S. Bryant, Consulting Forester, Boston, Mass., before the Boston Society of Civil Engineers, and printed in the Journal of the Association of Engineering Societies for June, 1911.

maximum rate until they are about thirty years old, when they begin to be crowded. At that age, however, the trees which must be removed are large enough to make saleable cordwood.

To sum up, therefore, I would advise you—to keep out fire from your lands, to plant pine along the shores of your reservoirs and streams, to thin your older stands of hardwood and underplant them with pine before finally cutting them, and to plant up with pine all open areas that are not yielding a fair return. You can both make money by growing timber and at the same time improve your catchment areas.

PORTLAND REGRADE OPERATION.

Eastern cities may well look to some of their western sisters for progressive ideas in civic improvement.

It is well known that Seattle, Washington, has in recent years veritably remodeled itself. From a city of steep hills she has been changed to one of gentle grades. This great project was eminently successful, largely because of the use of high-grade modern electrical and mechanical hydraulic apparatus.

Portland, Oregon, two hundred miles to the south, noticed the miracles being worked in Seattle and is now following suit by hydraulically reducing an abrupt prominence within her limits, known as Goldsmith's Hill. Because of the satisfaction given by the motors used to operate the pumps which washed the hills of Seattle into the sea, these same motors were later taken to Portland, where they are now being used to drive the pumps in the regrading there. The same successful performance obtained in Seattle from the motors is being experienced in Portland.

Fig. 1.

Like all properly engineered projects, the Portland regrading operations have gone through without disappointments. Nothing has been left to chance; every detail of the work was fully considered before operations began, practically insuring the success of the undertaking. The pumping units, including pumps and motors, were selected because their fitness for the work had already been demonstrated at Seattle.

The composition of Goldsmith's Hill is especially gravelly. The streams, therefore, are directed by huge nozzles so as to undermine the lower part of the bank, and the weight of the material above brings down the sand and gravel from the working face. From here it is washed through the sluice way into Guild's Lake, as shown in Fig. 1.

The trestle supporting the sluice through which the debris is conducted to the lake also supports two 18-inch pipes carrying the water pumped from the same lake. Fig. 1 is a general view of the site, showing how far the work had progressed by April 27th, 1910. The trestle is shown extending through the old Lewis and Clark Exposition grounds to Guild's Lake, where the fill is being made.

Fig. 2.

Fig. 2 shows Goldsmith's Hill from the corner of Raleigh and Twenty-ninth Streets on March 16th, 1910, before operations on it began. By November 3rd following, work was well under way, as is shown by Fig. 1. It might be mentioned that in some places the height of the bank to be reduced was 140 feet.

The pump house, a temporary structure, of course, is located near the lower end of the trestle. Its foundations were laid in the bottom of the lake at low water before any filling had been done. Now, however, the pump house is in the middle of a filled tract of several acres.

The contractors, the Lewis-Wiley Company, are carrying on the work day and night with no interruption except for Sundays.

It is expected that by the spring of 1913 the so-called Goldsmith's Hill will be no more and that its site will be suitable for no less than 300 residences, while the operation will reclaim to the city several acres of land from Guild's Lake, half a mile away. The project is, therefore, serving a two-fold purpose.

The motors are of Westinghouse make and rated at 650 h.p., 690 r.p.m., 2,300 volts, 2 phase, 60 cycles. Each is direct connected to two Worthington five-stage turbine pumps. The pumping service is amplified by the addition of a booster unit consisting of a Worthington volute pump directly connected to a 900 h.p. Westinghouse induction motor.

The pumping plant is capable of supplying 500,000 gallons of water an hour at a pressure varying between 200 and 300 lbs. per square inch, according to the demand.

Electric energy is supplied by the Portland Railway Light & Power Company's plant.

A NEW USE FOR SEWAGE WASTE.

Distillation of dried sediment from sewer water has been found by Prof. Honig to yield gas, as with coal or peat, and Brunn, Austria, is about to try this novel method for obtaining a supply of illuminating gas for the town. The heating value is claimed to be even greater than that of coal gas.

THE DESIGN AND MANUFACTURE OF CONCRETE PILES.

In a paper presented at the eighth annual convention of the National Association of Cement Users, Mr. Robert A. Cummings stated that all concrete piles of the cast-and-driven type must be reinforced with longitudinal rods, on account of the method of handling them by a line from the pile-driver fastened at or near the butt. Consequently, the pile has to sustain its own dead weight by being raised, as well as shocks and impact against obstacles, before reaching its position in the leads of the pile-driving machine. For this reason the pile must act and be designed as a beam capable of supporting its own dead weight and resisting outside shocks. The ratio of the depth or thickness of the pile to the unsupported beam length determines the tensile and compressive stresses and deflection that result from such handling.

It has been observed that when handling a pile of this type it rarely fails from compression in the concrete, but cracks are usually discovered on the tension side. These cracks may be accounted for, Mr. Cummings said, by the slipping of the usual longitudinal rods used in the concrete while the pile is being hoisted. While such cracks are not sufficiently serious to condemn the pile, they may affect the permanency of the reinforcement. In order to overcome this defect the author recommends that all longitudinal rods should be anchored at the ends, those at the butt opposite each other being bent over into a loop and welded together, while those at the point should be all brought together and electrically welded into one piece. Twisted and deformed rods are advantageous for longitudinal reinforcing, as their allowable bond stress is higher than that of plain rods.

The uniform circumferential spacing of longitudinal rods is very important, in Mr. Cumming's opinion, because any side of the pile may be subjected to tensile stresses, and whichever side is in tension, there must be sufficient steel in position to take the strain. The circumferential spacing of the longitudinal rods may be secured by means of a special spacing device placed at intervals of about 5 ft. throughout the length of the pile. The hooping of the concrete adds greatly to its ability to resist axial loads. Therefore, longitudinal reinforcing should have a helical wrapping of wire throughout the length of the pile, the pitch of which must not exceed 3 in. This wire wrapping assists in taking care of diagonal stresses resulting from the handling of the piles

Practical experience has shown that the butt end of the pile which receives the impact of the hammer should be especially reinforced. This has been done by means of a special reinforcement consisting of a unit cage of flat bands, held 2 in. on centres by a spacing bar for a distance of 2 ft. In the plane of each band a flat wire spiral is fastened to the cage. The embedment of this unit cage in the butt of the pile forms a resilient cushion to receive the impact of the hammer. In no case, in the driving of thousands of piles with this cushion, has the butt itself been broken.

Methods of Driving.—Piles of the cast-and-driven type are handled and driven by means of an ordinary pile driver. The ability to vary the fall of the drop-hammer is of great utility in overcoming the variable resistances to be met with in the driving. It has been found advisable to increase the weight of the ordinary drop-hammer as compared with the weight of the pile in the ratio of 2 or 3 to 1, so that the weight of the drop-hammer for driving the concrete piles will vary from 7000 to 12000 pounds.

Steam hammers are not as efficient or desirable for driving concrete piles as are drop-hammers. This last has been shown in a test made between a No. 2 Vulcan steam-hammer and a heavy drop-hammer, under the same conditions, using the same kind and size of concrete pile. The heavy drop-hammer did not break a single pile, whereas the steam-hammer broke several below the cushion. Further, the steam-hammer did not drive as many piles in a given time as did the drop-hammer.

The following explanation is offered by the author, as it applies also to the driving of the heavy steel casings or cores used in the making of the cast-in-place type of pile. He states that the limited fall (3 ft.) and light ram (3000 lb.) of the steam hammer, while delivering twice as many blows per minute as the drop-hammer, loses a large part of its energy in overcoming the proportionately greater inertia of the pile, steel casing or core. He states that an analytical treatment by Mr. Barton H. Coffer, M.E., of New York, confirms and justifies the practice of using hammers as heavy as 12,000 lb. for driving concrete piles, and, in his opinion, if penetration is to be the gauge for measuring the supporting power of a pile, the ratio of the weight of the hammer to the weight of the pile or core that is driven must be taken into consideration.

Manufacture.—The procedure in constructing cast-and-driven piles commences with the preparation of the molding bed. This, of course, will vary with the site, but it is desirable to select a flat and convenient location near the place of driving. It is very important that the bed shall be stable, so that the settlement due to he weight of the piles may be avoided. Where the ground is soft and yielding 2 × 4-in. pine stakes 3 ft. long, pointed at the ends, are driven to a solid bearing. These stakes are located at intervals of about 4 ft. in each direction and the tops cut to a uniform level. Then 4 × 4-in. pine sills are toe-nailed to the top of the stakes in longitudinal rows about 4 ft. on centres. Upon these sills a 2-in. solid wooden floor is placed, which forms the moulding bed. It is desirable that this bed shall be uniformly level to receive the forms for the piles.

The forms are made of two pieces of 2 × 8-in. dressed pine battened together and placed on edge to form the sides of the pile. The bevels or angles for tapered or octagonal piles are made by placing loose pieces of bevelled wooden strips at each end of the form. The steel reinforcement is delivered on the work in factory-made-units, so that it can be placed in the forms at once. When a reinforcing unit is suspended and centred in position, concrete of a wet consistency is depositeed and carefully puddled. As soon as the concrete of a pile has solidified, the forms are stripped and used for making other piles. The number of forms required will vary with the quantity of piles to be made and the prospective salvage in the lumber.

The curing of concrete in the normal manner delays the driving of the piles for a period of not less than three weeks, although a greater length of time is desirable, especially in cold and damp weather. Therefore, unless a stock of cured piles is always on hand it frequently occurs that this type of pile cannot be used at all, and resort is had to the use of the cast-in-place type. This practice is open to question on account of the inability of plain concrete to resist even moderate tension. In fact, it is almost axiomatic that all concrete piles must be reinforced. Every concrete pile is subjected to strains that induce very serious tensile stresses in the pile. Such stresses may result from superimposed loads or a lateral strain from the soil. Further, the making and storing of concrete piles for use at any time necessitates a large financial investment.

In order to avoid the above-mentioned objections, the writer has adopted the method of steam curing cast-and-driven piles. This enables such piles to be made and driven within 3 or 4 days and places the speed of driving on the same basis as that of the cast-in-place type.

The means used for steam curing will vary with circumstances, location of the work, speed required for delivery of the piles, the number needed, etc. During the past winter the writer has used concrete piles made and driven within 10 days, and as a result of this experience confidently recommends that such piles can be made, cured and driven immediately.

On this work the piles were allowed to set in a normal manner for 5 or 6 days, and were then gently hoisted from the moulding bed by a derrick, using an equalizing spreader and bridle, the chains of the bridle being fastened so that the pile was balanced. They were then placed in stacks of 25 or 30 and separated from one another by wooden blocks, particular attention being given to securing a solid bearing for each pile.

A light wooden shed, practically steam tight, was built entirely around the stack of piles. The steam was conducted direct from a boiler through a 1-in. pipe to three branch openings inside the shed. The steam pipe valve was opened and the piles were exposed to live steam for two or three days, when they were found to be ready for driving. On being first exposed to steam, the moisture condensed on the surface of the piles and remained until absorbed by the concrete when the temperature of the steam was reached. This steam treatment should be distinguished from heat applied indirectly or baking, in accelerating the set and hardening the concrete. The writer sees no reason why boiling water should not be used for the same purpose if the conditions are favorable for adopting this method. Precautions should be exercised in making sure that the concrete has solidified and that it has received its initial set before its exposure to steam treatment.

Attention is directed by the author to the publication of the tests of the Structural Materials Laboratory of the United States Geological Survey, an abstract of which is published in the Engineering Record of March 16, 1912, wherein it is conclusively shown "that a compressive strength considerably (in some cases over 100 per cent.) in excess of that obtained normally after aging for six months may be obtained in two days by using steam pressure for curing cement mortar."

BUILDING AND MUNICIPAL WORK IN WELLAND, ONTARIO.

Building Permits, 1912.

	Number of permits.	Total value of permits issued.
January	6	$ 7,735.00
February	8	8,615.00
March	16	34,870.00
Total for the three months	30	$51,220.00

The building conditions and general trade prospects show signs of great activity for this year. During this month the council let contract to pave two miles of the main streets, work to commence on the first of May. The street railway are making preparations to extend their lines on West Main, North Main, East Main and South Main immediately the weather is suitable. These extensions will exceed four miles of new track.

WATER METERS FOR REDUCING WATER WASTE.*

By F. H. Ruthrauff.

As to the effect of installing water meters at Decatur, Ill., I simply state the facts as I have found them during my 22 years' experience in the Water Department in Decatur.

The first five years I served as water inspector and worked faithfully in an effort to stop the waste, which was enormous, due to carelessness on the part of the consumers and to defective plumbing. In 1896 I employed four assistants, with the avowed intention of stopping all leaks. I again went over the city in 1898 with four assistants. I had citizens by the score brought into our police courts and prosecuted them for wilful waste.

After about five years' labor along this line I began to get discouraged. I found that a great many of our citizens believed we had an inexhaustible supply of water, and could not see any good reason why I should be so extremely anxious about this matter.

Consequently, I began to look for some other plan, believing that if this waste were allowed to continue, taking into consideration our rapid increase in population, we would in a short time find our supply short, or be at an unnecessary expense for additional machinery, mains and enlargement of our reservoir and filter plant in handling water merely to be wasted.

In 1901, I recommended to the council the adoption of the water meter on all services, but no action was taken. Again in 1902 I urgently recommended the same plan, and was then ordered to have all livery stables, hotels and laundries install meters. In the spring of 1908, the council ordered all services metered by July 1, 1908. The results are as follows:

April 31, 1904, the end of our fiscal year, we had 2,112 services recorded; five consumers for each service gave us 10,560 consumers; 987 of these services were metered. (There was no record kept of water pumped prior to 1903.) However, with 10,560 consumers, 4,935 of them metered, there was pumped for this year 1,023,180 gal., which gave us a per capita consumption of 266 gal.

For the fiscal year ending April 30, 1911, we had 4,939 services in use; 4,933 of them being metered. (The six services unmetered are large consumers.) This gives us, on a basis of five consumers to the service, 24,695 consumers. There was pumped during this year 1,124,212,338 gal., which is 100,749,158 gal. in excess of that for 1904.

With an addition of 14,135 consumers, we now have a per capita consumption of less than 125 gal. (as against 266 gal. in 1904). It is my belief that if the six consumers previously mentioned were metered, this consumption would be less than 100 gal.

We have accomplished by the enforced use of meters at least a 30 per cent. reduction in the average householder's bill. Under the old flat-rate system a seven-room modern house would cost him $17 per year, and under our present system the yearly bill should not exceed $12. We have also cut the per capita consumption from 265 gal. to 125 gal., saving an unnecessary pumpage of 1,270,928,175 gal. each year.

* Abstract of a paper read at the annual meeting of the Illinois Water Supply Association, March 5-6.

In describing the Dionic Water Tester in last week's issue of The Canadian Engineer we omitted to mention the fact that the agents in Canada for this instrument are Messrs. Vandeleur & Nichols, Dineen Building, Toronto.

ENGINEERS' LIBRARY

Any book reviewed in these columns may be obtained through the Book Department of The Canadian Engineer.

BOOK REVIEWS.

The American Transportation Question. By Samuel O. Dunn, editor of the Railway Age Gazette. Published by D. Appleton & Co., New York. Cloth; size, 5 x 7½; 209 pages. Price, $1.50 net.

This volume is a compilation of a number of recent addresses by the author in his course on Transportation at Northwestern University, and includes additional chapters on the regulation of railways and inland waterways in their relation to rail transportation. The first two chapters cover the fundamental principles of rate making. Railway valuation and profits occupy two chapters, and embody a sane and sound exposition of this phase. Throughout the volume the three important factors of the transportation problem, namely, rates, service and financial return, are not considered as separate and unrelated elements, but as closely inter-related problems. One would gather from the volume that the author thinks it highly desirable that the Interstate Commerce Commission should confine their activities to rate regulation.

Applied Methods of Scientific Management. By Frederick A. Parkhurst. Published by John Wiley & Sons, New York; Canadian agents, Renouf Publishing Co., Montreal. First edition. Cloth; 6 x 9. 326 pages, including index. Price, $2.00.

The main portion of this work appeared in a series of articles in Industrial Engineering during the year 1911. An appendix contains much new matter which was not included in the original. Many instructions and forms, which show substantially the medium employed to incorporate the principles of the science of management, into an efficient organization suitable for plant under the specific conditions illustrated, are given. The author states that he believes in adapting all details to meet each existing condition as found, and that an existing plant should be developed to its highest possible efficiency before making large outlays for extensive alterations or additions. This volume is a decided addition to the already extensive list of books dealing with scientific management, for theories and generalities have been avoided and the subject treated from a practical point of view, intensified by the many years of experience of the author along these lines.

Tests of Columns. An Investigation of the Value of Concrete as Reinforcement for Structural Steel Columns, by Arthur N. Talbot and Arthur R. Lord, has just been issued as Bulletin No. 56 of the Engineering Experiment Station of the University of Illinois. Price 25c.

The bulletin gives an account of the investigation of the strength of a type of column which has been used recently in the construction of reinforced concrete buildings. Structural steel angles are tied together by bent plates, making a form known as the Gray column, and this steel structure is itself filled with concrete and covered with a shell of concrete for fireproofing purposes. Such a column requires less space than the ordinary reinforced concrete column. Whether in such a column the steel and the concrete act together to give a strong stiff column has been a matter of some doubt. In the investigation described, tests were made on unconcreted steel columns of various lengths to determine the strength of the steel columns and the effect of length upon strength. Tests were then made on similar columns filled with concrete. This enabled the action of the steel and of the concrete to be compared. The breaking loads were determined and the shortening of the concrete and of the steel was carefully measured. Tests were also made upon columns having a fireproofing shell and upon columns reinforced with spiral hooping. It was found that the column strength is approximately equal to the ultimate strength of the steel column of the same length plus the strength of a short concrete column of the same quality of concrete. For loads approaching the ultimate, the shell of fireproofing concrete clung to the column without spalling. The columns tested possessed the qualities of a good structural member and seem adapted to more general use in building construction. Copies of Bulletin No. 56 may be obtained from the European sales agents, Chapman & Hall, Ltd., 11 Henrietta Street, Covent Garden, London, W.C., England.

Starting Currents of Transformers, with special reference to transformers with silicon steel cores, by Trygve D. Yensen, has just been issued as Bulletin No. 55 of the Engineering Experiment Station of the University of Illinois. Price, 25c.

This bulletin gives the results of tests upon five commercial transformers, showing the rush of current upon closing the primary switch, at various points of the impressed e.m.f. wave, and with a residual magnetism of various magnitudes, with the secondary open-circuited. The phenomenon is illustrated by means of oscillograms. Three of the transformers tested are of recent manufacture, with silicon steel cores, and the other two are old types. The test shows that the starting current for the silicon steel cores may rise to more than seven times the full load current, while for the old types the maximum rise is not above four times the full load current. The complete theory is given for calculating the starting currents, also for calculating a resistance or aircore inductance for limiting the starting current to safe values. In the appendix is recorded a series of tests on the permanence of the residual magnetism of transformers, and it is shown that under ordinary conditions the residual magnetism does not decrease with time, while the decrease due to severe shocks is very small. Copies of this bulletin may be obtained from the European sales agents, Chapman & Hall, Ltd., 11 Henrietta Street, Covent Garden, London, W.C., England.

Constructing Concrete Porches. By A. A. Houghton. Published by the Norman W. Henley Publishing Company, New York. Paper; 5 x 7; 60 pages. Price, 50c.

This book forms No. 9 of the Concrete Worker's reference books, and is explanatory of the construction of monolithic concrete and concrete block porches together with the moulding of columns, balusters, lattice and railings, as well as plain and reinforced types of porch floors. Many details of moulds and ideas that are not covered by patents, such as may be easily and cheaply constructed, are given.

Practical Chemistry for Engineering Students. By A. J. Hale; published by Messrs. Longmans, Green & Co., London. Canadian agents, Renouf Publishing Company, Montreal. Size, 5¼ x 7¾; 192 pages, including index, many tables and figures. Price 90c.

This treatise is intended for the use of students in the various branches of engineering. The program of practical exercises makes no claim to have introduced any fundamentally new principle. Its distinctive feature is the teaching of the subject with a bias towards the use of materials familiar in constructive industry. This is entirely proper and will be much more successful in arousing the interest and fixing the attention of the students. This manual is intended to give a little broader outlook on chemistry for the engineer than the mere dexterity in making analyses.

Precise Calculations of Pipe Drain and Sewer Dimensions. By. C. E. Housden. Published by Messrs. Longmans, Green & Co., London. Canadian agents, Renouf Publishing Company, Montreal. Size, 5 x 7¼; 53 pages. Price, 75c.

This little volume is called the "Precise and Therefore Economic Calculation of Pipe Drain and Sewer Dimensions for use in Water Supply, Drainage, etc.," and is a collection of tables based on the author's experience in this subject. Some of the tables have been framed and are applied on the same principles as the author's "Practical Hydraulic Tables and Diagrams," to which they are a self-contained, independent supplement. The tables are of special use in the precise and economic determination of drain and sewer dimensions, the calculation of which is by no means a simple matter, when, as is usually the case, only the required discharge and the available slope in the water surface are known. Numerous working examples are given and the work concludes with a collection of useful hydraulic tables. The simplicity of the formulae used, with their accuracy, will be a strong factor in recommending this book to engineers.

Concrete Bridges, Culverts and Sewers. By A. A. Houghton. Published by the Norman W. Henley Publishing Co., New York. Paper; 5 x 7; 58 pages. Price, 50c.

This is No. 8 of the series of Concrete Worker's Reference books, and illustrates and explains the various types of solid and reinforced arches, slab and girder concrete bridges, with notes on construction; also the moulding of concrete culverts, drains, and sewers, and forms for their construction. This little book, with the preceding one, is intended for the small contractor or builder.

Elementary Principles of Reinforced Concrete Construction. By Ewart S. Andrews. Published by Scott, Greenwood & Sons, London. Size, 4¾ x 7½; 196 pages; 57 illustrations; numerous tables. Price, $1.00.

This volume forms No. 1 of the Broadway series of Engineering Handbooks, and is intended to furnish an inexpensive treatise on reinforced concrete. It is written from an elementary standpoint in an explanatory method, without the use of advanced mathematics, and is at the same time in accordance with modern theory. The theoretical treatment is illustrated by numerous examples which enable the reader to follow the reasoning easily. The notation of the British Concrete Institute is used throughout.

PUBLICATIONS RECEIVED.

Report of the Ohio State Board of Health, 1910. Being the 25th annual report. C. O. Probst, secretary, Columbus, Ohio.

Collection and Disposal of City Waste in Ohio. Being a supplement to the 25th annual report of the State Board of Health of Ohio, and including a report of a study of the collection and disposal of city wastes in Ohio.

Statistics of Railways in the United States. 23rd annual report of the Interstate Commerce Commission, for the year ending June 30th, 1910. Prepared by the Division of Statistics, Washington.

25th Annual Report of the Interstate Commerce Commission. Dated December 20th, 1911.

Department of Public Works, Saskatchewan. The annual report of the Department of Public Works of the Province of Saskatchewan, for the year ending February 28th, 1911.

James Bay Surveys. A report on the James Bay surveys, exploration Cochrane to James Bay, June 9th to Sept. 12th, 1911, by Sydney C. Ells, for the Temiskaming and Northern Ontario Railway Commission.

The Smoke Problem at Boiler Plants. A preliminary report by D. T. Randall, for the Department of the Interior, Bureau of Mines, U.S. A reprint of the United States Geological Survey, Bulletin 334. Revised by S. B. Flagg.

Highway Bridges and Culverts. By Chas H. Hoit and Wm. H. Burr. Bulletin No. 43, of the Office of Public Roads, U.S. Department of Agriculture. Being a revision of Office of Public Roads, Bulletin No. 39.

The Principles of Specification and Agreement Writing. By C. R. Young, being a reprint of a series of articles in The Canadian Engineer. Copies may be obtained from The Canadian Engineer, Toronto. Price 25c.

Signal Installation. Bulletin No. 127, of the General Railway Signal Company, Rochester, N.Y., describing the signal installation on the Chicago and Northwestern Railway terminal, by J. A. Peabody.

CATALOGUES RECEIVED.

Lead Wool. The lead wool method of jointing, a pamphlet by The Lead Wool Company, Ltd., Snodland, Kent.

The Prescot Welder. A pamphlet describing electrical spot and seam welding, issued by the British Insulated and Helsby Cables, Ltd., Prescot, Lancashire.

Sewerage, Water and Sewage Disposal. Pamphlet issued by The Adams Hydraulics, Limited, York and London. Canadian agents, Francis Hankin & Company, 231 Coristine Building, Montreal.

Block System. A pamphlet describing the A. P. Block system for single track steam railroad, by F. L. Dodgson. Issued by the General Railway Signal Company, Rochester, N.Y., being their bulletin No. 128.

Tarvia. A pamphlet illustrating different installations of tarvia pavement, issued by The Barrett Manufacturing Company, New York.

Steam Wagons. Pamphlet describing Foden steam wagons, manufactured by Fodens, Limited, Sandbach, England. Canadian agents, Jones & Glassco, 201 St. Nicholas Building, Montreal.

Products of the Damascus Bronze Company. A very handsome catalogue issued by the Damascus Bronze Co., of Pittsburg, describing the uses of their product.

Hayward Buckets. Catalogue No. 39, of the Hayward Company, New York.

Gasolene Tractors. The International Harvester Co., of Canada, forward catalogue illustrating their Titan kerosene-gasolene tractors.

Correspondence and Discussion Invited

THE CARBONIZATION OF COAL.*

Professor V. B. Lewes.

The whole end and aim of carbonization is to obtain as much as possible of the energy stored in coal in the condition most applicable to uses for which it is to be employed, and as these vary over a wide range, practical experience has led to the destructive distillation of coal being carried out mostly under two distinct sets of conditions—the first aiming at obtaining the maximum result from the gaseous products, the second at obtaining the best possible coke, whilst in a third, applied chiefly to shales, it is the liquid products to which most attention is paid. Of late years many attempts have been made to bring the two great industries of gas making and furnace coke production, both dealing with the destructive distillation of much the same class of coal, into line, but in most cases a lack of appreciation of the principles underlying the complex actions taking place during carbonization has proved an obstacle to any important advance, each industry viewing the problem from its own particular standpoint, and failing to grasp the wide differences which exist between substances made as the result of a process designed for their special production and the same bodies when made as a by-product. Furnace coke, as an example, must have certain characteristics to fit it for metallurgical work, which cannot be obtained in the ordinary processes of making good illuminating gas, whilst if the gas is to satisfy the parliamentary requirements laid down for most large town supplies, it is useless to expect to obtain the same volume of it from a coke oven that one would from a gas retort, so that whilst the gas manager hankers after the economies incidental to carbonization in bulk, he is constrained to work with much smaller charges in order to obtain the necessary quality and quantity of gas, and although he uses temperatures quite as high as the coke-oven manager, he misses the factors that are necessary for a good furnace coke.

In regard to the composition of coal, twenty years ago I came to the conclusion that the most satisfactory view to take of the composition of coal was that it consisted of an agglomerate of the solid degradation products of vegetable decay, together with such of the original bodies as had resisted to a greater extent the actions to which it had been subjected, and all the experience of wood, peat and coal carbonization which I have had since confirms me in the opinion that this is in the main correct. The evidence seems to point to the presence in all bituminous forms of coal of degradation products of the original vegetation of a humus or ulmic character, and which is probably the portion carrying the nitrogen.

It has been shown by Muck and other observers that it is not always the coal containing the largest amount of volatile matter that evolves gas most rapidly, or is the richest in hydrocarbons, and this naturally follows from the fact that those coals which have the highest oxygen percentage are mostly those giving high volatile matter, and as these are rich in the humus bodies which yield most of the diluting gas and but little tar or rich hydrocarbon gases, they cannot give the high result of a coal in which the oxygen content is about 10 per cent., or rather lower, and which contains a large percentage of resin bodies. Observers have differed as to the nature of the binding material in coke, some holding that it was the residuum of the semi-fused constituents of coal, whilst others, chief amongst whom was Wedding, consider that it is carbon shed off by the decomposition of heavy hydrocarbon vapors, which is undoubtedly the cause of the carbon hairs found in coking. My own opinion is that the cementing material is due to liquid products, the most volatile of which go off as vapors, leaving pitch, which carbonizes and binds the mass into coke, and in considering the actions taking place during carbonization ample proof of this will be adduced. It is clear that the binding material is formed below 450 deg. C., as if we take a good coking coal and carbonize it at 450 deg. C. we obtain coke which, although not strong, is perfectly luted together; but if we now powder this low-temperature coke and again carbonize it, a large yield of poor gas is evolved, but no coking of the residue takes place. There is no doubt in my mind that it is the resin bodies and their derivatives, the hydrocarbons in the coal, that form the tar, which yields the pitch which lutes the coke, and also that the resin bodies play a very important, if not the chief, part in the weathering of coal.

Experience shows that the weathering of coal is a phenomenon which is dependent upon the absorption of oxygen from the air, and this weathering is fatal to the coking of some coals, the slacks of which are so susceptible to oxidation that a few days' or weeks' exposure destroys their coking power. Now, the avidity of oxygen for some vegetable resins is well known, the rapidity with which copal will absorb oxygen from the air may be taken as an example; common resin has itself been formed by the oxidation of turpentine, and countless ages under conditions tending to reduction may well have whetted anew the resinic appetite for oxygen. In any case the resin bodies are the compounds present in the coal most likely to possess this property, and it is the chemical actions so caused which lead to slow combustion and, when accelerated by any rise in the surrounding temperature, is capable of generating sufficient heat to lead to the spontaneous ignition of masses of broken coal large enough to prevent the escape of the heat as it is developed. Coal exhibits to a lesser extent the same property of absorbing gases that charcoal does, and the least absorbent will take up one and a quarter times its own volume of oxygen, whilst many bituminous coals will absorb more than three times their volume of gas. This action, at first largely physical, presents the oxygen in a probably active condition to the resin bodies in the coal, and leads to the rapid "weathering" and destruction of the coking properties found in some kinds of coal.

The lines of research intended to throw light on the composition of coal have been either to distil the coal at various temperatures and to draw inferences from the products of the nature of the original substance, or, to directly attack the coal by means of solvents. The early attempts to isolate definite bodies from coal by solvents were none of them very successful, but Bedson made a great advance in this line of research when in 1899 he pointed out the solvent power of pyridine bases, extracted from coal tar, which dissolved 16 to 18 per cent. of a Durham coal, but had no action on anthracite. In 1901 Baker experimented upon the action of this solvent on several coals, and found that from Durham coal (Hutton seam) 20.4 per cent. could be extracted with pyridine, and that after extraction the residue had lost the coking properties of the original coal.

* Abstract of a paper read before the Royal Society of Arts.

This observation was confirmed by Anderson and Henderson in 1902, who tried the action of pyridine in a research upon the coals of Bengal and Japan, and also upon some Scotch coals, the coking powers of which were known. They found that the extraction of a strongly coking coal by pyridine weakened the coke, whilst with inferior coking coal the property is entirely destroyed. In 1908 Professor Bedson read a paper before the society of Chemical Industry, in which he gave the results of experiments upon six coals obtained from the Redhaugh gasworks, which seem to show that with some gas coals an amount equal to practically the whole of the volatile matter capable of being driven off by heat can be extracted by pyridine.

	Volatile matter. Per cent.	Pyridine extract. Per cent.	Gasworks yield. Per ton.	Candle power.
I.	34.10	32.36	11,381	16.63
II.	33.28	33.39	11,392	16.30
III.	31.91	24.58	11,646	16.40
IV.	31.7	22.81	11,108	16.00
V.	33.66	29.77	10,913	16.39
VI.	30.87	22.63	10,730	16.76

Now, from these figures the inference is that in a coal like II., everything beside the fixed carbon and ash has been dissolved—that is, humus, resin and hydrocarbon bodies—and it would have been of the greatest interest had Professor Bedson made an analysis of the residue, or at any rate had shown that no volatile matter was left in it.

It appears probable that in a feebly coking coal the coking property is due almost entirely to the soluble form of resin constituent, and can therefore be entirely removed by extracting the coal with pyridine; whilst on the other nand, in strongly coking coals the property is due partly to soluble resin bodies, but to an even greater extent to other hydrocarbons of resinic origin, which resist the solvent action of the pyridine, so that the coking property is weakened but not destroyed by extraction. A similar conclusion was arrived at by Anderson and Roberts in 1898, from an entirely different point of view. Dr. Percy, more than fifty years ago pointed out the fatal effect of weathering upon certain coals and slacks, and showed that if a fairly good coking coal was kept at a temperature of 300 deg. C. for a few hours, and is afterwards heated to redness, it does not swell and coke. Anderson and Roberts, in trying this with various Scotch coals, found that, although it was true for a coking coal of medium power, a really strongly coking coal had the power only weakened, and they found also that the same phenomenon could be brought about by treating the two coals with sodium hydrate. The conclusion is that although resinous bodies which can be saponified or oxidized contribute largely to the coking, yet there are also present non-saponifiable bodies which in breaking up under the influence of heat, yield enough luting to form coke. I think the action of pyridine shows that these non-saponifiable bodies consist of substances very probably akin to those found in shale and some cannels. Burgess and Wheeler, in a paper read before the Chemical Society this year, took a Silkstone coal containing 33.4 per cent. of volatile matter, and succeeded in extracting 30 per cent. by means of pyridine, leaving a cokelike residue, which on distillation at 900 deg. C. yielded hydrogen and oxides of carbon—they would have found methane as well if they had looked for it—whilst the extract on destructive distillation yielded a mixture of the paraffin hydrocarbons and hydrogen. At first sight this looks as if pyridine was a solvent which could be used to separate the humus and resin constituents, but Messrs. Burgess and Wheeler are careful to point out that they hesitate to identify absolutely the paraffin-yielding constituents of coal with that portion extracted by pyridine, and they are wise in being cautious, as there are several anomalies to be cleared up. I have found several times that after extraction the residue contains as much volatile matter as the original coal, and sometimes more, in spite of repeated washings with acid, drying in vacuo and other forms of treatment intended to eliminate all pyridine, whilst the composition of the extract also shows anamalous results, and after the most careful measures have been taken to free it from pyridine, it will sometimes still contain more nitrogen than did the original coal.

Coal always contains a certain proportion of water which appears to be partly mechanically held and partly in some form of combination. In this it resembles wood, which after long air-drying still retains an average of 20 per cent. of moisture, which, if got rid of at an elevated temperature is reabsorbed from the air. The mechanically-held portion in coal is generally known as "pit-water," and represents ordinary wetting, which can be got rid of by air-drying, but the so-called "hygroscopic water" is driven out only by drying at 103 deg. C., and as this heating for some hours causes oxidation of the resin bodies, it also tends to destroy the coking properties of the sample. This result has led some observers to conclude that hygroscopic water is essential to coking, which is manifestly incorrect, as the tertiary coals, which contain the largest quantity of hygroscopic moisture, will not coke owing to the proportion of humus derivatives being largely in excess of the resin bodies.

Many classifications of coal have been suggested, some based on their chemical, some on their physical, and others on their coking properties, and of the latter the most generally adopted is that suggested by Gruner, in which he tabulates bituminous coals into five classes; although Schondorff, Muck and others have shown that it is not applicable to all kinds of coal, still this criticism applies to all classifications that have been proposed.

		Carbon. Per cent.	Hydrogen. Per cent.	Oxygen. Per cent.
1. Dry Coal	Long flame and non-coking	75—80	4.5—5.5	15.0—18.5
2. Fat gas coal	Coke porous and brittle	80—85	5.0—5.8	10.0—13.2
3. Semi-fat or furnace coal	Good coke but porous	84—89	5.0—5.5	5.5—10.0
4. Coking coal	Best coke	89—91	4.5—5.5	4.5— 5.5
5. Lean Coals and anthracite	Non-coking	90—93	3.0—4.5	3.0— 4.5

This arrangement shows not only the coking properties, but also the changes in composition which the coal undergoes—the concentration of carbon and reduction in highly oxidized bodies. In the first class we have the dry coals, yielding large volumes of gas and liquid products on distillation, and these coals—as might be expected—most resemble the lignites, and share with them the property of non-coking or binding together of the residue on carbonization. This is due to the fact that the humus-like bodies are still present in much larger quantities than the resinic compounds and hydrocarbons, and as on disillation they leave no binding material in the residue the resinic bodies cannot supply enough to give more than a friable mass. In the second class of coals altered conditions of temperature, pressure and time have led to further decompositions of the humus bodies, and the resinic constituents and hydrocarbons having increased in ratio by concentration, a point is reached at which coking takes place, although not of a satisfactory character. In the third class the action still has continued with further concentration of the resin bodies, hydrocarbons and residuum, with the result that the former bodies are so increased in comparison to the humus and residuum that a good coke results. In the fourth class the proportion of resin and hydrocarbon bodies has reached the right ratio as compared with the humus and residuum, and the best coking coal is obtained. Bituminous coals of the kind classified by Gruner may, therefore, be looked upon as an agglomerate of humus and the degredation products of these bodies down to carbon, luted and protected by resin

bodies and their derivatives; steam coal and anthracite as the degradation products of humus which has nearly completed its decomposition owing to the small quantity of resin bodies in the original vegetation; and cannel coal as consisting mainly of resin bodies, which having been in a semi-fluid condition, have mingled with the earthly matter in contact with it, so obtaining the high ash found in many kinds. In putting forward this theory as to the composition of coal, I wish it distinctly understood that by the terms "humus" or "resin" bodies, I do not imply any one definite compound, but merely bodies of this character, the humus bodies all containing a percentage of hydrogen from 5 per cent. downwards, whilst the resin bodies all contain a percentage of hydrogen above 5 per cent. If it is once admitted that coal is a conglomerate of the kind I have indicated, it explains all those obscure points which no other theory touches—such as why with two coals of almost identical composition and of high oxygen content, one should be a coking and the other a non-coking coal; the reason being that in the one the high oxygen content is due to humus bodies, which will not coke owing to the low pitch-forming nature of the hydrocarbons, whilst with the other the oxygen is due to resin bodies, which are essential to good coking.

All the evidence that can be adduced shown that when a coal undergoes destructive distillation all the hydrocarbons, together with the resin and humus constituents, undergo decomposition at a temperature certainly well below 700 deg. C., and that as the liquid and gaseous products distil out they leave behind their less volatile residues as a pitch, which lutes together the carbon particles and forms soft coke, whilst as the temperature rises above 750 deg. C., he pitch residue decomposes, yielding hydrogen, carbon monoxide and methane as gases. The carbon residue from the pitch binds the residual mass into coke, and it is this residual pitch that Burgess and Wheeler have mistaken for a primary constituent of coal. It is clear, however, that (putting detail on one side until our knowledge has been broadened by experience) the answer to the question as to what is the composition of coal—whether the answer is derived from a consideration of the actions taking place during its formation and of the substances from which it was derived, or is obtained from analytical data, as was done by Anderson and Roberts, or from the products of distillation as has been attempted by Burgess and Wheeler—must be that coal is a conglomerate of humus and its degradation products with the resinic bodies and their derivatives.

THE EFFECT OF VARIOUS SUBSTANCES ON THE RATE OF CORROSION OF IRON BY SULPHURIC ACID.*

By Oliver P. Watts.

In Vol. 8 of the transactions of this society, C. F. Burgess called attention to the remarkable reduction in the corrosion of iron by sulphuric acid, brought about by the addition of a small amount of arsenious oxide to the acid. Later he explained the protective action as follows: "The explanation which has been offered for this phenomenon is that the iron receives, by contact with the solution, an extremely thin coat of arsenic which resists the action of the acid and protects the underlying metals." He also gave experimental proof that the iron was coated with arsenic.

It has long been known that by dipping clean iron into solutions of suitable composition and concentration thin coatings of gold, silver, platinum, copper, and several other metals may be deposited on the iron. It is generally conceded that such coatings are not sufficiently continuous and impervious to protect the underlying metal from corrosion, even though the metal forming the coating may itself be thoroughly resistant to the corrosive agent. Instead of being a protection, such coatings are usually considered to be stimulators of corrosion.

Since all metals which thus deposit upon iron when it is immersed in a solution of the metallic salt are electro-negative to iron, a short-circuited voltaic cell is formed. of which the iron is anode and the metal deposit is the cathode. So long as any iron remains in contact with the electrolyte, it would seem, except for certain considerations which will be presented later, that the corrosion of the iron ought to be stimulated by this condition, and that the only way in which such a coating could afford good protection would be by covering the iron completely, so that no electrolyte could come in contact with it.

Speaking of the effect of other metals in contact with iron, W. H. Walker says: "Tin is a metal which, like copper, accelerates the corrosion of iron by aiding in the oxidation of the hydrogen set free by the reaction." M. P. Wood calls attention to the injurious action of metals, "The use of anti-corrosive, or anti-fouling paints, containing salts of any metal, is attended with the greatest danger to the coated (iron or steel) structure. These pigments are extremely sensitive to the presence of saline elements in moisture, their action being to rapidly dissolve portions of the iron, and to deposit the metal which they contain upon the surface of the plates, and these deposits, exciting energetic galvanic action, cause corrosion and pitting to go on with alarming rapidity. Both mercury and copper salts are offenders in this way."

It appears then, that arsenic is unique among the metals which precipitate themselves upon iron from solution, for arsenic protects iron almost completely from powerful corrosive agents, while the other metals are generally considered to aggravate corrosion and rusting. The protective action of arsenic cannot be due to any superior power of resisting attack by sulphuric acid, for silver, platinum and gold are even more resistant, and yet accelerate the corrosion of iron. It is evident that these other metals do not form continuous and impervious coatings over the iron, else they would protect it. It is difficult, perhaps even impossible, even with the aid of the electric current, to deposit from solution a thin coating of one metal upon another, so perfectly as to protect the underlying metal from corrosion by an acid ordinarily capable of attacking it. It is almost incredible that a thin yet perfect and non-porous metallic coating should be deposited by a process which depends for its operation upon the dissolving of the underlying metal. The protective action of coatings of copper, silver, etc., thus deposited on iron is about as effective as would be expected from a knowledge of their method of formation. They are continually being undermined by the corroding of the iron anode at points not yet covered, until the copper or silver becomes detached, to have its place taken by a new coating, and so on, as long as any of the salt of the depositing metal remains in the solution. If the coated metal be removed to an acid, the corrosive action is similar, except that the renewal of the coating can take place only at a rate not greater than that at which the detached metal redissolves in the acid.

If the coating of arsenic is so porous and imperfect as the action of acids shows the coating of copper, for example, to be, how can the arsenic protect the iron any better than copper does? It occurred to the writer that the ex-

* Abstracted from a paper read before the Am. Electro-Chem. Soc., April 20th, 1912.

planation lay in a high overvoltage or excess potential of hydrogen on arsenic, and the experiments which follow were undertaken to discover whether this is the explanation of the singular and mysterious protective action of arsenic. If the above explanation is correct, among the metals which deposit upon iron when it is immersed in a solution of their salts those having overvoltage for hydrogen should protect iron, and those of very low overvoltage should aggregate corrosion.

If an electrode of platinum coated with platinum-black be immersed in normal sulphuric acid the electrode will be electro-negative to the solution by about 1.14 volts. If now a small but slowly increasing electromotive force be applied between this electrode and an insoluble anode it will be found that the platinized cathode becomes progressively electronegative with regard to the solution. When a certain difference of potential between the cathode and the solution is reached, bubbles of hydrogen begin to appear on the cathode. If a cathode of smooth platinum is used, hydrogen will not appear on this until it has become 0.09 volts more positive than the other cathode was when hydrogen first appeared on it. Similarily zinc must be 0.70 and mercury 0.78 volts more positive than the platinum-black before hydrogen appears upon them. This excess of potential required to cause a visible liberation of hydrogen upon a cathode of any particular metal, over the potential required for the liberation of hydrogen upon platinum coated with platinum-black, is known as the overvoltage of hydrogen upon that metal. In Table I. are given the single potentials in normal solutions of the sulphates of the metals, and the overvoltage of hydrogen as stated by different observers.

Table I.

		Overvoltage in normal sulphutic acid			in 5 per cent. KOH,
	Single Potential	Caspari[4]	Foerster[5]	Harkins[6]	Nutton and Law[7]
Mercury	—0.98	0.78	0.43	0.74	
Zinc	+0.524	0.70		0.71	0.70
Lead	—0.095	0.64	0.35	0.62	0.57
Tin	—0.085	0.53	0.43	0.55	0.61
Cadmium	+0.162	0.48	0.48		0.52
Arsenic	—0.550			0.39	
Bismuth	—0.490			0.38	
Iron	+0.093				0.15
Copper	—0.515	0.23	0.10	0.25	0.41
Cobalt	—0.019			0.22	
Nickel	—0.022	0.21	0.10	0.15	0.37
Silver	—0.947	0.15		0.13	
Platinum	—1.140	0.09	0.07	0.07	
Gold	—1.356	0.02	0.055		

On the theory that the protection of iron by a deposit of arsenic is due to the high overvoltage of hydrogen on the latter the action would be as follows: Iron dissolves and by so doing deposits arsenic upon the surface of the iron. Since the arsenic is deposited simultaneously with the dissolving of the iron, and only as a result of this dissolving, it is hardly possible that the iron should be perfectly covered by arsenic, but here and there holes will exist, allowing the iron to make contact with the electrolyte. Voltaic cells are thus formed. From the single potentials of iron and of arsenic, + 0.093 and —0.550, these cells should have an electromotive force of 0.64 volts, and the corrosion of the iron ought to be very vigorous. It is here that the overvoltage of hydrogen comes in play. The iron is anode and the arsenic cathode, and, just as in any other primary cell with sulphuric acid as electrolyte, hydrogen is deposited on the cathode. But when hydrogen is liberated on arsenic the potential of the latter is raised 0.39 volts higher than —0.277, the potential at which hydrogen is liberated on platinum-black. This would rise the potential of the arsenic to + 0.113 volts, or higher than the potential of the iron anode. This means that in our iron-arsenic cell there can be no visible evolution of hydrogen on the arsenic, for before this can occur the potential of the cathode has become equal to that of the anode, and corrosion of the iron ceases, in other words, this particular primary cell polarizes so badly that after a few seconds of action its electromotive force has fallen to zero.

If the above explanation is correct, protection should be afforded by those metals which plate out on iron by immersion, and whose overvoltage for hydrogen is great enough to raise their potentials to at least equal the single potential of iron. The potentials of the following metals are far enough below that of iron to expect that they will deposit on iron even in moderately strong sulphuric acid: antimony, arsenic, bismuth, gold, lead, mercury, platinum, silver and tin. Potential measurements made by students in the writer's laboratory indicate that chromium should be included in the list. Omitting lead, on account of the insolubility of its sulphate, mercury, tin, and arsenic show the highest overvoltage; compounds of these metals were therefore used in a preliminary experiment, by A. C. Shape.

From the experiments certain definite conclusions can be drawn and other generalizations now appear profitable, but may require revision or rejection in the light of future experiments.

The writer's hypothesis, that the protective action of arsenic is due to its high overvoltage, has been in a general way confirmed. Other metals of high overvoltage have had a protective influence, while all metals of low overvoltage which deposits on iron are accelerators of its corrosion. So far as overvoltages are known, bismuth alone fails to conform to the hypothesis. Theoretically it should retard corrosion; actually it is an accelerator. Unless redeterminations of the overvoltage of bismuth and the single potential of iron shall reconcile theory with fact, the writer's hypothesis fails. The overvoltage of bismuth was presumably measured on a solid electrode. Bismuth deposited as a powder. If there is the same difference in overvoltage for bismuth as between smooth and spongy platinum, this correction would put bismuth in the list of accelerators.

The statements which follow are intended to apply only to the corrosion of iron by sulphuric acid.

Tin, chromium and mercury retard corrosion; of these, tin alone is as effective as arsenic. The protective action of mercury is very slight.

In studying the effect of different reagents on corrosion it is necessary to consider both the metal and the non-metal or acid radical, since each may have an effect of its own.

The binary salts and acids of the halogens are very good protective agents when used in considerable amounts. To combine most effectively the protective effects of a metal and a halogen, e.g., tin and chlorine, much stannous chloride should not be added, for a large amount of the salt of any metal which precipitates on iron in an acid solution is likely to act as a corrosive agent; only a small amount of stannous chloride should be added, and the extra chloride added as sodium chloride.

Oxidizing agents are in themselves accelerators of corrosion by acids, although in dilute solution this may be masked by a protective action which supervenes when the oxygen has been used up, as might happen with chromates.

Reducing agents should show more or less protective action, but this fact remains to be confirmed by further experiment.

In general, the whole subject as here presented is but a preliminary study which opens many possibilities for future investigation. It is hoped that the data appended

may prove of service to those wishing to pursue the subject, and that the writer's conclusions may meet with confirmation from independent sources.

For convenience in comparing the effects of different reagents, an index is appended.

Retarders of Corrosion.—Acid, hydrobromic; acid, hydrochloric; acid, hydrofluoric; arsenate of sodium; arsenic sulphate; bromide of potassium; chloride of ammonium; chloride of manganese; chloride of mercury; chloride of sodium; chloride of tin; chrome alum; chromium sulphate; fluoride of potassium; hydroquinone; iodide of potassium; mercury chloride; mercury sulphate; resorcine; stannate of sodium.

Accelerators of Corrosion.—Acid, chromic; bismuth sulphate; chromium chloride; copper sulphate; gold chloride; mercurous nitrate; platinum chloride; potassium chlorate; potassium chromate; potassium dichromate; potassium nitrate; potassium permanganate; silver nitrate; silver sulphate.

Of no Effect or Doubtful.—Ammonium sulphate, antimony, sulphate, boric acid, citric acid, potassium sulphate.

THE PRESERVATION OF POWER TRANSMISSION POLES.*

By W. R. Wheaton.

The following account deals with an experiment which is complete and covers a long period:—

In March, 1908, the San Joaquin Light & Power Corporation set a line of Western yellow pine (pinus ponderosa) poles. The line is about thirty miles long and contains approximately 600 poles. These poles were cut in the Sierras above Fresno at an elevation of about 4,000 ft., and thoroughly seasoned before treatment. A portion of the poles were given a brush treatment with carbolineum and with creosote, and the balance were treated in the open tank with creosote, zinc chloride and crude oil. The butt only was treated. Western yellow pine is very susceptible to a preservative treatment. Some of the butts were thoroughly penetrated with creosote and with zinc chloride, the average penetration at the ground line being 3 in. The penetration with crude oil averaged about 1½ in. The crude oil used was a heavy oil of asphaltum base supplied from the Kern River fields. In order to get a comparative life of the wood treated and untreated, stubs of untreated timber were set along the line about a mile apart. The writer inspected this line in June, 1910, at which time it had been set for 27 months. The untreated stubs set along the line were completely rotten. Of the poles given a brush treatment with creosote, 27 per cent. showed signs of decay and 29 per cent. of the poles given brush treatment with carbolineum. Of the poles treated with crude oil 45 per cent. were slightly attacked, and of the poles treated with zinc chloride, 28 per cent. showed attack. The poles treated with creosote in the open tank (over 50 per cent. of the entire line was treated in this way) were all perfectly sound and showed no signs of decay.

In August, 1911, two of the poles in this line which had received a brush coating of creosote fell over, due to the decay of the butt. During August and September, 1911, the line was gone over and all of the poles which had been given a brush treatment of creosote and carbolineum were so badly decayed that they were strapped to a creosoted cedar stub.

Since the erection of the plant by the San Joaquin Light & Power Corporation Western red cedar has been treated. The butts only are treated by the open tank process. There is no necessity for treating the top, since the top is not subject to decay. With this process it is attempted only to fill the outer ring of sapwood with creosote, and if the timber is thoroughly seasoned there is little difficulty in accomplishing this. The penetration varies with the width of the sapwood from ½ in. to 1 in. with an absorption of from 7 to 9 lb. to the cubic foot. There are treated and untreated cedar poles in the lines which have been set for four years. The creosoted poles are still perfectly sound, while the poles set untreated have decayed through the sapwood and into the heart.

Creosote is used in preference to chloride of zinc or other treatment which might be effective in an arid climate because after the installation of the irrigation systems the poles are often in the middle of irrigated fields, where zinc is washed out of them, so that they have to be replaced after a brief service. A 50-ft. creosoted pole placed in the line means an investment of about $25, while the use of chloride of zinc would cut this cost to about $24.25. The saving is too small to be considered against the possibility of the loss of the preservative in one or two years.

* Abstract of paper presented at Annual Convention of Wood Preserver's Association, Chicago.

LIGNO-CONCRETE.*

By Gerald O. Case (Member).

In the introductory remarks, the author refers to the use in America and Australia of concrete in combination with timber, and points out that, while the concrete effectively preserves the timber, it is not used to the greatest advantage. The object of the author's investigations was to ascertain if it were possible to reinforce concrete with timber rods. Roughly speaking, steel is about eight or nine times stronger than timber, but ten to fifteen times as expensive. The efficiency of timber, as a reinforcing material, depends on whether there is sufficient adhesion between the timber and the concrete, and whether the difficulties of the absorption of moisture by the timber from the wet concrete, and the splitting the latter, can be overcome.

The paper describes the experiments made by the author to ascertain (a) the amount of water absorbed by eighteen kinds of timber immersed in fresh water, along the grain and through the end grain respectively; (b) the relative absorption by the timber of fresh and sea water in the same period; (c) the relative amount of water absorbed by timber embedded in 6 to 1 concrete and neat cement blocks; (d) the effect of applying wood preservative, creosote, varnish, etc., to the timber before insertion in the concrete or cement blocks; (e) the effect on the adhesion between the timber and the concrete of soaking the rods before insertion. Examples are given to show that concrete effectively preserves timber embedded in it.

Particulars are given of the construction of twenty-five concrete beams reinforeed by timber rods. Three lignoconcrete beams, 8 in. deep by 4 in. wide, were tested with a central load on a 4 ft. span, the average ultimate load producing fracture about three tons. The results of these tests are compared with the tests on ferro-concrete beams recorded by Mr. E. Marburg in the Proceedings of the American Society for Testing Materials (1904, Vol. IV.). It appears that for the same ultimate strength of beam it is necessary to use 9 per cent. of sectional area of pitch pine

* Abstract of paper read before the Society of Engineers, London. April 1st, 1912.

tensile reinforcemnts as against 1 per cent. steel reinforcements. A comparison of the prices of steel and pitch pine shows a saving in favor of ligno-concrete.

As the author points out, in cases where more than about 1.2 per cent. of steel reinforcement is required, ligno-concrete cannot compete with ferro-concrete, because the required size of the timber bars would be too large for convenient use. There appears, however, to be a big field for it for use in constructing bungalows, buildings for small holdings, floors, piles, posts, fencing, coast and river works, etc. It has already been used for making fence posts and for building a short length of sea wall. The ligno-concrete fence-posts cost about two shillings per cube foot. They are about 20 per cent. cheaper than creosoted deal, and about 40 per cent. cheaper than Engish oak. In Canada four bungalows have been built with ligno-concrete slabs, and the Pacific Coast Construction Company, of Victoria, British Columbia, now have contracts in hand for twenty buildings in which this material is to be used.

ENGINEERING NOTES.

Regina, Sask.—There is a probability that the position of city engineer will be vacant owing to the present incumbent, Mr. Thornton, being appointed works commissioner.

Lethbridge, Alta.—The fire rangers of the Rocky Mountain reserve will meet in this city and consider the question of installing a telephone line throughout the forest. Mr. S. J. Gilling, telephone expert for the provincial government, has prepared a report on the subject.

PERSONAL.

Mr. James C. Lindsay has been re-appointed engineer for the municipality of Belleville, Ont.

Mr. W. H. Sullivan has been appointed to the position of chief engineer of the Welland Ship Canal.

Announcement is made of the appointment of **Mr. J. L. Weller** to the position of charge of the Welland Ship Canal.

Mr. J. C. Gardner has been appointed engineer-superintendent on the construction of the good roads of Welland County, Ontario.

Mr. I. F. Willsie has taken charge of reconstruction work on the Canadian Pacific Railway. Until recently Mr. Willsie has been assistant engineer for the city of London, Ont.

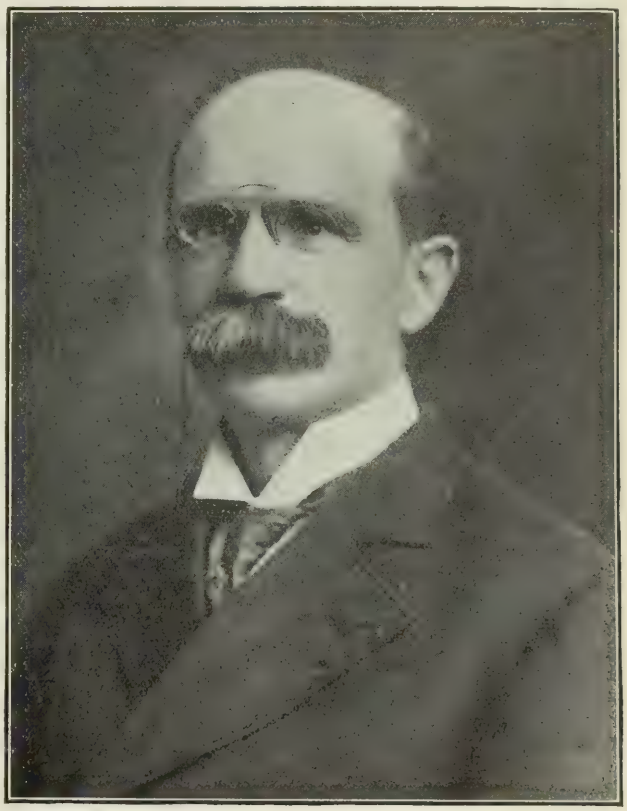
Mr. H. H. Adams has been appointed to the position of president of the Kansas City terminals. Mr. Adams was formerly manager of the Toronto, Hamilton and Buffalo Railway.

Mr. R. W. Heafield, 264 Reid Street, Peterboro', Ont., was the author of an article on "The Material List Method of Store-Keeping," which was published in The Canadian Engineer of April 11, 1912. Mr. Heafield will be glad to furnish further details of the method to any one sufficiently interested to enquire.

Mr. Gunni Jeppesen, who was for many years designing engineer of The Strauss Bascule Bridge Co., of Chicago, Ill., has been appointed managing engineer of the same company. Mr. J. R. Hall, who was formerly chief draftsman, has been appointed designing engineer, and is succeeded as chief draftsman by Mr. A. O. Walker.

Mr. W. W. VanEvery has just been appointed city engineer of Sault Ste Marie, Ont. Mr. VanEvery graduated from the School of Practical Science, Toronto, thirteen years ago, and since then has been continuously engaged in different kinds of engineering work, both in Canada and in the United States. While in the United States he was construction engineer with the Lackawanna Steel Company during the construction of their new plants at Buffalo, N.Y., and Lebanon, Pa. Later he was sales engineer for the Allis-Chalmers Company, of Milwaukee, Wis. In Canada he has been connected with the construction of the following new plants: The Canada Car & Foundry Co., at Turcot, Montreal; M. Beatty & Sons, Welland, Ont.; The Tallman Brass & Metal Co., Hamilton, Ont.; extension to the Canada Screw Company's plant at Hamilton, and extensions to the Harris Abattoir plant, Toronto. He has also done considerable consulting work besides, and previous to taking the city engineership of the Soo, was engineer for the Algoma Steel Company of the same city. Mr. VanEvery is an associate member of the Canadian Society of Civil Engineers.

Mr. C. H. Rust, M. Can. Soc. C.E., M. Am. Soc. C.E., has tendered his resignation as city engineer for Toronto. Mr. Rust was born in Essex, England, December 25th, 1852; was educated at Brentworth Grammar School, and began professional work under the late Mr. Frank Shanley. In



the year 1877 he entered the employ of the city of Toronto as rodman; in 1881 he was appointed assistant municipal engineer, and during the year 1892 took charge of the city's work, but it was not until February, 1898, that Mr. Rust was appointed city engineer. Mr. Rust was elected a member of the Canadian Society of Civil Engineers in 1887, and in the year 1901 was honored by the position of vice-president of that body. In 1911 he was elected president of this organization. He was interested in other engineering and municipal societies, having been elected a member of American Society of Civil Engineers, the American Society of Municipal Improvements, and the American Waterworks Association.

OBITUARY.

Through the "Titantic" disaster Canadians lost a prominent metallurgical and chemical engineer in the person of **Mr. Ernest Sjostedt.** He had been connected with the erection of many important steel and metal plants, among which are the reduction plant and the water gas plant at Sault Ste. Marie, and the Standard Chemical works. He was a native of Sweden and a graduate of the School of Mines, Stockholm. When he met his death he was returning from a business trip in the interests of The Lake Superior Corporation and the Dominion Government. He was sixty years of age.

The engineering fraternity recently lost one of its members in the person of **Charles Beresford Fox,** of the firm of Fox and Wragge, Toronto. He was the eldest son of Mr. Francis Fox, a member of the firm of Sir Douglas Fox and Partners, civil engineers, London, England. Mr. Fox has been a resident of Toronto for the past three years. Prior to coming to Toronto he had been engaged in many important engineering works, having passed some years in South Africa on the Rhodesian railways, and at the construction of the bridge over the Zambesi River at Victoria Falls. He was also engaged for about two years at the building of the Assiout Barage on the Nile in Egypt, and for a time at the Simplon Tunnel. His death occurred on April 15th last.

COMING MEETINGS.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—413 Dorchester St. W., Montreal. Meeting of the Mechanical Section. Thursday, April 25th, at 8-15 p.m. Paper on "Distribution of Stress in Certain Tension Members," by Mr. C. Batho, A.M. Can. Soc. C.E.; Secretary C. H. McLeod

CANADIAN INSTITUTE.—198 College Street, Toronto. Saturday Evening Lectures, 8 p.m. April. 27th—"Early Economic History of Canada," S. A. Cudmore, Toronto University. Nominations. May 4th—Annual Meeting and Election of Officers.

ONTARIO MUNICIPAL ASSOCIATION.—Annual convention will be held in the City Hall, Toronto, on June 18th and 19th, 1912. Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ont.

CANADIAN PUBLIC HEALTH ASSOCIATION.—Second Annual Meeting to be held in Toronto, Sept. 16, 17 and 18.

ENGINEERING SOCIETIES.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—413 Dorchester Street West, Montreal. President, W. F. TYE: Secretary. Professor C. H. McLeod.

KINGSTON BRANCH—Chairman, A. K. Kirkpatrick; Secretary, L. W Gill; Headquarters: School of Mines, Kingston.

OTTAWA BRANCH—
177 Sparks St. Ottawa. Chairman, S. J. Chapleau, Ottawa; Secretary, H. Victor Brayley, N.T. Ry., Cory Bldg. Meetings at which papers are read, 1st and 3rd Wednesdays of fall and winter months; on other Wednesday nights in month there are informal or business meetings.

QUEBEC BRANCH—Chairman, W. D. Baillairge; Secretary, A. Amos; meetings held twice a month at room 40, City Hall.

TORONTO BRANCH—96 King Street West, Toronto. Chairman, T. C. Irving; Secretary, T. R. Loudon, University of Toronto. Meets last Thursday of the month at Engineers' Club.

VANCOUVER BRANCH—Chairman, C. E. Cartwright; Secretary, W. Alan, Kennedy; Headquarters: McGill University College, Vancouver.

VICTORIA BRANCH—Chairman, F. C. Gamble; Secretary, R. W. MacIntyre; Address P.O. Box 1290.

WINNIPEG BRANCH—Chairman, J. A. Hesketh; Secretary, E. E. Brydonejack; Meets every first and third Friday of each month, October to April, in University of Manitoba, Winnipeg.

MUNICIPAL ASSOCIATIONS

ONTARIO MUNICIPAL ASSOCIATION.—President, Chas. Hopewell, Mayor, Ottawa; Secretary-Treasurer, Mr. K. W. McKay, County Clerk, St. Thomas, Ontario.

SASKATCHEWAN ASSOCIATION OF RURAL MUNICIPALITIES.—President, George Thompson, Indian Head, Sask.; Secy-Treasurer, E. Hingley, Radisson, Sask.

THE ALBERTA L. I. D. ASSOCIATION.—President, Wm. Mason, Bon Accord, Alta.; Secy-Treasurer, James McNicol, Blackfalds, Alta.

THE UNION OF CANADIAN MUNICIPALTIES.—President, W. Sanford Evans, Mayor of Winnipeg; Hon. Secretary-Treasurer, W. D. Lighthall, K.C., Ex-Mayor of Westmount.

THE UNION OF NEW BRUNSWICK MUNICIPALITIES.—President, Councillor Siddall, Port Elgin; Hon. Secretary-Treasurer J. W. McCready, City Clerk, Fredericton.

UNION OF NOVA SCOTIA MUNICIPALITIES.—President, Mr. A. S. MacMillan, Warden, Antigonish, N.S.; Secretary, A. Roberts, Bridgewater, N.S.

UNION OF SASKATCHEWAN MUNICIPALITIES.—President, Mayor Bee, Lemberg; Secy-Treasurer, W. F. Heal, Moose Jaw.

UNION OF BRITISH COLUMBIA MUNICIPALITIES.—President, Mayor Planta, Nanaimo, B.C.; Hon. Secretary-Treasurer, Mr. H. Bose, Surrey Centre, B.C.

UNION OF ALBERTA MUNICIPALITIES.—President, Mayor Mitchell, Calgary.; Secretary-Treasurer, G. J. Kinnaird, Edmonton, Alta.

UNION OF MANITOBA MUNICIPALTIES.—President, Reeve Forke, Pipestone, Man.; Secy-Treasurer, Reeve Cardale, Oak River, Man.

CANADIAN TECHNICAL SOCIETIES

ALBERTA ASSOCIATION OF ARCHITECTS.—President, G. M. Lang Secretary, L. M. Gotch, Calgary, Alta.

ASSOCIATION OF SASKATCHEWAN LAND SURVEYORS.—President, J. L. R. Parsons, Regina; Secretary-Treasurer, M. B. Weeks, Regina.

ASTRONOMICAL SOCIETY OF SASKATCHEWAN.—President, N. McMurchy; Secretary, Mr. McClung, Regina.

BRITISH COLUMBIA LAND SURVEYORS' ASSOCIATION.—President, W. S. Drewry, Nelson, B.C.; Secretary-Treasurer, S. A. Roberts, Victoria, B.C.

BUILDERS' CANADIAN NATIONAL ASSOCIATION.—President, E. T. Nesbitt; Secretary-Treasurer, J. H. Lauer, Montreal, Que.

CANADIAN ASSOCIATION OF STATIONARY ENGINEERS.—President, Wm. Norris, Chatham, Ont.; Secretary, W. A. Crockett, Mount Hamilton, Ont.

CANADIAN CEMENT AND CONCRETE ASSOCIATION.—President, Peter Gillespie, Toronto, Ont.; Secretary-Treasurer, Wm. Snaith, 57 Adelaide Street, Toronto, Ont.

CANADIAN CLAY PRODUCTS' MANUFACTURERS' ASSOCIATION.—President, W. McCredie; Secretary-Treasurer, D. O. McKinnon, Toronto

CANADIAN ELECTRICAL ASSOCIATION.—President, N. W. Ryerson, Niagara Falls; Secretary, T. S. Young, Canadian Electrical News, Toronto.

CANADIAN FORESTRY ASSOCIATION.—President, John Hendry, Vancouver. Secretary, James Lawler, Canadian Building, Ottawa.

CANADIAN GAS ASSOCIATION.—President, Arthur Hewit, General Manager Consumers' Gas Company, Toronto; J. Keillor, Secretary-Treasurer, Hamilton, Ont.

CANADIAN INDEPENDENT TELEPHONE ASSOCIATION.—President, W. Doan, M.D., Harrietsville, Ont.; Secretary-Treasurer, Francis Dagger, 21 Richmond Street West, Toronto.

CANADIAN MINING INSTITUTE.—Windsor Hotel, Montreal. President, Dr. A. E. Barlow, Montreal; Secretary. H. Mortimer Lamb, Windsor Hotel, Montreal.

CANADIAN PEAT SOCIETY.—President, J. McWilliam, M.D., London, Ont.; Secretary-Treasurer, Arthur J. Forward, B.A., 22 Castle Building, Ottawa, Ont.

THE CANADIAN PUBLIC HEALTH ASSOCIATION.—President, Dr. Charles A. Hodgetts, Ottawa; General Secretary, Major Lorne Drum, Ottawa.

CANADIAN RAILWAY CLUB.—President, A. A. Goodchild; Secretary, James Powell, P.O. Box 7, St. Lambert, near Montreal, P.Q.

CANADIAN STREET RAILWAY ASSOCIATION.—President, D. McDonald, Manager, Montreal Street Railway; Secretary, Acton Burrows, 70 Bond Street, Toronto.

CANADIAN SOCIETY OF FOREST ENGINEERS.—President, Dr. Fernow, Toronto.; Secretary, F. W. H. Jacombe, Department of the Interior, Ottawa.

CENTRAL RAILWAY AND ENGINEERING CLUB.—Toronto. President G. Baldwin; Secretary, C. L. Worth, 409 Union Station. Meets third Tuesday each month except June, July and August.

DOMINION LAND SURVEYORS.—President, Mr. R. A. Belanger, Ottawa Secretary-Treasurer, E. M. Dennis, Dept. of the Interior, Ottawa.

EDMONTON ENGINEERING SOCIETY.—President, J. Chalmers; Secretary, B. F. Mitchell, City Engineer's Office, Edmonton, Alberta.

ENGINEERING SOCIETY, TORONTO UNIVERSITY.—President, J. E. Ritchie; Corresponding Secretary, C. V. Ross.

ENGINEERS' CLUB OF MONTREAL.—Secretary, C. M. Strange, 9 Beaver Hall Square, Montreal.

ENGINEERS' CLUB OF TORONTO.—96 King Street West. President Willis Chipman; Secretary, R. B. Wolsey. Meeting every Thursday evening during the fall and winter months.

INSTITUTION OF ELECTRICAL ENGINEERS.—President, Dr. G. Kapp; Secretary, P. F. Rowell, Victoria Embankment. London, W.C.; Hon. Secretary-Treasurer for Canada, Lawford Grant, Power Building, Montreal, Que.

INSTITUTION OF MINING AND METALLURGY.—President, Edgar Taylor; Secretary, C. McDermid, London, England. Canadian members of Council:—Prof. F. D. Adams, J. B. Porter, H. E. T. Haultain and W. H. Miller and Messrs W. H. Trewartha-James and J. B. Tyrrell.

INTERNATIONAL ASSOCIATION FOR THE PREVENTION OF SMOKE.—Secretary R. C. Harris, City Hall, Toronto.

MANITOBA LAND SURVEYORS.—President, George McPhillips; Secretary-Treasurer, C. G. Chataway, Winnipeg, Man.

NOVA SCOTIA MINING SOCIETY.—President, T. J. Brown, Sydney Mines, C. B.; Secretary, A. A. Hayward.

NOVA SCOTIA SOCIETY OF ENGINEERS, HALIFAX.—President, J. N. MacKenzie; Secretary, A. R. McCleave, Assistant Road Commissioner's Office, Halifax, N.S.

ONTARIO PROVINCIAL GOOD ROADS ASSOCIATION.—President, Major. T. L. Kennedy; Hon. Secretary-Treasurer, J. E. Farewell, Whitby; Secretary-Treasurer, G. S. Henry, Oriole.

ONTARIO LAND SURVEYORS' ASSOCIATION.—President, T. B. Speight, Toronto; Secretary, Killaly Gamble, 703 Temple Building, Toronto.

THE PEAT ASSOCIATION OF CANADA.—Secretary, Wm. J. W. Booth, New Drawer, 2263, Main P.O., Montreal.

PROVINCE OF QUEBEC ASSOCIATION OF ARCHITECTS.—Secretary, J. E. Ganier, No. 5. Beaver Hall Square, Montreal.

REGINA ENGINEERING SOCIETY.—President, A. J. McPherson, Regina; Secretary, J. A. Gibson, 2429 Victoria Avenue, Regina.

ROYAL ARCHITECTURAL INSTITUTE OF CANADA.—President, F. S. Baker, F.R.I.B.A., Toronto, Ont.; Hon. Secretary, Alcide Chausse, No. 5. Beaver Hall Square, Montreal, Que.

ROYAL ASTRONOMICAL SOCIETY.—President, Prof. Louis B. Stewart, Toronto; Secretary, J. R. Collins, Toronto.

SOCIETY OF CHEMICAL INDUSTRY.—Dr. A. McGill, Ottawa, President; Alfred Burton, Toronto, Secretary.

UNDERGRADUATE SOCIETY OF APPLIED SCIENCE, McGILL UNIVERSITY.—President, J. P. McRae; Secretary, H. F. Cole.

WESTERN CANADA IRRIGATION ASSOCIATION.—President, Wm Pierce, Calgary; Secretary-Treasurer, John T. Hall, Brandon, Man.

WESTERN CANADA RAILWAY CLUB.—President, R. R. Nield; Secretary, W. H. Rosevear, 115 Phœnix Block, Winnipeg, Man. Second Monday, except June, July and August, at Winnipeg.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand and projected, contracts awarded, changes in staffs, etc.
Printed forms for the purpose will be furnished upon application.

PLANS AND SPECIFICATIONS ON FILE.

The following Plans (P.) and Specifications (S.) are on file for reference only unless otherwise noted at the office of The Canadian Engineer, 62 Church Street, Toronto:—

Bids close		Noted in issue of
4-30	Tunnel sewer, Edmonton, Alta. .....(S.)	4-4
4-30	Trunk sewer, Edmonton, Alta. .....(S.)	4-11
4-30	Subway, Moose Jaw, Sask. .....(P. & S.)	4-18
5-10	One diesel oil engine, Vernon, B.C. .....(S.)	4-25

(Saskatoon plans and specifications are on file at The Canadian Engineer Office, 820 Union Bank Building, Winnipeg).

TENDERS PENDING.

In Addition to Those in this Issue.

Further information may be had from the issues of The Canadian Engineer referred to.

Place of Work.	Tenders Close.	Issue of.	Page.
Arborg, Man., school house	May 1.	Apr. 11.	59
Bay View, N.S., lifeboat house and dwelling	Apr. 30.	Apr. 11.	60
Calgary, Alta., timber structures	May 15.	Apr. 18.	76

Vancouver, B.C., pumping engine, hose wagon, etc.	May 2.	Apr. 11.	60
Winnipeg, Man., twelve additional rooms to Britannia School.	Apr. 30.	Apr. 18.	60

TENDERS.

Berlin, Ont.—Tenders will be received by the town of Southampton until May 1st, 1912, for the laying of 500 ft. of 15-in. sewer pipe along the lake shore road. Full particulars may be had on application to Messrs. Bowman & Connor, Civil Engineers, Berlin, Ont.

Berlin, Ont.—Tenders will be received up to April 27th, 1912, for the construction of a new bridge over the River Nith, one mile north of New Hamburg, bridge consisting of (a) 110-ft. steel span; (b) concrete abutments. Specifications, etc., at the office of Messrs. Bowman & Connor, Civil Engineers, Berlin, Ont.

Brantford, Ont.—Tenders will be received by Geo. W. Alderson, Secretary-Treasurer, S. S. No. 3, Grandview P.O., until April 30th, 1912, for the erection and completion of an eight-room school house at Grandview. Plans and specifications at the office of the architects, Messrs. Taylor & Taylor, Hope Chambers, Brantford, Ont.

Denfield, Ont.—Tenders will be received by E. R. Barclay, clerk of Lobo Township, Poplar Hill, until Wednesday, May 1st, 1912, for concrete abutments and steel superstructure for a bridge over the Sydenham River at Ivan P.O., Lobo Township. Also for three small concrete bridges. Plans, etc., may be obtained either from F. W. Farncomb, consulting engineer, London, Ont., or James McNair, commissioner, Denfield.

Exeter, Ont.—Tenders will be received up to Monday, May 6th, 1912, for about 6,000 feet of 4" and 6" cast iron waterworks pipe, also about one dozen hydrants and valves. F. W. Farncomb, consulting engineer, London, Ont. (See advt. in Canadian Engineer.)

Exeter, Ont.—Tenders for the construction of about 3,000 feet of vitrified sewer pipe will be received up to noon of May 10th, 1912. Plans and specifications at office of F. W. Farncomb, consulting engineer, London, Ont., and T. B. Carling, town clerk, Exeter, Ont. (See advt. in Canadian Engineer.)

Guelph, Ont.—Tenders will be received until May 3rd, 1912, for the laying of 3,000 feet of track on the York Road, in the city of Guelph. Plans and specifications at the office of the City Engineer or the Guelph Radial Railway Company. (See Advt. in Canadian Engineer.)

Lebret, Sask.—Tenders for the erection of a brick veneer school building will be received up to May 31st, 1912. Plans and specifications may be seen at the office of W. Crossley, Lebret, Sask, or at secretary-treasurer, J. Z. Lafleur's office, Lebret, Sask.

Moose Jaw, Sask.—Tenders will be received by the City Commissioners until May 15th, 1912, for the laying of approximately 34,000 square yards of pavement. Plans, etc., at the office of J. Antonisen, City Engineer. (See Advt. in Canadian Engineer.)

Moose Jaw, Sask.—Tenders will be received by the City Commissioners, Moose Jaw, up to May 1st, 1912, for the laying of approximately 4-5 mile of sewer and water mains. Plans and specifications may be obtained from J. Antonisen, city engineer.

Montreal, P.Q.—The management of the Cedar Rapids Power Co. are inviting tenders for the construction of a dyke and a portion of the power house. This work will cost about $2,000,000.

Montreal, P.Q.—Mr. L. N. Seneca, secretary Board of Commissioners, will receive tenders up to noon, April 30th, for the construction of retaining walls around the ponds in Lafontaine Park.

Orangeville, Ont.—Dr. Riddell, mayor of this municipality, will receive tenders for reinforced concrete bridge to be erected on the West Roadway. The tenders are to be in by 7.30 p.m., May 6th.

Oshawa, Ont.—Mr. John Bale will receive tenders for the work of erecting a new church and Sunday School building up to noon, May 4th next.

Ottawa, Ont.—Tenders will be received until May 6th, 1912, for the construction of Azimuth Mark and Stellar Camera Huts, Royal Observatory, Ottawa. Plans, etc., at the office of R. C. Desrochers, Secretary Department of Public Works, Ottawa.

Ottawa, Ont.—Tenders will be received up to May 6th, 1912, for dredging required at the following places:—

Prince Edward Island—Vernon River.

Nova Scotia—Cheticamp, Margaree Harbor, Sydney Harbor, D'Escousse, Digby, Musquodoboit, Mill Cove.

Full particulars, specifications, etc., can be obtained from R. C. Desrochers, Secretary, Department of Public Works, Ottawa.

Ottawa, Ont.—Corporation of the city of Ottawa, Municipal Electric Department, calls for tenders on fifty (50) ornamental iron lamp posts together with globes and fittings for same. Tenders to be by noon of April 30th, 1912. Specifications may be had at the office of the Electrical Superintendent, J. E. Brown, 75 Laurier Avenue W., Ottawa.

Ottawa, Ont.—Tenders, addressed to the Board of Control, will be received up to noon of April 30th, 1912, for the supply of 2,000 feet of 2½-inch double jacket-rubber-lined fire hose complete with couplings (Higbee thread). Also for the supply of two 55-gallon chemical tanks, to be constructed in accordance with specifications to be seen at the office of the Chief of the Fire Department, City Hall.

Ottawa, Ont.—Tenders will be received up to May 14th, 1912, for the supply and installation of two electrically operated pumping units each having a capacity of 2,000 imperial gallons per minute. Newton J. Ker, City Engineer, Ottawa. (See Advt. in Canadian Engineer).

Ottawa, Ont.—Tenders will be received until May 13th, 1912, for dredging required at the following places in the Province of Ontario:—South Lancaster, Gananoque, Kingsville, Blind River, Cobourg, Honey Harbor, Port Hope, Trenton, Deseronto. Combined specifications and form of tender can be obtained on application to R. C Desrochers, Secretary, Department of Public Works, Ottawa.

Ottawa, Ont.—Tenders for interior fittings, post office, Hillsborough, N.B., will be received up to May 6th, 1912. Plans and specifications to be seen on application to Mr. B. Steeves, clerk of works, Hillsborough, N.B.; Mr. D. H. Waterbury, clerk of works, St. John, N.B., and at the office of R. C. Desrochers, secretary Department of Public Works, Ottawa.

Ottawa, Ont.—Tenders addressed to Chas. Macnab county clerk, Court House, Ottawa, for the following road machinery, will be received up to May 6th, 1912: Two ten ton road rollers, three rock-crushers, two twenty ton bins with screen attached, and nine two-yard spreading wagons.

Ottawa, Ont.—The Board of Control will consider tenders for asphalt pavements. The tenders are to be in the hands of the secretary by 4 p.m., April 30th next.

Port Arthur, Ont.—J. J. Hackney, Commissioner of Utilities, will receive tenders for the construction of sewer and water mains to be laid on St. Paul Street. The tenders are to be in his hands by 5 p.m., April 29th.

Prince Albert, Sask.—Tenders for the various works in connection with the two four-roomed brick schools to be erected in Prince Albert for the Public School Board, will be received up to noon of April 30th. Plans and specifications can be seen at the office of the Architect, O. Albrechtsen, Prince Albert.

Scotland, Ont.—Tenders will be received until April 29th, 1912, for the construction of a reinforced concrete bridge for the Township of Oakland. Plans and specifications can be seen at the office of Fairchild and Webster, Civil Engineers, Brantford, or at the residence of Percy M. Button, Township Clerk, Scotland, Ontario.

St. John, N.B.—Tenders will be received at the office of the Common Clerk, City Hall, up to noon of April 26th, 1912, for birch or oak planking for ferry dept. Estimated quantity required is:—20,000 superficial feet 6-in. x 6-in. x 35-ft. long. Geo. H. Waring, Superintendent, Adam P. Macintyre, Comptroller, St. John, N.B.

Stratford, Ont.—The branch manager of the Canadian Bank of Commerce will receive tenders for the erection of a new bank building. He has the plans and specifications. Tenders are to be in by noon, May 6th next.

Toronto, Ont.—Plans are being prepared and tenders will be called for immediately for the erection of a ten-storey warehouse on Wilton Avenue, near Yonge Street, for the Imperial Optical Company. Building will be of reinforced concrete, and the cost will approximate $70,000.

Vancouver, B.C.—Tenders will be received up to noon of May 15th, 1912, for 2,000 lineal feet of 18-inch lap welded wrought steel water pipe and 13 double gate valves with flange ends. Specifications, etc., can be obtained from James Stuart, Purchasing Agent, Vancouver.

Varna, Ont.—Tenders will be received up to May 15th, 1912, for drainage work of by-law 11, 1911, estimated at 30,500 cu. yards. For particulars apply to John E. Harnwell, Clerk of Stanley Township, Varna.

Vernon, B.C.—Tenders will be received until May 10th, 1912, for the supply and erection, on foundation supplied by the city, of one 200 B.H.P.; 257 R.P.M. diesel oil engine for direct connection to 125 K.W., 3-phase, sixty cycle, alternating current generator with excitor. D. G. Tate, city clerk, Vernon, B.C. (See advt. in Canadian Engineer.)

Winnipeg, Man.—Tenders will be received by M. Peterson, Secretary, Board of Control Office, until April 29th, 1912, for the supply of labor and materials required in the erection of a building over the weigh scales at the Central Market. Plans, etc., at the office of City Engineer, 223 James Avenue.

Winnipeg, Man.—Tenders received by R. H. Smith, Secretary-Treasurer, Winnipeg Public School Board, up to Monday, April 29th, 1912, for the erection of a stone and brick school on Ruby and Lenor site. Plans, etc., with J. B. Mitchell, Commissioner of School Buildings, School Board Office, Winnipeg.

Winnipeg, Man.—Tenders for the plumbing, heating and ventilation fixtures required in the Dormitory Building at the Agricultural College, St. Vital, will be received up to April 27th, 1912, by Colin H. Campbell, Minister of Public Works, Winnipeg. Plans, etc., at the office of the Provincial Architect, 261 Fort Street.

Winnipeg, Man.—Tenders will be received until April 29th, 1912, for the construction of a permanent pavement, 24 feet wide, on the north side of Portage Avenue, extending from the western limits of the city of Winnipeg to the western limit of Lot 20, St. James. Plans and specifications at the Engineer's office at the Municipal Hall, St. Charles. Frank Ness, Secretary-Treasurer, Rural Municipality of Assiniboia, Kirkfield Park P.O., Man.

Board of Highway Commissioners, York County.—Tenders for the construction of Dundas Street from the city limits west to the Humber River, will be received up to Tuesday, May 7th, 1912. E. A. James, engineer to the Board. (See advt. in Canadian Engineer.)

CONTRACTS AWARDED.

Belleville, Ont.—The tender of Messrs. J. Lewis Company for water pipes was accepted by the municipal council. Their prices were lowest.

Grand Forks, B.C.—Contracts have been let for an additional 25 miles of grading on the Kettle Valley Railway west of Carmi. C. H. Williams & Co. secured a six mile contract; Milligan, Dussault & Co., nine miles; and Porter & Connelly, ten miles.

Lethbridge, Alta.—The city council have let various contracts as follows:

Sidewalk, curb and gutter, Forest City Paving Co., $22,500.

Sanitary sewers, Hotson, Leader & Goode, $26,000.

Grading, Marquard Construction Co., $25,273.

For sewer pipe, 6in., Western Supply and Equipment Co.; 8in. to 12in., J. B. Turney & Co.; over 12in., Western Supply and Equipment Co.

For steel pipe, 6in., 8in., 10in. and 12in., Western Supply and Equipment Co.; 4in., 20in., and 24in., J. B. Turney & Co.; 14in. and 18in., General Supplies Co., of Calgary.

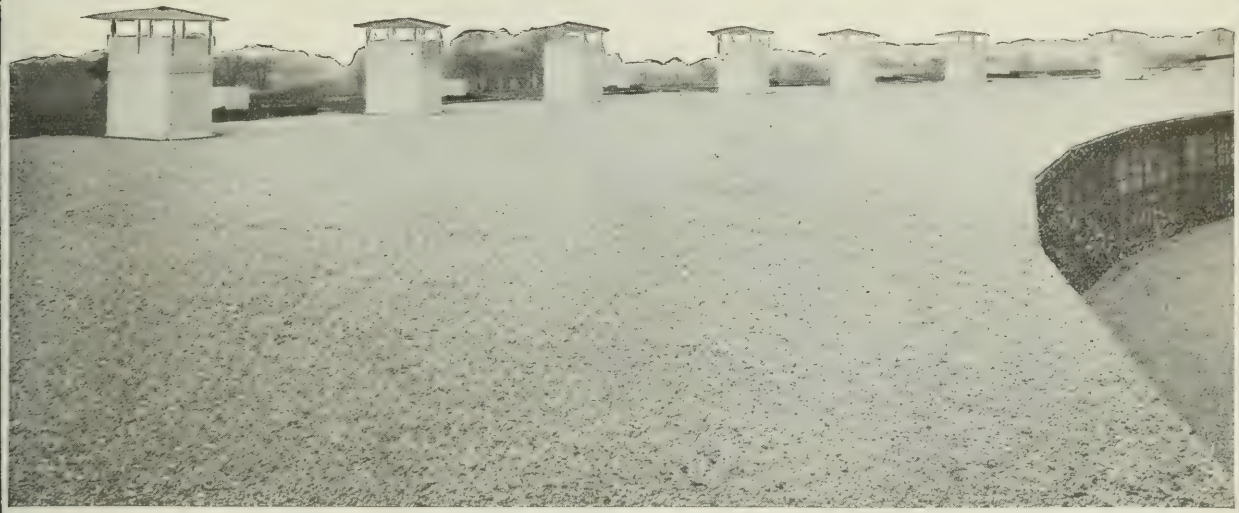
Galvanized iron pipe, Western Canada Agency; J. B. Turney & Co.; Metals, Ltd.; the contract being divided for various sizes.

Moving crane, J. B. Turney & Co.

Special piping, Crane Co.

Cement, Western Supply and Equipment Co.; price, $2.97 f.o.b., stores.

Barrett Specification Roofs



Longest Wear for Lowest Cost.

THE cost per year of service is the only true test of a roofing.

It discloses the absolute superiority of Barrett Specification Roofs. That is why on large manufacturing plants, where costs are carefully computed, such roofs are almost invariably used.

Barrett Specification Roofs are inexpensive, costing much less than tin for instance, and little more than the best grade of ready roofings.

Their cost of maintenance is nothing, for these roofs require no painting; they can't rust and they will give satisfactory protection for 20 years or more.

Insurance underwriters classify Barrett Specification Roofs as "slow burning" construction acceptable on "fire-proof" buildings.

Barrett Specification Roofs are also immune from damage by acid fumes. That is why they are used extensively on railroad roundhouses.

On cotton mills, with their humid interiors, these roofs also give perfect satisfaction, for dampness does not affect them from below.

From the viewpoint of economy and satisfactory service, no other type of roof covering compares with Barrett Specification Roofs.

That is why they have won almost universal approval for use on flat-roofed structures of all kinds.

The Barrett Specification Roof illustrated above is 50,000 square feet in area and covers the Roundhouse of the Vandalia Lines (Penna. System) at Terre Haute, Ind.

The St. Louis Roofing Co., of St. Louis, Mo., were the Roofing Contractors.

Special Note.

We advise incorporating in plans the full wording of The Barrett Specification, in order to avoid any misunderstanding. If any abbreviated form is desired however the following is suggested:

ROOFING—Shall be a Barrett Specification Roof laid as directed in printed Specification, revised August 15, 1911, using the materials specified, and subject to the inspection requirement.

Copy of the Barrett Specification, with diagrams, ready for incorporation into building specifications, free on request.

The Paterson Manufacturing Co., Limited

Montreal Toronto Winnipeg Vancouver St. John, N.B. Halifax, N.S.

Moose Jaw, Sask.—Contract for installation of sewer and water mains has been awarded to Messrs. Patrick Kilkenny, Limited, Moose Jaw, for $19,544.59. Other bidders and prices are as follows:—Navin Bros., $22,828.23; McManus Construction Co., $22,873.60; Hurst Construction Co., Ltd., $24,058.92; W. Manders, $24,060.61. W. H. Greene, Assistant City Engineer.

Moose Jaw, Sask.—The contract for the supply of 1,000 k.w. turbo-generator set has been awarded to the Canadian General Electrical Company.

New Westminster, B.C.—The contracts for the Seventh Avenue school have been awarded as follows: Main building, Mr. William Forrester, for the sum of $32,150; plumbing work, Mr. James McMurphy; electrical work, the Parker Chase Company.

Port Arthur, Ont.—The contract for the construction of a warehouse for the Fitzsimmons Fruit Company, to be erected on the corner of Ambrose and Wellington Streets, has been awarded to Mr. Geo. Otta. Estimated cost about $30,000.

St. Catharines, Ont.—Messrs. Hitch and Company, Montreal, have been awarded the contract for the erection of the new building of the Sterling Bank in this city.

Vancouver, B.C.—Contracts for the construction of two city stables were awarded to F. J. Palo, at $3,950 each.

Vancouver, B.C.—The El Oso Paving Company have received the contract for the erection of an eight-room modern fireproof school building to cost $63,000.

Victoria, B.C.—The contract for the erection of a new municipal hall at Oak Bay has been awarded to Mr. A. H. Mitchell, for $10,500.

Welland, Ont.—Contracts for road machinery have been awarded as follows:—

One road roller, Waterous Engine Co., $2,650.

Two road rollers from Sawyer-Massey Co., $5,300.

One crusher from Sawyer-Massey Co., $1,150.

Three Champion graders, Hamilton Machinery Co., $220 each.

Three plows, Canada Foundry., $22 each.

One 25-h.p. International Harvester Co. gasoline engine (on trial), $2,000.

Five two-yard wagons, Sawyer-Massey Co., $135 each.

One six-yard spreading dump car, Port Huron Engine Co., $580.

Windsor, Ont.—Contracts for the construction of approximately 20,000 yards of paving on May and Hall Avenues, at a cost of $27,184.50, has been awarded to Messrs. Geo. Caldwell & Company.

RAILWAYS—STEAM AND ELECTRIC.

Belleville, Ont.—The municipal council have ordered tender forms prepared for 500 feet of best quality hose. J. G. Lindsay, Engineer.

Medicine Hat, Alta.—The ratepayers voted against the street railway by-law.

Montreal, P.Q.—The municipal council have received a request from the Canadian Pacific Railway that they be granted permission to erect elevated lines in several streets.

Regina, Sask.—A large water tank in the yards of the Canadian Pacific Railway will be moved to the round house. At present the tank interferes with the handling of baggage.

LIGHT, HEAT AND POWER.

Fredericton, N.B.—The Public Utilities Commission held a meeting for the purpose of fixing the power rates of the Fredericton Gas Light Company.

Moose Jaw, Sask.—The names and prices of the various firms tendering on the supply of a 1,000 k.w. turbo-generator set for the municipal power house are given as follows:—William Robinson, $25,200; Siemens Bros, $27,830 for Fraser-Chalmers combination: Siemens Bros., $27,660 for Bellis-Morcom combination: Bellis-Morcom, for the Siemens combination, $26,000; Allis-Chambers with Lancashire combination, $28,350; Bellis-Morcom, with general electric combination, $25,000; Allis-Chambers Company, with A. C. B. combination, $26,190; Canadian Westinghouse Co., proposal "A" combination, $28,888; Canadian Westinghouse Co., proposal "B," $30,070; Goldie-McCulloch, Rateau combination, $29,000; Escher-Wyss Zoelly combination, $26,000; Brush Co., $26,505; C. A. Parsons, $29,387.

Welland, Ont.—The management of the Welland Electrical Company have rejected the offer of the municipal council to dispose of their plant and property at the figure offered viz. $50,000.00. The company have agreed to appoint arbitrators at any time to confer with the city officials.

GARBAGE, SEWAGE AND WATER.

Fredericton N.B.—The Water and Sewage Committee have ordered the installation of several improvements to the pumping plant and water supply system. A new boiler and filter are included in these changes.

North Vancouver, B.C.—The municipal council have made an application to the authorities at New Westminster for the use of Lake Dick for water storage purposes. The lake is estimated to have a capacity of 220,000,000 gallons.

BUILDINGS AND INDUSTRIAL WORKS.

Brampton, Ont.—The new Pease Foundry to be erected here will comprise eleven buildings, which will aggregate a floor space of 137,000 square feet. The plans for the plant are being prepared by Messrs. Ellis & Connery, Toronto and are nearing completion. The buildings will all be of the single storey variety, except the office building, which will be two stories. They include a foundry, warehouse, shipping-room, blacksmith shop, machine shop, core rooms and ovens, rumbling room, pattern shop, pattern vault and dome and tin shop for the manufacture of furnace casings.

Calgary, Alta.—The design for the new stores of the Hudson Bay Company is something of a novelty and all stores constructed in the future will follow the same general design. There are twelve great columns across the front and the structures will be six stories in height for the present, although the foundations will be designed for a height of ten stories.

Calgary, Alta.—The management of the Winona Pioneer Tractor Company will erect a plant in this city. The site of this plant is in Victoria Square.

Edmonton, Alta.—A permit has been issued for the construction of a concrete and veneer brick plant. The plant will cost $10,000, and will belong to Messrs. Kohrg and Konig, Madgeburg, Germany.

Hamilton Ont.—A report states that the management of Pratt and Latchworth of Buffalo, N.Y., are considering the question of erecting a plant in this city for the manufacture of steel castings to be used on locomotives and cars. Mr. C. W. Sherman of Buffalo, N.Y., is at present interested in the matter.

Hamilton, Ont. — The management of the Canadian Drawn Steel Company will erect a brick extension to their present plant. Mr. Stewart McPhie, Hamilton, has prepared the plans. The cost is to be $5,000.

Hamilton, Ont.—Mr. Stewart McPhie has prepared plans for a new church to be erected by the congregation of the Congregational Church. The cost of this work will be $30,000.

Medicine Hat, Alta.—The ratepayers voted in favor of granting privileges to three new factories. They are porcelain factory, a glass factory, and a new steel works.

Moose Jaw, Sask.—The plans prepared for a new theatre, under the management of Mr. W. B. Sherman, show a building with a seating capacity of 1,500, and the cost of erecting the same is estimated at $100,000.00.

Moose Jaw, Sask.—The management of the Canadian City and Town Properties, Ltd., are about to erect a four storey building with foundations capable of supporting a weight of seven stories. It is to cost about $300,000.

Montreal, P.Q.—The authorities of Laval University have received a permit to erect a $60,000 dental college.

Nelson, B.C.—The Brackman-Ker Milling Company will erect a business building, 2 stories, 70' × 107'. The plans include one electrical hoist, a crusher and a complicated loading platform. The architect is Mr. Alex. Carrie.

New Westminster, B.C.—The new mill of the British Canadian Company will be well equipped from a mechanical standpoint; all the machines will be operated by individual motors. Eight boilers and suitable condensers will be included in the programme. There will be about four hundred men employed.

Oak Bay, B.C.—Plans for a new municipal hall have been prepared by Messrs. James and James, Victoria. The estimated cost for this work is $10,500.00.

Ottawa, Ont.—The municipal council are considering the erection of a market in the western portion of the city. Among the alderman in favor of the project are Ald. Forward and Black.

Port Arthur, Ont.—A report states that the Northern Islands Pulp Woods Company will erect a pulp and paper mill in this city.

Port Arthur, Ont.—An extension is being built to the Prince Arthur Hotel by the Imperial Construction Company The estimated cost for this work is $45,000.

Regina, Sask.—A report states that the management of the firm of Tees and Persse, of Winnipeg, are considering the erection of a warehouse in this city.

Rosetown, Sask.—A flax mill will be erected in this town of sufficient size to employ about 75 people. It has been proposed that the mechanical part of the enterprise be so constructed that an electric light plant may be operated from the surplus energy.

Rosetown, Sask.—A Presbyterian Church will be erected in this town in the near future.

Rosetown, Sask.—The management of the Union Bank are about to erect a brick office building in this city.

Saskatoon, Sask.—A company taking the name of the Dominion Sanitarium Company has been formed in this city with Mr. C. W. Underhill as president. The management contemplate erecting in the town of Watrous a large sanitarium and hotel. These will be erected on the shore of Lake Manitou. The cost of the buildings will be about $35,000, and they will be provided with mineral baths, sun rooms, etc.

Stratford, Ont.—The ratepayers will vote and decide the question of erecting a new market building and an extension to the present fire hall. Ald. J. W. Alles is interested in the matter.

Toronto, Ont.—The management of National Drug Company have had plans prepared for a new plant to be erected at the corner of Beverley and Phoebe Streets. Mr. W. W. Bole is interested in the project.

Toronto, Ont.—A report states that the Metropolitan Engineering Company of New York, N.Y., are about to establish a branch plant in this city for the manufacture of electrical meter protective devices. Mr. Noice is to take charge of this plant. This company is a branch of the New York Edison Company.

Toronto, Ont.—Mr. D. B. Williams, 124 Baldwin Street, will erect a four storey warehouse on Spadina Avenue. The plans have been prepared by W. C. Mason.

Toronto, Ont.—The management of the Imperial Optical Company have had plans prepared for a ten-story building on Wilton Ave. The material of construction will be reinforced concrete 42' × 55'. The cost is estimated to be $70,000.

Vancouver, B.C.—The management of the Hudson Bay Company are having plans prepared for a $1,500,000 building to be erected in this city. Mr. Burbidge, Stores Commissioner, Winnipeg, Man., will arrange the details.

Vancouver, B.C.—The municipal council have had plans prepared for a rock bunker to be erected in the eastern portions of the city. It is estimated that about 100,000 cubic yards of rock and gravel will be required by the city engineer's department during the coming season.

Vancouver, B.C.—Messrs. Alexander and Brown have prepared plans for a new church to be erected by the congregation of St. James' parish. It is to cost about $100,000. Rev. Mr. Eteson is interested in the matter.

Vancouver, B.C.—The number of tall buildings in this city will be increased by the new structure to be erected for the United Building Corporation. It is to be an eighteen story structure, 120 x 100. Messrs. James Coughlan & Sons are shareholders in this company and will supply the steel work. Tenders for the remaining portions of the work and for the various supplies will be called in the near future.

Weston, Ont.—The management of the Gurney Foundry are about to enlarge their plant by the addition of extra warehouse and foundry floor space.

Winnipeg, Man.—A report states that a large grain elevator will be erected by the Canadian Pacific Railway in this city.

BRIDGES, ROADS AND PAVEMENTS.

Brantford, Ont.—Work has been commenced on a new steel bridge across the canal near the municipal water works.

Fort George, B.C.—The provincial government and the Grand Trunk Pacific have agreed to share the cost of construction of a bridge across the Upper Fraser River near this point. The structure will be so designed that it may be used for vehicular purposes as well as for railway traffic.

Lethbridge, Alta.—The municipal council, upon the advice of the City Engineer, are reconsidering the question of pavement for the lanes of this city. The ratepayers are to decide the question of gas supply, and if the by-law is carried all the mains will be buried in the lane-ways.

Montreal, P.Q.—Tenders for park improvements amounting to $35,000 will be called by the Board of Control. This work will be carried out on the Champ de Mars. Mr. Todd, landscape artist and the city engineer have revised the plans for this work.

Montreal, P.Q.—The local council of the district of Greenfield Park will spend the sum of $23,000 on road improvements.

Province of New Brunswick.—The Department of Public Works are preparing to call tenders for the construction of a number of steel bridges.

North Vancouver, B.C.—Mr. J. L. Crawford has made an application to the municipal council for permission to erect a cable bridge across Lynn Creek, about a mile south of the municipal bridge.

Quebec, P.Q.—The National Battlefields' Commission are planning to construct an important park on the Plains of Abraham near this city. Sir George Garneau, Quebec, is the president of the Commission.

Revelstoke, B.C.—It is expected that steps will be taken immediately for the construction of a motor road between Banff and Windermere. The road after leaving Banff will follow up the Bow River to Castle Mountain, thence crossing the Bow will reach the head of Vermilion River, through the Vermilion Pass in the main range of the Rockies, and following the Vermilion to the Kootenay River, will parallel this stream to a point opposite the St. Clair Pass. Leaving the Kootenay, the road will cross the St. Clair Pass, and the descent will be made to the Columbia River via the famous St. Clair canyon and Hot Springs. Mr. W. W. Foster is deputy minister of Public Works for this province.

Victoria, B.C.—Ald. Stewart, of the municipal council, has suggested that the Rock Bay bridge be planked and made safe for traffic. If this is carried out the cost will be about $2,000.

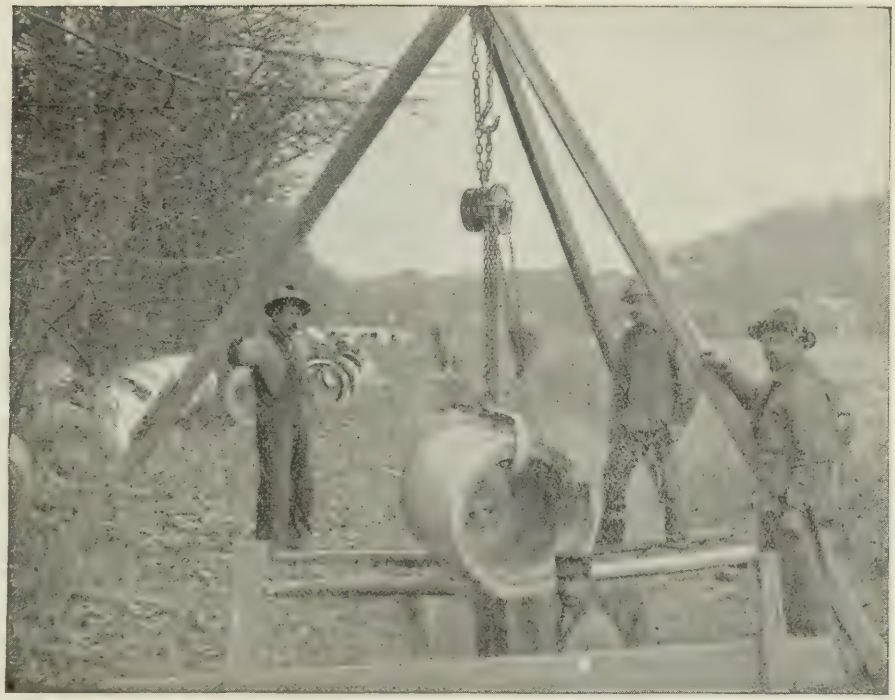
West Belleville, Ont.—The municipal council have ordered plans and specifications of a sewerage system prepared. James G. Lindsay, Engineer.

FIRES.

Hamilton, Ont.—Fire caused damage to the extent of $10,000 to the plant of the American Can Company.

Montreal, P.Q.—The warehouse and contents of Messrs. J. R. Walker and Company was damaged by fire to the extent of $25,000.

THE TRIPLEX BLOCK



A Triplex Block hung from a temporary rigging and used for laying pipe.

What is the Life of a Triplex Block?

WE don't know. Triplex Blocks built by the Yale and Towne Co. at the very beginning—twenty-five years ago—are still in actual use. The Triplex Block of to-day possesses greater lasting powers. With its steel parts—its chain superior to any other—its non-wearing gear movement—and the guarantee of a rigorous test before shipment under a fifty per cent. overload. It will outlast the man who buys it, no matter how young he may be.

CURRENT NEWS.

Brantford, Ont.—The municipal council will secure information with a view of reducing the damage caused by the recent flood. A plan of co-operation with other municipalities along the Grand River for the erection of storage facilities to prevent flooding is being considered.

Moose Jaw, Sask.—What might be considered a record in building construction has been performed in this city. The Robin Hood Mills were in operation after less than three weeks construction. The building is a seven story structure, 54 × 112.

Regina, Sask.—The municipal board of trade are taking steps to interest local business men in a large coal district in this vicinity. Mr. G. S. Porter, Regina, is interested in the project.

PATENTS.

The following is a list of patents recently granted to inventors in Canada. The list is furnished by Messrs. Featherstonhaugh & Co., Royal Bank Building, Toronto:—G. F. Brown, capstans; G. E. Goldstein, process of seasoning cigars; N. P. F. Death, illuminated signs; A. Hutchinkins, acetylene gas generating machines; G. Low, jr., push button electric switches; A. J. Lavoie, internal combustion engines; T. G. McGonigle, rotary engines; H. J. S. Martin, universal joints for fluid pipes; W. D. Seale, street indicators; T. M. Stewart, valves; A. B. Surarus, street indicators; A. Warrell, asbestos packing; J. Wright, lanterns.

THE AUSTRALIAN TRANSCONTINENTAL RAILWAY.

The government of this country will undertake the construction of this great work without the assistance of a contractor

British manufacturers of railway material will probably receive a considerable preference in all iron goods, and makers supplying internal combustion engines should obtain ample opportunities of demonstrating their ability to compete on favorable terms with American enterprises. Tenders are now being invited (in London and Australia only) for 135,000 tons of steel rails. They must reach the high commissioner's office in London by 2 p.m. on May 29.

About 2,000 men will be engaged on the work, 1,000 starting at each end. The two parties will meet in the middle of the route in a desert and will have to be supplied with water at enormous cost. The gangs will need to be accompanied by camel commissariat corps, and will for many months encounter grave risks. The line is to be 1,070 miles long, and in the opinion of Mr. King O'Malley, the Labor minister for home affairs, is the longest that has been ever undertaken as one job.

Within five years, Regina, Moose Jaw, and all the municipalities within the Soo Line district to Weyburn will be securing water in the Saskatchewan River by means of the Government system. Such was the prediction of Mr. T. Aird Murray, Toronto, consulting engineer, who is at present engaged by the Saskatchewan Government in connection with the proposed system of water distribution from the Saskatchewan River. The minimum daily flow of the Saskatchewan River is 1,800,000,000 gallons of water, and of that quantity all that will be required to serve the purposes planned by the Government will be 300,000,000 daily.

ORDERS OF THE RAILWAY COMMISSIONERS OF CANADA.

Each week on this page may be found summaries of orders passed by the Board of Railway Commissioners, to date. This will facilitate ready reference and easy filing. Copies of these orders may be secured from The Canadian Engineer for small fee.

16304—April 11—Directing C.P.R. to construct a station and appoint an agent at St. Francois de Salle, Que., and to file plans within 30 days showing side track.

16305—April 12—Directing C.P.R. on or before May 1st, 1912, to make Winchester, Ont., regular stop for trains 21 and 22.

16306—April 12—Naming express collection and delivery limits for town of Chapleau, Ontario.

16307—February 15—Approving C.N.O. Railway branch line to Bond St., and spur line into William St., Oshawa, Ontario.

16308—April 15—Granting certificate of correction to G.T.P. B.L. Co., correction location plan Regina Boundary Branch.

16309-10—April 13—Authorizing C.P.R. to reconstruct bridge No. 24.5 on its Macleod Sunbdivision and bridges 33.9 and 103.9 on its Edmonton and Muskoka Subdivisions.

16311—April 15—Approving location of Central Railway Company of Canada from Oka at mileage 31 to south side of highway at Carillon at mileage 45.61 (Montreal to Midland Line).

16312—April 3—Authorizing C.P.R. to cross with additional track, track of Street Railway at Pacific Avenue, Fort William.

16313—April 11—Directing C.N.R. to construct road crossing, etc., and grade roadway to loading platiorm, elevator and team track by 1st May, 1912, under penalty of $10.00 per day. At Polly, Sask., complaint, Board of Trade.

16314—April 12—Directing that Supp. No. 6 to G.T.R. Tariff C.R.C. No E. 1432 and Supp. 5 to C.P.R. Tariff C.R.C. No. E. 1286 may become effective June 1st, 1912, re Order 15844 January 27th, 1912, Consumer's Cordage Co., Ltd., Mtl.

16315—April 12—Directing C.P.R. to construct suitable farm crossing for F. W. Dodwell, of Austin, Man.

16316—April 13—Authorizing C.P.R. to construct spur for William Davies Co., Ltd., near Front and Overend Sts., Toronto, Ontario.

16317—April 13—Granting certificate of correction to G.T.P. B.L. Co., error in location plan Regina-Boundary Branch.

16318—April 13—Authorizing G.T.R. to construct siding into premises of Ridgeway Milling Co., Ltd., Ridgeway, Ontario.

16319—April 12—Authorizing G.T.R. to construct additional track across Pape Avenue, Toronto, Ontario.

16320—April 13—Approving revised location of C.N.R. (Calgary-Strathcona Branch) mileage 72.58 to 81.75, Alta.

16321—April 15—Approving joint agreement between C.P.R. and C.N.R. for joint facilities at Regina, Sask.

16322—April 15—Approving location of C.P.R. station to be erected at Cutknife, Sask.

16323—April 12—Directing C.N.O. Ry. to install electric bell at crossing, Manvers Road, 1st highway east of Bowmanville Station, Ont. Complaint, James Veal.

16324—April 15—Directing Dominion Atlantic Rly. before 1st July, 1912, to install electric bell a short distance east of Berwick Station, N.S. Complaint, John Buchanan. 20 per cent. from Railway Grade Crossing Fund.

16325—April 11—Approving location of Campbellford, Lake Ont. & Western Ry. Co., Glen Tay, to Cobourg Line, from mileage 88.21 (from Glen Tay) to mileage 106.17, and to take possession of certain portions of G.T.R. right-of-way.

16326—April 13—Approving location of James Bay & Eastern Rly. (C.N.R.) station grounds at Demeules, Que.

16327—April 15—Authorizing C.P.R. to construct additional tracks across highways at Tantallon, Esterhazy and Killaley, Sask.

16328—April 12—Re King St. crossing C.P.R. at Walkerton, Ont., crossing to be widened; bell question reserved for further consideration of Board.

16329—April 15—Authorizing G.T.P. Ry. to construct spur for Edmonton Portland Cement Company, Ltd., near Edmonton, Alta.

16330—April 15—Authorizing C.N.O. Ry. to construct bridge across the Muskegogama River at mileage 94, from Sudbury Jct.

16331—April 18—Amending Order No. 13357 of March 30, 1911, as follows:—"Express Companies are absolved from making delivery under the terms of this Order where the condition of the roads or streets is not in a reasonably passable state for vehicular traffic."

16332—April 17—Authorizing M.C.R. to reconstruct bridge No. 180.52 over Grand River.

16333—April 16—Approving character of work known as "the Hill Drain" across Pere Marquette Ry. being constructed by Twp. of Aldborough, County of Elgin, Ont.

16334—April 16—Approving location of C.N.Q. Ry. station at Cap Sante, Que.

16335—April 17—Approving Plan "B" in connection with grade at Jackson St., Bethany, Ont., C.P.R. (G. B. & S. Ry.), and rescinding Order 16115 of March 13, 1912.

16336—April 17—Approving location of C.P.R. station at Claresholm, Alberta.

16337—April 17—Authorizing C.P.R. to construct 9 spurs for Birds Hill Sand Company near Winnipeg, Manitoba.

16338—April 13—16339—April 15—Approving location of G.T.P. B.L. Co. stations to be known as Bremen and Meacham, on its Prince Albert Branch; and Stony Beach and Keystown, on its Regina-Moose Jaw Branch.

16340—April 17—Authorizing G.T.R. to construct spur for Barber-Ellis, Ltd., in city of Brantford, Ont.

16341—April 17—Directing C.P.R., G.N.W., and C.N.R. Telegraph Companies to deliver telegrams within corporate limits of city of St. Boniface, Man., free of charge.

16342—April 18—Authorizing G.T.R. to construct spur for Connell Anthracite Mining Co., Ltd., Carlaw Ave., Toronto.

16343—April 18—Approving plans of C.N.R. Standard Portable Station for use on Eastern Lines.

16344—April 18—Approving location of James Bay & Eastern Ry. (C.N.R.) station grounds at Chute A. L'Ours, Que.

16345—April 18—Dismissing application of Stockton & Mallinson, Regina, Sask., re Dominion Express rates.

16246—April 18—Authorizing city of Fort William to construct Pacific Ave. across C.P.R.

Volume 22. Toronto, May 2, 1912

DISCHARGE CAPACITY OF SAFETY VALVES.

The February issue of The Journal of the American Society of Mechanical Engineers contains the results of some tests made upon Crosby safety valves by Prof. E. F. Miller, of the Massachusetts Institute of Technology.

The tests were made to determine the discharge capacities of 3-and 3½-in. locomotive pop safety valves, Fig. 1, at varying lifts under 200 lb. steam pressure and of corresponding sized inspector valves of the flat-seated and bevel-seated types, Figs. 2 and 3, under 100 and 150 lb. steam pressure. In each case the spring was released by a spindle and the valves were set a definite distance from their seats. In order to avoid unequal expansion, the metal of the valve body and that of the spindle were made the same in the case of the locomotive valves; and the difference in expansion was similarly obviated, as far as possible, in the inspector valves.

Connection was made to the boilers through a 5-in. line and all the discharge was condensed in a surface condenser and weighed.

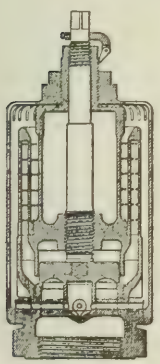

Fig. 1.—Muffled Locomotive Type.

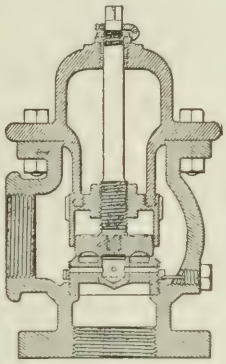

Fig. 2.—Flat-seat Inspector Type.

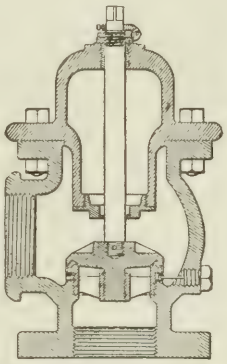

Fig. 3.—Bevel-seat Inspector Type.

The additional lift due to the yielding of the metal because of the presence of steam pressure on the under side of the valve was determined in each case by placing the valve in a testing machine and subjecting it to a load corresponding to the steam pressure, the movement of the valve with relation to its seat being measured by a micrometer caliper.

The results of the tests are plotted in Figs 4 and 5. As a result of these tests the muffled locomotive pop safety valve is now made as shown in Fig. 6.

In an addendum to Prof. Miller's paper, Mr. A. B. Carhart, of the Crosby Steam Gage & Valve Co., makes some general comments regarding pop safety valves. Quoting in part these remarks, he says:

"Pop safety valves were invented about 60 years ago and about 30 years later were perfected in this country and went into general use. Broadly, the invention consists of an addition to the disk of the valve so that when the valve is closed the addition is excluded from the action of the steam. However, when the valve opens the outflowing steam acts upon it and with the initial force causes the valve disk suddenly to rise higher and the spring to be compressed more than it would be with a force due to the steam pressure acting upon the original area only.

"The bevel-seated valves (Fig. 3) generally have this additional area at the periphery of the disk, outside of the seat, where it forms a chamber with a more or less contracted outlet at the extreme lip of the valve, through which all the steam must pass after escaping over the seat before it reaches the open air.

"As the seat is formed at an angle of 45 deg. to the vertical, the passage between the seat and the disk faces, when the valve opens, is diagonally upward, and what is called the lip of the valve is so related to this seat that the

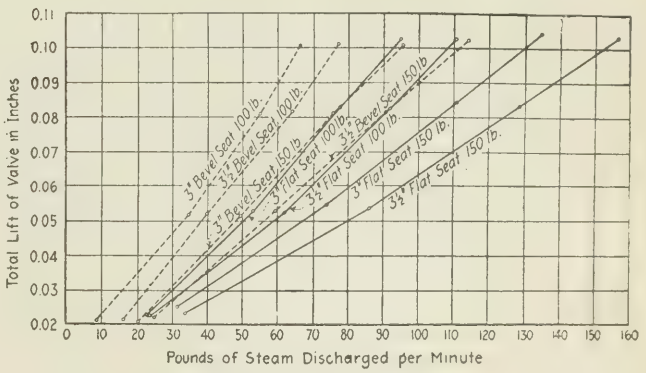

Fig. 5.—Results of Tests on Inspector Type of Pop Safety Valve.

steam is forced to impinge directly upon it before being deflected downward toward the bottom of the chamber where it reacts. The effect of the impact upon the lip of the valve is increased by the expansive force of the steam acting in the lip chamber on account of the partial and momentary

confinement before it passes into the open air. Sometimes openings are made through the lip or in the floor of the chamber, through which the steam escapes and so reduces the pressure within the lip chamber that the valve disk will not lift too high.

"Annular valves have the additional area located at the centre of the disk and within the outer seat. This area is excluded from the action of the steam when the valve is closed, by means of an inner seat, but is acted upon directly by the steam when the valve opens. The disk is simply a flat cover for the valve base and has two concentric seats

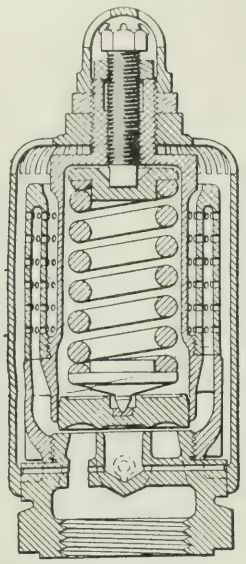

Fig. 6.—Muffled Locomotive Pop Safety Valve as Now Made.

in the same horizontal plane. The central area of the disk, which is not exposed to the steam when the valve is closed, covers a well which communicates to the outer air through four hollow arms radiating from it out through the sides of the valve body.

"When the valve opens, the steam is discharged directly across the outer flat seat, and there is also a separate additional flow over the inner seat into the central well and out through the four hollow arms. The openings through these arms are controlled by a sleeve, threaded on the valve body, so that it may be turned upward or downward as desired. If it should close the open ends of the hollow arms, preventing the escape of the steam through the central well, the reactionary effect upon the disk to lift it against the spring would be greater than if the openings from the well were unobstructed; and by locating the sleeve at intermediate points the lift of the valve can be varied.

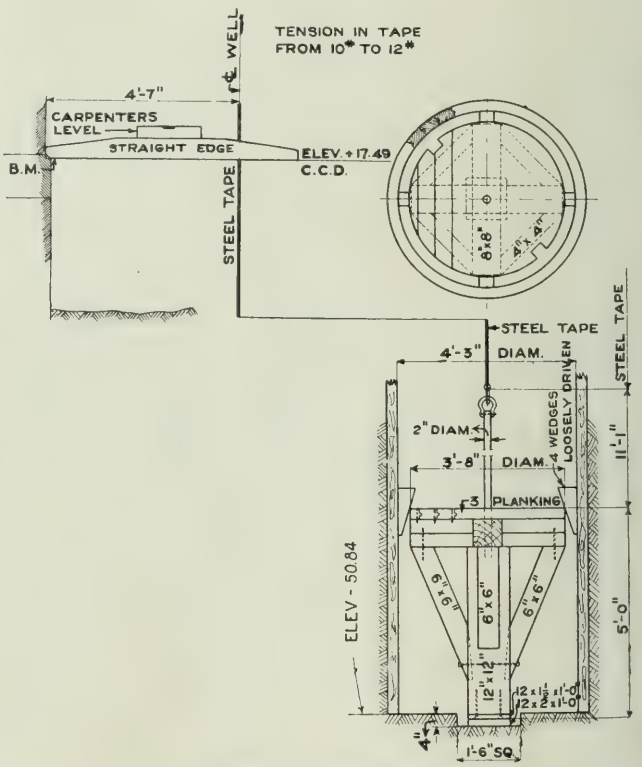
"In bevel seated valves the disk is ordinarily guided vertically so that it will return properly to its seat when the valve closes, by means of four or more radiating wings or vanes extending from the face of the disk in the steam space and bearing against the sides of the inlet or throat of the valve. But in the annular valve there are no guides or wings attached to the disk, which is simply a flat member having the truncated form of the central zone of a sphere.

"This is placed in a cylindrical chamber outside and above the steam space, and there it lifts or moves freely as acted upon by the steam against its lower face and by the opposed spring which presses upon it at its centre. The contact between the chamber and the spherical part of the disk is the least possible, which permits universal movement of the disk without possibility of cocking or sticking, and yet insures that the disk will return accurately upon its seats when the valve closes."

TESTS ON HARDPAN.

Hardpan and rock underlie the clay bed on which a large portion of the city of Chicago is located. Deep building foundations generally are carried down to one of these materials, the standard construction being wood curbed circular wells excavated down through the clay bed and filled with concrete. No tests are recorded as having been made on the bearing power of Chicago hardpan, despite its frequent use as a foundation bed, until the construction of the Cook County Hospital was undertaken. The following is an abstract of discussion before the Western Society of Engineers, by Mr. Frank A. Randall, chief engineer for Morey, Newgard & Co., who are engineers for the work.

The preliminary borings were made 6 ins. in diameter for about 30 ft. in depth and 3 ins. for the balance of the depth. These borings show below yellow clay a thick stratum of "soft sticky clay" down to about 37 ft. below ground level, with solid blue clay running into "hard clay and gravel" down to hardpan at an average of about 47 ft. below ground at the south end and 56 ft. below ground level under the main building. The main building is about 550 ft. long by 70 ft. deep, and has four pavilions, 40 ft. by 200 ft., projecting from the rear. The ground area covers



Details of Apparatus.

about 75,000 sq. ft. Rock was shown according to borings at elevations —67 and —89.5 in two cases, but the latter figure was assumed to be the more reliable. Because of the great difference in cost between caissons to hardpan and to rock and the size of the loads to be carried, it was decided to use hardpan caissons, provided the test showed a satisfactory layer of hardpan, with rock in the same relative location as in the preliminary borings. Bids were received also for pile foundations, but as the prices for these amounted to some $13,000 more than those for caissons, the latter were used. The caissons tested were carried on down after the test to determine the thickness of the hardpan stratum and the depth to rock. The hardpan was found to be from 15 to 20 ft. in depth, with hard clay

and gravel beneath, and rock was found at elevation —90, below ground level.

The test was made in caisson No. 163, which was 4 ft. 3 ins. in diameter and 64.7 ft. below ground level, or at an elevation of —51.17 ft., Chicago City Datum.

The apparatus consisted of a loading platform, extra bearing plate, wedges, 12-ft. rod, steel tape, straight edge, carpenter's level, platform scale, 13 tons of pig iron and tripod with drum for raising and lowering pig iron. The apparatus as used is shown on the screen.

The timber loading platform consisted of a central post 12 x 12 ins., with two 8 x 8 pieces crosswise at the top and covered with 3-in. planking. The post was shod with a steel plate 12 x 12 square by 1½ ins. thick. The extra bearing plate was a steel plate 12 x 12 x 2 ins., and was used beneath the loading platform, resting directly on the hardpan. Four wedges were used to steady the platform, loosely placed, as shown in the sketch. (See Figure.)

The steel rod, 2 ins. in diameter and about 12 ft. long, sat in a babbitted hole, 14 ins. deep, in centre of the platform. To the upper end of this rod the steel tape was attached. The rod projected up through the pig iron and thus permitted the tape to be unfastened while pig iron was being lowered into well. The tape was an ordinary steel tape, graduated to feet and inches.

The straight edge was as shown in detail and was found perfect when tested by reversal of the carpenter's level, which latter was of more than ordinary sensitiveness and accuracy. The platform scale was obtained from the hospital and was found correct by checking same against known weights. Thirteen tons of pig iron was on hand, but only about twelve tons of this was used, this amount being considered sufficient by all concerned. The tripod was of ordinary construction, such as was used on the work for excavating and filling wells.

Water had been standing in the well for several days and this water was removed Friday morning, on Jan. 26th. It is also necessary to deepen well between 2 and 3 ft. in order to remove earth which had been softened by the standing water.

As soon as this was done a hole 4 ins. deep and about 18 ins. square was dug in the centre of the bottom of the well and the bottom carefully cleaned and leveled. The extra bearing plate was then set, leveled and centred in this hole. It had been intended to enclose the central hole in a wooden box of four sides, to be backed up with concrete and clay to keep all water out of hole, but water sprinkled in from above directly into hole, so this had to be abandoned.

At 5.30 p.m. (Friday) a start was made at lowering the platform, but due to the fact that the platform had to be rotated so that notches would clear lugs in rings of lagging, the platform was not in place until 7.25 p.m. Platform was raised and dropped several times onto bearing plate in order to force out as much as possible of the earth which had sloughed off into hole.

Loading of pig iron onto platform was begun at 8.40 p.m. Pig iron was weighed out in batches averaging about 600 lbs. as fast as lowered and placed. The pigs were of varying size and were placed in layers of stretchers and headers radiating toward centre and bonded together in addition by small pieces of wood as deemed necessary. No pig iron was placed closer than 1½ ins. of the lagging, the pile when completed being about 4 ft. in diameter and a little over 12 ft. high.

Five readings were taken at intervals, the method being as follows: A permanent bench mark was established upon water table of present hospital building, within 4 ft. 7 ins. of the centre of well. Elevation of B. M. = + 17.49 C. C. D. This was leveled across from the B. M. to the tape by means of straight edge and read tape to the nearest 1/16 in.

The readings taken were as shown in the following table:—

Time.	Load.	Reading Ft.	Ins.
Jan. 27—			
12.15 a.m.	4,079	52	4½
6.30 a.m.	10,887	52	4 15/16
9.35 a.m.	17,362	52	4 15/16
12.00 a.m.	23.189	52	4 15/16
Jan. 28—			
9.00 a.m.	24,189	52	5⅛

The well tested was a very wet one, due to the fact that two sewers, 6 and 9 ins. in diameter, were cut into in sinking. This well was the wettest one encountered. From about 12 ft. to 14 ft. of water stood in the well during test.

When the platform and bearing plate were removed it was noted that ⅛ in. of compressed earth adhered to top of loose bearing plate.

The caissons were designed for 44,000 lbs. per square foot at top of caisson and were belled twice the diameter of the shaft. Considering hardpan at 60 ft. below the surface, the unit designing load on the latter is about 13,300 lbs. per square foot, or about one-half of the test load. The test load was applied to 1 sq. ft., while the area of the well was about 16 sq. ft. It is not known how much bearing value of the hardpan is increased when the caisson is completed and the well completely filled, but it must be a very material increase. The results indicate that the hardpan stratum will carry the load designed for with safety. Doubtless a portion of the settlement was due to the compression of the loose soil which sloughed in as platform was being lowered.

The test was conducted by Morey, Newgard & Co., under the personal supervision of the author. The W. J. Newman Company, contractors for the caissons, supplied labor and material. The total cost of the test was $400.

GROUND WATERS.

Underneath the surface of the earth is a vast body of water which may be likened to an underground lake, called the ground-water. It is into the upper surface, frequently termed the water-table, of this ground-water that wells are sunk for domestic and other water supply. In "The Water Powers of Canada," issued by the Commissioner of Conservation, it has been estimated that, if all the moisture resident in the upper 100 feet of the ground were collected, the amount would be the equivalent of a lake of water some 17 feet deep; that is, the equivalent of about seven years' rainfall. During periods of plant growth this ground-water yields, chiefly by capillary action, part of its moisture to the plants; and then, during seasons of excessive rainfall, is again replenished from the rainfall. The annual fluctuation in level of the ground water-table under normal conditions is but a few inches.

The underground waters of Canada, in some places, are now being tapped and wasted. State after State, in the United States, has enacted laws designed to conserve the underground waters.

BRITISH ENGINEERS ARRIVE.

The engineering party, under the direction of Mr. Henry W. Crees, of London, Eng., arrived in Montreal on Saturday, April 27th last, by the Canadian Northern liner Royal George.

CONCRETE FENCE POSTS.*

By L. J. Hotchkiss.†

A paper on this subject should include a description of the more important types of posts so far developed and a discussion of their merits. It has not been possible, however, in the time available to get together the information for such a paper. I shall, therefore, confine myself to the one post with which we have had experience on the Burlington Railroad.

The machine was set up in 1911 and a small number of posts, about 6,000, were made. It has now been put in operation for this season's work, but has been running only a few weeks.

In going into a new proposition of this kind there are always some delays in getting the plant organized and operating smoothly. We have had the usual amount of trouble along this line and have not yet been able to determine how cheaply we can make posts.

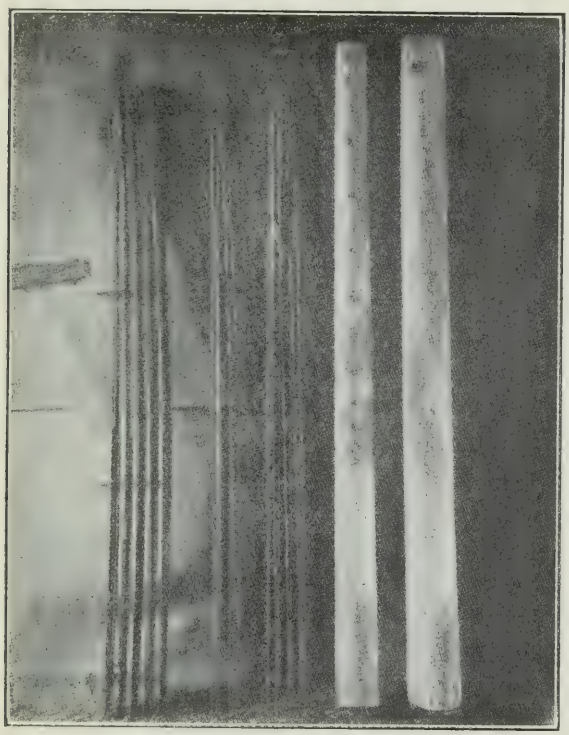


Fig. 1.

With the plant as now arranged, the machinery is all enclosed in a frame building 28 feet by 94 feet. The concrete materials are brought into the house at the rear of the post machine and storage room is provided in the house for a considerable quantity of material so that it may be warmed for use in cold weather. The drawing shows piles of stone chips and sand. The chips, or screenings, were tried experimentally because they could be obtained at practically no cost. They were not satisfactory, however, as the concrete seemed to lack strength and the posts were not smooth. A mixture of sand and screenings was tried, with somewhat better results.

A supply of small gravel containing a large proportion of sand was then obtained and this material is superior in every way to the others mentioned. It can be obtained in any desired quantity and at a moderate price, and will undoubtedly form the standard material for this work.

As the posts are taken out of the machine they are placed on a push car standing on the track shown at the upper part of the drawing. In cold weather they are stored in the house for a few days before being taken out of doors. In warm weather they are stored indoors or out, as may be most convenient. They are removed from the moulds a day or two after being made and stored against the heavy timber racks until ready for shipment or until they are strong enough to be corded up in piles. For a week after being removed from the moulds they are thoroughly wet down once a day and in summer protected from the sun by tarpaulins.

In the rear of the post machine is the measuring machine, consisting of two hoppers for gravel and cement. A small conveyor operates in the bottom of the hoppers and dumps the materials in proper proportions into a boot. Here it is picked up by a bucket elevator and taken to the mixer at the top of the machine.

The mixer is a large shallow bowl with a concave bottom. A number of paddles rotate in this bowl and mix the concrete, water being sprayed on it from a perforated pipe. In the bottom of the mixer is a hole which is closed by a form of gate valve, and through which concrete is discharged into the moulds below.

Under the mixer is a turntable arrangement which holds four moulds at a time. There is also a jolting device so arranged that as each mould is being filled it is alternately raised and dropped through a distance of perhaps an inch. This tamps the concrete effectually and insures a smooth finish.

Two forms of reinforcement are used. The one which was used last year is made from sheets of No. 24 or No. 26 black iron. The sheets are passed through a machine which cuts out half the reinforcement for a post at each pass. At the same time long slits are cut in the iron and the edges of the slits turned up. Two strips of this material are inserted in the mould to form the reinforcement for one post.

It has not been altogether satisfactory, however. If the concrete material is a bit too coarse it does not run through the slits readily and the posts are not well filled out. The reinforcement also has a tendency to get out of place during filling and is occasionally found to be near the centre of the post instead of at the outside.

Fig. 1 shows an improved style of reinforcement now coming into use. It is made entirely of wire, each wire being crimped to insure a bond with the concrete. The material is shipped knocked down, as shown at the left of the photograph, and is quickly made up into the cages shown at the centre. The wires may be of such size as needed to give the required strength and the concrete flows around it without obstruction.

Fig. 2 illustrates the post and also the method of fastening the wires to the posts. By reference to the cross sections it will be seen that there is a groove in one side of the post and that the holes through the posts are offset, being smaller on the grooved side of the post. These holes are of such a size that a ten-penny nail can be pushed through them until the head brings up against the offset. The fence wire is then placed on top of the projecting end of the nail and the latter bent up around the wire until its point is curled back into the groove, thus holding the wire tight against the post. This work is done with a small tool which is shown in successive positions in the upper part of the drawing. This is a very cheap and effective fastening. One difficulty has developed in connection with it, however.

* A paper before the Eighth Convention of the National Association of Cement Users.

† Assistant bridge engineer, C. B. & Q. Railroad, Chicago.

The pins with which the holes through the post are made are necessarily all alike. The post is tapered. As a result the small part of the hole through which the shank of the nail passes is longer nearer the bottom of the post than at the top. Consequently the nails at the top stick out too far and when bent around the fence wire the points strike the bottom of the groove and make it difficult to pull the wire up close to the post. A tapered strip is now attached to the outside of the mould under the heads of the pins. It is of such a thickness that the offset in the holes is a uniform distance from the grooved side of the post and all nails project the correct distance to insure proper fastening of the wire.

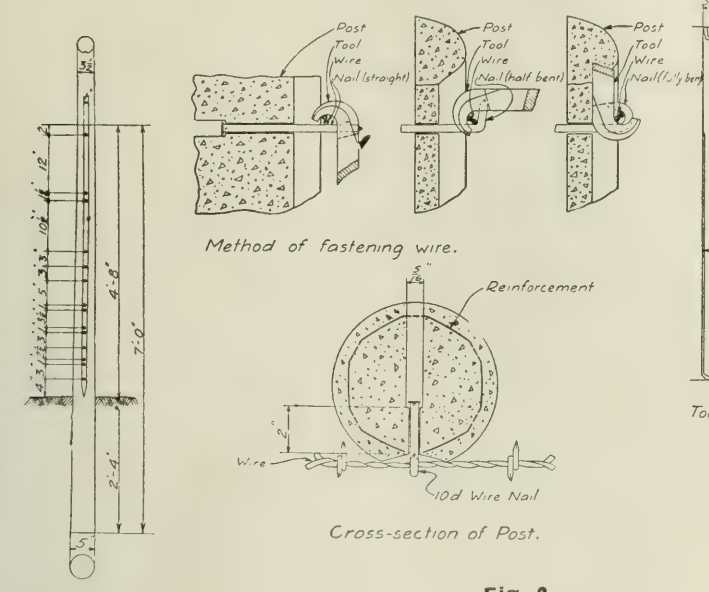

Fig. 2.

Another method of fastening the wires is shown in Fig. 3. It will be seen that the hole through the post is of uniform diameter and a piece of wire with one end doubled back is substituted for the nail. The other end of the wire projects at the back of the post, and by means of the tool shown this is twisted up into a corkscrew. The fastening has not yet been tried out in practice, but its use on an experimental post seems to indicate that it is simple and efficient. It was designed for use with a round post having no groove. As our moulds are all grooved, we expect to use it with this type of post.

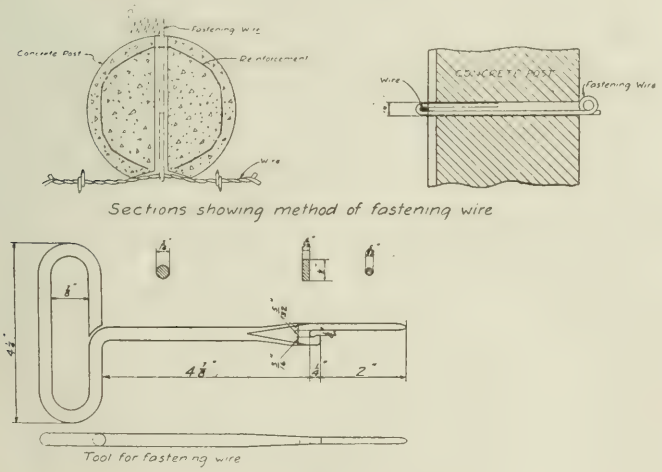

Fig. 3.

The annual consumption of cedar posts on a large railroad runs into hundreds of thousands. Rot and grass fires eat them up, unruly steers break them off and the ever-present hobo finds them good fuel for his campfire, provided he can get them without too much labor. None of these agencies except the steer have any effect upon concrete posts and there is a large field for their use. They must be produced cheaply and in large quantities, however, and must be strong enough to stand rough handling as well as to resist the forces which come upon them in service.

The machine we are using will turn out 400 posts per ten-hour day. As previously stated, we do not yet know how low the cost can be gotten, but we are satisfied it can be made such that they will compete with cedar posts.

It must not be expected that a concrete post will stand the degree of rough handling which can be given a wooden post. It is easy enough to make them strong enough to withstand the loads which come upon them in a fence and they are in no sense fragile. But some degree of care must be used in handling them or cracked posts will result.

If they are used with the same degree of care and intelligence required in any other form of permanent construction it is very certain that most satisfactory results may be obtained.

TRACK ELEVATION AT MONTREAL.

Montreal is still awaiting an arrangement with the Grand Trunk Railway regarding the elevation of the company's tracks. It is now at least three or four years since the matter was taken up seriously, it having been in the realms of discussion for years previous to that. Some few years ago, however, the company and the city got as far forward as to discuss plans. Plans were even drawn up, and, if not actually approved of, were at least given favorable consideration. At the present time, the railway passes into the city from the west on a surface track, the crossings being very numerous, and being on a level with the street. The track coming up from the south crosses the Victoria Bridge and joins the track entering the city from the west. The work of elevating the tracks will naturally be very costly, and this may, to a considerable extent, explain the many years' delay which has taken place in carrying out the work to completion.

The whole subject was to have been taken up at the last meeting of the Railway Commission, held here a few days ago. The city had previously consented to contribute $2,000,000 towards the work, and it was generally thought that the railway regarded this as sufficient. In fact, it was generally understood to be the sum originally asked by the railway. Now, however, the Grand Trunk expresses its dissatisfaction at the amount, the work being much more costly than previously supposed. The public do not quite understand why the city should pay anything towards elevating railway tracks, but the principle seems to have been accepted by the city council. The Commission will deal with the matter at its next meeting.

INVESTIGATION AND CARE OF RETURN RAILWAY CIRCUITS.*

By E. E. Nelson.

In the early days of electric railroading it was supposed that the earth had zero resistance on account of its area being practically infinity. This was soon found to be far from the truth. As the number of cars operated increased the drop in voltage become so large that it was found impossible to move the cars, and means had to be taken to help out the earth return. In some cases a copper return was laid in between the tracks and frequently joined to the rails. But with the heavier loads and greater distances, the cost of this becamt prohibitive. Means were then taken to utilize the great carrying capacity of the rails themselves. This was done by bonding the rail joints together by means of copper wire fastened into holes drilled in the rails. This work was usually left to the track department who assigned it to the cheapest paid workmen. These men did the best they knew how, but it was a better mechanical than electrical job which was put out by such men. Now it is intended by all electric railways to use the track rails for the return of current from the cars to the power house. But on account of the rails being in close contact with the ground such railways use both the rail, ground, and material buried in the ground for their return circuits.

When a steam engine, electric generator, motor, or similar machinery breaks down, the electric railroad manager is notified in a very forcible manner, but when his rail bonds are in poor or only fairly good condition, there is no startling notification. Perhaps he notices that the power at the cars is usually weak and he notifies his power house that they are not holding up the voltage. Or he jumps to the conclusion that his feeder capacity is too small a section, and on the spur of the moment strings in additional feeders without any great benefit. Or possibly he may notice at the end of the month or year that the kilowatt-hour per car-mile on his road is much larger than that expended by his associates. To remedy this he may get after his transportation superintendent and tell him that the motormen are very wasteful with the power. All these troubles in addition to many more that might be mentioned are likely to be caused by poor track bonding.

It is realized by practically all railway managers to-day that unless extreme care is taken with the return circuits the losses in these circuits will become enormous; even enough to make the difference between a road paying and not paying dividends.

Rail steel is a very good conductor. Weight for weight it is about one-seventh as good a conductor as copper. A copper wire bar weighing 1 lb. per yard has an area of about 110,000 cir. mils, hence an iron bar weighing one pound per yard is equivalent to about 16,000 cir. mils copper. The resistance of 16,000 cir. mils copper is approximately 0.6 ohm per 1,000 feet. Therefore, the resistance of a steel rail in ohms per thousand feet is equal to 0.6 divided by the weight of the rail in pounds per yard, and the carrying capacity of the steel rail in circular mil copper equivalent is equal to 16,000 multiplied by the weight of the rail in pounds per yard. Seventy pound rail, which is the size commonly used in street railway work, therefore, has a carrying capacity equal to 1,120,000 cir. mils copper. In order to use this great copper equivalent carry capacity, it is only necessary to bond the rails themselves electrically together. This is now usually done by the following types of rail bonds: expanded terminal copper bonds; soldered, brazed or welded copper bonds; amalgam bonds; and by means of welding the rail joints themselves together by either a cast, electric or thermit weld.

A rail bond has its greatest resistance where it comes into contact with the rail. If the steel has a resistance of seven times that of copper, the area of the contact between the bond and the rail should be seven times the area of the bond. In the expanded terminal copper bonds using the ordinary T-rails, it is possible to get about ten times the contact surface of a 250,000 cir. mils bond, but as moisture soon creeps in and corrosion takes place, the effective contact surface is soon cut down.

The greatest trouble with all rail bonds is that enough care and attention is not used in their purchase and installation. Copper rail bonds should be flexible enough so that movement of the rail will not damage either the bond or the contact surface between the bond and the rail. An ideal place for installing bonds is underneath the fish-plates, fastening the bond terminal into the web of the rail. In this location the bond can be made very short, usually not over 10 in. The shorter the bond the less the resistance of the track return is increased at the joints. Also in this location the bond is protected from copper thieves. It is usually a good plan to keep the area of the bond as large and its length as short as possible. Another very important thing to look out for is that the fish-plates do not pinch the copper strands of the bond. If these strands are pinched by fish-plates, the expansion and contraction of the rail due to changes in temperature will soon cause some of the strands of the bond to break in two, and the carrying capacity of the bond is by this means considerably lessened. Some roads use two bonds on the same joints in order to insure a path of good conductivity in case of failure of a single bond. Where double bonding is not required to keep the heating of the joints down, this practice is not recommended. One of the two bonds is very likely to have imperfect contact and the road has the service of only single bonding at the expense of double bonding, so that it is better practice to install a single bond of sufficient capacity and to maintain it.

The capacity of a bond will be determined by the heating of the bonds at the contact. For contact surfaces about 100 amperes per square inch is good practice. A 4/0 bond has a contact surface of about 1.5 in., so that about 150 amperes may be allowed for each 4/0 bond. The fish-plate well bolted up will carry about 50 amperes. Hence 400 amperes is a load for two rails bonded with single 4/0 bonds. Of course, such a track will carry considerably more current but there will be heating at the joints and the life of the bond will be very much lessened in the same way that the life of any machine is lessened when it is overloaded. If more current has to be carried, a larger bond should be used. If this is not possible, double bonding will have to be resorted to.

When the bonding supervisor is called upon to order bonds for a piece of new track, he frequently finds that the rails and fish-plates have already been ordered and possibly are on the ground. The fish-plates selected have frequently no provision made for a bond placed underneath them on the web of the rail, so that he is forced in ordering bonds to use bonds of an undesirable type. Fish-plates ordered for an electric railroad should have as large a space as possible between the plates and the web of the rail. Extreme care should be used in selecting bonds to see that the strands of the bonds are not pinched by the fish-plates. For this purpose full information should be given the bond manufacturers of the size of the rail, fish-plate and bolt

* A paper read at the seventh annual convention of the Southwestern Electrical and Gas Association, Houston, Texas.

spaces. This is best furnished by means of blue-prints of the rail sections, and fish-plates used. These blue prints can easily be obtained from the rail joint manufacturers.

Too much care cannot be taken in the way in which bonds are put on. In drilling the holes in the rail, oil under no circumstances should be used, because it is impossible to wipe all of this oil out of the hole, and a thin film will be left in, which will cause a high resistance contact, which in turn will cause heating. In a short time the increase in the resistance of the bond will be so much that electrically the bond is of no use whatsoever. The writer has not found any trouble in having holes bored dry, but if some sort of a lubricant is demanded sal soda and water is recommended. After such use, however, the hole should immediately after it is drilled be very carefully wiped out with a clean rag. Without any delay the bond should be installed so that the contact will not be damaged by rust. Before installing the bonds, the bond contact terminals should be polished with emery cloth. When using a screw compressor a very small amount of flake graphite mixed with oil placed in the punch hole on the bond head will prevent the compressor plunger from cutting the bond and will enable the compressor screw to be turned up much more readily. Care should be used, however, that none of this graphite and oil is gotten on the contact surface. The writer has found that the wrenches furnished by the makers for screw bond compressors do not have enough leverage power. It is his custom when a new screw compressor is received to have the length of the wrench increased to five feet. He also instructs the compressor man by all means, if possible, to break the compressor by turning up on the wrench when compressing bonds in the rails.

Care should be used in sharpening the drill bits used for boring bond holes, as a drill bit not properly ground will drill a hole considerably larger than it is supposed to. For this reason bonds expanded by means of driving a steel pin into the centre of the bond head are, in the writer's judgment, very undesirable. These steel pins do not allow for various sizes of holes drilled with different bits. Men to work on the bonding gangs should be selected with great care. Only such men should be used as are able to realize the importance of bonding and are able to be taught how to install them. They should be conscientious enough to do the best they can whether or not the boss is watching them.

Immediately after a bond is installed and it is covered up by the fish-plate, it is impossible to tell whether or not a first-class or only a fair job has been done. Poor workmanship will show up in six months or a year's time. Bonds which extend around the outside of the fish-plates are undesirable, both on account of their great length and their danger from copper thieves. Soldered, brazed, and welded bonds have been used to a considerable extent, but it is very difficult to get them properly installed with the kind of labor usually available. The electric brazed bond, however, is desirable, but its installation necessitates expensive machinery. Amalgam bonds give good results for temporary bonding, but do not last for any great length of time. Welded joints can only be used in paved streets where the rail is buried. This prevents sudden changes in temperature, and also prevents buckling due to expansion. This type of joint is to be recommended where the full carrying capacity of the rail is required and the tracks are buried in paved streets.

Railroad crossings and all track special work should be bonded by means of copper cable extending around them, unless the crossings and special work are of the solid weld type. The carrying capacity of this cable should be the same as the rail itself, as on a bolted up crossing or special work very little dependence can be placed upon the rails themselves carrying any current. If desired, old rails, well bonded into the tracks on each side of such special work, can be used to good advantage for special bonds. On all track, attention should be paid to having the fish-plate bolts well tightened up, for, if the joints are loose mechanically, the bonds will soon be damaged so that they are of no practical use.

If there is a great deal of current leakage from the rail to the ground, it will be found that the base of the rail will wear out, due to corrosion, much faster than the ball. In fact, if this leakage is too much, the base of the rail will be damaged in a short time so that it cannot be spiked to ties. Salts will increase this corrosive effect. It has been found that ties treated by the chloride of zinc process in order to prevent the ties from decaying, will, when used under rails carrying electric current of 100 to 200 amperes, cause the base of the rail to be eaten away in three years' time, so that the rails are practically useless. This happened under the writer's observation on tracks that were both well and poorly bonded. The poorly bonded track corroded much faster than the well bonded track.

An idea of how much current sometimes leaks from an electric railway track, is given by an observation of the amount of current given up to a power house negative bus by means of a 500,000 cir. mils cable connected to telephone lead sheathed cables about 4,000 feet away from the power house. The output of the station at the time was 1,500 amperes. It was found that 350 amperes of the return was being picked up on the telephone lead sheathed cables buried in an underground conduit, and was returned through the 500,000 cir. mils ground wire, thus amounting to over 20 per cent. of the current return.

In investigating railway circuits, it is well to keep graphical records of the power house output, and also to place graphical recording meters at various places on the system between the rails and water pipes. From these records values can be gotten of the power house output and at exactly the same time the leakage from the rail to the ground can be obtained. All of these values can be placed on a map and different values of the leakage for different outputs of the station and different shiftings of the location of the load on the system can be studied. Thus a good idea of what is necessary to do in order to cut down leakage to a minimum from the track to the ground can be decided upon. At any rate, the track bonding should be kept in first-class condition. For this purpose the bonding should be carefully done in the first place and once a year all rail bonds should be tested by reliable men. All defective bonds should be repaired. It is common practice to compare the resistance of a rail joint with the resistance of a length of the same kind of rail. That is, the resistance of the joint would be said to equal two, three, or four feet of rail, as the case might be. There are various bond testers on the market which will give this reading direct. Most of them rely on the current in the rail itself, or that there is no current flowing to give any tester which will show conclusively whether or not there is any current in the rail. Sometimes it is hard to tell whether the joint in question has as good carrying capacity as the rail itself, or that there is no current flowing to give any readings. Joints on seventy pound rail bonded with 4/0 bonds which show a resistance of five feet of rail, are only fairly good. Those joints which go over ten feet are bad. A 4/0 bond in 70-lb. rail will, if it is in first-class condition, usually show a resistance of from one to two feet of rail.

Before deciding upon the supplementing of track returns by means of auxiliary return feeders, it is well to make some test of the exact resistance of the track return, and of the overhead resistances. This can be done by

means of a water rheostat load placed at night upon the system, after the cars are all in. Ammeter and voltmeter readings should be taken using, perhaps, a telephone line, or, if the system is sectionalized, one of the unused sections, as a voltmeter lead back to the station. The resistance of the overhead and ground return can then be calculated by ohm's law. Assuming that the track bonding is in first-class condition, then, if any more feeder is to be run, this feeder, for the best economy, should be used as a ground return, if the return resistance is the largest; and for a trolley wire feeder if the overhead resistance is the largest. Although in general it is necessary to keep the resistance of the return considerably less than the resistance of the overhead, in order to minimize leakage and keep the return current confined to its legitimate conductors which consist of the rails and ground feeders.

To sum up, it can be stated that satisfactory return circuits are only possible with first-class track bonding. Poor bonding workmen will spoil the best bond ever made. Care should be used in the purchase of track bonds, and the greatest care should be used in their installation. Periodically, thoroughly reliable men should test and repair all bonding.

TRACK FOUNDATIONS UNDER PAVEMENTS.

The selection of the type of track foundation under city streets which will give the best service at a minimum expenditure is a problem which confronts engineers when they prepare for the reconstruction of existing lines or for new extensions. In a recent issue of the Electric Railway Journal this subject was commented upon editorially, and the remarks there made are worth attention. There appears to be a general tendency to use concrete almost exclusively for this purpose. Careful investigations made recently on the surface railways in Chicago, however, have shown that similar results may be obtained by using a compactly-rolled or tamped crushed stone or gravel. A study of the advantages and disadvantages of both types affords a comparison that is instructive.

When concrete is employed as a track foundation the accepted practice has been to make the depth 6 in. under the ties. On new work little difficulty is experienced in obtaining first-class concrete foundations; the track is laid and blocked to a proper elevation, and the concrete foundation deposited in place and allowed to set perfectly before it is necessary to turn traffic over it. In the reconstruction of old track the results are not so satisfactory unless it is possible to route traffic around the piece of newly-laid track; in fact in many cases the foundations are not permitted to set sufficiently before cars are operated.

Investigations as to the proper length of time to allow for the setting of concrete foundations have shown that it should be not less than ten days, and experience on the Chicago railways has extended it to fourteen days. In many cases the failure to allow sufficient time has resulted in crushing the green concrete, causing the track to become badly out of line and surface. It has been learned that the best results are obtained by spacing the ties, whether steel or wood, at 3-ft. centres. The general opinion has been that concrete provided additional bearing. It has been found, however, that dependence upon the concrete bearing value has led to increased tie spacing to such an extent as to break down the foundation.

The use of crushed stone or gravel instead of concrete for foundations offers little advantage from the standpoint of initial cost for new work. However, in the reconstruction of old track, the use of one of these materials may be advantageous for several reasons. Although it may be necessary to increase the depth of the foundation 1 in. or 2 in., the cost of the material in place is lower, and the setting time is eliminated. In fact, the best results are obtained if traffic is turned over the track immediately after it is raised to the finished elevation. This reveals the weak points and permits retamping before the paving is laid.

The fact that ties must be spaced at closer intervals on crushed stone than on a concrete foundation has influenced the popularity of the latter type. The result of the tests on the Chicago railways shows that spacing should be decreased to 2-ft. intervals for either wood or steel ties. The reduced cost of material and labor with crushed stone as compared with concrete, however, more than offsets the increased cost of ties. As to the relative life of the tie in crushed stone or in concrete foundations, experience has shown that there is practically no difference. A factor which does not appear to receive proper weight is the reduced maintenance cost resulting from the use of crushed stone.

While the use of concrete is absolutely necessary in some instances, particularly where the subsoil is composed of quicksand or boggy material, these cases are special. Where the subsoil has good bearing qualities, crushed stone may be used so as to secure increased flexibility and decreased maintenance cost. Another point for consideration is the result of increased rigidity where that exists in track construction. The more rigid construction is believed to increase rail corrugations, and, therefore, to decrease the life of the rail. The cost of rail-grinding is also a factor.

During the reconstruction of old track, the problem of routing cars is a serious one, especially during rush hours, on many railways. As it is essential to a good concrete foundation to keep the track affected out of service for at least ten days, the cost and inconvenience of the delays experienced in routing traffic around new work should be considered.

Since the cost of material and labor in the construction of a concrete foundation is about the same as for crushed stone and the life of both types is about the same, provided equal diligence is employed during the construction period, the matter should be considered from the standpoint of operating cost. The increased facility for making repairs and the probable reduction of rail corrugations, which affect the cost of maintaining the equipment if they are serious, are worthy of thought When the question of foundation is not governed by the bearing quality of the subgrade, it appears that crushed rock or gravel has many advantages under the conditions prevailing in Chicago.

TEST OF MARINE THERMOMETER.

The Minister of Marine will afford Prof. H. T. Barnes, of McGill University an opportunity to make a practical test of his micro-thermometer, the instrument devised by the professor to give warning of the presence of icebergs at sea. A test of the apparatus was made in the Gulf of St. Lawrence by the steamer Stanley in 1910.

The Minister's intention now is to give it a further and more extensive trial. To this end the Government ice-breaking steamer Montcalm will be commissioned to cruise during the month of June next in the waters of Belle Isle and between that point and the entrance of Hudson Straits, equipped with the micro-thermometer. Every precaution will be taken to give the instrument a thorough trial. Should it prove efficacious in indicating, at any considerable distance from the ship, the existence of ice in quantity, doubtless the micro-thermometer will be adopted as a standard adjunct to modern equipment designed to assure the safety of ships at sea.

AN EFFICIENT METHOD OF HANDLING CONCRETE FOR STREET PAVING BASES.

The illustration shows the plan view of an installation used in laying the concrete street bases in Portland, Oregon.

This installation embodied several novel features, and resulted in a great saving, both in time and money, over the ordinary methods of handling concrete in this kind of work. The raw material was piled on a cross street back of the mixer, and a drag bucket was used to haul the sand, gravel, and cement to the mixer.

On the streets where there were no railway tracks, Koppel portable track was laid down the centre of the street, a Y switch leading to the mixer, as shown in the drawing. A turntable was placed at the end of the track, and from the turntable short sections of portable track were laid at right angles to the length of the street, and reached to the curb line.

The mixer unloaded directly into Koppel steel dump cars, and the cars were then run down the track to the right or left, and the concrete deposited just where it was needed, requiring very little shoveling. In this way a section of the street base was laid clear across the street, after which the turntable and cross tracks were moved six or seven feet back toward the mixer by merely removing a section of the portable track.

On the streets where there were double railway tracks two different methods were employed in carrying on the work. In both of these methods the mixer, materials and Y switch were placed as in the method just described.

On some of the streets the portable track was laid the length of the street between the two railway tracks. This method allowed the concrete to be dumped to either side of the portable track, thus filling in the space between the railway tracks. At the end of the portable track a turntable was placed, from which a section of portable track ran to one curb. This left one of the railway tracks clear, while on the other, when a car came along, the cross section of portable track was very easily lifted up and replaced after the car had passed. The turntable and portable track were blocked up just enough to permit the cross track to be laid on top of the street railway rails, so no elevated tracks were required. After the one side of the street and the section between the railway tracks was completed, the portable track was removed to the other side of the street and that part of the street completed. Another method employed on streets with double railway tracks was to lay the portable track on one side of the street and fill in that side of the street and one of the railway tracks. The portable track was then moved to the other side of the street, and that side and the other railway track filled in. This left a space between the two railway tracks to be filled in, which was done by using the turntable and a cross section of portable track which was laying either side of the street.

In all three methods employed, the concrete was dumped away from the portable track, and as a section of the base was laid a short section of the portable track was removed and the turntable and cross section of track moved back toward the mixer.

The great advantage of all three methods was that the concrete was placed just where it was needed, and handling the concrete reduced to a minimum.

TESTS OF SHEET PILING.

The last report of the Committee on Wooden Bridges and Trestles, of the American Railway Engineering Association gives some interesting methods for tests on sheet piling.

The procedure suggested for these experiments was that a strong concrete open-top box be made, across the middle of which a vertical plate diaphragm of tempered spring steel could be set; this diaphragm being held in place against horizontal motion at its top and bottom. On both sides of this diaphragm the box would be simultaneously filled with the material to be tested, as sand; thus representing (when the box is full) sheet piling driven in sand.

40'

Plan of Layout for Handling Concrete.

The sand was then to be removed from one side of the diaphragm, as would occur when a trench is excavated protected by sheet piling. After the diaphragm had assumed the curve due to the pressure of the sand its curved shape was to be accurately determined and a closely fitting template made to record its curvature.

In order to determine the amount and distribution of the sand pressure, the diaphragm would then be removed from the box and placed horizontally, supported at its ends at the same points it was supported by when vertical in the box. A number of metal strips should be provided, each long enough to reach across the diaphragm, but of varying thickness to make up any required weight, and of equal width.

These would be piled at equal intervals on the diaphragm until it reaches the exact curve of flexure which was given it by the sand and recorded by the template; bearing in mind that the tops of the successive piles of metal strips must be on a curve of some uniformity (which may be called the curve of load) without such irregular outline as that of a battlement, and carried over the supports on the line indicated by the curve approaching them. The total pressure, and the centre of pressure, would thus be determined, it is thought, with considerable accuracy.

As a check, the flexure curve of the diaphragm already found could be plotted to a convenient scale, and successive differentials taken thereof up to and including the fourth. As the equation of this flexure curve is unknown, the differentiation would be done graphically, remembering that the first differentiation gives the curve of tangents to the flexure curve; the second the curve of moments; the third the curve of shear, and the fourth the curve of load, which should

agree with the curve of load determined by the first method —that of weights superimposed on the horizontal plate.

Other materials than sand need testing, such as a heavy semi-fluid mud, and ballast. In each case the angle of repose would be noted of the unretained material, and its weight per cubic foot.

In order to obtain definite conclusions the concrete box and steel diaphragm should be of rather large size; and to prevent the friction of the retained material on the sides of the box from affecting the result materially, narrower steel plates could be placed on each side of the main diaphragm, observations being taken on the main plate only.

The investigation could be extended to determine the pressure on abutments, which are generally filled against gradually on one side only. It seems probable that under such mode of filling, the total pressure would be greater, and its centre lower, than in the case of sheet piling.

THE PEAT PRODUCER GAS POWER PLANT AT THE GOVERNMENT FUEL-TESTING STATION.*

By B. F. Haanel, B.Sc.†

Owing to alterations in the construction of the peat gas producer, now being made by the Körting Brothers, of Hanover, Germany, the tests which have been made and are now under way are not complete. This paper, therefore, can only treat in a general manner of the production of power from peat in so far as it relates to the investigations made at the Fuel Testing Station.

The reasons and necessity for the establishment of a Fuel Testing Station, and the benefits which it is expected will accrue to those provinces which possess no coal deposits and consequently are dependent on foreign sources for their fuel for all purposes, by demonstrating a satisfactory and comparatively cheap method for the production of power from peat, lignite and the cheaper grades of the imported coals, have been many times stated, so that it will be unnecessary to reiterate them here.

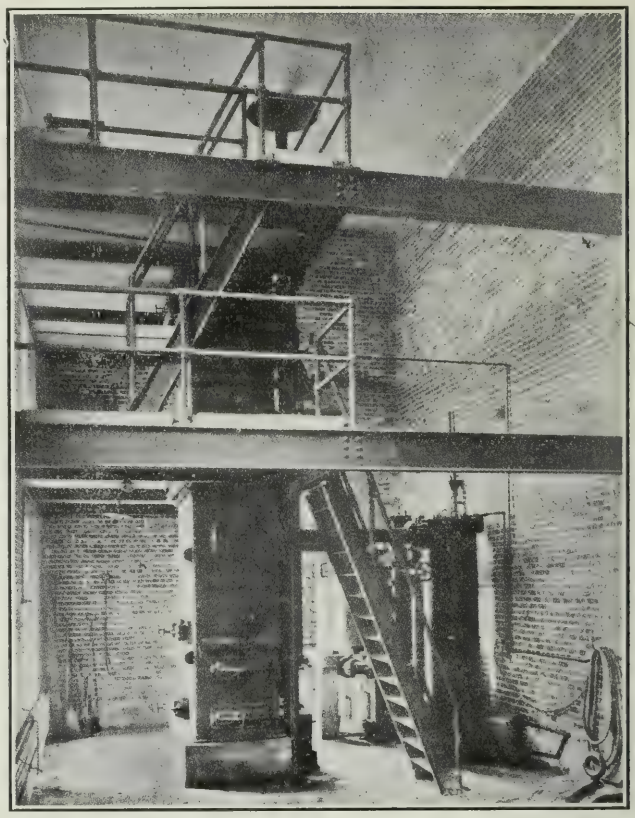
While the Fuel Testing Station was originally erected for the purpose of demonstrating a commercial and economical method of generating power by the utilization of peat in a gas producer, the plant has been enlarged sufficiently to include the investigation of lignite and coal in the producer.

That part of the power plant in which peat is exclusively used consists of a 60 horse power Körting peat gas producer and gas engine with a direct connected 50 kw. direct current generator. The load which it is desired to carry on the engine is regulated by means of a portable resistance stand capable of absorbing the full load of the generator.

The producer gas cleaning apparatus consists of a wet coke scrubber, tar filter and a dry scrubber. The engine is started by means of compressed air, which is supplied by a compressor driven by a 3 h.p.—a.c. motor, which charges into a receiver. A suction fan driven by a 1 h.p.—a.c. motor is provided for starting the producer.

Description of Producer.—The Körting peat gas producer as originally installed, consists of a rectangular steel shell about 15 feet in height from the floor level by about 5 x 3 feet in horizontal section. Near the top, grates are provided on either side. These two entirely independent grates are separated by a space approximately 12 x 12 inches. Below the grates are chambers into which the ashes drop, and these ash chambers and the grates above are accessible through two doors. About 3 feet above the floor level there is a second grate with two ash pits, one on either side, access to which is provided by two doors as above. Directly above the grates near the top or upper zone, a cast iron chamber is provided. This chamber is connected by means of a water jacketed pipe to a similar chamber beneath the grates near the bottom of the producer. This is called the lower zone. These two chambers are provided with doors for the purpose of cleaning. In addition to the doors just described, there are two doors situated on the back of the produced just over the lower zone grate bars through which the fire can be poked or cleaned.

On top of the producer are two hoppers for feeding fuel to the two grates of the upper zone. The doors covering the ash pits of the upper and lower zones are provided



60 Horse Power Körting Peat Gas Producer at Government Fuel Testing Station, Ottawa, Canada.

with adjustable air openings. The lower end of the water jacketed pipe mentioned above, is submerged in a water seal.

The lining of the producer, which is made of the best quality of fire brick, conforms to the general shape of the producer for a distance of about four feet above the grate bars of the lower zone. From this point, the lining is jogged or stepped on the two narrow sides until the grate bars of the upper zone are reached, leaving a space of about 12 x 12 inches.

Principle of Operation.—The green peat containing about 30 per cent. moisture and a large amount of volatile matter, is fed through the two hoppers described above, and is partially burned on the grates of the upper zone. The heat resulting from the combustion of peat is, or should be, just sufficient to drive off the moisture and volatile matter, leaving behind practically pure peat coke, which falls through the narrow opening below the upper grates into the

* From the Journal of the Canadian Peat Society.

† Chief Engineer, Division of Fuel anl Fuel Testing, Department of Mines, Canada.

lower zone where the final and complete combustion takes place.

In addition to the moisture and heavy hydrocarbon vapors driven off from the peat during the process of coking, the gases passing into the lower zone contain nitrogen, a small amount of carbon monoxide, carbon dioxide, and a trace of methane and ethylene.

When the producer is in condition for operation, the space between the grates of the lower and upper zones is filled with peat coke, the lower layer of which, for a height of about eighteen inches above the lower grates, is incandescent owing to the combustion of the coke on these grates.

The gases, heavy hydrocarbon vapors and moisture evolved from the combustion of peat in the upper zone, are drawn up (by means of the suction of the fan or engine) into the gas chamber above the grates of the upper zone, previously described, into and down through the water cooled pipe into the chamber beneath the grates of the lower zone and then up through the bed of incandescent peat coke to the two off takes on either side of the producer to the cleaning system and engine.

A small quantity of the heavy hydrocarbon vapors and possibly some of the moisture is condensed on the walls of the water cooled pipe and drops into the water seal below, where the resulting tar can readily be removed.

The gases of the upper zone and the remainder of the hydrogen vapors and moisture now pass through the incandescent coke of the lower zone. Here the hydrocarbon vapors admitted into the lower zone together with the moisture (steam) and air admitted through the air openings in the ash pit doors, in passing through the hot carbon either burn, or are split up into permanent combustible gases. The moisture is reacted upon by the hot carbon. The result of this reaction is free hydrogen and either carbon monoxide or carbon dioxide. The carbon dioxide, evolved in the upper zone, is reduced to carbon monoxide. The final gas consists of a large quantity (by volume) of nitrogen, carbon monoxide and smaller quantities of carbon dioxide, hydrogen, methane and ethylene.

The Cleaning System.—As previously mentioned, the cleaning system consists of a wet coke scrubber, tar filter and dry scrubber.

The wet coke scrubber consists of a cylindrical, steel shell about 6 feet in height by 2½ feet in diameter, closed at the top by an air tight cover and at the bottom by a water seal. This shell is filled for a height of about 3 feet with coke. When in operation, this coke is continuously sprayed with cold water. The final gas leaving the producer enters the scrubber near the bottom and leaves near the top. In passing up through the wet coke and water spray, the gas is cooled and most of the dust and a large quantity of tarry matter, which escaped decomposition in the producer, is removed.

From the wet coke scrubber, the gas passes through the tar filter. This filter consists of a cast iron box about 3 feet in height, and 3 feet by 6 inches in horizontal section. Inside this box are fixed a number of baffle plates and four perforated metal plates which are placed near the outlet. These plates can be sprayed with hot water when the suction on the system indicates that the filter is clogged. The gas enters at one end of the filter and passes in and out among the baffle plates and through the perforated metal plates and then into the dry scrubber. Most of the tarry matter carried with the gas past the coke scrubber is removed in this filter and flows off with the wash water into the seal. The dry scrubber is a cylindrical steel shell about 4 feet in diameter by about 3 feet in height, closed on the top and bottom. The top cover can be removed. This shell is packed with excelsior through which the gas must pass before entering the engine. Free moisture and some tarry matter is removed from the gas in its passage through the scrubber.

Results of Tests.—Several tests have been made with the peat manufactured at the Victoria Road peat bog, and with that manufactured at the Government peat plant at Alfred.

In these tests, peat with varying quantities of moisture were used, the lowest quantity being 15 per cent. and the highest 43 per cent. Since the producer is designed to operate with peat containing from 25 to 30 per cent. water and is, therefore, not provided with an evaporator for supplying steam (which is absolutely necessary when running on dry fuels), 15 per cent. moisture peat was found to be too low for satisfactory operation owing to the high temperature prevailing in the producer and of the final gas,—thus lowering the thermal efficiency,—and the formation of some tar.

While peat containing moisture up to about 40 per cent. can be used by operating the plant at half load, the most satisfactory moisture content was found to be about 25 to 30 per cent.

Any tar which may be formed and find its way past the cleaning system into the admission valve and cylinder of the engine can be easily removed while the engine is running, by injecting into the open end of the cylinder a mixture of oilsoap and water. Tar resulting from the distillation of peat is readily soluble in such a mixture and in this respect differs from coal tar.

Fuel Consumption.—The average fuel consumption per b.h.p.h. at full load (60 h.p.) was found from many tests to be from 2¼ to 2½ lbs.

For one bare horse power year of 3,000 (300 ten-hour days), this would amount to 3.75 tons.

For the purpose of showing the saving in fuel costs, which can be realized by generating power from peat in the peat producer gas plant, the following comparisons are given.

In estimating the following costs, the cost of one ton (2,000 lbs.) of machined peat, at the bog where the producer-gas plant is assumed to be situated, is taken at $2.00. The cost of a ton of soft coal is assumed to be $4.00 in carload lots, f.o.b. At some points this price would be less, while at others it would be considerably higher.

The consumption of peat per brake horse power hour is assumed to be 2½ lbs.; lower fuel consumptions have been obtained, but the writer desires to use a conservative figure.

The fuel consumption per brake horse power hour of the coal producer gas plant is taken at 1½ lbs., and that of the steam plant at 6 lbs. The latter figure relates only to comparatively small plants.

On this basis, the fuel costs per brake horse power year (3,000 hours) would be as follows:—

	Fuel, cost per brake horse power. Year.
Peat producer gas plant, peat at $2 per ton	$ 7.50
Coal producer gas plant, coal at $4 per ton	9.00
Steam plant, coal at $4 per ton.....	36.00

When peat is manufactured on a larger scale with machines provided with mechanical excavators and other labor saving devices, the above cost (2.00) per ton will be very greatly reduced, so that a power plant situated at the bog will be able to show a much greater saving in fuel costs over that of a coal producer gas plant or steam plant.

In order to arrive at the saving, which will be effected by the utilization of either peat or coal in a producer gas power plant over that of a steam power plant, it is necessary to estimate the operating costs and fixed charges since these will remain about the same for all the plants in question. A slight saving will, however, be realized in the peat

producer gas plant, over the steam and even the bituminous coal producer gas plant, in the operating costs, since the peat producer gas plant is very easily handled, the producer practically taking care of itself. Hence, one man, an engineer at moderate wages, can easily take care of a 100 h.p. plant. While this is true in a general sense, the writer has seen a 150 h.p. bituminous coal producer plant handled entirely by one man, but such cases are not common. A bituminous coal producer is more difficult to operate and requires more or less constant attention, and therefore for proper working should have the services of a stoker. A steam plant of like capacity would require a fireman in addition to the engineer. In short, a peat producer gas power plant, in its simplicity and ease of operation, is not unlike an anthracite producer gas plant, which is recognized as the simplest of all such plants.

While hydro-electric energy is in many sections of those provinces possessing water powers, the cheapest power available, and for many purposes the most suitable, it must be borne in mind that there is a limit to which electric energy can be economically transmitted, since the cost of power increases rapidly with the length of the transmission line. In addition, there are localities which cannot be served by such transmission lines and still others to which such power is not suitable—for example, those requiring a 10-hour or intermittent service. For such districts, it is manifestly cheaper and more satisfactory to develop power independently by some other means, and it is hoped that producer gas power plants erected on a few wisely chosen bogs will serve this purpose.

The demonstration plant at Alfred and the Peat Producer Gas Power Plant erected in the Fuel Testing Station at Ottawa (the former serving to demonstrate a commercial process for the manufacture of a cheap fuel from peat and the latter serving to demonstrate an entirely commercial, economical and reliable method of generating power from such fuel), will, it is hoped, prove instrumental in:—

1. The development of such of the peat bogs found in the the provinces of Ontario and Quebec, as are suitable for the manufacture of peat fuel, along sane and commercially profitable lines.

2. The establishment of power plants on the bogs, which will serve existing towns and cities with electric light and power, and attract industries to those parts of the above provinces which can be economically and satisfactorily served by such power.

CONCRETE TELEGRAPH POLES ACROSS MARSHY GROUND.*

By GEORGE GIBBS.†
